At their first appearance in 2002, Egyptian DVDs though remastered and produced in a portable format were not intended for the local market, neither the Egyptian nor the regional Arabic-speaking market. This could be ascertained from the following observations: There are numerous paid and free-to-air satellite channels showing and even specializing in showing Egyptian films, which by far, is the primary cinema industry in the region (Hayward: 2000). In the most populated-Arab country, Egypt, the number of people under the age of 20 reaches 40% ( [www.cia.gov](http://www.cia.gov)) and this age group tend to be more interested in contemporary films rather than in old or “classic” films. Also, the DVDs were originally remastered for satellite broadcasting but with the DVD technology the subtitling was added and the DVDs were marketed in Europe first and later in the Middle East. Finally, when the un-mastered version of the film was being sold on CD-ROM for 11 Egyptian pounds (A\$2.40) the DVD was being sold for 80 Egyptian pounds (then equivalent to the same cost of a DVD in Australia A\$20). This means that the cost of the DVD was beyond the purchasing power of the average Egyptian viewer. The subtitling of the films, old and new, was offered into English and French and with the remastering and marketing being in London, it was almost certain that the DVD industry was intended for the “target” viewer. Today, the only source for what Egyptian film is available on DVD is at the London-based company Fineartfilm.

### Cinema in Egypt

The Lumiere Brothers took their Cinematograph to Alexandria in 1896, the same year they were showing their early films at cafes in Paris (Abu Shadi: 2004). Within a decade, and in 1907, Egypt would have its dedicated buildings to showing films: a cinema theatre. Egyptian silent films began as early as the 1920s and the first feature silent films *A Kiss in the Desert* and *Laila* appeared in April and November of 1927. In 1932, the first talkie *Children of the Rich* was montaged and subtitled in Paris. The first purpose-built studios were established in 1935 and *Zainab* was the first Egyptian film to participate abroad at the first session of the Venice International Film Festival of 1936. During its peak Egyptian cinema was producing 80 films a year and since 1927 it has been the powerhouse of Arab cinema (Hassan: 1995).

SouEIF (2004) points out that in Egypt, films are described as either Arabic or foreign films. Yet, in all other countries films are described as either “Egyptian” or foreign films despite the fact that almost all Arabic-speaking countries have no viable local film industry. In north Africa, where more films are made than anywhere else (except in Egypt) the films have no local audience and are largely viewed as ‘art films’ made for export and directed at ‘target’ audience abroad. Likewise, in Syria, films are produced by the state cinema organisation at

the rate of one film every two years for the purpose of participating at international film festivals. The rest of the Arab world watches “Egyptian” films.

Today, the total number of Egyptian films is estimated to be around 4000 titles which feed the Arab satellite channels (Kassem: 2002). Some of these channels are dedicated solely to the broadcasting of Egyptian films. Throughout its history Egyptian cinema participated at international film festivals and presented its work through some of the most gifted and internationally known directors such as Youssef Chahine, Henry Barakat and some of the talented actors such as Omar Sharif.

### Omar Sharif

In *Blazing Sun* (1954) Omar Sharif made his debut in Egypt thanks to the opportunity given by his school mate and later Egypt’s prominent film director Youssef Chahine and the patronage of Egypt’s first female actress of the day; Faten Hamama. Sharif later married Hamama in 1955, the same year Anwar Wagdi, Egypt’s most popular male actor died. Sharif, through films with Hamama, soon became the most popular ‘premier garçon’ of Egyptian cinema.

Prior to his debut in David Lean’s *Lawrence of Arabia* (1962) Egyptian actor Omar Sharif was already the top male actor in the country. He had appeared in 22 Arabic-speaking Egyptian films in addition to other films in Lebanon and Tunisia where he acted in French. Since his move to Hollywood and subsequent residence in France, he participated in several local productions and acted in English, French and Italian. Yet, despite his residence abroad he continued to be the voice of Egypt through his commentaries on National Geographic documentaries on Egyptian archaeological heritage, Egyptian documentaries and his presence at important functions both in Egypt and abroad. Politically, widely-known but never confirmed, he played a role in Egyptian President Anwar Sadat’s endeavours to restore ties with the US (1974) and to open diplomatic channels with Israel in 1977 (Ynetnews:2006). In 2004, the Egyptian Football Association enlisted him in the team to present Egypt’s case for the 2010 World Cup bid and he has been the honorary President of the Cairo International Film Festival since 2006. Most recently, he provided the audio commentary for the ‘Treasures of Tut Ankh Amun’ Exhibition held in Melbourne in 2011.

While Sharif’s filmography since 1962 is fairly well known and documented for instance at the Internet Movie Database ([www.imdb.com](http://www.imdb.com)), his filmography prior to 1962 is neither examined nor documented. When the Egyptian DVD industry began with an Omar Sharif film it was addressing both the foreign audience by offering a film of a familiar face and the local audience by offering a repeatedly shown and often-watched film. The selected film for this research, *A Man in our House*, is widely considered one of the most loved Egyptian films, a classic in its own right.

### Definition of Classic:

Over the past fifty-one years and since its first screening in April 1961 (Kassem: 2002), *A man in Our House* has been shown several times a year in almost every Arab country. The

film is directed by Henry Barakat (1912-1997), one of the foremost Egyptian directors of the fifties and sixties, a period commonly referred to as La Belle Époque of Egyptian cinema (Maarouf: 2005). In casting the film, Barakat brings together some of the leading actors of the day who made the production a national document that is repeatedly viewed. The film takes as its main theme the struggle for liberation and independence from the British occupation yet the real issue examined is the context of an average Egyptian family and its values. The film is based on a novel by a famous novelist Ehssan Abdelqudous whose novels graced Egyptian cinema more than Egypt's prominent novelist and the 1988 Nobel Prize winner of Literature Naguib Mahfouz. Yet, despite the crew and cast, the popular novel and theme it is the cinematic language employed that created a national icon. Here, multisemiotic features exemplified in the dialogue, décor, cultural semiotic features that are deployed and co-deployed in a particular fashion to create meaning come together to create a film of significant form. Buckland (2003: 2) explains the term

"The art critic Clive Bell came up with the term 'significant form' to indicate what he believes distinguishes good art from bad art. When we say that a film has 'significant form', what we mean is that the whole is more than the sum of its parts. The film's parts add up to create a new entity that does not exist in each part."

Furthermore, Stefan Sharff offers a definition of the term: "Significant form is the opposite of pedestrian rendition... Images fit together so magnificently that they ascend to a higher level of visual meaning" (1982: 7). Film critic and former Censor General in Egypt Abu Shadi (2004, 2006) examines *Fifty classic Egyptian films* and offers a definition of classic films: "Films that transcend time, place and language and command repeated viewing". In her attempt to define classic films, Anthony (2003) suggests "classic movies embody a method of storytelling that leaves something to the audience's imagination". While different views abound on the definition of a classic film, the fact remains that in Egypt *A Man in Our House* is considered an Egyptian classic by virtue of its inclusion in the List of the Best 100 Films (Tawfic: 1969) and in the List of the Most Significant 100 Films (Al Hadary: 2007). Moreover, its repeated showing on July 23<sup>rd</sup>, the National Day of Egypt, since 1961 as well as its showing on Victory Day since 1974 as well as during the month of Ramadan has bestowed, if not confirmed, a special place and position in modern Egyptian and Arab culture. For instance, the film was shown on Emirates Airlines flights as recent as October 2011. The fact that the DVD industry chose to launch its production with the film appears to be justified in attempting to address the local market despite the prohibitive cost of the DVD as well as the non-Arabic viewer who is familiar with the Hollywood actor but has never seen any of his earlier 22 Arabic-language films.

Prior to its release on DVD the film was remastered for broadcasting on satellite channels like hundreds of other Egyptian films that were purchased by foreign media companies and shown on their satellite channels. The Rotana Media Company was founded in 2002 and in 2004 it launched its specialized Rotana Cinema and Rotana Zaman offering round-the-clock "Egyptian" films with the occasional film or two from Lebanon and in 2006 when Keif El-hal (How are you?) the first Saudi Arabian film was produced, it was given a courtesy showing by the Saudi owned company. Rotana purchased the originals of almost one-third the

Egyptian library of films and continued to release the remastered films on DVD. The other two-thirds of the Egyptian film library are almost in the hands of another Saudi Media Company that runs the original Film Channel the ART (Arab Radio and Television) which was launched in 1991. This prompted an Egyptian outcry to ban the sale of originals/negatives and even called on the parliament to initiate a national campaign to buy back Egyptian filmic heritage which should remain in Egypt and not abroad. Once again, the cost of the original film buyback proved to be prohibitive for the Egyptian Ministry of Investments which pulled out of the national campaign. Rotana replied by acknowledging the Egyptian heritage stating that the purchase was legal from the various owners of the originals. Furthermore, it had invested large sums of money in remastering the damaged negatives and most importantly the company is based in Cairo. This means that it employs Egyptians, it has its originals in Egypt and it shows the Egyptian films round-the-clock on its free-to-air film channels.

The debate over the ownership of the negatives of the Egyptian classic films raises some issues. By virtue of having remastered the film and having it broadcast in its original language the media company has discharged a major part of its responsibility towards the Egyptian viewer. However, it is the subtitled version of the film (the DVD) that harms both the company and the reputation of Egyptian cinema abroad by virtue of its defective subtitling. By offering inadequate subtitling, Rotana could be said to subverting the cinema industry in Egypt. An analogy to the translation of Egyptian literary classics is perhaps in order. If classic literature written by Egypt's prominent novelists such as Naguib Mahfouz, Ihsan Abdelqudous and Youssef Idris is translated by well-known and accomplished native English translators the like of Denys Johnson-Davis, William Hutchins and Humphrey Davies, shouldn't the subtitling of films based on these novels merit the same treatment?

#### The audiovisual scene in Egypt

The argument on whether the subtitling of Egyptian classic films should be entrusted to experienced or accomplished subtitlers has not been examined in Egypt simply because the professional context is lacking. The demand for subtitled programs to feed the mushrooming satellite channels, all broadcasting around the clock, has not been mirrored by a demand for subtitling courses or subtitler training opportunities. Subtitling in Egypt has traditionally been a one-way street: subtitling foreign films and television drama into Arabic and prior to the digital age of satellite channels there has been one subtitling company in Egypt: Anis Ebaid & Sons founded in the 1940s (Al Ahram : 1980). The proliferation of satellite channels created the demand for subtitled programs which in turn invited channels to hire more 'translators' to 'translate films' into Arabic. It is perhaps insightful to observe that Arabic does not have a word for subtitling but uses the combination 'film translation', even in the credits of a subtitled film one could read "Translated by..." instead of 'subtitled by...'. Despite the fact that subtitling into Arabic as a professional practice lacks both professional training and academic examination (Gamal: 2008) it continues to respond to market needs on an *ad hoc* basis and despite some well-known and documented challenges (Al Ahram: 2006, Alsharqalawsat: 2003). However, the subtitling of Egyptian programs and feature films into foreign languages and particularly Egyptian films of significant form is a rare activity that has

very little demand in Egypt. In a nut shell, Egypt has always been an importer of audiovisual material and subtitles very little of its own into English. The only subtitling of Egyptian films seems to be confined to international film festivals and in this case the subtitling is privately commissioned by the producer and/or director and is rarely examined. On the other hand, Swedish subtitler Ivarsson and Carroll comment on the logistics of subtitling and points to the important but neglected area of post-production “directors do not care about what happens to their films overseas”(1998: ii). It is also insightful to observe that official translation programs in Egypt (and the rest of the Arab world) continue to disregard audiovisual translation and focus on print translation. For instance, in 2011 several conferences were held by Arabic language academies in Egypt, Jordan, Lebanon and Saudi Arabia to examine ways to strengthen Arabic in the age of globalisation and have suggested several strategies to boost the use of Arabic as well as the national translation programs. However, the multimedia world remains outside their immediate concern and translation on screen does not merit even a mention. It is in this light that the subtitling of Egyptian films and particularly those deemed to be classic films of export quality, should be viewed and judged. Historically, there has been no opportunity neither for the training in or the examination of subtitling Arabic-language films into English.

#### Significance of the DVD industry in today's world

While the term DVD is mostly associated with feature films it is increasingly becoming associated with the audiovisual translation world. In addition to subtitling and dubbing, audio-description for the deaf and hard of hearing viewers, it is also associated with the do-it-yourself or how-to books. Several books, including a book on audiovisual translation (Cintaz: 2007), come with a DVD. As culture in the Twenty First Century is increasingly becoming reliant on online and digital technology, an increasing number of institutions began employing the multimedia format of the DVD as the most convenient format for presenting and storing information and more significantly for making it accessible. DVDs are now used in almost every domain where accessibility through multilingual translation is required. This covers cinema, tourism, law, marketing, advertising, finance, health and investment to name but a few common areas. For emerging economies keen on attracting investments, a single DVD could provide the most convenient and affordable format for producing vital information that is portable, affordable and accessible.

#### Examining translation in the multimedia format

Digital technology over the past two decades changed completely the way translation is produced and consumed (Gambier: 2003, Diaz Cintas: 2007, 2008, 2010). Most translations are now produced and accessed on screen and are associated with more channels: visual, acoustic, video, colour and text. This multimodal format has in turn made translation a complex process that must account for these channels. Whereas traditional print translation was mono-dimensional in the sense that it relied almost solely on text, the current multimodal translation accounts for more. In the case of DVD translation and particularly in the case of feature films, subtitling is a lot more than just translation. The dean of Japanese subtitling Shimizu published a number of articles on the art of subtitling which were collected and

published posthumously in 1992 under the title “Subtitling is not translation”. The dictum originally referred to the fact that in subtitling a film dialogue not everything said is necessarily translated due to the constraints imposed by the medium of film/screen. In the multimodal age, the dictum could be seen in a different light and this time it is not only seen as a reductive form of translation but as a more inclusive form that accounts for other meaning-making features of the medium. In film, and as Abe Mark Nornes (1999) explains translation must be mindful not only of the words spoken, but also of the words unspoken (non-verbal communication), and the other meaning-making features of décor, cultural references, proxemics, kinesics features that contribute to the (target) viewer’s understanding of the subtitled film.

De Linde and Kay (1999) also observes that while native viewers are capable of processing meaning-making features in film “simultaneously” target language viewers tend to process such features “serially”. This means that subtitling must account for a lot more than just the dialogue. Multimodal discourse analysis (O’Hallaron: 2006) offers subtitlers a *modus operandi* that enables them to capture these meaning-making features in a detailed fashion that would make translation easier to account for all features that are deemed necessary for translating meaning and not just the audio. While multimodal description is a slow process (Baldry and Thibault: 2006) time-consuming and a commercially unviable (Taylor: 2003) and even “costly and boring” (Lemke: 2006) the purpose of multimodal analysis has significant relevance to the examination of multimodal documents such as film. One of the main advantages is that it identifies the diverse features that help in making meaning in film. While it is arguable whether a multimodal analysis would benefit a subtitler with undeveloped film literacy, it is almost certain that multimodal analysis is a step in the right direction towards acquiring a heightened awareness of meaning-making features in film and would enhance the subtitling process by making it more sensitive to the visual than to the audio, which is the current situation in the Egyptian DVD subtitling practice. O’Hagan and Ashworth concur that “increasingly translators needed to become computer literate, and now it is becoming increasingly necessary for them to be literate with digital media so that they are able to process various digital content that is subject to language facilitation (2002: 132).

## Conclusion

The events of the Arab Spring in Egypt in 2011 have brought to the fore the importance of the digital technology and social media. The controls exercised by the old regime have crumbled with the espousing of online technology by a massive young population estimated at 405 of the population. The young have espoused digital technology to form new groups of soccer fans The Ultras, political opposition parties April 6<sup>th</sup> Movement, made Facebook the virtual meeting place and are now exploring the field of on-line authoring. For generations literary figures and education specialists have been bemoaning the low level of reading by young Egyptians. While it is indisputable that reading is, and has never been, a national pastime, the new digital age has brought with it some opportunities. Thousands are now contributing online and this energy, if harnessed, may help leading institutions such as the Library of Alexandria to lead the way into enriching the Arabic content online. Reading habits will change in the new digital age and schools must begin putting some of its curricula

on DVD to teach the young how to deal with the new tool, and how to manipulate its features and ultimately author and contribute content and not simply consume it.

The great task of the peace is to work morals into it. The only sort of peace that will be real is one in which everybody takes his share of responsibility. World organizations and conferences will be of no value unless there is improvement in the relation of men to men.

Si Frederick Eggleston

The visible difference in the whole definition "Multicultural communication" depends on the differences in culture and historical experience of the countries – participants for the long period of their existence. Even from the position of the so called "pure definition" multicultural world declares about necessity of intercultural communication through tolerance and intellectual development on the base of moral principles as unique value of mankind's existence. To be able to appreciate new approaches to international intercultural cooperation in Learning and Teaching one must look and look all things, and here is where the teachers in different countries step in. Life around us may tell us about all these things from the point of view of political, economical, social, moral, ethic and aesthetic items of our living, but the very teacher has the wonderful power to show them to us. And to classify it. And to explain it to those interested, that nothing is politically right, that is wrong morally. The very long teaching practice with school and university students demonstrates clearly two important intellectual and psychological intercultural communication models, contributing greatly to raising-upbringing A LEADER, responsible for sustainable development of the whole world due to personal professionalism and unique personal development. The role of a teacher is especial as new approach to International multicultural communication itself. A teacher is able to draw our attention to students personality, emphasizes his individuality, character, talents and abilities, he reveals to us the inseparable links that exist between him and surrounding society. Only a leader we have been teaching and upbringing in a student auditorium, penetrating successfully and optimistically through international intercultural communication principles using productive methods of teaching, - enables us to feel the spirit of the times. Leadership in the new conditions of living is a phenomenon. The more we while learning-remembering, suffering, trying to understand and remember, comprehend the past of our motherland and different people, the greater is our solicitude for the future, the deeper we appreciate and love what is ours, the fuller we appreciate and protect what is not ours. In accordance with Leadership as one of the main principles of IIC and the core of the communicating-cooperation we have been approbated some productive methods of teaching-learning on the base of International Intercultural Communication. As a result, it appeared to be wider than even expected. The very IIC as a very sphere of study became a completed perfect complex system-state of intellectual and moral world-conception items, guaranteeing people readiness to be fruitful and useful, sense of stability and sustainable development in a family, community, society, country, world. The teachers work proves, that "We can't direct the wind, but we can adjust the sails".

Common sense is in our case like insight. It lies in engaging in worthwhile activities.

The very teachers unite in their searching for effective methods of teaching the obligatory regulations and notions – firm, understandable, valuable, unforgettable and significant, common for everybody in the world from the position of common sense as the unique value. The wisest Alfred Robert Thatcher ever said: "You work hard, not because work is everything, but because work is necessary for what you want." The Unity of teachers as style of professional thinking, practical method of solving the problems of those taught and need the assistance - is the scientific approach in growing national and international intellectual and spiritual mentality, overcoming any crisis or preventing it. That is what the International Teachers Association has been carrying out, and as any good will and good deed needs time for embodiment.

Educating in a wide sense means a special unique mission. Those carrying out educated function see their mission as that of reconstructing the world attitude to values that are more rich than oil. It is a historical mission, in the point of which is arising people of different countries unite their efforts in restoring their national self-confidence within and its power and prestige abroad. It starts at school, goes on at the University, flows into Society – endlessly.

Taking into account such wise truths as "People do not fail, they give up" and "Life is not so much a matter of position as of disposition" - wise teaching is to affect on forming the whole attitude for life, so important while crises as well of without it.

Affecting the attitude-forming, the teachers in combined efforts shape the personality, enable to feel oneself to be in responsibility for others in their striving to perfection through self-estimation (evaluation) as a lifeguard in a need and a victory.

The task itself is tremendous by scale. The first one is the teacher's personality, applied with all traits are in demand in new conditions. The societies demand the extraordinary qualities of the educator's teaching, inseparable from the robust normality of the intellect.

The other side of the coin is necessity of broadening the whole sphere of social problems, as the assumed right of society. The whole approach is correct both chronologically and logically. In the hard new conditions of any crisis the teachers happen to demonstrate their democratic and pluralistic ideals, derived from the very point of the profession, enabled them to combine in their actions the national and universal aspirations.

Circumstances and persistence are major components in the development process of establishing teacher as a leader of any society. International teaching-stability is based on independent process of educating-making, when the teacher's professional genius is used by them to combine, by the necessity of the past with a shrewd sense of the future. The teachers are to become the main part of the developmental state-engine, able to take into account exclusive national goals with imposed and compulsory inter-and trans-national means of educating implementation. Their contribution to children and adults let the latter to apply their knowledge to the gifts of nature and the items of civilization in order to satisfy their needs maximally safely preventing any crisis. Due to the simple mathematical reasoning the Universal values are equal to highly-skilled teaching itself as method and practice.

The magic of insight comes to those are ready to be in accordance, open and professional. That is why the teachers-professionals are to have the psychological maturity to deal with any arising problem. They are assertive in their thinking style by teaching the students to accept challenges, enrich their life, maintain their self-confidence and remain flexible.

In the conditions of crisis in the society the very teachers themselves will examine some of the alternatives and innovations that are being proposed as ways of improving education. It is the very case when expectations alone can produce positive changes in "learning ability" of the society, the children and adults ones on a way to Leadership in a future.

In new conditions teachers put a strong emphasis on Team work. Team work is a core-idea of organizing A Learning Center. on a base International Teacher's Association.(Denmark). The results of the work having been analyzed in some schools and Universities are promising.

Training Methods of Good Teaching being applied have been performed as workshops. They were: 1. Lesson-workshop rotation. 2. Apprenticeships, assistantships and Inter-ships as

intellectual following managing of teaching.

3.Role-playing evaluating. 4.Audiovisual method in class.5.Lectures.

The Key-idea of the Learning Center is Managing effective leadership in Teaching.

Accordingly, there are some necessary personal traits the Learning-Center workshops make possible to shape in successful teachers for achieving desired results in helping people to come away any crisis more or less painfully. The traits are like these:

1.Enthusiasm .2.Conscientiousness.3. Emotional.;4. Social boldness.5.Intuitiveness .6.Charisma. 7.Practicality and High Energy.. Self-confidence and resilience – are common traits. We name it self-assurance.

In a wide sense educating means is a historical mission, in the point of which is arising people of different nations to the realization of a notion” unite. ”To unite” means to tie or unite their efforts in restoring their national self- confidence within, and it’s power and prestige abroad.

A unique individuality is reliable and useful as a lifeguard in a need and in a victory. Tolerant approach to education as method and action, should provide teachers and students with the intellectual tools and social skills of communication in the society in order to cope with the complex human, spiritual – moral and technical problems in present and future. It is right to represent concrete goals as finding a solution, not winning a war. It is wrong to belittle, attack or destructively criticize. It is right to have teacher’s whole international community practically good communication skills from the most trivial conflicts like –who is the most important? It is right to respect all peoples feelings, even if disapprove their actions sometimes.

At the process of penetrating through the whole idea of tolerant education, firstly theoretically, we developed a series of interviews with teachers and students from Sweden, Denmark, Japan, Poland, Russia, the Baltic countries and different regions of the world, promoting of Tolerant Educational Thought and Research. It was extremely important for educators of all nations to popularize tolerant education as essential basis in sustainable development of a democratic an peaceful mentality and culture, as a foundation of an intellectual and moral success in our teacher’s business. Linking the knowledge generated in a systematically firm and scientifically promoted tolerant teaching and upbringing, we form independent thought in the minds of the general public. A series of interviews would be launched as ”Tolerant Education Today: Conversation with Contemporary Thinkers”, and provided by qualified teachers, specially trained for that purpose, effectively linked to academic or vocational training in all fields. The results of different levels of complicity interviews showed that it would necessary to convert into data the information directly given by teachers, interested

. A true, real tolerance, as patience, let us freely express our ideas and not to fight against the very sphere of a human being thought. It demands a nobility and honesty from every person, responsibility and reliability, as a rightness of a life. A tolerance is a very high and significant word to be used in vain. A real and honest human –being’s life has only one way – to a tolerance as a knowledge, ready to learn to Leadership as a life position, stimulus, motive, achievement ,evidence, experience.

The whole understanding of this truth inspires teachers and students with a determined love for work not only in getting useful knowledge from teaching ,but joint-combined learning, training, coaching, schooling and doing the best in every kind of practice. We named this practice as Diplomacy of living and teaching-learning in Peace with yourself and the others. That is why the important step in our scientific method realization was a collection of experimental facts or data. So, we consider the process of a new personality formation not as something “imposed by external force, including the so called “pure education”. We consider it to be an independent

inner perfection of an individual, as insight, when the whole education promote the personal's development without discouraging it occasionally. Declaring some necessary items of a new education we take a definition of "A Winner" - A Leader .

The winner sees an answer for every problem. So, the peace-education declares to be a winner, a friendly, cooperative person, getting along with colleagues, class-mates, neighbors, relatives, yourself. Some practical measures to increase the vitality in realization of true Peace-Tolerant education appeared to be effective and wise.

- 1.The Peace-Tolerant Education curriculum should contain a common core of learning pedagogical Psychology as a Philosophy of such education itself;
- 2.Focusing on a broad range of tasks requiring peace approach to family-school-university-community-society-country-surviving problems we propose tests and ideas-actions as indicators of Tolerant peace education.
- 3.Comparing analysis different tests, ideas and outcomes among different groups of population, children, young and adult let make possible and effective using tests as indicators of tolerant Peace-education.

Acting in such a way we mean realization of some expected results as transformation the present "culture of violence" in common understanding and recognition their own role in the happiness of the so called "close" and "far" people. The core of the solution we see in recognition, learning, realization and appreciation of life-values common for everybody in different cultures. The whole way is rather difficult, but it may have been overcome. In the face of chosen psychological method reaching tolerant education procedure we denote practical performance as "Inspired Teachers and Students".. Good teaching creates culture of communication in order to raise a New Personality – its norms, values, when systems of good teacher's qualification and wisely organized learning can transform culture itself.

International Teacher's Association has worked out principles of a tolerant education and a system of pedagogy methods leading to an upbringing and teaching a leader of a sustainable development world. The stability of international teacher's unity comes from the spirit of equality and oneness the noble values embodied in core universal unity.

Scientific psychological method of tolerant (peace) education, formulating right attitude and a new definition of a Happiness as a useful activity for the sake of common progressive development, does not depend on outward conditions. It depends on inner conditions that mean to think rightly. From the point of view of tolerant education to learn to think rightly means to create positiveness as insight inside and good actions for people outside.

We adapted Memorandum of a Tolerant -lover teacher, a Peace-lover psychologist. The document consists of three parts:

- 1 .A psychological portrait of a new time teacher
2. The Program of Action
3. Problem-solving skills and dealing with responsibility (charge) curriculum.

They look like common findings:

Tolerant-lover teachers are keenly observant, intelligent and have a great desire for learning and self improvement. They think in broad terms and are concerned with the world beyond their own personal sphere- town, nation, country, world. They are likely to become involved in community affairs, social organizations, they enjoy being part of a group endeavor and find themselves organizing, managing and supervising group activities. They are forward-looking and progressive, staying current and up to date. Having experimental mind they respond to contemporary social, political and cultural trends. Their strong points include concern for human welfare and social betterment. They establish themselves with wisdom.

Defining the trends, directions and approaches to a tolerant-peace education as methods of its realization, we proposed our teachers and students that they should choose for their own practice the most important definitions of a personal growth from a position of their own personality. We realized it in a course of a series-system of role plays, oriented to several goals to be achieved. We have done this work in different countries, so, the results gotten were very interesting. The task was to choose and to explain different items of personal-living values in order of their significance for a person. The final goal was to describe a tolerant leader as a personality of a new progressive society –civilization. So, the line of qualities to discussed looked like that below: sense of power, feeling important, feeling lovable, feeling self-confidence, feeling natured, feeling valued/respected, knowing and living by ones' values, feeling unique, feeling successful, feeling accepted, being assertive, maintaining one's integrity, managing stress effectively, daring to risk, being self-disciplined, having self-defined goals, managing conflict effectively, accepting responsibilities and challenges, feeling capable of influencing others, feeling in control of one's life, having positive body image, being able to accept praise and criticism, having broad range of emotions, being able to act independently and interdependently, feeling proud, being able to give and receive, feeling useful, feeling connected, feeling competent to make decisions, dealing effectively with peers and authority, feeling safe, knowing it's okay to make mistakes, feeling trusted/trustworthy, feeling competent to make decisions, dealing effectively with peers and authority, feeling safe, knowing it's okay to make mistakes.. All items consisted of a Tolerant Leader Image, but in different consequence due to each personal choice. Some problem-solving skills and dealing with charge we consider being the most important were:

- I can identify problems and propose possible solutions.
- I can find and use a range of information from different sources.
- I can distinguish between facts and opinions.
- I can evaluate different solutions to a problem and select the best one.
- I can be positive when faced with a new situation that is difficult.
- I can show I have a strength to adapt to a major charge.

In coming to a conclusion about our hypothesis, we are swayed only by experimental evidence. For some of these reasons, the source of quality of Tolerant education through International Intercultural Communication realization may be due to complicating factors as: good teaching, comfortable psychological atmosphere of teaching and learning, high level of living values knowing, including information about habits, even predictions in cultures of all potential participants. Hence when the critical temperature of misunderstanding and fears in some cases is approaching from below, the system of communication finds the exchange energy as intellect, moral living values and common sense as protection, security and cooperation in dependence of mutual understanding of personalities-leaders all over the world. We mean we governed principally by what the majority of people (schoolchildren, university students, teachers, parents) think about it. We constantly checked our hypothesis by experiment we called Actions and were guided solely by the results thus obtained. The actions proved to be interesting and useful when we had realized the close connection between tolerant (peace) education and Ecology of an Individual Soul, that gives a Personality an opportunity of observing the only and the very way to Happiness to be useful and demand – for everybody. It is the way to peace, by peace, for the sake of peace, having choice and flexibility, clearing away the mystery, act successfully through a fortunate case of survival, being inspired by the common task.” We owe the Peace on the Planet of a sustainable development people to our own efforts.”

Our preliminary work was constructed as a road to Personal Improvement, included progressive variants of concrete solutions on some behavior's aspects, necessary to be taken into account by teachers –leaders. We discussed effective measures of prevention-denial of drug problem; work, marital, financial ones; anger, physically abusive, poor appearance, loaded with secrets, depressed, high absenteeism from school or work, guilt, embarrassment, hides the alcohol,

argues with family member 's situations. We are sure all these problems being ignored form a base for any conflict starting in a family and completing in a world community.

The International Teachers Association represented and approbated international pedagogical methods, and having compared all of them had chosen the very right and universal – a tolerant education, as a complex of principles and methods useful in the study of time-dependant cooperative phenomena of development.

A tolerant education serves humanity, and teachers are the very persons have the power to face.. In a team-work it becomes a unique task of communication, responsible for the successful result of the tolerant teaching-learning as a whole process. By modeling virtues, exercising powers, and letting innermost values guide us, those involved and interested become the embodiment of these virtues, powers and values.

In tolerant teaching teacher's values clarify what they stand for. It gives them commitment to follow those highest values as responsibility, confidence, sense of useful, stability and high professional qualification. That is why the teachers are capable to propose the students the tasks should be solved out in the process of common-team work. The tasks are:

1. To identify the core values which underlie the global vision statement concerning a Personality , A Leadership, A Communication under circumstances of an international team-work;
2. To identify the barriers which prevent us from adopting and living those core values and following the best models of behavior and intention.
3. To develop strategic action plans (organizational, community or personal) in order to overcome those barriers and thus make the Global Vision Statement of a new personality a reality.

A Tolerant teaching itself has a fast-growing research culture, bringing together a unique combination of a knowledge about teaching and an artistic combination of professional skills, subjects and educators, quality parenting findings and a wise theoretical new approaches of international researchers to unite everything in a strict system of a new understanding world global vision. Exciting alliance of teachers from different countries on a base of International Teacher's Association established a Learning centre for teacher training and continuing professional development. Thus, step by step the very Philosophy of a tolerant education as a nonseparate unite of teaching-learning has been forming, contributing greatly to strengthening of a vibrant and friendly research community.

In a process of a constant working out the most effective methods of a tolerant(peace) education we must take into account the very humanitarian technologies in a poliethnic and multicultural sphere.

To know the quality of inner moral and intellectual energy in our students was very important. In order to use this energy the knowledge of the main items of tolerant education, strictly combined with antinationalism and fundamentalism seemed to be very useful for making up a principally new look at the problem and creating a strategy of students's actions. We organized some workshops, sittings, conferences, role-plays, maximally close to a reality of a modern life from the point of view of professional managing and prevention conflicts in ordinary socium's existence. One of the most crutial problems to be solved by intercultural cooperation as teaching-learning was connectedness.

Communicative functions have been making up in the process of communication in an auditorium and outside. A document, called as "Ground Rules and Ground Norms" has been worked up in order to help students in making-up right decisions and prove rightness professionally. They were:

1. Be nonviolent- no “killer phrases”.
2. Leave “baggage” outside.
3. Build on each other’s idea.
4. No idea is a bad idea.
5. Be honest and open.
6. Listen and understand.
7. Participate actively.
8. Start and end on time.
9. Respect confidentiality (build trust).
10. Build team work.

The structure of a such system compound from rules and norms was effectively serving itself as a guide on the path of communicative value of so complicated, even hard material for over thinking. To guarantee pragmatic and cultural knowledge through real communication four levels fore levels of theoretical and practical activities had been proposed to follow:

1. Surviving. 2. Adjusting. 3. Participating. 4. Integrating. Within each level we have organized the functions into general types as school and then college, university of effective living. They were: A. Basic needs. B. Socializing. C. Metalinguistic .D. Professional. E. Cultural.

That means, the emphasis for all teachers in their principal-centered to a tolerant education position is an urgent necessity to negotiate and communicate not only their students and colleagues in their own countries, but with educators and students, youngsters and adult – abroad. So, a document – Demands for a new generation teacher as an ideal educator had been worked out and approbated in different countries So, in our teaching and learning practice we are trying to build and keep alive Emotional Health and Professional effectiveness as A Key and Instrument in forming a tolerant education as a whole.

- On a base of a scientific-methodical centre of an International Teacher’s Association a prolonged system of a practical daily work for teachers and students in a line of a tolerant education has been worked out and is checking up systematically concerning analyzing of results gotten in different countries. There are some recommendations , being important in the course of a work teacher’s team from different countries:
- Read a lot about different trying to find out a motive and reason for a tolerant learning-teaching in mental, social and political sphere of material having been read at classes and outside.
- Choose your own tolerant, loving and giving attitude and attention to people and share it with them.
- Be able to define the subject and object of Peace in approaches to a tolerant education as final expectations and results of activity.
- Know the names and biographies of well-known Peace-loved educators, writers, psychologists, scientists, actors, sportsmen, doctors, etc.
- Be able to list some most effective ways to eliminate conflict and wars from life of Humans, and, particularly, terrorism as a kind of war with a help of rightly chosen tolerant education for a world.
- Taking into account, that we, teachers of the world have a goal to shape a new personality, a leader, when a tolerant education is a base and a module of a competence a Human being Personality in a sustainable development world, on a base of International Teacher’s Association Learning centre has been worked up a prolonged scheme of a tolerant education for mutual benefit and effectiveness teaching in different countries. Being supported by UNESCO, it appeared to be useful as a main direction of development. There are some moments of the whole system seemed to be important:
- Realizing the final aim-goal as upbringing of a highly professionally skilled and highly organized from a position of adopting human living values Tolerant personality of a new world, we represent a Tolerant education itself as the very possible and unique in recognizing under the multinational circumstances of a modern world. Tolerant education

not only stretches from formal education, to training, to raising public awareness. It is also considers how entrenched learning through socialization may need to be challenged (and/or preserved).

- A tolerant teaching for a new world, developed on a base of ITA, is tied to the development of the tolerant education-upbringing itself and perspectives, but also influences it through interpretation and clarification of that agenda. International unity of teachers, being supported by UNESCO in research approaches and practical activity, approbated the main principals of this organization as alive and effective:
- 1.Future thinking: actively involves stakeholders /our teachers and students/ in creating and enacting an alternative future without wars and multinational conflicts;
- 2.Critical thinking: helps individuals assess the appropriateness and assumptions of current decisions and actions;
- 3.Systems thinking: understanding and promoting holistic change;
- 4.Participation: engaging all in sustainability issues and actions.
- So, in united activity the teachers of the world develop capacity with regard to leadership as a product of a tolerant education. Through ITA's activity became possible to build mechanisms to promote leadership development in national systems of education in the world. International Teacher's Association role both for and as sustainable development of a new personality should be emphasizes strongly by improving the culture of a traditional educational system within a tolerant education and upbringing.
- An idea about international tolerant education must raise a profile of education as a whole internationally. It must gain resources of all kind from governments to make basic education of a new level an entitlement for all .Education is a motive, a source, a moving power and an engine in the process of a personal development, guaranteeing decency, prudence and Following to this common direction of teaching and upbringing we automatically enrich the notion "What counts as a tolerant education"? It is concerned with organized/formal/ international education programmes and in providing opportunities for the widest number of people possible to participate in a world of sustainable development. Realizing the final aim-goal as upbringing of a highly professionally skilled and highly organized from a position of adopting human living values Tolerant personality of a new world, we represent a Tolerant education itself as the very possible and unique in recognizing under the multinational circumstances of a modern world. Tolerant education not only stretches from formal education, to training, to raising public awareness. It is also considers how entrenched learning through socialization may need to be challenged (and/or preserved).
- A tolerant teaching for a new world, developed on a base of ITA, is tied to the development of the tolerant education-upbringing itself and perspectives, but also influences it through interpretation and clarification of that agenda. International unity of teachers, being supported by UNESCO in research approaches and practical activity, approbated the main principals of this organization as alive and effective:
- 1.Future thinking: actively involves stakeholders /our teachers and students/ in creating and enacting an alternative future without wars and multinational conflicts;
- 2.Critical thinking: helps individuals assess the appropriateness and assumptions of current decisions and actions;
- 3.Systems thinking: understanding and promoting holistic change;
- 4.Participation: engaging all in sustainability issues and actions.
- So, in united activity the teachers of the world develop capacity with regard to leadership as a product of a tolerant education. Through ITA's activity became possible to build mechanisms to promote leadership development in national systems of education in the world. International Teacher's Association role both for and as sustainable development of a new personality should be emphasizes strongly by improving the culture of a traditional educational system within a tolerant education and upbringing.

- An idea about international tolerant education must raise a profile of education as a whole internationally. It must gain resources of all kind from governments to make basic education of a new level an entitlement for all .Education is a motive, a source, a moving power and an engine in the process of a personal development, guaranteeing decency, prudence and wisdom. As UNESCO document declares, "It is education of a certain kind that will save us, as leaders, the issues now looming so large before us in the twenty first century"[1.R.Wade,J.Parker, 2008, p.5].We believe in our common sense professionally. So, constructing a tolerant education we stay as practical, as generous in our ideas, keeping eyes on the stars and our feet on the ground due to Dante's old phrase , presenting life witty solutions as professional reliability.

*Measuring the Readiness to Adopt a Japanese Laboratory-Based Education Model:  
The Case of Indonesia*

Abstracts

The Laboratory-Based Education (LBE) model is implemented by the majority of universities in Japan and has been proved to generate research, patents, and publications both nationally and internationally. Another indicator of success in the Japanese LBE is the set of independent research skills demonstrated by the students.

This study aims to design an implementation roadmap of the LBE model for universities under the jurisdiction of the Ministry of Religious Affairs (MORA). However, this paper only focuses on the measurement of the readiness and enthusiasm of people for LBE adoption. This is based on the Rogers' Diffusion of Innovations Theory which highlights that the environment contributes significantly to the successful adoption of innovation.

The questionnaire-based data collection is used to identify the readiness factors for LBE adoption. Several pertinent factors are important for the success of LBE implementation as a new approach, such as management commitment, resource provision, employee commitment and training. Based on the responses from people in management who are considered to be representative of object institution, the greatest mean was in the commitment of management to supporting the adoption of LBE (mean = 6.067), followed closely by employee commitment (mean = 5.861). Besides gaining information from the management level, the questionnaire was also distributed to the non-management level of the integrated laboratory in which the LBE will first be implemented. The mean of non-management readiness in terms of support for the management level in respect of LBE was high (mean = 5.828), while enthusiasm for the success of LBE was also high (mean = 5.175).

**Keywords:** Laboratory-Based Education, Indonesia, innovation, higher education

## Introduction

Innovation is often understood in the context of the discovery of new products that are considered as 'firsts' in the market. In fact, innovation is not only limited to new products but also encompasses new concepts or approaches that aim to achieve organisational goals (Rogers 2003). Innovation plays a very important role in the education sector worldwide, including Indonesia. Innovation in the higher education context can be in the form of a teaching program, teaching style, or other aspect of education, and is highly necessary to compete with other universities.

Improvements in the education sector, particularly in Indonesian higher education, must include everyone who attempts to compete at the local, regional or even international level. This is an important fact to be considered by universities under the Indonesian Ministry of Religious Affairs (MORA). The latest data released by MORA shows that the Ministry controls fifty two public institutions (MORA 2012a), yet in spite of this relatively high number of higher education institutions under their jurisdiction, only five MORA universities are included in the list of Indonesian top 100 universities (MORA 2012b).

Concerning the fierce competition in the education sector, higher institutions under MORA, particularly those that offer study in science and technology fields, need to improve their academic performance by, for example, increasing community-based research, number of publications, patents and so on. In addition, teaching style and teaching programs, among other things should be continuously improved. This kind of improvement will indirectly increase the quality of university graduates and make them more attractive to stakeholders. The question that arises from this issue, then, is how to solve the problem.

Returning to the discussion on innovation in higher education, we propose that the education model should be changed to achieve a higher level of publications and patents. As observed by the first author of this paper, some higher institutions under MORA, and indeed the majority of higher education institutions in Indonesia, are still implementing classroom teaching which is mainly based on the use of textbooks. A similar situation occurred in New Zealand universities, as highlighted by Mintrom (2008) in his study on pressures and dilemmas in managing the research function of a university. Mintrom (2008) also pointed out that the general advancement of knowledge comes from research-based activities, which is a very different approach to the practice of classroom teaching, tutorials, and laboratory sessions. In Japan, academics are accustomed to combining textbook study and research output in their teaching as a consequence of the high number of research activities undertaken. Moreover, the involvement of students undertaking research projects with academics is also high in Japan. Final year students (Bachelor Year 4) join their desired laboratory in seventh semester, and some programs request that students join the laboratory earlier, in their sixth semester. This situation has positive implications for research, for both academics and students. For example, students can focus more on their research project, hold regular meetings with their supervisor, and so on. For academics, there is a higher possibility of generating publications and patents from the research projects they supervise. This situation does not exist in the majority of Indonesian higher institutions, including MORA universities. It has implications that relate to the low number of students who can graduate on time; for instance, the average number of students who graduated on time (4 years) in one department of a MORA university in 2011 and 2012 was only 15.98%. Moreover,

this will impact on the accreditation of the department. A national accreditation evaluation, designed by the Indonesian Ministry of Higher Education, regularly evaluates the performance of higher institution in Indonesia, and this accreditation level is important because it impacts on the level of research and academic subsidies received from the government.

The first and most urgent element in the adoption of the Laboratory-Based Education (LBE) model is to provide a supportive environment in which students and academics can work intensively on their projects. In this way, academics can involve students in their research as part of the students' final projects.

Several universities in Indonesia, such as the Institut Teknologi Sepuluh Nopember (ITS) and the Universitas Hasanuddin, have started to follow the way of Japanese universities by implementing the LBE. The adoption of LBE by these Indonesian universities is because of the significant benefit of this concept experienced by Japanese universities, e.g. greater linkage to industry, increased publications and a higher number of patent applications granted year to year. According to a statistical report issued by the World Intellectual Property Organization (2012), Japan has the highest average number of patents granted up to 2008 compared to the United States of America and other leading countries such as China, Korea, the United Kingdom and Canada. In those countries, universities have the potential to be contributors to a portion of those granted patents.

The on-going implementation of LBE by some leading universities in Indonesia, as well as the significant contributions of LBE in Japanese universities, are worthy of consideration by MORA universities. The implanting of this Japanese education style can serve as a role model to increase the academic performance of MORA universities. However, adopting a Japanese-style education in MORA universities, particularly those which offer science and technology programs, is not a simple task. Firstly, the measurement of readiness to adopt this model/innovation should be assessed. The readiness of laboratory personnel to adopt the change in education style in MORA universities is extremely important, since the integrated science and technology laboratory will be the starting point for implementing Japanese-style LBE. This must be followed by the observation of existing MORA universities, and in particular, the integrated science and technology laboratories. Observation to gain a deep understanding of Japanese universities and their laboratories and systems must also be carried out. The output of this research will be a roadmap for the implementation of Japanese-style LBE into MORA universities, and part of the roadmap will propose a re-designed laboratory within the object institution to support the adoption of the model. However, this paper will only focus on reporting the measurement of readiness to adopt LBE within the object institution.

### **Laboratory-Based Education Model**

The Laboratory-Based Education (LBE) model has been implemented by the majority of universities in Japan and has been proved to generate research, patents and publications both nationally and internationally. In addition, an indicator of success in LBE implementation in Japan can be seen from the independent research skills gained by final year students. As

previously stated, final year students (Bachelor Year 4) have to join their desired laboratory, where they normally work under their *Sensei* (research supervisor) on their research projects.

According to Soemantri (2011), the LBE concept has several objectives, as follows:

- To improve the quality and relevance of science and engineering education
- To increase the involvement of faculty members in research
- To increase student involvement in the laboratory
- To increase interaction between faculty members and students

The most visible outcome of this model in the academic environment of Japanese universities is shown by the proximity of the *Sensei*'s office to the students they supervise. The students (final year of Bachelor degree, Masters and PhD) have a work desk from which they normally work on the research project. Figures 1 and 2 show the laboratory in a Japanese university which provides an appropriate environment for students to work in on their research projects. 'Appropriate environment' refers to a sole-user desk, internet access, online journal access, and student email account provided by the university as a means of receiving academic information.

**Figure 1** Student research laboratory in a Japanese university

**Figure 2** Experimental laboratory which also serves as a location for students to work on their research

Typical differences between laboratories in Japan and Indonesia are presented in Table 1.

**Table 1** General characteristics of laboratories in Japan and Indonesia

Aspect	Japan*	Indonesia**
Definition	A place designed for students to work on their research project, attached to either the experimental laboratory or an independent space	A place for laboratory sessions/experiments as part of teaching
Laboratory structure	Linear	Top-Down
Facility related to students	A work desk set, equipped with features such as internet access and a university email account to receive academic-related information, plus 24-hour access to the laboratory	None
Funding	Research grant mainly from industry or government	Mainly from university (for procurement, operational, small research grant)
Research environment	<ol style="list-style-type: none"> <li>1. Regular meetings, e.g. weekly, with research supervisor</li> <li>2. Close relationship between laboratory members (helping one another) → culture in the laboratory</li> <li>3. Establishment of university-industry linkage (ease of obtaining particular data and using industrial equipment)</li> </ol>	<ol style="list-style-type: none"> <li>1. Irregular meetings with supervisor</li> <li>2. Students mostly working independently</li> <li>3. Lack of university-industry linkage</li> </ol>

\* Observation in a Japanese university (generally typical of all Japanese universities)

\*\*Observation in a university under MORA in Indonesia (generally typical of other Indonesian universities)

Several of the points from Table 1 are highlighted below.

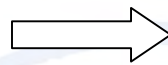

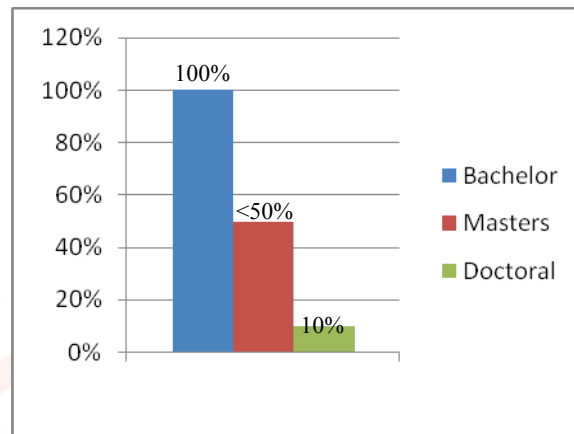

The laboratory structure found in the object institution has a top-down structure in which the laboratory normally has an organisational-style structure, i.e. top management, middle management and administrative staff. In Japan, most laboratories are independent and have a very lean structure, i.e. Professor, Associate Professor, Assistant Professor and students (final year of Bachelor, Masters and PhD).

The establishment of university-industry linkages in Japan has been a feature of the mutual university-industry relationship for several years; for example, Hane (1999) highlighted that the *Gakujutsu Shinkokai* or Japan Society for the Promotion of Science (JSPS) held licenses for university patents with 58 local Japanese companies, the majority of which were small or medium enterprises. This practice continues to address the needs of industry through research in Japanese universities to this day.

Of the LBE concept, it can be said that the LBE does not merely increase the ability of students to conduct research independently; it also enriches the course material of academics as a result of the research undertaken. Ragunath (2007) emphasized that education is not limited to classroom teaching alone, but includes shared research experiences and knowledge transfer.

In our opinion, the LBE model is not only a model that involves students in their supervisor's projects; it is also a grouping within the research area that clearly shows what research groups the faculty supports. This kind of research specification easily provides a way in which a group can expand its research area.

Figures 3 and 4 describe the differences between universities in Japan and Indonesia in terms of laboratory attachment in the way that research is grouped. Figure 3 illustrates the composition of final year students (Bachelor), Masters and PhD students in Japan when they join a particular laboratory.

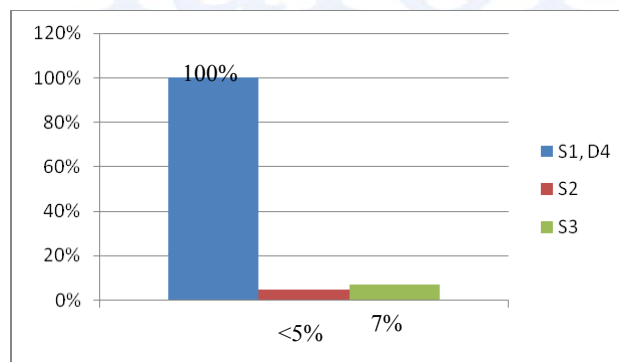

Member of lab = research group

**Figure 3** University in Japan

Source: adapted from Usagawa (2011)

Figure 4, by contrast, shows the situation of public universities in Indonesia where the student is not encouraged to join a laboratory that supports their research. Here, research groups are normally non-existent and lead to students having to work independently.

Research group ??

**Figure 4** University in Indonesia

Source: adapted from Usagawa (2011)

Another concern of the LBE is in the layout of the laboratory (refer to Figures 1 and 2) which, in most laboratories in Japan, serves as a teaching and research area for students. This is different from Indonesian universities, particularly a MORA university. The laboratory mainly serves only for laboratory sessions and is closed after office hours. This means that there are no activities for students, especially for Year 4 Bachelor students in the laboratory outside office hours. Concerning the space for students, Figures 5 and 6 show the Computer Integrated Manufacturing (CIM) Laboratory of the object institution in which there is unused space. This space is quite large and could easily function as a laboratory desk space for final year students to work on their research. In essence, the necessary space could be found by providing independent rooms or by employing the unused spaces inside the laboratory to provide research desks for students.

**Figure 5** CIM Laboratory

**Figure 6** Unused space in CIM Laboratory

Laboratory-Based Education (LBE) is considered by personnel in the object institution to be a new approach, and it is therefore important to understand people's readiness and enthusiasm for innovations such as LBE. Their perspective about a new approach is very important because it can act as a guide to the possible success level of the innovation if it is adopted. The measurement of people's readiness and enthusiasm to a new approach is reported in this paper.

The elements of Diffusion on Innovations Theory (Rogers 2003) that contribute to this research and are considered in the design of this questionnaire to gain useful information from respondents are as follows:

1. Compatibility
2. Communication channels
3. Leader characteristics
4. Organisational slack
5. Change agents

*Compatibility* -- It is necessary to assess the compatibility of LBE with the values and culture that exist within in the object institution.

*Communication channels* -- These influence the rate of innovation adoption, particularly the speed of adoption (Rogers 2003).

*Leader characteristics* -- It is important to measure the management characteristics relevant to innovation adoption; for instance, the willingness of management to be actively involved in the implementation of innovations.

*Organisational slack* -- According to several studies, organisational slack has a positive relationship with organisational innovativeness (Rogers 2003). This means that organisations with available resources are more ready to adopt innovations.

*Change agents* -- Rogers (2003) explains the importance of change agents to the successful diffusion of an innovation such as LBE. Besides the management level of the integrated science and technology laboratory of the object institution, there are entities that belief has influence in the decision to adopt innovation.

## **Methods and Analysis**

This research will consider the readiness and enthusiasm for change of people in the sample laboratory. It is important to know that the starting point for changing the environment in support of LBE will be in the integrated science and technology laboratory of the object institution.

To gain appropriate data from respondents, several administrative issues needed to be taken into account when designing the questionnaire, such as the length of the questionnaire and how easy it would be to read and understand (Cooper and Schindler 2003). Addressing these issues is important because respondents are usually very concerned about the use of their time when they complete a questionnaire.

The questionnaire was designed in two parts, Part A and Part B. Part A covers respondent details, such as their position in the laboratory, number of working years and so on. There are four sets of questions in Part B of the questionnaire that explore the level of readiness of management level in relation to resources, management support/attitudes toward innovation, employee commitment and training provision. Another twelve-item questionnaire was designed to measure the readiness of Pranata Laboratorium Pendidikan (PLP) non-management laboratory assistant staff to adopt LBE and to support management in that adoption. A further three questions for PLP to assess their enthusiasm for the adoption of LBE were also included in the questionnaire. Although the questions given to management personnel and PLP were different, both sets measured the readiness aspect of innovation adoption. All questionnaire items were adapted from previous study conducted by Amar and Davis (2010).

For the purpose of this research, the responses from management and non-management (PLP) levels are considered to be representative of the views of the integrated laboratory. As stated earlier in this paper, the perspectives of people from the integrated science and technology laboratory of the object institution are important for assessing the success of the future implementation of the innovation.

## ***Demographics of Respondents***

Of the 28 respondents, 9 of 10 management people participated in the research (90%), while 100% of responses (19 out of 19) came from PLP. The majority (66.7%) of the management level has < 1 year working experience in the laboratory of the object institution. Approximately 47.4% of the non-management level have 1-3 years of working experience in the laboratory of

the object institution.

### ***Readiness for LBE***

Twenty-eight responses were gained through the questionnaire survey conducted in June-July 2012. Because of the statistically low number of respondents, the data analysis will only use the descriptive analysis and non-parametric test to show the mean of readiness and the mean differences of the two groups of respondents.

For management personnel, the mean of the readiness to adopt innovation in terms of resource provision, management support, employee support and training was good. Almost all responses have mean  $> 4$  which indicates that management people have a readiness to adopt innovations such as LBE. The two greatest means were in the commitment of management to support the adoption of LBE (mean = 6.067) followed by employee commitment (mean = 5.861).

Non-management (PLP) people showed their readiness to support management if LBE was adopted (mean = 5.829).

Using the Mann-Whitney Test, there were no differences in the median grades of resources, management support, employee commitment and training on the working group (p-value 0.193, 0.147, 0.601 and 0.294 respectively; all are  $> 0.05$ ). There was also no difference in the median grades of readiness at non-management level based on the number of working years; for example, 1-3 years and  $>3$  years (p-value 0.214 and  $> 0.05$  respectively).

### ***Enthusiasm for LBE***

With regards to enthusiasm, the non-management (PLP) level demonstrated their enthusiasm for the success of the new approach. The mean average for enthusiasm was 5.176. As mentioned several times in the paper; the importance of measuring the level of enthusiasm is significant because the starting point for LBE implementation will be in the integrated laboratory of the object institution. For the PLP group, there were no differences in the median grades based on their length of working years; using the Mann-Whitney test, the p-value was 0.644 ( $p > 0.05$ ) for people working for 1-3 years and  $>3$  years alike.

## **Discussion and Conclusion**

This paper has presented several observations concerning the Laboratory-Based Education (LBE) model as well as the key results of a questionnaire survey to help evaluate the readiness and enthusiasm for a new innovation such as LBE. The information gained from the survey will be used as the foundation to develop a roadmap for the implementation of LBE in MORA universities, and in particular for the object institution that was the subject of this study.

The research involved people from the integrated laboratory of science and technology of the object institution. As stated in the previous section, the starting point for the implementation of LBE will be in the integrated laboratory of the object institution. Because LBE is perceived as being 'new' by people at this institution, it is important to measure their readiness and

enthusiasm for LBE. The commitment of leaders or management level staff, and the support of laboratory personnel, are among important aspects that must be clarified before the full adoption of the innovation.

Twenty-eight responses were received from the management and non-management levels in the integrated laboratory of a object institution. The small number of respondents was because there were only 30 people in these management and non-management positions; however, the majority of responses gained were 'positive', which is greater than 4 on the 1 to 7 agreement scale. These 'positive' responses are the first picture of the 'openness' to innovation from the object institution, which is a very important concern in the adoption and implementation stages of an innovation. In general, the positive perception of innovation will assist in the success of implementation.

It is interesting to note the differences in median grades using the Mann-Whitney test, because it is found that there are no differences in readiness in terms of management commitment and support, resource provision, employee support and training among personnel at management level in the object institution who have different lengths of working experience. At the non-management level, it is also shown that there are no differences in median grades between respondents with different working year experiences.

The results presented in this paper are useful for designing the LBE implementation roadmap for the object institution, or to other MORA universities that offer science and technology fields. For example, the commitment of management to supporting the adoption of LBE is the most influential factor in innovation adoption. By considering this factor, therefore, the implementation roadmap should provide training for the management level to assist in understanding the innovation, while at the same time encouraging support for the innovation. Innovation, whether it is in the form of hard technology or soft technology, needs support from management to achieve success.

The other interesting result came from the non-management level of the object institution which shows that there is a 'positive' view of the innovation in the agreement to support management in the implementation of LBE. Willingness to work as a team and to learn new things related to LBE, for example, will be important factors for the success of LBE implementation. In the implementation roadmap, this group of people should also have appropriate training to improve their knowledge and understanding of the innovation.

The results presented in this paper are expected to provide useful information for designing the implementation of the LBE model. There is, of course, limitation in collecting data by means of a questionnaire survey. The number of respondents involved is low because the research focus is only on representatives of the integrated laboratory of the object institution as the proposed place to implement LBE. Based on the low number of responses and adhering to statistical rules, e.g. normality of data, some of the descriptive statistics and non-parametric test results are presumably sufficient to judge the readiness and enthusiasm of people for the LBE innovation.

Further work will continue to develop the implementation roadmap for the LBE model. The quantitative data will be accompanied by interviews with people, particularly the decision

makers of the object institution, to explore certain necessary aspects in more detail. Re-designed layouts of the research institution's laboratories will also be proposed. The proposed re-layout designs are expected to support the success of LBE implementation in MORA universities. In short, this research supports the implementation of the LBE to improve relative academic performance, but it is not limited to the science and technology fields, and it is possible for other fields, such as social science, law, Islamic studies and others, to adopt this innovation.

*Changes in the Role of Elementary School Teachers in Taiwan over the Past 60 Years*

Pohsiu Kuo

0421

National Hsinchu University of Education, Taiwan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The role of teachers frequently changes according to changes in society. This study uses historical and documentary analysis to analyze the image of teachers, which governments aimed to shape in the context current to the time, from the perspectives of social change, the teacher cultivation system, relevant legislature, and teacher compensation. Using historical and documentary analysis, this study investigates changes in the role of elementary school teachers in Taiwan over the past 60 years. Finally, we provide a conclusion and recommendations for future studies.

Keywords: Social change, role of elementary school teachers, teacher cultivation, teacher compensation

## **I. Introduction**

Although every country has its own method for educating teachers, they all hope that teacher education develops professional educators who benefit the development of education. When analyzing teacher education, Chi (2002) noted that the ruling authorities in Taiwan faced numerous domestic challenges at the beginning of the 1970s. At that time, the Normal Education Act implementing monopoly power of the teacher education system was announced. This was primarily related to the preservation of ideology and national hegemony. The government hoped that teachers would teach the party state ideology and serve as the primary channel for controlling social thought. Schools were a site of political socialization; teachers became pawns of the party state, accepting specific knowledge and influence in specific fields.

After martial law was lifted in 1987, the social atmosphere became increasingly open. Society criticized the closed, conservative, and backward teacher education system and requests for educational reform increased daily. For the Executive Yuan Educational Reform Committee, teacher education became an important aspect of educational reform. The Teacher Education Act announced in 1994 brought the largest transformation to the teacher education system in history. The education system moved from being unitary and closed to diverse and open, from a publicly funded system to a reserve-style system that relies primarily on individual payment with public stipends. After changes in the political and economic environment, the government implemented strategies to transform the teacher education system and resolve existing problems. Additionally, the role of teachers also changed following reforms to the teacher education system.

Teacher education was influenced by the role of teachers that the government aimed to cultivate. Chen (1998: 146) stated that all teacher training systems served the government. Under this perspective, the Taiwanese government has determined the role of teachers throughout changes to the teacher education system over the past 60 years. This study explores this issue from a historical perspective, analyzing the changes in Taiwan's teacher education system and the compensation and social prestige of teachers to understand the roles the government and society established for elementary school teachers.

## **II. The Changing Role of Teachers Caused by Changes in Related Laws**

### **i. The Role of Teachers in an Authority-Oriented Teacher Education Model**

After the Nationalist government moved to Taiwan, according to “Normal School Law” and “Normal School Regulations,” normal schools were subject to the teaching objectives and policies of the Republic of China. Emphasizing strictness, competent teachers were trained for elementary schools. The training goals were to strengthen the teachers’ constitution, cultivate their personal character, educate them in national culture, enhance their scientific knowledge and ability, and foster the habit of hard work. This led to interest in studies on children’s education and lifelong education services (Taiwan Provincial Government Department of Education, 1987: 2-3). Using the Pingtung Normal School at that time as an example, one of its famous “Three Actions” was an emphasis on labor; thus, teacher education focused on promoting nationalism and habits of hard work.

The “Normal School Student Training Standards” announced by the Ministry of Education in 1958 not only specified academic admission tests, but also greater teaching of the Three Principles of the People, national spirit educational material, and the president’s instructions. During weekly meetings or other gatherings, the Three Principles of the People and Sun Yat-sen’s teachings were presented and, to explain the national policy of resisting Communism and the Russians, the conspiracies and atrocities of the Communists of the Russian empire were reported (Taiwan Provincial Government Department of Education, 1987: 217-28). Public reports from the Executive Yuan indicate that before 1984, normal school students and elementary school teachers were required to assist in the government’s campaigns promoting Mandarin Chinese.

Normal education teachers could not escape government interference. The monolithic teacher education system was a representation of national ideology. The “Normal Education Law” reinforced the importance of teacher education by recommending teachers receive strict physical and mental training and professional education to become competent teachers who promote national spirit. The “Taiwan Provincial Normal College Student Group Education Achievement Investigation Interim Implementation Essentials”

announced in 1980 divided the achievements of normal college students into two categories, class activities and social activities. “Patriotic spirit,” which comprised 20% of class activities, referred to the display of patriotic actions and sentiment, such as cherishing the national flag, respecting leaders, standing to honor the national anthem, advocating the Three Principles of the People, promoting national policies, supporting government decrees, making patriotic donations, denouncing unfavorable views of the nation, and stopping or reporting rebellious behavior (Taiwan Province Department of Education, 1987: 126). The government’s control on individual thought is evident in every regulation. According to the traditional teacher education system described by Fan (2008: 69), the government expected teachers to champion national spirit by enrolling in government-funded conservative normal institutions that would shape them into teachers who felt responsible to enforce national policies. Thus, teachers were national machinery who promoted government ideology.

The results of implementing the teacher education reforms in the “Teacher Education Act” in 1994 were diverse. Fwu (2000) stated that social change significantly influenced the “Teacher Education Act.” By implementing this act, teacher education channels were diversified, the teacher education system was liberalized, the hiring of teachers was delegated to schools, and teacher professionalism was enhanced. Today, the teacher education system has officially transformed from a monolithic system to a diverse new system.

## ii. The Role of Teachers in Market-Oriented Teacher Education Models

After the Ministry of Education established the “Teacher Education Act” in 1994 and the “College Teacher Curriculum and Standards Setting” in 1995, ordinary universities were allowed to develop a curriculum for teacher education. By 2005, 10 years after the teacher education curriculum was liberalized, the “Teacher Education Act” had been revised 10 times. A number of these revisions further modified teaching practices and the approval system. Thus, under the trend of marketization, teacher education wavered between two possibilities, that is, academia guiding the market or the market guiding academia. The role of teachers was also ambiguous, somewhere between professional and nonprofessional. However, because a reserve-style teacher education system was

adopted, the supply of teachers increased significantly. This, combined with a sudden drop in the national birthrate, led to a serious imbalance, where supply outweighed demand. The domestic scholar Wu (2006: 2) called this the “period of lost control” in the development of teacher education. Official teachers, substitute teachers, and “wandering teachers”<sup>1</sup> were regarded as level divisions by student parents. Although official teachers held a high social status and substitute teachers were “dissatisfied, but controllable,” wandering teachers were regarded as “flawed products.” In early Taiwanese society, teachers were considered the voice of knowledge. Under globalization and easy access to media and the Internet for knowledge, the position of teachers has become insignificant. Additionally, the number of teachers has increased significantly, hindering the preservation of the prestige and status formerly held by teachers.

The greatest power behind open and diverse teacher education systems is marketization. Under marketization, the teacher education system in Taiwan was reformed from a planned to a reserve system. The characteristics of teacher supply and demand changed from the high-level mosaic fit relationship of the past to a quasi-labor market relationship, where supply exceeded demand (Chi & Hwang, 2009). The role of the government also changed from control to supervision. Following the diversification of teacher education, numerous qualified teachers travelled extensively seeking employment, with the number of people willing to join the teaching profession significantly outnumbering the available positions. Huang and Sun (2003) indicated that when the government removes the umbrella of teacher education, or when the market is saturated, teachers cannot become even a market vassal and eventually drown in a saturated market; the role and social position of teachers is also marginalized.

The planning of teacher education by related government agencies only emphasized “diversity.” They failed to assess teacher demand or supply and demand in advance. Diverse teacher education policies consider being a teacher to be a type of profession, and emphasize adequate reserve education. However, by blindly following the market,

<sup>1</sup> Because of the oversupply of teachers, numerous unemployed teachers travelled throughout Taiwan seeking employment during schools’ annual teacher selection. This led to media mockingly labeling these teachers “wandering teachers.”

teacher education eventually faced a serious imbalance of supply and demand. The teacher education system was transformed from a monolithic system, where the number of teachers was insufficient, to a diverse system, with an oversupply of teachers. The government employed monolithic teacher education policies to guarantee quality teacher education. However, because the number of teachers was insufficient, secondary and elementary schools continued to employ numerous unqualified or substitute teachers. After the implementation of diverse teacher education policies, individual interest in being a teacher was emphasized; however, whether people had the appropriate abilities was not considered, strict replacement mechanisms were not executed, and the ideals of teacher professionalism and quality were not achieved. Yang, Lin, and Liu (2007) reported that diversified teacher education policies lead to two major problems, an imbalance in the supply and demand of secondary and elementary school teachers and a decline in teacher quality. Although “diverse education” was established as the goal, the significantly more important aspect of teacher quality was ignored.

The “Teachers’ Act” issued by the Ministry of Education in August 1995 became the legal foundation of teacher rights and responsibilities. Despite careful examination of the clauses in the Teachers’ Act, evidence of national ideology cannot be found. This demonstrates how the government’s hegemony of teachers was replaced with teacher and guardian autonomy. Article 26 of the “Teachers’ Act” delineates methods for organizing teacher associations. Article 27 defines the fundamental duties of teacher organizations as follows: maintain teachers’ professional dignity and autonomy; collaborate with authorities on teacher engagement and engagement criteria at every level; research and resolve educational problems; supervise the management, operation, and payment of savings to former teachers; attend teacher appointments and appeals, visit statutory bodies related to teachers; and organize self-discipline conventions. Teacher organizations have become an important force for monitoring school activity. Article 16 states that teachers’ rights include advising on school education reforms and executive items. Teacher education and student guidance is implemented according to a code; schools enjoy professional autonomy over their regulations. Besides greatly increasing their status in school executive affairs, teachers were officially recognized as professionals. On September 28, 2002, numerous teachers marched the streets calling for

three labor rights. On June 1, 2010, the “Amendment of Certain Provisions of the Labor Union Act” was passed on its third reading, and on May 1, 2011, its implementation began. The greatest impact of this act was that teachers were allowed to form unions. Traditionally, teachers were expected to focus only on learning and the paragons of virtue; however, after losing the burden of sagacity and advocating professionalism and autonomy instead, the issue of how to promote ethics to students emerged again.

### **III. Examining Changes in the Role of Teachers Using Preservice Teacher Education Models**

#### **i. The Role of Teachers in an Authority-Oriented Teacher Education Model**

The Nationalist government seized control of Taiwan after the war in 1945, ending 50 years of Japanese rule. At that time, Taiwan already had four normal schools, Taipei First Normal School, Taipei Second Normal School, Tainan Normal School, and Taichung Normal School (Cultural and Educational Bureau of the Taiwan Governor-General Office, 1940: 254). Wang (1999) indicated that in the “National Government Organization Law” issued during the political tutelage period, the chairman of the Nationalist government assumed responsibility of the Standing Committee of the Chinese Nationalist Party, the head of the five branches assumed responsibility for the chairman of the Nationalist government, and the rank and power of the Nationalist Party exceeded that of the Nationalist government. In other words, after the Nationalist government seized control of Taiwan, an era of party rule began.

In 1949, the Nationalist government was defeated in China. After moving to Taiwan, in addition to martial law, every aspect of politics, the military, economy, education, and culture was employed by the government to deter communist thought. In 1951, the government promoted the national policy of “resist Communism and Russia,” beginning with normal schools implementing military discipline and education. For example, when Huang (2003: 47) was serving as principal, the Taichung Normal School used meetings, speeches, student dramas, external theater groups, and the national teacher education sports week to promote opposing Communism and Russia among students. After moving to Taiwan, the government pursued innovations in education to build the country.

“Teachers are number one, teacher education comes first” became the mantra of education (Sun, 1963: 69).

In the 1950s and 1960s, Pingtung Normal School provided “resist Communism and Russia” presentations, “national spirit education,” and campus-wide national spirit tests annually. The school also frequently held campus-wide speeches on topics such as, “the Maoists are not China” and “what is actually happening in the bandit region and the process of pursuing freedom.” The school further established youth party divisions within Pingtung Normal School for resisting Communism and Russia (Huang, 1986:54–58). This indicates that schools actively participated in party activities and cooperated with the government to host speeches, integrating national ideology into the curricula and lives of students.

Regarding educational funding following World War II, according to statistics by the Taiwan Province Department of Education, from 1944 to 1949, annual educational funding was 6.41%, 8.41%, 20.78%, 25.79%, and 24.91% of the total budget, respectively. Until 1954, more than 20% of the national budget was allocated to education (Department of Education, 1955: 305). Data from the Chief Executive Office (1946) indicated that in 1946, the annual education funds per secondary school student, professional school student, and college/university student was NT\$554.68, NT\$719.70, and NT\$6,056.39, respectively. The amount allocated for each normal school student was NT\$5,649.14. From the perspective of educational systems, this indicates that after the Nationalist government moved to Taiwan, teacher education standards declined from their specialist level under Japanese control to a moderate level (Peng, 2011: 87). However, the funds the government allocated for each normal school student approached the amount allocated for specialist university students. That the government invested a higher ratio of educational funds into normal schools indicates the importance the government placed on developing teacher education. Teaching students experienced military-style management; their food, clothes, residence, and behavior were controlled. Upon graduation, teacher education students were distributed among secondary and elementary schools. Shen (2004: 87) described normal schools as their own societies, with significant financial investment from the government, militarized management, and

future employment priority for students. When these teaching students became teachers, their duty was to recreate this society. The militarized controls are evident in the memories of early graduates from these normal schools.

Liu (1998: 354) recalled studying at Tainan Normal School from 1954 to 1958:

**“Staying at the dormitories, living a class-based group life, each day’s work and rest based on the sound of the horn, the signal for waking at six in the morning...and the “morning roll call,” “morning self-study,” “raising and lowering the flag,” “evening self-study,” “evening roll call” every day. Unless something important occurred and we had arranged a vacation in advance, every student was required to attend.”**

This shows that teacher education was controlled, life education was valued, and a patriotic consciousness and national spirit was integrated in life education. Cai (1998: 351), who graduated from Tainan Normal School in 1956, indicated that the greatest difference between teacher education and ordinary secondary education was a thorough implementation of life education:

**“The sound of the horn in the morning woke you suddenly; the bugler played the signal to rise. When the loud horn broke the silence of the dawn, you did not dare continue to sleep. To rise, dress, wash your face, brush your teeth, and organize your things, you were limited to 20 minutes, which is certainly quick. Orderly and clean, we wore khaki military training clothes and, making quick steps toward the drill grounds, assembled under the morning sun...**

**...sitting on long narrow benches with no backs, four people sat in a row according to regulations. The required posture involved sticking out your chest and maintaining a straight waist, with your arms clamped to your sides. From the bowl to the mouth, students must not eat and speak at the same time. Any slight mistake, the military instructor could appear to correct you at any time...”**

This shows that the government implemented military-style control of the food, clothes, residence, and behavior of teaching students. The entire student body wore the same uniform and lived together in dormitories. Students could not enter or leave the school at will. Chen (1998: 349) stated that when studying at a normal school “we were together from dawn to twilight, eating and sleeping together.”

Considering international trends, by the beginning of the 1970s, every country had adopted globalized and international standards of teacher education (Kao, 2002: 91), whereas Taiwan’s teacher education system was monolithic and closed, with a curriculum that trended toward unification. The government consciously or unconsciously ignored certain structural dimensions of the teacher education system; thus, in the 50 years after the war, the government monopolized Taiwan’s teacher education system. The group-style instruction of teacher education was the government’s “ideology factory”; teachers even endorsed government policy and assumed responsibility for “political socialization.”

Although the government used teacher education to impart ideology, the life education in teacher training significantly influenced students. Most graduates of normal schools approve of the life education they received. Huang (1997:129–130) recalled the life education she experienced at Hualien Normal School:

**“Every week, every class was responsible for a “labor service” and required to finish the work within a limited time. At that time, because lawn mowers were extremely rare and personnel was abundant, we became ‘volunteers,’ planting trees, cutting the grass, smoothing soil, and moving rocks. Whether it was winter with freezing wind or summer with the hot sun, a task was a command, and we had to complete it on time... Additionally, students sent representatives to manage food, purchasing, and kitchen supervision, and every week there was a food review meeting. As secondary school students, we grew up considerably ...”**

Lin (1997: 140) describes attending Hualien Teachers College in the following extract:

**“Besides living in a regular routine, every week we also had labor service, such as weeding, landscaping, and digging. The things we never did at home we did at school. Even after a typhoon, we were required to dig up slit at the lake. Under the hot sun, our sweat dripping onto the dirt... even now I remember it like it was yesterday.**

**However, unexpectedly, the good life habits developed during my years at Hualien Teachers College helped me endure the later days when I had no one to care for me, and I even had enough strength to help others.”**

The recollections of these alumni reveal how capable teachers were cultivated during this period. By implementing education opportunities in every aspect of life, enables students to learn through doing, the government hoped to cultivate teachers who valued “service” and “labor.” The influence of these programs was extensive. Chen (1986: 158) described the influence of teacher education at Pingtung Normal School: “After receiving this training for three years, in my 30-year career of teaching and studying, I have always aimed to contribute to the country.” This is precisely what the government aimed to achieve, that is, when the students become teachers, they reproduce the life education they learned at normal schools in elementary schools.

Wang (1998: 332) recalled that when receiving teacher education, the school emphasized cultivating teachers who could “act as teachers, family, friends, and servants.” Teachers and students’ were counseled together, emphasizing mutual support and life education.

When Li<sup>2</sup> served as principal of Hualien Normal School, the lyrics he wrote for the school song, “words are the teachers of people, actions are a model for people,” expressed the school’s and society’s hopes that education students would become an example. Thus, teacher colleges employed hidden education and expectations to increase the importance of ethics and national spirit among students

## ii. The Role of Teachers in the Market-Oriented Teacher Education Model

<sup>2</sup> Sheng Li was the first principal of Hualien Teachers College following its transformation from Hualien Normal School. He was the fourth principal in the history of this institution, serving from 1956 to 1964.

After the lifting of martial law, the authoritarian education system was examined, and the monolithic teacher education style implemented by the Ministry of Education was questioned. Most criticism targeted how teacher education was used to promote government ideology under the party-state system. Examples of these criticisms can be seen in the second committee of the Legislative Yuan in 1993 (Legislative Yuan, 1993: 485), where Legislator Wan-Zhen Chen presented her experience, emphasizing that the Nationalist Party must be banned from demanding publicly funded students join their party. After diversity and open development was implemented, teacher colleges were no longer the only channel for teacher education. However, after students completed teacher education programs, they were required to pass examinations to obtain official teaching positions. Recently, teacher education organizations have been inexplicably driven to marketization. An example of this is the increasing influence of evaluations on the content of Taiwan's higher education. Teacher education organizations must accept evaluations because they influence the number of admissions approved by the Ministry of Education. Following graduation, the pass rate of teacher education students, and the number and ratio of students who pass the employment examinations, are important evaluation indicators. Therefore, curriculum teaching, teacher examinations, and evaluations are closely linked, driving teacher education organizations toward market and performance development.

Curricula for cultivating teachers have trended toward "credits programs." People wishing to become elementary school teachers must first obtain 40 credits from foundation courses including educational psychology, education philosophy, education sociology, and theories of education; at least two subjects must be studied. The teaching method course comprises the principles of education, class management, educational testing and assessment, teaching media and operation, curriculum development, and principles and practices of guidance. At least six credits must be from the teaching methods course, and at least 10 credits must be from the core courses.<sup>3</sup> The practicum

<sup>3</sup> The foundational subject curriculum includes the following: 1) Mandarin pronunciation and speaking; 2) writing characters; 3) children's literature; 4) children's English; 5) local languages; 6) ordinary mathematics; 7) theories of natural science; 8) theories of life technology; 9) theories of social learning fields; 10) music; 11) keyboard music;

and teaching materials provides four credits. At least eight credits must be achieved from the fields of teaching materials and methods. Elementary school teachers were traditionally required to be knowledgeable in every subject. However, after the implementation of the credits program, teacher education students can select courses to obtain the credits required to earn their certificate, before attending the teacher examination. Under these conditions, many question whether educational demands can be satisfied. Although teacher education is diverse, reduced professionalism seems likely.

The universalization of higher education and the development of media and the Internet have increased the circulation of knowledge. Under the market mechanisms, the role of teachers has trended toward meeting market demands. Official teachers, substitute teachers, and reserve teachers have been categorized using subjective methods.

#### IV. Transformations in the Role of Teachers Considering Teachers' Compensation and Prestige

##### i. The Role of Teachers Considering Teachers' Compensation

According to data in the National Income Statistics Report (2009: 13) published by the Directorate-General of Budget, Accounting and Statistics, Executive Yuan, the average annual income in Taiwan was NT\$1,582 in 1951; NT\$6,103 in 1961; NT\$19,777 in 1971; NT\$90,314 in 1981; NT\$227,244 in 1991; NT\$415,336 in 2000; NT\$388,665 in 2001; and NT\$471,797 in 2009. The monthly salary of elementary school teachers was just NT\$75 (Yang, 2011), and their annual income was approximately NT\$900, less than the national average. In the 1960s, the monthly income of elementary school teachers was approximately NT\$600. Chen (2011) reported that as a wood carving apprentice during that period, he could easily earn between NT\$3,000 and NT\$4000 per month, indicating that teacher salaries were comparatively low.

In 1967, the average annual income in Taiwan was NT\$10,028. According to salary calculations at that time, teachers who graduated college earned NT\$695 per month, with an annual income of approximately NT\$9,000. In 1971, the average yearly income was

---

12) arts and crafts; 13) performance and art; 14) theories of art; 15) health and sports; 16) folk sports; and 17) scouts.

NT\$16,777 (Directorate-General of Budget, Accounting and Statistics, Executive Yuan, 2009: 13; Yan, 2007: 41). In 1973, compensation for one day of work was approximately NT\$50 (Wu, 1997: 68); monthly incomes were approximately NT\$1,300; and annual incomes were approximately NT\$15,600. However, teacher compensation remained unchanged, indicating that in the 1970s in Taiwan, teacher compensation was below the average among professions.

Before the 1970s, although teacher compensation was not high, the publicly funded system and guarantee of future employment made teaching enticing for low-income families. Wang (1997: 124) stated the following when studying at a normal school in the 1960s:

**“The students who qualified to study at Hualien Teachers College in the 50s<sup>4</sup> were generally from poor families. Their reasoning was innocent. They believed that entering Hualien Teachers College honored their ancestors; thus, they were satisfied and happy.”**

Zhang (1997: 132) discussed student opinions regarding studying at normal schools during that time:

**“The boys who studied at normal schools were mostly from impoverished households. They had no choice but to demean themselves. Therefore, they frequently appeared unable to attain their ambitions, to the point that they frequently complained.”**

Becoming a teacher was not the first choice of students who performed exceptionally. However, normal schools provided publicly funded education to students who were poor but performed exceptionally.

Educational organizations continuously monitored teacher compensation during the early period. In 1964, during Pan's<sup>5</sup> inaugural speech as Head of the Department of Education,

<sup>4</sup> The “50s” referred to in this section is the 50s according to the R.O.C. calendar.

<sup>5</sup> Chen-Chew Pan graduated from the National Teachers College. On April 21, 1964, Pan took over as head of the

he commented on teacher status and compensation:

**“Respect the status of teachers. Improve welfare for teachers. Restore the traditional virtue of respecting teachers and ethics. The phrase ‘good teachers rejuvenate the country’ demonstrates the great responsibility that teachers have and the majesty of their position. Therefore, we must encourage society to respect and increase the self-confidence and self-respect among teachers. How can teachers set a good example when their lives are impoverished. The public know this. Hereafter, exhaust yourselves, use every possible condition, and do everything you can to improve the welfare of teachers.” (Dictated by Chen-Chew Pan, interview by Zhong-Sheng Zhu and Shao-Yi Guo, 2004: 163)**

Recently, the diversification of teacher education has led to an oversupply of teachers. In 2009, only 0.9% of teachers passed the elementary school examination (Ministry of Education, 2009: 262). Under a faltering economy, teaching jobs are stable. Additionally, teachers are only required to have a college degree to earn an average salary of NT\$30,000 per month. Compared to the NT\$22,000 first proposed by the government, teacher compensation is higher than that of other professions. This is the reason over 10,000 people sit the elementary school teacher test annually although the pass rate drops to new lows every year.

When compensation for teachers is low, public funding and employment guarantees can attract exceptional students to the field. When teacher compensation is comparatively high, how are exceptional students attracted to the field? After talented people have invested themselves into teaching, teacher education policies and the position the government sets for teachers are the crucial factors for retaining exceptional teachers.

## ii. Examining the Role of Teachers and the Prestige of the Teaching Profession

---

Taiwan Province Department of Education. He has attended the nine-year national teaching plan and implementation. On June 8, 1972, he resigned from being head of the Taiwan Province Department of Education. Later, Pan chaired the Youth Commission, the Taiwan Province branch of the Nationalist Party, the Youth Corps, the Nationalist Union, and Academia Historica.

Although, to date, no scholars have investigated teacher compensation and the prestige of the teaching profession in the 1970s in Taiwan, numerous memoirs indicate that the teaching profession was a decent option for impoverished families.

In 1970, Lin (1981:100–119) investigated the occupational prestige of 40 common professions. University professors were ranked second, secondary school teachers were ranked fourteenth, and elementary school teachers were ranked sixteenth. When a similar investigation was performed again in 1979, university professors ranked second, secondary school teachers ranked thirteenth, and elementary school teachers ranked seventeenth. Educators hold a high position in all occupational prestige investigations. In 1990, Lin again investigated the prestige of the teaching profession and its professional image and reported that the teaching profession is ranked high and considered prestigious (Lin, 1991). Hwang (2003) investigated the structure of Taiwan's occupational prestige and socioeconomic status scale, classifying secondary and elementary school teachers as professionals. In the five levels of socioeconomic status, all teachers were located in the highest levels. The results of investigations in 1971, 1979, and 1990, which spanned almost 20 years, and those of a socioeconomic status investigation in 2003, did not change significantly over time. The results indicate that although teachers do not earn high salaries, they are respected by most people.

To date, the “Education Fundamental Act” announced in 1999 has been amended twice, once in 2005 and again in 2006. This law is the legal foundation of education, officially providing guardians with the right to participate in education. Under the trends of universal information and greater guardian rights, teachers' professionalism faces closer scrutiny. In 2008, Liu conducted “A Survey Study of the Occupational Prestige of Teachers and the Influencing Factors,” and discovered that teachers received the same high level of approval and occupational prestige in various regions. Additionally, despite the varying backgrounds of the respondents, all of them ranked teachers in the first or second level of occupational prestige. Compared with the results found by Lin (1991), this indicates the occupational prestige of educators continues. This notion is deeply rooted (Liu, 2008) because Chinese people have traditionally emphasized respecting teachers. Additionally, the government considers education to be the foundation of the

nation and a sacred job that preserves culture. Teachers are expected to possess “specialized knowledge and ability” and be “content with poverty” because they focus only on principles. This is why teachers had comparatively high occupational prestige during Taiwan’s early history; this level of prestige remains today. However, because of the enhanced rights of guardian, and the increased availability of knowledge, guardians demand teachers meet even higher standards.

## **V. Conclusion and Outlook**

Regardless of how society changes, the role of teachers and teacher compensation is monitored closely. This study adopted a historical context as the primary axis and analyzed the qualities teacher education aimed to cultivate using changes in regulations and education models. We also analyzed changes in teacher compensation and social prestige, deriving the conclusions presented below.

### **i. Conclusions**

**(I.) Considering changes in teacher education laws and regulations, the government’s control of education has decreased, shifting from obvious regulation to invisible control. After the implementation of the “Teacher Education Act,” marketization became the primary influence on the teacher education system. An oversupply of teachers increased the professionalism of the teaching profession.**

Although the government’s control of teacher education has declined, the teacher examinations evaluating the quality of teacher education programs reveal that the government has not completely rescinded control. Instead, the government has simply shifted from obvious political control to control through regulations.

Since the Teacher Education Act was implemented, marketization has influenced the teacher education system. The development of teacher education became a type of “crash course,” and teacher education practices have become a type of “technical training.”

**(ii.) During the authoritarian period, although the government injected ideology into teacher education to cultivate teachers with national spirit and patriotism, the life education they also provided produced teachers who were passionate about**

## **education.**

During the authoritarian period, the government maintained discipline using military control methods and used teachers to promote political ideology. However, teacher education emphasized a mentor system and life and ethics education, strengthening students' characters. When these students eventually became teachers, their ability to care for others contributed to an image of teachers being passionate about education.

### **(iii.) Teacher compensation indirectly influences their social prestige and status**

During the authoritarian period, because of teachers' low salaries, numerous elementary school teachers relied on tutoring to boost their income. However, when teachers tend toward being a "utility," society's perception of them is influenced, leading to a decline in the prestige and status provided to teachers. When society develops rapidly and the economy is healthy, the teaching profession is not the first choice of exceptional students. When exceptional students of impoverished families study at teacher colleges, they tend to perceive they have not achieved their ambitions. During economic decline, when teacher compensation exceeds that of graduates with equal academic credentials, teaching becomes a highly desired profession. Thus, teacher compensation influences their social prestige and status.

### **(ii.) Outlook**

Changes in the teacher education system indicate that the role of teachers has also changed. If transferring knowledge is the primary goal of teachers, then teachers are merely technical artisans of knowledge. However, teachers are also responsible for cultivating student character, values, and attitudes. To prevent teacher education from becoming a formality, diversification should be a strategy, not a goal. This can also resolve the teacher supply and demand problem. Diverse teachers and teacher quality cannot be equated directly, and teacher professionalism and quality cannot be sacrificed merely to obtain numerous and diverse teachers. Only when teachers' professionalism is enhanced and their role strengthened, can their professional status be increased.

Furthermore, teacher education cannot be transformed entirely by market mechanism; the government should establish teacher education policies emphasizing teacher education systems, adjust the number of teacher education students, and enhance the quality of teacher education. Additionally, teacher education organizations should provide evaluations, progressive teaching, guidance for advanced students, and career planning. We hope that improving teacher education in Taiwan can increase the professional status of teachers and establish a global perspective based on local cultural development.

*Multilingualism and European Border Regions - A Polish-German Case*

Monika Kowalonek-Janczarek

0427

Adam Mickiewicz University, Poland

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Promoting multilingualism through learning foreign languages is one of the goals of educational policy of the European Union. At the beginning of 2008 the European Commission's Group of Intellectuals for Intercultural Dialogue prepared the report "A Rewarding Challenge, How the Multiplicity of Languages Could Strengthen Europe.", according to which the European Union should encourage its citizens to learn a *personal adoptive language*. A special socio-political context to realise this idea are border regions, as they are said offer a unique possibility to get acquainted with the language and culture of neighbours. This communication is particularly difficult in the case of more or less unrelated languages. A perfect example of such a situation is the Polish-German linguistic and cultural relationship as it has been shaped under various historical and socio-economic circumstances, which are presented in the paper. This is followed by a discussion of the contemporary multilingual landscape of the Polish-German region, as the prestige, the attitudes and the representations of each language are different.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## Introduction

In the Charter of Fundamental Rights the European Union treats linguistic diversity as a fundamental value and Europeans are encouraged to follow the so called '1+2 principle', which means mastering their mother tongue and two other foreign languages. One of the suggested orders for the languages learnt/taught in the border regions is: mother tongue plus neighbour's language plus English. Turning specifically to the *personal adoptive language* mentioned for the first time in the report 'A Rewarding Challenge, How the Multiplicity of Languages Could Strengthen Europe' (2008) it should be highlighted that a language different from both the language of identity and the language of international communication, and rather a sort of second mother tongue than second foreign language is meant. Moreover, as the authors of the report suggest: 'Learning that language would go hand in hand with familiarity with the country/countries in which that language is used, along with the literature, culture, society and history linked with that language and its speakers.' (p. 7). Border regions, due to geographical proximity, are said to a special socio-political space, as they offer a unique possibility to get acquainted with the language and culture of neighbours. There arises a question how these assets are being used by European citizens?

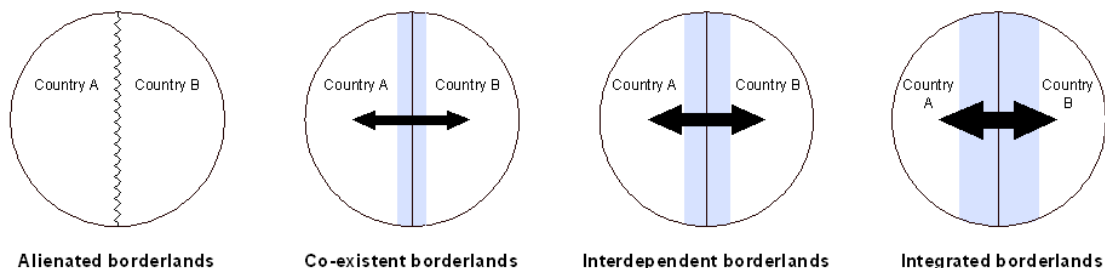

Using the Polish-German border as an example, the paper shows how historical and socio-economic circumstances shape the contemporary multilingual landscape.

## Definitions

As border regions are said to be a kind of laboratory, in which multilingualism is the objective reality, the relevant terms: multilingualism and borderlands will be explained in the beginning.

Although there have been many attempts to characterize the term multilingualism, it is far from easy to give its explicit definition. According to Weskamp (2007: 33) multilingualism can be understood in two dimensions: individual and social. Individual multilingualism means mastering more than one language, while social is connected with the linguistic situation in the countries, in which multilingual landscape is reality e.g. Switzerland.

Borders have long been a prominent theme in many disciplines of science. Attempts to define the term 'border' have tended to be consistent in terms of its role as a separating line, but in the broader understanding the border has an ambivalent character and one of the features of a border is its degree of openness to the diffusion of people, ideas and goods. Martinez (1994: 7) basing on the study he conducted in the US and Mexico proposed the following division:

1. alienated borderlands- border is treated as a barrier and is functionally closed, and cross-border interaction is totally or almost totally absent,

2. co-existent borderlands- the border is no barrier anymore and remains slightly open, people take the first contacts, but the mutual cooperation is limited to a certain degree,
3. interdependent borderlands- the border is stable, there are good, friendly and cooperative contacts between the people. Economic and social complementarity prompts increased cross-border interaction. For Martinez (1994: 9) are the U.S.-Mexico borderlands a good example of strong asymmetrical interdependence, while a more balanced interdependence may be found in parts of western Europe, where economic inequality among neighbouring nations is less of a problem than e.g in regions where Third World conditions predominate or in general in the Western Hemisphere,
4. integrated borderlands – the border is permanently stable, residents of both countries perceive themselves as members of a common social system. In the ideal situation both nations have the same level of development. There is unrestricted movement of people and goods across the boundary. This situation is rare and can be found only in Western Europe.

After having explored the types of borders, we can outline the reasons for the fact why European borders nowadays tend to be more open and stable than other borders. Using the Polish-German border as an example, which is not a typical European border, the next section shows how historical and socio-economic circumstances shape the reality. Scholars have long characterized the Polish-German border as a deeply troubled region. In contrary to Western Europe, where the cross-border cooperation started to develop gradually after the Second World War, East European countries were separated by the Iron Curtain.

### **Polish-German border from 1945 till today**

In this section, a brief historical outline will be given. The modern Polish-German border is marked by the Odra and Nyssa River. It was established in 1945 at the Potsdam Conference as a conclusion of negotiations between Great Britain, the Soviet Union and the United States. It is not an exaggeration to say that Poland has experienced one of the largest boundary changes after World War II. Its borders shifted westward with the allocation of pre-World War II German eastern territories to Poland as compensation for the annexation of Poland's eastern provinces by the Soviet Union that same year (Allen 2003, in Brym 2011 ). Poland acquired a large amount of territories, which cover a space of 103,000 square kilometers, and handed over 180, 000 square kilometers of land to the Soviet Union (Yoshioka 2007: 274). German residents were evicted from the region, and the area was repopulated by a Polish population displaced from Poland's former eastern territories. Germany was divided into two separate states. East Germany (German Democratic Republic), together with Poland (The Republic of Poland, from 1952 on The People's Republic of Poland) became a member of the Soviet bloc, whereas West Germany a member of the Western block. East Germany confirmed the border on 6 July 1950 in the Treaty of Zgorzelec (*The Agreement Concerning the Demarcation of the Established and the Existing Polish-German State Frontier*), while West Germany have not acknowledged it until 1970, when Chancellor Willy Brandt signed the Treaty of Warsaw.

After the Treaty of Zgorzelec, six distinct phases have become apparent in the role played by the border in the bilateral relationships.

According to Kurcz (1992: 12-13) the first lasted from 1950 to 1956, and the border had in this period the function of a strong barrier. The second phase after 1956 (till 1960) was characterised by some common political events especially in cross-border towns Görlitz/ Zgorzelec and Frankfurt (Oder)/ Słubice. During the third phase the Treaty of Friendship,

Cooperation and Mutual Assistance (1967) was signed, but the border was still a strong barrier with nearly no contacts between the citizens. The fourth phase started with opening the border in January 1972, what can be treated as a miracle. In this time there were finally opportunities for contact between Poles and East Germans. Because of Solidarity- the first independent trade union federation founded in Poland in the 1980s, which gave rise to an anti-communist movement, aiming at advancing the causes of workers' rights and in general social change the East German government decided on 30 October 1980. As far as the third and the fourth phases are concerned, we can talk about co-existent borderlands. The fifth phase started in 1980 and one year later the Polish government reacted to the rising Solidarity movement by declaring martial law so the border became again a barrier. It has to be highlighted that Solidarity movement is considered to have contributed to the fall of communism. As the socialist governments in both Poland and East Germany collapsed in the early 1990s, the bilateral climate improved markedly. The sixth phase described by Kurcz is characterized by two important Treaties. The first one is "Treaty between the united Germany- Federal Republic of Germany and the Republic of Poland on the confirmation of the frontier between them" (14 November 1990). Under the terms of the treaty, both sides:

- reaffirmed the frontier according to the 1950 Treaty of Zgorzelec with its subsequent regulatory statutes and the 1970 Treaty of Warsaw;
- declared the frontier between them inviolable now and hereafter, and mutually pledged to respect their sovereignty and territorial integrity;
- declared that they have no territorial claims against each other and shall not raise such claims in future.

The second one: "The Polish-German Treaty of Good Neighbourship and Friendly Cooperation" (17 June 1991). The most crucial issues included in the Treaty were: promoting the language and culture of the neighbor, cooperation in the border region and respecting the rights of minorities.

What deserves special mention is the fact that after the end of the Cold War the legacy of the Iron Curtain continued to divide Europe, but on the other hand the creation of Euro-regions can be seen as a positive unifying symbol. The first Euro-regions, in other words co-operation structures were established in Western Europe on Dutch-German border (1958), while in Eastern Europe it was possible to create them after the end of the Cold War. Along the Polish-German border we can distinguish four Euro-regions:

1. 1991- Neiße-Nisa-Nysa (Poland/ Germany/ Czech Republik)
2. 1993- Pro Europa Viadrina (Poland/ Germany)
3. 1993- Spree-Neiße-Bober (Poland/ Germany)
4. 1995- Pomerania (Poland/ Germany/ Sweden)

They all have aims in common: bringing together citizens from both sides of the border through political, cultural and educational cooperation. As an example, One of the most visible outcomes of the cooperation between Poland and Germany is the university, Collegium Polonicum in Ślubice, which was founded in 1992 and is a place of scientific cooperation between Poles and Germans.

It has to be highlighted that from 1990 to 2004, with the exception of East Germany, the former Iron Curtain coincided with the external border of the European Union. Since Poland's entrance into the European Union in 2004, passports have not been required any more for

German and Polish citizens to travel between the two countries. Moreover, the control of border customs checkpoints along the Polish-German border was abandoned on December 21, 2007. According to Mirwaldt (2010) 'there is an expectation that cross-border cooperation and cross-border contacts will thus facilitate citizen understanding and reconciliation, particularly across historically difficult borders such as the Polish-German.' Understanding is not possible without knowing the language of the neighbor. The border regions as places of communication offer a possibility to communicate with neighbours in languages spoken in the border regions.

### **Learning languages in the border region**

The research history on the European languages in the 20<sup>th</sup> century started with the basic idea that a good European language is an inflectional language, a language that looks like Polish or German or Latin, reflecting the Indo-European inheritance (Heine / Nomachi 2010: 1). According to Haspelmath (2001: 1492-1510) it is possible to maintain that there is a European linguistic area which is due to specific historical factors, namely the following:

- Retention of Proto-Indo-European structures and processes of assimilation of non-Indo-European to Indo-European languages.
- Influence from a common substratum of a pre-Indo-European population in Europe.
- Contacts during the great transformations at the transition from late antiquity to the early Middle Ages in Europe.
- Latin and the common European culture of the Middle Ages.
- The common European culture from the Renaissance to the Enlightenment.

Both Polish and German are written using the Latin alphabet. As far as the differences are concerned: Polish belongs to the Slavonic subgroup of Indo-European languages, and is the second most widely spoken in this subgroup, and the first most widely spoken in West Slavic branch (to which belong also e.g. Czech and Slovak), while German belongs to the Germanic subgroup alongside with English and Dutch. German is the most widely spoken first language in the European Union, whereas Polish the sixth.

People decide to learn a language for different reasons and have different attitudes toward languages. The authors of the report "A Rewarding Challenge, How the Multiplicity of Languages Could Strengthen Europe" (2008) suggest:

By drawing a clear distinction, when the choice is made, between a language of international communication and a personal adoptive language, we would encourage Europeans to take two separate decisions when it comes to language learning, one dictated by the needs of the broadest possible communication, and the other guided by a whole host of personal reasons stemming from individual or family background, emotionalities, professional interest, cultural preferences, intellectual curiosity, to name but a few.

The language of the international communication is nowadays English. Although the term 'lingua franca' is nowadays best known for global English, its concept in the original meaning was different. Etymologically seen it comes from Arabic *lisan al farang* and was used as a contact language e.g. between Arabic speakers and travelers from Western Europe (House 2008: 66).

Attempts to describe motivational aspects in the language learning process can be traced back to Gardner and Lambert (1972). In general attitudes toward languages can be divided into two

groups: instrumental and integrative. An instrumental attitude reflects a desire to learn a language for utilitarian purposes e.g. for enhancing one's career. An integrative attitude reflects a need to get acquainted with the cultural identity and to form interpersonal relationship with speakers of the target languages. It is significant to stress that this distinction is too simplistic, because we can differentiate various types of these attitudes. For the aim of the study conducted in the Polish-German border region the attitudes were divided into 4 groups:

1. geopolitical (due to proximity to Poland/Germany)
2. hobby
3. pragmatic
4. personal

The first step was working out an quantitative questionnaire for the target groups: adult German people learning Polish (233 participants) and adult Polish people learning German (478 participants) and obtaining required information concerning e.g. the following question: What is your attitude towards the language you learn?

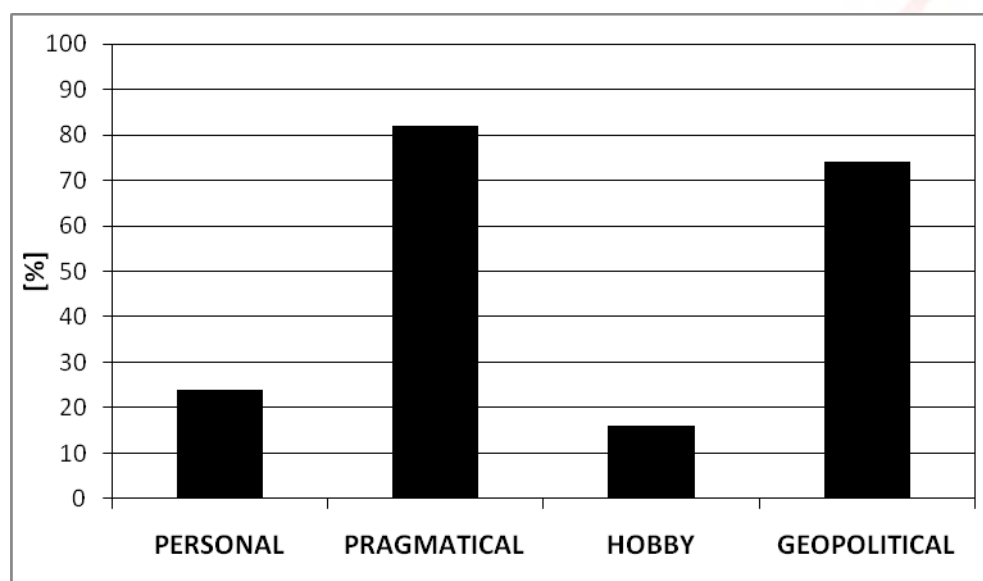

The target groups were asked in multiple-choice questions to name all (out of 4: geopolitical, hobby, pragmatic, personal) which refer back to them.

Moreover, they were confronted with the open question: what problems do you have with the language you learn?

The next stage of fieldwork in the Polish-German were qualitative interviews with Polish and German language instructors.

Combining two methodological approaches seemed to be necessary, because 'the use of multiple, independent methods of obtaining data in a single investigation in order to arrive at the same research findings' (Mackey/ Gass 2005: 181) helps to assess reliability.

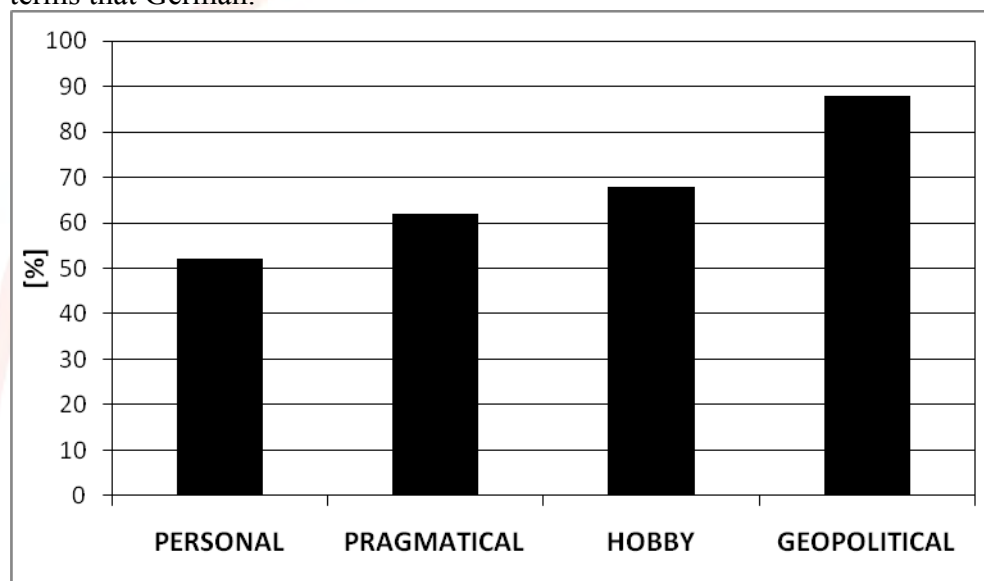

In general the results of a quantitative study reveal that attitudes towards German (Table 1) are mainly pragmatic.

**Table 1: Attitudes towards German**

The more detailed answers were grouped into logical categories: I need German for my professional future, for my professional career or for my job. Without doubt German is being perceived as a language with an instrumental value. Geopolitical reasons are also of importance; in other words it can be stated that living in the border region offers a unique possibility to learn the neighbours' language. A little bit surprising is the last position of a hobby.

To examine the research question on the possible differences in attitudes towards German and Polish there has to be made a comparison. We can see from the table 2 that Polish is mainly being learnt for geopolitical reasons or as a hobby, so it is being regarded in more affective terms than German.

**Table 2: Attitudes towards Polish**

It is interesting to note that among the responses concerning hobby one of the main answers was that it is being perceived as a key to slavonic languages and cultures. The quite high rank of pragmatic attitude towards Polish is surprising, as it was supposed that the personal attitude would be of greater importance.

Concluding, it has to be noted that the attitudes towards both languages are different. All these findings must be judged in the light of the study's limitations.

The results of the conducted study reveal one common problem named by instructors of both languages. These are pronunciation problems in Polish and German.

The main aspects that were named in the group of Polish language instructors can be summed up as: **Stereotypes and lack (or not enough) motivation**

The following statements illustrate it in a very good way:

The most students we have are at levels A1 and A2 (beginners), our pronunciation of ś, ć, rz, ż is a very big problem. (Interview 1)

Polish is in students' eyes a very complicated and exotic language, but many people are ambitious enough to learn it. So it's possible. (Interview 2)

The main problem in the teaching process are stereotypes, even not those which concern Poles or Poland, but those connected with the Polish language. (Interview 3)

Polish seems to the students to be difficult and 'rustling'. But all my students know what piwo (beer) is (Interview 6)

As far as German language instructors are concerned, the following aspect was brought to light: **Dominance of English its and alleged easiness in comparison with German**

A lot of Polish students are learning German, much more than vice versa, but the tendency is sinking even here in the border region, because of English (Interview 4)

English seems to be much easier and practical that is why probably more and more students are deciding to learn it. (Interview 8)

The participants of the study also confirmed that pronunciation is the biggest problem that they have in the learning process.

## Conclusions

Summing up, the Polish-German border regions have undergone transformation: dividing lines that were once closed and have now become zones of cooperation.

The conducted study confirms that socio-economic circumstances shape the contemporary multilingual landscape as attitudes towards neighbouring languages are different. It is difficult to estimate if the idea of *personal adoptive language* has chances to be strongly established in the region. As pronunciation problems, stereotypes and alleged easiness of English were named as main problems there should be found some common solutions, how to motivate the students more effectively. As far as the Polish-German context is concerned, learning languages spoken in the border region can succeed only when it is carried out in mutual cooperation.

Official Conference Proceedings 2012

Abstracts

In an attempt to provide insights into how online learners learn, this study surveyed 46 online learners of two fully-online university language papers. The questionnaire, consisting of 19 five-point Likert questions and 13 open-ended questions, concentrates almost entirely on the difficulties and challenges confronting online learners, and on how learners adjust and adapt to online learning. Results confirm overwhelmingly that online learning is individualized/personalized, and that the commonest learning pattern is paired or small-group. Learners expressed great frustration over the difficulties in: *finding partner to work with, finding common available time to work together, keeping in touch with the class and the teachers, keeping self-motivated, and being a self-regulated learner*. Other problems include lacking communication, interactions, socialization, and instantaneous feedback. Findings were compared, through correlative analysis, with the difficulties and challenges identified by online teachers in the CALL literature. Many correlations were found.

## 1. INTRODUCTION

Current computer-assisted language learning (CALL) research seems largely to focus on and identify various pedagogical challenges confronting online language teachers. Online language learners, arguably the most important participants in this adventure, seem to be largely overlooked. What are the challenges they have been facing? How do they take up the challenges and adapt to the new learning environment? Specifically, how do they engage, interact, pair/team up, and collaborate without the benefit of a traditional classroom? All of these challenges and more seem under-investigated in the literature.

Two major CALL research areas in recent years have, legitimately and naturally, centered on the experience of the online teachers who found themselves engaged, in an overnight fashion in many cases, in revolutionary ways of teaching, and on the online learners who are no more prepared than their teachers in this new adventure, namely, online language learning.

While the examinations into teachers' experiences are wide-arranging and far-reaching, (e.g., virtual classroom management, online tasks design, online community building, online assessment, scaffolding, pedagogical shift, to name just a few), the investigations into online learners seem to be limited to learners' attitude towards, perception and evaluation of, satisfaction and performance with certain online learning tools, methods, or a particular setting of an online program.. The findings are typically "positive" and "favorable" in nature. They seem to suggest that online learners are, by and large, getting on with their learning with few problems and issues. If there are any, they are minor ones. For instance, Yaneske and Oates (2010) investigate what benefits students perceive when Wimba Voice Board (VB) was implemented within a MA module for language learners to support asynchronous audio discussion. Positive appraisals from students such as "able to post audio message", "easier to identify their (students') strengths and weaknesses in feedback delivered by audio" are among the benefits reported in the study. Yaneske and Oates did, to their credit, ask what difficulties students had experienced when using a VB. Typically, students' report was somehow channeled into reporting technical difficulties instead of addressing the most pressing and real issues of online learning, e.g., pair/group interactions, group-work, etc.

Let us have another example of study on online learners, by Lai and Gu (2011), which investigates students' use of technology outside the classroom to self-regulate their language learning. The overall findings are encouraging, as "the participants reported positive perception of and engagement with the use of technology for goal commitment, resource regulation, cultural learning regulation, and affection regulation" (p325).

We will look at, again, another recent study briefly which is entitled *Learners reflections on and perceptions of computer-mediated communication in language classroom: A Vietnamese perspective* (Nguyen, 2011). Findings were all extremely positive, including: participants enjoyed the technology-enhanced class in general; it helped improve students' computer skills and collaborative experience.

Another similar study, which attracted my attention immediately when I saw it, has the title of *Learner Experiences in Web-based Language Learning* (Son, 2007). It

investigates students' perceptions and attitudes towards web activities, and finds that to be, no surprise, POSITIVE, yet again!

However, no one seems to be asking the hard questions. How difficult was it to study online? What were the difficulties? How did you (students) take up the challenges and adapt, or avoid the challenges, rather?

It's important to note that most of the studies cited above are not online learning in a strict sense. Rather, they are blended learning combining face-to-face teaching with some CALL elements in those courses. Contrary to that, the current research project looks at online learners who studied in a *complete* online course without any physical classroom or face-to-face interactions among teachers and students. The difficulties these learners encountered are more real and cannot be easily remedied by reverting to, even just momentarily, traditional classroom teaching methods.

Needless to say, inquiries into online learner difficulties demand urgent attention by CALL researchers. There needs a, perhaps, "re-think of the online pedagogical approaches" as claimed by Sun (2011) after her examining, from a teacher's perspective, two online language papers which she had taught for almost four years. She finds that

- 1) the assumption that *Virtual Classroom* and the *Online Learning Community* existed in online language teaching is mere myths;
- 2) online language teaching is, characteristically, one-to-one and small-group teaching;
- 3) an urgent call is needed for a radical pedagogical shift in online language teaching from teacher-centered approaches towards a personalized, small-group orientated, multi-dimensional model of teaching.

In the same spirit, it is wrong to assume that online learners are having a smooth sailing in this new adventure. The picture, painted by most of the CALL literature which survey learners, seems to be telling us that online learners may have, at times, various attitudes, perceptions, preferences on certain things, but they are, most of the time, agreeable and satisfied, and most importantly, trouble-free in their learning.

This is not the case from the experience of this writer. Some serious, critical investigations into the ways online learners learn in general, and specifically what the difficulties (big or small) are confronting them, become imperative in CALL research. If it has been a terrible struggle for the online teachers (many of us are still struggling) in the online learning enterprise, it's rather arrogant for us not to look into the learners'.

It is the intention of this research project to, therefore, bridge the gap between "satisfactions" and "dissatisfactions (namely, difficulties and challenges)" of the online language learners.

Having done the "justice" for online learners by urging more critical research on the ways they learn, one issue remains. Findings and claims made by the online teachers or researchers such as those above by Sun (2011) beg for parallel studies and verifications of some kind, not least by online learners. It is, therefore, the second intention of this research project to carry out a correlative analysis. The findings by

the teachers and researchers found in the CALL literature will be compared and correlated with the difficulties and challenges identified in this study. To just what extent do the challenges for online teachers match those for online learners?

## **2. THE RESEARCH PROJECT**

### **2.1 The Context**

The virtual learning environment (VLE) is Blackboard in which the two fully online papers under investigation reside. Both papers are semester-long. They were developed, between 2007-2008, specifically to be the alternatives for two campus-based, face-to-face papers in the Bachelor of Arts (Chinese) program. The first online paper (Introduction to Chinese I) became operational in 2008, followed by the second one (Introduction to Chinese II) in 2009. They are run alongside the campus-based ones and immediately attracted a large number of students. They became very popular among students in various bachelor degree programs at the university who are doing Chinese major, Chinese minor or Chinese elective papers. The flexibility in time and space offered in online learning seems to fit in well with students' busy schedule of study. The two papers have by now been delivered for more than ten times.

All the class members of the two online papers in that four-year period (2008-2011) were considered prospective participants. However, not all of them could be contacted due to many of them having graduated or left the university with no further contact details. We had to use, as the recruitment instrument, the email list of an online organization (Chinese Program Community) at the university which all of the students belonged, or had once belonged. An advertisement of the questionnaire was sent out to all the past students who were still on the member list. There were about 140 of them in the list, but we couldn't be sure whether those email addresses were current and still in use by our intended participants. After several mass emails, a total of forty-six students elected to participate in the study by taking the survey at SurveyMonkey. It's worth noting that not all the 140 prospective participants had passed the online papers. Some of them may have failed those papers. We did not have any particular recruitment criteria to either include or exclude any particular types of students. It was the researcher's intention to include as wide-ranging views as possible on online learning –of both those who successfully passed the papers and those who failed.

It's also worth noting that the context of this research project, i.e., the settings and the participants, is the same as Sun (2011)'s project, which discusses the pedagogical challenges for online teachers from a teacher's point of view. The current one – investigating the online learners - is a logical next step. It will be interesting to see what Sun (2011) says does match what the students say in this study.

### **2.2 Aims of the Project**

It is the intention of this research project to depart from the majority of previous studies on online learners, which mainly focus on the general attitude, perception, evaluation, satisfaction, and performance of the learners towards certain use of online technologies. This research project will probe directly into learner problems. The supposed problems or difficulties drawn-up by this researcher are based on formal

and informal feedbacks given by the students while they were doing the online papers. They represent the frustrations both expressed by the students and observed by the teachers. In many cases, they are frustrations *felt* by the teachers too. Needless to say, the researcher had also been informed by the CALL literature when formulating those hypotheses (questions and statements in the questionnaire). We will not only put those hypotheses to the test by asking participants' opinions on them, but also want to make sure there is plenty of room for the participants to spell out their own problems, issues and frustrations.

Numerous previous studies have reported that online teachers have been in the forefront of making changes ever since the beginning when they became, in an overnight fashion in many cases, an online teacher, e.g., remoulding themselves into one-to-one or small-group tutors, giving up lecture-type teaching and facilitating small group learning instead, building online learning community, to name but a few. It is hard to imagine that they can survive in this new adventure without having to learn and adopt new things and without having changed their teaching behaviors and methodologies to a certain degree. What about the online learners then? What changes have they made in order to survive and succeed?

Another concern this researcher has is the truthfulness and validities of the findings and claims made by the online teachers and researcher in the CALL literature, such as those made by Sun (2011). It begs, as we argued earlier, for verifications, clarifications and explanations, especially by the online learners.

Shaping by the above considerations, the aims of this research project become apparent; that's to:

1. provide an overview of student experience in fully-online language learning in terms of the difficulties and challenges confronting them;
2. detect any changed behaviors in online learning, as oppose to traditional classroom learning;
3. discover any emerging/new patterns of learning brought about by online leaning technologies and pedagogies;
4. compare learners perspectives resulted from the investigation above with teachers' perspectives on those issues found in the current CALL literature in order to discover correlations and discrepancies between the two.

### **2.3 Methodology**

The research instrument in this study is a survey employing both qualitative and quantitative methods for data collection. This is a retrospective research with all the prospective participants being past students who had completed the online papers under investigation, and many of them had in fact left the university. The advantage of that is that the survey questionnaire could ask all the questions the researcher wished to ask and include all the aspects relevant to the study as the researcher saw fit. Proper procedure was followed in obtaining ethics approval from the university, and the platform for the survey was SurveyMonkey.

The survey is in the form of an anonymous questionnaire which consists of thirty-two questions, and is divided into two parts, with Part One being further divided into four sections, as briefly indicated below:

## Part One – General Characteristics of Online Language Learning

- A. Participation (Questions 1-4)
- B. Group-work (Questions 5-8)
- C. Instructional material (Questions 9-14)
- D. Learning style (Questions 15-19)

## Part Two - Personal experience (Questions 20-32)

All the questions in **Part One** are opinion-scale type where questions or statements about some general characteristics of online language learning are put out and participants are asked to indicate to what extent they agree or disagree by picking one number on a five-point-scale, e.g.:

Group-work and project-type work are important parts in online learning.

- 1. Strongly Disagree
- 2. Disagree
- 3. Neither Agree nor Disagree
- 4. Agree
- 5. Strongly Agree

Questions in **Part Two** are open-ended questions asking participants to share their personal experience in online language learning, e.g., *Without the benefit of a traditional classroom, how did you socialize in an online class?* Participants are urged to answer those questions in as much detail as they can, and are reminded that answers from all them will collectively form a picture of what online language learning is really like. These are qualitative data (see Appendix 1 for the all the questions in the Questionnaire).

The results were analyzed using SPSS. Statistical data obtained from the first part of the survey (19 Likert-scale questions) is presented in four tables with each representing one area of online learning: participation, group-work, instructional material and learning style. The tables summarize the percentage of response to the five-point Likert scale (1=strongly disagree and 5=strongly agree) with means and deviations. It will paint a comprehensive picture as to what are the difficulties and challenges for online learners and how they rate the level of difficulty.

The second part of the data analysis concentrates on the responses of the open-ended questions in Part two of the questionnaire. The thirteen questions in this section are designed to further elicit students' personal experiences and ask them to think and provide us with more details (related to the supposed difficulties detailed in Part One) and more problems and issues which they may have. Towards the end of the questionnaire, several questions are devoted in getting participants to think of and report on their particular ways of learning in the online setting, in the attempt to uncover emerging or changed learning behaviours, both in individual and group (large or small). It was hoped that some kinds of new learning patterns or models could emerge from students' the responses.

Data collected from the responses of the 13 open-ended questions are grouped into two major themes (topics) for analysis and discussion:

1. the difficulties and challenges
2. the change of learning behaviors and emerging new learning methods

Upon the completion of discussion and analysis of all the questions in the questionnaire, a summary will be drawn up, which will be compared with the list of challenges for teachers discussed in the Introduction section of this report. A correlative study will then be carried out. Through correlative analysis, the extent to which the challenges for learners match the ones for teachers will be closely examined, along with a brief discussion on how we could best address these difficulties and promote successful new ways of learning.

### 3. RESULTS

As mentioned earlier, we only managed to compile an e-mailing list of 140 students, yet without being sure who would receive the invitation to participate and who would not, as all the students we surveyed were past students. We received, nevertheless, forty-six responses, giving a response rate of approximately 33%.

#### 3.1 Participation in online learning

The first four questions in the questionnaire concern *student participation* in online learning. “Not enough opportunity for peer interaction”, “difficult to participate and engage in an online class”, “interactions were limited to small group”, and “not having a functioning online community” were the difficulties we put to the students. Student responses overwhelmingly tilt to the “agree” and “strongly agree” scales, with the means (on a five point Likert scale) being 3.22, 3.87, 3.83 and 3.13 for Questions 1, 2, 3, and 4 respectively (see Table 1 below). In particular, those who “Agree” and “Strongly agree” in Questions 2 is as high as 80.4%, which seems to confirm, rather convincingly, that students are indeed interacting and learning in small groups in online setting.

**Table 1: Students’ Experience of Online Learning Participation (%)**

Questions/Statements	N	1. Strongly Disagree	2. Disagree	3. Neither Nor	4. Agree	5. Strongly Agree	Mean	SD
1. There was not enough opportunity for peer interaction. I found it more difficult to participate and engage in an online class than a traditional classroom.	46	4.3	26.1	15.2	52.2	2.2	3.22	20.37
2. Instead of interacting with many people in a class (multi-dimensional interactions), my interactions with classmates	46	0.0	2.2	17.4	71.7	8.7	3.87	29.68

were often limited to a small group of classmates.								
3. I learnt in a small group rather than in a big class, e.g., I only practiced with a handful of classmates, as I knew fewer classmates than I would have done in the traditional classroom setting.	4 6	0.0	6.5	15. 2	67. 4	10. 9	3.83	27.0 8
4. Much work was needed by the teacher to foster the building of an online learning community	4 6	0.0	21. 7	43. 5	34. 8	0.0	3.13	19.8 4

### 3.2 Group-work in online learning

In this section, we have four questions again asking, students' opinions on group-work, project-type work, learner cooperation and collaboration, and group discussion. The words of the questions are on the positive (as opposed in the last four questions), and the responses are overwhelmingly positive too (see Table 2 below). While all the means being rather high (3.39 and above), the response for Question 7 stands out in particular with its mean being 4. No one disagrees, let alone strongly disagree, with the statement that learner cooperation and collaboration should be encouraged in online learning.

**Table 2: Students' experience of group-work in online Learning (%)**

Questions/Statements	N	1. Strongly Disagree	2. Disagree	3. Neither Nor	4. Agree	5. Strongly Agree	Mean	SD
5. I liked the group-work we had to do	4 6	0.0	8.7	19. 6	60. 9	10. 9	3.74	23.8 9
6. Group-work and project-type work are important parts in online learning	4 6	2.2	4.3	8.7	67. 4	17. 4	3.93	27.1 3
7. Learner cooperation and collaboration should be encouraged in online learning.	4 6	0.0	0	17. 4	65. 2	17. 4	4	26.7 2
8. There needed to be more group discussions on study-related matters amongst class members and with the teachers.	4 6	0.0	13	41. 3	39. 1	6.5	3.39	19.0 4

### 3.3 Instructional material in online learning

The next set of questions (question 9-14) concerns with instructional materials in online learning, which is, as the researcher pointed out to the respondents before they had started filling out the questionnaire, *not specifically referring to the online Chinese papers they had done at the university. Rather, they represent the aspirations and ideals as to how online instructional material should be.* Respondents were asked to look back to their experience in online learning and see how much they would agree with those statements.

The intention was to gauge students' opinions on 1) task-based instruction, 2) authentic teaching material, 3) learner initiatives in designing online instructional materials, 4) learner co-construction of course material and resources, 5) learner creativity and 6) the role of the instructional materials in developing student's real-life problem-solving and critical thinking skills. We did not expect a lot of feedback, as learners may not be familiar with the area of teaching materials in general. However, responses were overwhelming again. Instead of a lot of ticks in the "neither agree nor disagree" scale as we had expected, responses show very high means for each question, with the mean of Question 11 being the highest in all the responses in the Questionnaire: 4.09 (see Table 3).

**Table 3: Students' Experience of Instructional Material in Online Learning (%)**

Questions/Statements	N	1. Strongly Disagree	2. Disagree	3. Neither Nor	4. Agree	5. Strongly Agree	Mean	SD
9. Online language learning instruction should be task-based rather than rote learning.	46	0.0	2.2	47.8	37	13	3.61	21.38
10. Online language learning material should help develop real-life problem-solving and critical thinking skills.	46	0.0	8.7	15.2	60.9	15.2	3.83	23.70
11. Authentic learning materials should sometimes be used.	46	0.0	2.2	13.3	57.8	26.7	4.09	23.64
12. Learner initiatives should be encouraged rather than everything prepared and spoon-fed by the teacher, e.g., having some topics of learning suggested by learners.	46	0.0	11.4	15.9	63.6	9.1	3.70	25.05

13. Learners should be encouraged to co-construct class resources and the learning environment, and co-create new learning and knowledge.	46	0.0	8.7	39.1	37	15.2	3.59	17.35
14. Learner creativity should be encouraged.	45	0.0	2.2	24.4	57.8	15.6	3.87	23.37

### 3.4 Learning style in online learning

The last set of statements (Questions 15-19) inquires about the ways online learner learns (see Table 4). We need to look into them one by one as each question represents an individual, separate issue of learning style, except Question 16 and 17 are inquiring the same thing: the personal learning environment.

Self-directed and self-regulated learning (in Question 15) may have been new jargons for some students (2 respondents opted to skip the question), but their responses (75% agree and strongly agree) seem to indicate that they do have experiences on that are aware of this an important issue in online learning.

Questions 16-17 concern with having choices in online learning, in which learners, as individuals, figure out and form their own learning environments. Data collected shows strong agreement (means: 3.76 and 3.70) among students. It confirms that they did, to some degree, pick and choose, and learned in their own various ways.

The next statement in the questionnaire (Question 18) represents an attempt to find out whether online learners prefer online learning because of their personal learning preference, need, social life and technology choice are being met. Results suggested that was the absolute case for 65.2% of the respondents. 8.7% disagreed, though.

The last statement is about whether learners had control over their learning. 60.9% said they did.

**Table 4: Students' Experience of Learning Style in online learning (%)**

Questions/Statements	N	1. Strongly Disagree	2. Disagree	3. Neither Nor	4. Agree	5. Strongly Agree	Mean	SD
15. Without a classroom and the presence of a teacher, I found online learning to be more self-directed and self-regulated.	44	0.0	6.8	18.2	50	25	3.93	19.38

16. Online learning is individualized or personalized learning. It allows flexibility, encourages self-direction and choice, e.g., I did not always just follow the teacher's instructions, or I was able to re-arrange learning material, or choose my own online tools, and configure the learning environment to best suit my learning goals and needs.	4 6	0.0	10. 9	21. 7	47. 8	19. 6	3.76	17.7 4
17. I believe other class members formed their own personal learning environments too.	4 6	0.0	0	41. 3	47. 8	10. 9	3.70	22.9 6
18. My preferences, needs, social life, technology choices, etc. were better served by online learning.	4 6	0.0	8.7	26. 1	41. 3	23. 9	3.80	16.0 8
19. I felt that I had control over the learning process.	4 6	0.0	8.7	30. 4	43. 5	17. 4	3.70	17.2 8

### 3.5 Online Learners' Personal experience

The thirteen open-ended questions (Questions 20-32) in the Questionnaire were designed to give ample space for participants to describe, reflect and comment on their personal experience of online learning. The major themes ran through all the 13 questions are the same as those in the 19 Likert-scale questions in Part One: 1) the difficulties and challenges, and 2) the changes of learning behaviors and emerging new methods of learning.

It is interesting that the data around the topic of learner difficulties and challenges scattered around in almost all the responses for the 13 questions, very often without direct probing. Students seemed to be thinking of these difficulties all the time! A summary of the difficulties includes:

- following the material online
- being a self-directed, self-regulated learner
- keeping self-motivated
- ensuring constant engagement
- staying on task
- finding a partner to study / pairing up
- interacting with others
- getting hold of people through email
- socializing (e.g., I cannot socialize without meeting up with them face-to-face)

We have two questions (Questions 24 and 25) asking *the question* specifically. In Question 24, we listed 11 could-be difficulty areas and ask respondents to tick as many items as were applicable to them. The result (see Table 5) shows that the biggest difficulty in online learning is to "follow the schedule and study regularly" (50%), followed by "finding partners to work and practice with" (41.7%). The next

biggest problem is “finding a common available time work with a partner”. The third biggest difficulty is “technical difficulties”, which was expected and but will not be further investigated in this project as numerous previous studies have dealt with that.

**Table 5: Learner Difficulties**

<b>What other difficulties did you encounter during the course? (tick as many items below as were applicable to you)</b>		
<b>Answer Options</b>	<b>Response Percent</b>	<b>Response Count</b>
1) Technical difficulties, e.g., getting online, or going into the Virtual Classroom (vRoom), or getting online tools to work (e.g., Voice Recorder, the Studio to record paired oral presentations), etc.	44.1%	15
2) Finding “partners” to work and practice with	47.1%	16
3) Finding a common available time to work with a partner	44.1%	15
4) Sticking to the pair-work or group-work schedule	17.6%	6
5) Keeping in touch with the class	32.4%	11
6) Keeping in touch with the teacher, e.g., turning up at the weekly Virtual Classroom sessions	29.4%	10
7) Keeping interested in the course	20.6%	7
8) Keeping motivated	26.5%	9
9) Following the schedule and study regularly	50.0%	17
10) Keeping the assessment deadlines	2.9%	1
11) Being self-regulated as a successful learner should	26.5%	9
12) Others. Please state:	2.9%	1
<b><i>answered question</i></b>		<b>34</b>
<b><i>skipped question</i></b>		<b>12</b>

In Question 25, we asked the specific question again for students to share with us the “most challenge thing” in online learning. Responses include:

- having less communication with the teacher
- finding partners to work with
- keeping things up
- writing and listening

- studying consistently on weekly basis
- desolation (I felt lonely)
- oral presentation

Date collected for the second theme (topic) of this project, i.e., the change of learning behaviors and emerging new ways of learning, are mostly found in the responses for Questions 26, 27, 29 and 31. The information given by the students on this topic (theme) is very little, unfortunately. As a matter of fact, none of the responses for Question 26 (*In the new learning environment (as opposed to traditional classroom learning), what changes and what effort did you have to make to adapt?*) answered the questions straight; instead, students mostly indulged in their leaning difficulties again which have already appeared in other questions-responses.

Subsequently, when students were asked whether they had noticed any new ways/models of learning by other class members (Question 29), almost all the respondents but three (out of 34) replied with a simple “no”.

#### 4. DISCUSSION

The areas of difficulties and the challenges for online learners have clearly emerged as a result of this survey. The most salient and talked about ones seems to be:

- finding partner to work and practice with
- finding common available time to work together
- keeping in touch with the class
- keeping in touch with the teachers

These outcries points directly to the root of the problem in online learning: lacking a physical place where students can meet, study and hang out routinely at a fixed given time. Under the circumstances, students have no choice but make changes and adapt. This can be proved by students overwhelming confirmation of their having to interact and learn in a small group (Question 2). Interestingly, they did not seem to be aware that they had made an effort to change in the ways they learn, and the small-group learning, which they had become heavily relied on, was the new learning model/pattern we have being looking for and to confirm. This helps to explain the surprising (for the researcher) and “innocent” answers of “no” in Question 29 and 34 when they were asked about changes and new learning methods.

It is possibly, due to the lack of it, students highly rated group-work, project-type work, learner cooperation and collaboration, and group discussion in online language learning, especially in the area of learner cooperation and collaboration. The positive assertion of the benefits in online learning should not be ignored.

In assessing the design of instructional materials for online learning, students showed their strong appreciation over task-based instruction, authentic teaching material, and learner initiatives in designing online instructional materials. They also placed strong emphasis on the development of real-life problem-solving and critical thinking skills.

As for self-directed and self-regulated learning in online setting, student’s responses are of no surprise, as they had been telling us how difficult it was for them to stay and

keep focused in the papers. The topic of self-motivation had resounded throughout the survey. Online teachers must take heart to this issue and work hard to help students develop self-directing and self-regulating skills.

There have also been confirmations from the students that they did, as individuals, choose various learning tools, figure out and form their own learning environments. Data collected shows that not only they believed that were the case, but they actually did operate in their own ways to a great degree throughout the course. Individualized or personalized learning has become a unique feature in online learning, which online teachers must no longer ignore. There urgently needs further studies into how individual learners operate in their own learning environments, how individuals link up with other learners, and what can be done to foster and enhance individualized learning.

Learning difficulties identified by the students here correlate favorably with what is said by the teachers and researchers in the CALL literature, especially those by Sun (2011), e.g., the dysfunction of the virtual classroom and the small-group learning centers scattering independently around the online learning community.

## 5. CONCLUSION

Learner difficulties in online setting are real and will not fade away, if one looks into the fundamental causes for that – the disappearance of the traditional classroom. Urgent, serious and critical investigations become imperative. Pressing issues such as interactions, group work, instructional materials, learning methods and teaching methodologies, etc. need to be addressed and closely examined in all online language courses. The focus of these studies should be moved, at least to some extent, from the online teachers to online learners. This is to ensure that all the decisions made and solutions adopted are well informed by learner experiences. The goals are to make decisions and solutions which will serve online learners' interests to the greatest possible extent.

Official Conference Proceedings 2012

Abstracts

The influence of English and digital technologies becomes growingly intense in the Internet era where English is used as the *lingua franca*. Specifically, in the today's business world, giving presentations in English is turning to be a common feature of working life ever more. When giving a presentation in English, even those with high English proficiency tend to be agitated, apprehensive, reluctant, diffident, etc. Many presenters feel terrified that their presentations are not powerful and attention-grabbing enough due to a lack of suitable techniques and skills. More importantly, the only feedback from the instructor may be deemed inadequate. The present study examined the influence of YouTube on the presentation skill development of 195 MBA students in a 36-hour intensive English course in June 2012. With the course contents consisting of 30% lecture and 70% practices, the participants were trained to familiarize themselves with presentation skills as an essential requirement of the business world. After having been given in class, all presentations were then uploaded onto YouTube. Employing a simple 4-option questionnaire, the co-authors asked the participants to express themselves by describing and comparing their feelings evoked from the in-class votes compared to the views gained from the Internet network. The findings revealed that most participants (66.7%) believed that, combined, both approaches enhanced their English learning with greater effectiveness, while 28.2% preferred merely the in-class presentation activity ensuring higher reliability than YouTube. Despite being the generation of cutting-edge technology, only 5% preferred presentation uploaded onto YouTube only.

## 1. INTRODUCTION

When the world becomes borderless, mounting globalization facilitates the exchange of knowledge and ideas. An international language like English has become invaluable and inevitable. This situation is true for both non-English immigrants and for the people of the non-English-speaking host countries. For the former group, non-English immigrants must learn English as the official language of the English-speaking country in order to survive. For the latter, both immigrants and hosts must be able to speak English for effective communication in diverse settings such as at the workplace, hospital, school, department store, etc. As a member country of the ASEAN Economic Community (AEC), Thailand will become a bilingual nation. The country thus needs to prepare her people in the domain of English proficiency. It has been observed that Thai learners, who are traditionally reticent, tend to value harmony and respect to authorities (Lohsiwanont, 2001, pp. 33-39). Examining the cultural adjustment of 15 Thai Ph.D. students at a Midwestern university in the U.S., Lohsiwanont (2001) found three major difficulties, one of which was oral English proficiency (p. 65).

Cultural norms are found to be a major influence affecting language use (*see* Macias, 1987; Heath, 1983; Delpit, 1988; Delpit, 1992; Heller 1997; Jaturongkachoke, 2001; Lohsiwanont, 2001; McDermott & Varenne, 1995; Sakdisubha, 1987, for instance). Macias (1987), for instance, found that cultural conventions of some non-English speaking students may cause them to be silent as silence means respect in their culture. However, in the English-speaking classroom, especially the American one, all students are expected to share thoughts and be voluntarily involved in class discussions. Extensive research has been conducted the effect of the racial and cultural background on English acquisition (e.g., Heath, 1983; Delpit, 1988; Delpit, 1992; Lohsiwanont, 2001; Long, 1998; McDermott & Varenne, 1995; Heller 1997), especially when there is a collision of two or more languages where one becomes *dominant* and the other *inferior* (Grosjean, 1982). Such introversion may even make plenty of non-native English learners sound incompetent. Students who are considered incompetent in English may experience limited opportunities for both the realms of education and employment.

This current study explores how YouTube, a new mode of pedagogical media, can be used to help Thai students to become proficient Thai-English bilinguals. It is interesting to know whether or not the cultural trait of being *reserved* has changed or still continues to exist, and YouTube can help these young-blood Thais to overcome their shyness, diffidence, and considerateness (if any). It will also establish a record of English as a Foreign Language (EFL) learners' attitude towards sharing knowledge on YouTube.

## 2. INFLUENCE OF THE INTERNET MEDIA UPON ENGLISH LEARNING

It is obvious that the Internet has great contribution in English learning and teaching process. Loads of researchers and technological gurus have reported that the fast development of technology has created a novel learning way by using IT while countless e-learning courses

emerge everywhere (*see* Brandon, 2005; Crichton & LaBonte, 2003; Dudeney, 2007; Dudeney & Hockly, 2007; Frendo, 2005; Horton, 2006; Limlumlertkul & Liu, 2010; Leong & Koh, 2012; Martin, Parker, & Deale, 2012; Pagram & Pagram, 2006; Pufahl, Rhodes, & Christian, 2001, among many others). In Thailand, modern technologies like the Internet, computer, and digital become common in its educational and occupational realms. Even Thai first graders now learn how to use tablets. The following section provides information on studies of the use of technologies in language teaching.

Horton (2006) stated that e-learning is the use of digital, information, and computer technologies to construct learning experiences in distant modes. Brandon (2005) asserted that this pedagogical approach allows learners to access pedagogical contents which will be included in the common templates along with instructions and examples. Willie (1979) found that the use of media positively correlates with language development; nonetheless, to have plenty of e-learning courses may be useless. Brandon (2005) suggested there may be only an online course, but that one must be able to transform the business. Online or e-learning can support three organizational tenets for learning: timely topics, greater freedom, and cost retrenchment, while the actual learning remains the same or even better (Crichton & LaBonte, 2003). In Thailand, the importance of the Internet is highlighted for information retrieval (Pufahl et al., 2001).

Pagram & Pagram (2006) proposed that e-learning includes an immeasurable variety of electronic materials in instructions comprising CD-ROM, computer-based learning, and web-based learning, among many others. Likewise, there are plenty means of communicating via the Internet, but people usually use only the World Wide Web and e-mails (Dudeney, 2007). Dudeney and Hockly (2007) claimed that the introduction of the Internet or other technologies to the classroom is not easy because some negative attitude towards the world of technology still exists (pp. 8-9).

In this study, the authors thus use the term e-learning to cover the use of YouTube, a website or the Internet medium, as a form of e-learning. The usual classroom-based pedagogy remains the same as known for centuries. YouTube is the only one electronic medium employed under examination in this business English classroom. In the current study, the co-authors will look specifically into both optimistic and pessimistic attitudes towards technology which may arise from the presentation activity.

### **3. HOW TO TEACH BUSINESS ENGLISH**

In his book *How To Teach Business English*, Evan Frendo (2005) has suggested that “teacher” function as a *trainer*, who alters learners’ behavior or ability so that they can perform a particular job effectively,” a *coach*, who knows how to help learners to recognize their personal strengths and weaknesses so that they can plan the lessons and activities accordingly,” and a *consultant*, who offers knowledge gained from his or her business know-how and expertise (p. 5). Keeping these roles in mind, the co-authors planned to teach around 240 MBA students by starting the class with some necessary concepts of grammar, reading and writing, or so-called “linguistic competence.” For the speaking part, oral presentation is used as a means to apply such linguistic competence to their real-life experiences, or so called

“discourse competence.” To master English, students need to be well-equipped with both linguistic and discourse competence as strong foundation (Frendo, 2005).

As the Internet became popular among students at the moment, if you key the words “Oral presentation,” approximately 8,350,000 websites will pop up (September 30, 2012). If one looks into YouTube and click the same phrase, millions of websites display. What is meaningful here is that the Internet drastically intrudes our daily life at all realms including education, business, and medicine, among many others. In a study conducted with students in the United States, positive perception was found among the respondents “as a means of enhancing learner-learner, learner-instructor, learner-content, and learner-interface interaction” (Martin et al., 2012). Such constructive influence made the co-authors—who were also the co-instructors in the present course—decided to use the Internet for business learning and teaching. As billions of people love to watch YouTube and there are many sample videos of good presentation there, the authors came to a decision to embrace such website in their pedagogy. Most recently, Leong and Koh (2012) studied the attitude towards online education or online learning among lecturers of higher education in 5 schools including Schools of Business, Engineering, Computing & Information Technology, Language Centre, and Centre of Excellence for Pre-University Studies. They have found that School of Business lecturers have shown the most positive views of online course. Thus, in this study, it is interesting to examine whether business students favor the use of YouTube in their English learning or not.

#### 4. AEC2009-2015 AS A NEW REQUIREMENT

To non-specialists in the field, ASEAN stands for the Association of Southeast Asian Nations. As a member state which is a political paragon in the region, Indonesia became the ASEAN Secretariat. To empower its ten member states, consisting of Brunei Darussalam, Cambodia, Indonesia, Lao PDR, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Viet Nam, the ASEAN Economic Community (AEC) was formed with its roadmap from 2009 to its full enforcement operations in 2015 (Association of Southeast Asian Nations, 2009). According to such roadmap, professionals and skilled labor can cross the border more legally and conveniently, whereby an exchange of personnel will be widely accepted (Association of Southeast Asian Nations, 2009, pp. 29-30).

As a State Member, Thailand, where interculturalism has long been highly valued, has warmly embraced the new economic requirements in a vast variety of aspects including employment and English as a *lingua franca*. Fasold (1987) addressed a remark that even though Thailand has never been colonized, English, *a world language*, has been taught to Thais fundamentally for economic reasons (p. 10). In Thailand, at least one foreign language is compulsory for all students (Pufahl et al., 2001) and that language is English. Regarding AEC as the most recent requirement, Thai subjects have to adjust themselves both at work and in their study life to survive.

For the former reason—employment, to abide by the AEC roadmap, many private behemoths started to hire foreign staff from Cambodia, Myanmar and Viet Nam. Likewise, Thai applicants for a private company’s job have to attain the 550+ TOEIC score. Even the

employed have to develop and/or maintain their English proficiency accordingly. A good example of a telecommunication state-owned conglomerate's endeavor to drive its employees to master English was well demonstrated in Chanseawrassamee's most recent work (2012).

For the latter—education, numerous Thai academic institutions have increasingly provided many bilingual and international/English programs from the kindergarten level up to the university level. A similar trend has been found in the higher education programs in both public and private institutions; namely, 356 international programs in 1999, 465 in 2002, and 521 in 2003 (Office of the Educational Council, 2004, p. 149).

In the present study, YouTube is used as a way for MBA students to learn English and become more outgoing via YouTube. The influence of YouTube on learning English will then be examined. Approximately 240 MBA students in the Flexible Program took the Intensive English Course for 36 hours. Even though the MBA Flexible Program is a Thai program and the English subject is a non-credit course, the students are found to be eager to be prepared their English skills for the full form of AEC enforcement in 2015. Significantly, the number of class hours has doubled from 18 hours in almost twenty previous cohorts to 36 in the most recent one—the cohort investigated in the current study. This is an obvious attempt of a public higher-education institute to cope with the forthcoming AEC in two years ahead.

## **5. METHODOLOGY**

### **5.1 Nature of the Intensive English Course at a Postgraduate Institution**

The Intensive English Course is a non-credit course which lasts 36 hours. The class meets once a week on Saturday for 6 hours per day (from 9 to 16 hours) for 6 weeks. The course is provided at an outstanding postgraduate institute in Bangkok. The major purpose of the course is to prepare the MBA students for reading textbooks and assignments, most of which are in English. However, as the time passed and the imposition of technology and English became apparent, teaching English by using the grammar-translation approach may be deemed improper. The co-authors thus added some interesting activities, e.g. self-introductory talk, oral presentation, etc., to make the class more interactive and lively. In the previous cohorts, students were asked to present on an exciting variety of topic including moon cakes, mobile phones, tourist spots, and cars.

Each day, grammatical concepts, reading assignments, and writing practices were provided in one 3-hour session. The other 3-hour session would allow all students to apply what they had learned in the first session to their speaking and/or presentations. For this batch, students were assigned to give a presentation on the “buffet restaurant.” The presentation was tape-recorded on June 16, 2012, which was the third day of class so that there would be some time for each group to increase the views. The second author undertook the task of uploading the videotape of each group onto YouTube, but one. Group 6 Cake Makeup of Section 2 had videotaped the group presentation and uploaded the file onto YouTube itself a week before

the other videotapes were uploaded. It is thus interesting to know whether such variables can affect the results or attitude of the participants in the current study or not.

In each speaking/presentation period, a brief glimpse of preparatory presentation skills and techniques were provided. Concurrently, students learned how to pronounce English at the word, sentence, and passage levels. Some speaking activities included tongue twister, stress and rhythm, *-ed* and *-es* ending pronunciation, non-existent sounds in Thai, and patterns of professional business English statements. The students were then asked to do many speaking tasks both individually and collectively. Winning each activity, each group was rewarded. When giving presentations, students had to learn how to make a good introduction, systematic outline, understandable visual aids, effective ending, and ample questions&answers. The reward for presentation depended on the prompt in-class votes as well as the views on YouTube. In this research study, the group which had won the in-class votes in each section were awarded 12 gift vouchers from Oishi Express, a Japanese restaurant. Each voucher was valued at 450 baht. The winning group based on the number of views on YouTube received gift vouchers from Oishi Grand for 12 persons. The gift voucher cost around 650 baht each. The impact of rewards upon the students' learning progress, in-class interaction, and learning attitude is fully discussed in Chanseawrassamee's work (2012).

To persuade MBA students to pay more attention to the Internet results, they were apprised of some famous people such as Justin Bieber who became successful because of YouTube. As there were over 200 students in this cohort, the class was divided into two sections. Each section studied the same lecture topics alternatively in the morning and afternoon sessions.

## 5.2 Number of in-class votes and number of views after being posted on YouTube

This portion reports the number of both in-class votes and views which, to some extent, is believed to influence the option selected by the students in each section. Table 5.1 shows the number of views each group of the first section gained.

**Table 5.1 Number of all options selected by MBA students of section one**

Group	Brand Name	Total Vote (June 16)	Total View (June 30)	Total view (July 7)	Total View (July 14)	Total View (Sep 30)
1	Siam Savory <sup>1</sup>	10	526	910	1,692***	1,789
2	The Eight Eggs <sup>2</sup>	10	312**	312**	312**	312**
3	Choco Flex <sup>3</sup>	2	325	558	577	597

<sup>1</sup> See <http://www.youtube.com/watch?v=w4Vn8I9CuSM&feature=channel&list=UL>

<sup>2</sup> See <http://www.youtube.com/watch?v=VeeZ9ujl6K0&feature=plcp>

Group	Brand Name	Total Vote (June 16)	Total View (June 30)	Total view (July 7)	Total View (July 14)	Total View (Sep 30)
4	Sweetest Things <sup>4</sup>	10	83	106	151	160
5	Ka-Nom-Thai <sup>5</sup>	1	78	107	119	147
6	Full Moon Buffet on the Beach <sup>6</sup>	18	258	328	348	361
7	7 Bizarre <sup>7</sup>	16	301	435	645	691
8	May Rise <sup>8</sup>	14	640	926	1,189	1,251
9	Wow Zaab <sup>9</sup>	6	19	111	135	142
10	Le Saab Hour <sup>10</sup>	30*	268	314	330	346

**Remarks:** \*This group won the in-class vote.

\*\*This group's number of votes did not change all through the whole course and beyond.

\*\*\*This group won the view vote.

In the first section, Group 10 Le Saab Hour won the in-class vote on June 16, the day when the presentation was made by all groups. However, based on the views after uploading the video file onto YouTube, Group 1 Siam Savory won the contest. Only one group—Group 2 The Eight Eggs—did not change its number of views even three months passed (as of September 30, 2012). According to a computer science professor, such phenomenon can happen if the attempt to add the number of views made from the same URL was detected. This phenomenon also occurred to Group 10 Village Buffet Restaurant of the second section (see Table 5.2 below).

It is well worth mentioning that throughout the first day of posting the videotapes from June 16 until September 30 that there have been no destructive, offensive, or disapproving comments posted by viewers.

In the second section, Group 6 Cake Makeup won both the in-class votes and YouTube views. Like the first section, only one group's number of views did not change. As aforementioned, such phenomenon led to the same elucidation: when the repeated attempt to add the number of views made from the same URL is detected, YouTube automatically blocks such transactions.

As there were some significant differences in the videotaping and uploading time, which may modify the results of both sections, it is interesting to know if such results may or may not affect responses to questions in the questionnaire.

### 5.3 Questionnaire

In the present study, both authors acted as the participatory co-researchers as they were the two instructors of the course. The co-authors' main purpose of introducing YouTube into their course was due to the website's growing popularity among modern, young Thais. Despite such belief, the co-authors wished to test if the new approach fitted their students and could help them to learn English more effectively. The 2-page questionnaire was designed to determine whether students liked either one of in-class activity and also presentation videotaping share on YouTube, or both, or neither of them. In particular, the co-authors wanted to know if YouTube could really help young Thai learners to come across their shyness and diffidence as a cultural trait. Initially, a singing contest was planned to be included. Nevertheless, some activities including a sing-along contest, had to be removed due to temporal constraints. The number of students (approximately 240 in total) was also another factor of the best selected activities. The respondents were asked to complete the questionnaire in either Thai or English as they wished. In the questionnaire, they were asked to select the most favorable way of learning related to making an effective presentation in English. Four options available for them to select only one were:

- (1) Prefer English presentation as an in-class activity only;
- (2) Prefer English presentation as exchange of knowledge on YouTube;
- (3) Prefer English presentation both as an in-class activity and exchange of knowledge on YouTube; or
- (4) Dislike English presentation both as an in-class activity and exchange of knowledge on YouTube

Percentage of each option was then calculated to find the respondents' overall preference. Open-ended questions for free expression of opinion were also provided for each student's free articulation. One hundred per cent of the participants were willing for further informal discussion.

### 5.4 Participant

On the last day of class, questionnaires were distributed, filled in, and returned from 195 students (male: 80; female: 115) out of the entire 240 in the "Intensive English" course

provided at a postgraduate institution in Thailand. Their ages were between 23 and 38, with an average of 27 years old. Their fields of study varied from one to another because this is an MBA course, which, by nature, incorporated diverse fields of study comprising technology, information technology, biotechnology, engineering, English, arts, decorative arts, science, political science, medical technique, veterinary science, commerce, accounting, management, finance, finance & banking, statistics, marketing, economics, international business, and law. To take this intensive course, all these students had passed a written examination and an interview at a famous postgraduate institute where this research was conducted. Hence, the participants were considered to have a medium to high degree of English proficiency. Since the participants in the current study were young generations of the country who were believed to be adept at the Internet and/or other multimedia skills, the introduction of YouTube was performed in order to see whether or not such cutting edge of computer technology will assist in their English acquisition and development.

As the “Intensive English” course was provided before the first semester began, all participants were new to each other and needed to learn to work both as an individual and as a group. This Intensive English course thus functioned as a place where all newcomers learned to know each other whilst learning English.

## 6. FINDINGS & DISCUSSIONS

This portion discloses the number of each option selected by each section. Table 6.1 shows such a number.

**Table 6.1 Number of each option selected by MBA students of sections one and two**

Section	Option 1	Option 2	Option 3	Option 4	Total
<b>1</b>	23	5	70	0	98
<b>Percentage</b>	<b>23.5</b>	<b>5.1</b>	<b>71.4</b>	<b>0</b>	<b>0</b>
<b>2</b>	32	4	60	1	97
<b>Percentage</b>	<b>33</b>	<b>4.1</b>	<b>61.9</b>	<b>1.0</b>	<b>100</b>
<b>Total</b>	55	9	130	1	195
<b>Percentage</b>	<b>28.2</b>	<b>4.6</b>	<b>66.7</b>	<b>0.5</b>	<b>100</b>

Table 6.1 reveals that most respondents of both sections (66.7%) prefer the instructor to employ both in-class and Internet activities (Option 3) rather than either or neither activity. Fewest participants selected Option 4. This may be explained in the sense of saving-losing face culture in Thailand, where teachers or instructors are highly respected. In the Thai culture, saying something against the teacher may be deemed unacceptable or even aggressive.

Looking at Option 1, the percentage of preference for in-class activity of the first section is roughly 10% lower than the second section. There seems to be some relevance to the way Option 3 was chosen by the two sections. .

Option 2 gained a very low percentage in both sections. This may be mainly because of the unreliability of the Internet votes for the time being. Students tended to depend more on the real-time activity rather than in the cloud. While most students who chose Options 1 may have firmly believed that it would be fairer if all participants experienced the same in-class activity together, students who chose Option 2 may valued the tenet of knowledge exchange online. For this group of students, even though the in-class votes seemed fair, reliable and spontaneous, posting their presentation on the Internet may have been regarded as a door to be seen and appreciated.

Despite the majority of Option 3 alike, the higher percentage of the first section (71.4%) is found approximately 10% over the second one (61.9%), in reverse to Option 1. This can be best explained by the winning group of each section. For the first section, different groups won the in-class and Internet contests. Students in this section may have regarded the Internet views as an additional means to win. For the second section, the same group—Group 6 Cake Makeup won both the in-class votes and the YouTube views. Some students may be of the opinion that the result was, to some extent, unfair.

As each Option entails plenty of comments and complaints, it will be better to let respondents articulate their comments freely. These constructive comments should be reported using the respondents' own words because they were not only involved in the presentation activity, but also other pedagogical concepts. These comments are precious to all instructors, educators, and program directors for the course improvement in the future. Subheadings 6.1 – 6.4 will reveal comments made by students of each section on the four options one by one.

**a. Discussion on Option 1: Prefer English presentation as an in-class activity only**

As discussed in Section 5, the differences between the results of the in-class votes and the YouTube views may affect the comments of the respondents. For that reason, the co-authors reported the comments made by each section separately.

**Section 1 (23.5%)**

Students of the first section loved the in-class presentation activity because it was deemed fairer than YouTube. It allowed students to freely express themselves and actively participate in the activity. Some students even asked for some more presentation practices. Details are followed.

- It looks fair as the audiences show up where the presentations really take place.
- The result comes from audiences who really participate in the presentation live rather than from the virtual attendance via the Internet.

- I like this way because the vote of YouTube presentations depends mostly on the name of the presentation. The presentation should focus on the content, not the key word.
- Taperecorded and live presentations are different in terms of atmosphere, setting, time, conciseness, readiness, etc. Unlike the in-class activity, clipped videotapes on YouTube just show part of such attempts.
- In-class votes seem to be fairer. YouTube votes are not real because they depend on the number of the size of a particular group's social network.
- In-class activity is completed in class.
- The in-class vote reflects the reality more than YouTube. One man one vote.
- It's a real communication in the classroom. All teams compete against each other. This is much better than YouTube.
- I prefer in-class votes because it is a way to practice English. I feel that I always actively participate in the in-class activity.
- In-class activities reflect the real number of students' votes and feedbacks in the classroom. The number of views on YouTube may not reflect the attention of the live audience. YouTube can be cheated.
- Live presentation creates more participatory feelings.
- Too many factors affect the number of views on YouTube.
- In-class votes are fair.
- There should be more in-class presentation activities.
- I don't like YouTube views because the number of viewers does not reflect or guarantee the quality of our presentation. If any group has more friends or acquaintances or more time, they can get a lot of votes. Fun presentations do not necessarily mean that they are good. I want the work to be judged by the quality not by quantity.
- In-class presentation makes students to become more confident in their presentations. This is good for our future careers.

## **Section 2 (33%)**

It would be best to let participants express their own voices. Like those in the first section, most students in the second section who favored this option mentioned that the number of views gained from YouTube was unfair, distorted, or even unethical. Some students were worried about the quality of the presentation and afraid that their work might be not worth being posted on YouTube. Some of their critical comments are as follows:

- In-class activities allow students to learn to know each other and exchange ideas. In-class votes are quite fair and transparent for all groups, while the YouTube views only reflect the number of clicks made by the same person. Personally, in-class activities are more useful.
- In-class presentation (including evaluation) is more advantageous and fairer than learning via YouTube because some students may be inconvenient to access the Internet. The number of views received is not transparent.

- In-class activities offer fair voting than the Internet views. On YouTube, the number of views can increase speculatively, thereby the number of views gained is unethical.
- The presentation on YouTube does not truly reflect the English proficiency, knowledge, or ability. I think in-class presentation practices should be more highlighted by adding more cases in different situations.
- In-class activities allow students to see the audience's behaviors and the class's response spontaneously. The exchange of ideas and comments is real, not exaggerated. More actions are brought into the classroom, which is quite different from YouTube.
- I believe that in-class activities allow students to participate more actively in the presentation. Students are sitting, watching others, and voting. This is much better than adding views on YouTube which can increase much more easily. It's not a good way to do or to give the fact/truth due to the fact that they can use many ways to increase the total views.
- In-class activities allow students to express themselves in the domain of knowledge applications, language usage skills, and self-introduction.
- The number of in-class votes is real according to the number of the present students in the real time. All in-class voters jointly perceive the atmosphere, teaching media, and interaction among students and between students and the instructor. The YouTube votes can't decide the real data.
- I don't want to use the number of views in selecting the winning group because the group which presents well may not win. The group which can present well may win because sharing the video on the Internet or any other media can be done quite easily. In-class vote is thus more preferable.
- Uploading the video on YouTube may be unable to measure the quality of the presentation because the number of views can increase by sharing link. Rather, in-class activity allows all to see the quality of the presentation of each group more clearly.
- Time used in preparing ourselves for the presentation is quite limited, thereby the work may not be good enough. The presentation thus should be done in class only and should not be posted on YouTube.
- In-class activities are not boring and fun being rewarded.
- All students get involved in the in-class activity. The number of views is not a good indicator for the best presentation.
- Students have ample opportunities to practice pronunciation, presentation, and aloud reading, thereby learning to know the rights and wrongs. YouTube has both advantages and disadvantages, but most views come from just clicking, not really watching the presentation or evaluating its quality.
- In-class presentation activity promotes expressiveness of students, but is not suitable for the class consisting of over 100 students. In addition, in-class votes may support and promote only students with higher English proficiency, but not those with lower to lowest. This activity thus may encourage only competent students to become outstanding rather than embrace all students.

- I prefer the in-class activity because over 100 students can show their potential, jointly do activities, and share attitude. The activity enables students to evaluate their own potential and try harder to fill their gaps.
- For the efficiency of the presentation evaluation, the in-class presentation activity is more direct to the point. This is because all participants jointly decide the winner and compare good presenters with the poorer. The uploaded files on YouTube are viewed by the voters who are not present in the classroom.
- In-class presentation activities enhance both listening and speaking skills. This can attract attention of the students and doesn't make them feel asleep and bored.
- It's unfair because the Group Cake Makeup had uploaded their presentation a week before the instructor did for other groups. The instructor should do this for all groups so that time is not a variable affecting the number of views.

In brief, the participants of both sections who preferred this option highlight the importance of fairness, spontaneity, close cooperation, active participation in class and among group members rather than on YouTube where everybody could see, but offered less face-to-face interaction. Respondents also valued class and presentation attendance as a means to practice English skills and exchange of ideas, thoughts, and experiences freely. Some even asked for such an in-class activity more.

The difference in terms of uploading time slightly affected the responses because there was only one person who stated such trouble. The following section reports the comments made by technological enthusiasts.

#### **b. Discussion on Option 2: Prefer English presentation as exchange of knowledge on YouTube**

##### **Section 1 (5.1%)**

Around 5% of the first section liked YouTube rather than the in-class activity. Only three explanations were provided by "*technogeeks*, a technology enthusiast" (Dudeney & Hockly, 2007, p. 9) as follows:

- I want to create a video file like an advertisement and add sounds rather than the in-class presentation which emphasizes only fun and produces unclear pictures.
- This is intended to exchange knowledge in a vast array, ubiquitous manner, and extensive publicity across the cyber world.
- Nowadays, the Internet is widely used and there are a lot of Internet users. Uploading the presentation onto YouTube allows exchange of knowledge to happen, enables diverse audiences to view our work, and invites comments from them for our improvements.

##### **Section 2 (4.1%)**

Only 4% of this section preferred the YouTube medium only. Despite such a few respondents who chose this option. The number is meaningful in the sense that it shows the trend of technogeeks. Below are some salient comments.

- YouTube allows me to practice English in various ways including listening, writing, and speaking. I just want the instructor to check my English script before giving a presentation. The sheets distributed in class should be bound for tidiness. It's a waste of time to go around and get the loose sheets one by one.

- YouTube is a medium for sharing knowledge. It allows students to receive comments or critiques from many people in various fields. We can bring those comments into our presentation improvement process in the future.
- The public can come and see the presentation. We can take the comments into our consideration and make our presentation better in the future.
- YouTube makes students to become more attentive because the video is open to the public, not limited to the class only.

From both sections, the answers, even few, are significant in the sense that Thailand is going to become part of the AEC in 2015, thereby this 5% from the first section and 4% from the second one can be seen as a signal of new generations who welcome comments from people around the world and become more and more open-minded. In other words, they feel positive towards the cutting edge of technology. This finding directly accords with many technological gurus in the 21<sup>st</sup> century (see Brandon, 2005; Crichton & LaBonte, 2003; Dudeney, 2007; Dudeney & Hockly, 2007; Frendo, 2005; Horton, 2006; Limlumlertkul & Liu, 2010; Pagram & Pagram, 2006; Martin, Parker, & Deale, 2012; Pufahl, Rhodes, & Christian, 2001, for instance) that learning via technology is unavoidable and irresistible.

Like other students who chose Option 3 in 6.3 below, students who preferred both pedagogical approaches have found that YouTube helped them to become outgoing and, simultaneously, encouraged them to perform better. This viewpoint accords with Hawthorne's effect that satisfactory performance can be created when people are overseen.

#### **c. Discussion on Option 3: Prefer English presentation both as an in-class activity and exchange of knowledge on YouTube**

While in-class activities only (Option 1) tend to be valued more because they ensure fairness, Option 2, despite its lower number, highlights the fact of modernity and technological absorption. This section has shown that a combination of both is preferable because students long for both real-life experience and share their thoughts to the global viewers. Some even mentioned that uploading their videotapes onto YouTube made them learn fundamentals of marketing like e-commerce. Some sample comments made by the first section are shown first.

##### **Section 1 (71.4%)**

- So fun and every member can join our presentation activities in the class and expand to others who can vote for our presentation too.
- In-class presentation may produce the fairer number of votes, but the number of views on YouTube may reflect the quality of the presentation which sparks more viewers' interest in the presentation.
- The in-class presentation highlights creativity without any impact of connections. YouTube focuses on connections. More friends, more views.
- In-class votes come from the impression on the presentation. Thus, the sequence of the presentation somewhat influences the number of votes. YouTube votes come from popularity or public relations. Both results come from different sources, so it depends on the objectives of votes.
- YouTube uploading can increase comments from outsiders about our work. These viewers come from assorted occupations, so their comments can help us improve our work in the future.

- In-class presentation allows the audience to see the preparation and attentiveness of presenters. The YouTube presentation requires a competent cameraman to record pictures and media, which is much more difficult. Both activities are thus interesting in terms of learning.
- In-class activities let the audiences to perceive the live atmosphere of presentations. On YouTube, the basic marketing principles, e.g. e-commerce, are learned.
- Both are interesting because the comments are made by both inside- and outside-class viewers.
- Each has pros and cons. In-class presentation let all group members to participate in the work. The audiences have a chance to learn how to present effectively from other groups as well. However, the vote result is made in a narrower mode. Votes on YouTube allow the outsiders to help judge the presentation. However, the number of views may not really reflect the number of viewers, just clickers.
- Gain new experiences both inside and outside class.
- In-class presentation activity allows the audience to see all preparations. The YouTube activity reflects the group's unity, attempts through an increase of views.
- In-class activity—prompt decision made by a small group; YouTube activity—long-term decision made by the public.
- I agree with this teaching method and both ways of presentation activities. This makes me feel that joining this class gives me more than knowledge.
- I like both ways. An interesting thing based on these two ways is that the in-class winner may not be the YouTube winner.
- The comments coming from both the class and the public can help add more perspectives.
- YouTube votes should have more control.
- In-class activity makes English not so boring and learning English from YouTube opens students' eyes to worldwide English.
- In-class vote is good because the audience's feedback is clear. However, the in-class vote may be based on fun rather than quality. Some may vote for their group however poor their presentation is. YouTube activity is also good, but it may be a result from sharing information or plenty of friends.
- In-class presentation creates fun and lightens the atmosphere. Uploading the presentation onto YouTube creates interactions among group members outside class. We became closer very fast because we mutually plan and present our group work.
- In-class presentation activity develops outgoing personality and enhances public speaking skills. Uploading the presentation on YouTube enables us to know the public impression.
- The preparation time should increase for another week. The video should show the presenters faces more clearly.

## **Section 2 (61.9%)**

Around 62% of the second section chose this option. This means that the majority of this section truly belonged to the modern world full of state-of-the-art technologies while firmly rooting themselves in the classroom-based pedagogy. In other words, they incorporated both traditional classroom and state-of-the-art online learning together. Their comments are shown below.

- Both are the best.
- In-class activities allow students to practice in front of the audience. So, they gain real-life experience. Uploading the video onto YouTube helps to gain more comments from the audience online.
- Both are ways of sharing thoughts in the form of presentation both inside and outside class. We can also attend and watch other groups' presentations, which are very useful.
- I like both kinds of the presentation activity because they are useful and knowledgeable. I can apply the knowledge gained to my daily life. The presentation activity also provides me a chance to familiarize myself with English usage. This activity thus allows me to develop my English skills, potential, and applications. It helps to encourage me to express myself or communicate more freely.
- The in-class activity is useful, whereas the YouTube activity attracts comments from others outside the classroom, which is also good. However, there should be some cautions in terms of rights and privacy. It is an activity in the institution. After uploading, anyone can come and see the video. Some presenters may not want to show off publicly.
- The in-class activity gets an immediate result and the result is direct. That is, the result accords the audience's mind. YouTube provides each group a chance to establish advertising strategies. Such techniques may prevent to evaluate the real satisfaction of the audiences.
- I like both ways, but the YouTube vote should be done in the long run, not in the short run. The number of views may be clearer in the long-term competition.
- In-class activity allows classmates to make comments. The YouTube activity allows the general public to critically comment. Students also learn to know how to work as a team in order to attract more people to view the presentation of their groups. I like both ways.
- I like both even though the number of views on YouTube may not accord with the fact.
- It's a way to allow students to jointly do an activity with other classmates in the classroom while allowing the general public to view our activity so that they see us in various forms. They can also join the activity by voting.
- In addition to the comments given by classmates, YouTube allows students to gain comments from the public. This allows students to learn both advantages and disadvantages of their posted presentation and such knowledge will enable them to improve their presentations in the future.
- I like both because they help me to develop my English skills. I can share the video and watch it repetitively in order to review my mistakes.

- More time should be given. The format of presentation should be assigned beforehand so that when being uploaded onto YouTube, all videos will have the same format and easy to understand.
- As for results of the presentation on YouTube, the presentation format should be more emphasized so that the format is suitable for viewing.
- I like the teaching method by incorporating both in-class and online activities. However, I don't like the way the number of views is used in deciding the winning group.
- In-class activity allows all students to actively participate and they become more enthusiastic and attentive to the class. The teaching and learning activity is not boring. I want the instructor to keep this teaching format. In addition, presentation uploading on YouTube encourages students to work harder and more efficiently.
- I like both of the activity—in class and uploading on YouTube because in-class activity emphasizes participation in other presentations and YouTube is world wide displayed.
- Both of them always make the students to participate in class. Moreover, they make the group of students know each other more and communicate more not only in class but outside class as well.
- The students knew beforehand that their presentation would be uploaded onto YouTube. This encourages the students to pay more attention and add more new ideas into their presentation. This is because our work is made public.
- They provide two-way communication.
- It's a way to share knowledge and information both in class and worldwide. Good idea!
- Add confidence to the presenter and feedbacks both in class and the public. More inspiration in giving a presentation.
- The in-class activity allows non-business students to learn new jargons and to become more confident. The YouTube activity opens a window for others to see us, share knowledge, and give useful feedbacks.
- Right now, the Internet becomes more and more important, so uploading a video onto YouTube allows other people to know what we are doing. However, the uploading method may sometimes experience technical problems, resulting in the stagnant number of views.
- This course covers a wide range of activities which make the class interesting, not boring. Good for further learning and self-development.
- I like both because they make the class fun. However, all students, not some, should be involved in the activity.

In short, the respondents who like both the in-class and the YouTube activities realize the growing importance of the Internet in their daily life. While they favor the social interaction which comes from group work, they embrace the global change in the area of technology, especially the Internet. Some even mentioned the technical problem arising from using the YouTube uploading application. Unlike the group which prefers only in-class activities, for this group, allowing the public to watch the in-class presentation videos and provide

feedbacks is seen as an encouragement rather than an obstruction. Despite the seemingly unfair number of views, respondents who prefer this option still have positive attitude towards the use of YouTube in the classroom. Such positive views include: personality improvement, English competency enhancement, active encouragement for better performance, and foundation for e-business, among many others. Next, Option 4 selection is quantitatively reported and qualitatively discussed.

**d. Discussion on Option 4: Dislike English presentation both as an in-class activity and exchange of knowledge on YouTube**

This option was the least selected by the respondents in both sections.

**Section 1 (0%)**

No one in the first section select this option. This may be concluded that most students loved the activity, whether in class or on YouTube. However, it can be also interpreted that they do not dare to show some resistance against the instructors who acted as the researchers in the present study. As noted by Lohsiwanont (2001), Thais preserve harmony and respect to authorities.

**Section 2 (1%)**

Outliers are always valuable and require scrupulous attention. Even though there was only one respondent in this category, it is worth mentioning his or her comments. The sole comment from a participant in Section 2 was:

“I like small-group activity. I think students gain more from working in a small group than a big one.”

As mentioned above, students are not culturally supposed to act against the teacher. As one can see in the answer, it does not look like that this student does not like the activity per se. However, as each section consists of around 120 students, it is quite impossible for the instructors to efficiently embrace all students. The fact that no one had known before that there would be a questionnaire handed out on the last day of class, and this questionnaire was distributed on the very last day can confirm a fact that, despite the huge class, this student kept coming to the class until the end of the course.

## **7. CONCLUSIONS, LIMITATIONS, & RECOMMENDATIONS**

Both the in-class and YouTube activities are found to be useful in the respondents' English learning. In spite of some serious difficulties, plenty of students positively regarded YouTube as a way to practice and sharpen their English skills, build up self-confidence, share knowledge & experiences, and provide them with a window of opportunity to receive public feedbacks.

It is also interesting to learn that though these young adults are familiar with modern technologies, some still have problems with YouTube or the Internet access, whereby making them prefer the traditional classroom-based pedagogy. Also, despite technological abundance in a developing country like Thailand, it may be too soon to conclude that all urban citizens fond of or excel at technology, can catch up with its cutting edge, or even have equal Internet access. Rather, the digital divide still exists in Thailand even in the urban area.

Although most respondents prefer a combination of the in-class and the YouTube activities, doubts are still legion, especially in the area of reliability, complexity, and system requirements of YouTube. Whether selecting Option 1 (in-class only) or Option 3 (a combination of the in-class and YouTube activities), many students mentioned some negative experiences when trying to increase the number of views for their groups; therefore, they may have some dislike, uncertainty, or even fears of technology—here YouTube. So, such technological introduction should be performed by teachers with due caution, profound knowledge, and deep sensitivity (*see* Dudeney, 2007; Dudeney & Hockly, 2007; Frendo, 2005, for instance).

As complex as it may be at the first start, the total number of respondents who preferred technology (a combination of Options 2 and 3) is greater than those who preferred the other two options. This is meaningful to all educators and instructors in planning their futuristic course content and activities. Like what many participants mentioned, technology makes their learning more fun and interesting. Significantly, the saving-losing face culture existing in Thailand for a long time gradually disappears from this young generation. Likewise, despite the personality trait of introversion among Thai students, the respondents mentioned that they became more outgoing and confident after joining the presentation activity in class and posting their videotape on YouTube.

The influence of Hawthorne's effect of being watched is also proved to be solidly constructive in the current study. A significant number of respondents stated that YouTube allows them to trace back how they had given their presentation. Also, they felt that they had to be more attentive and work harder because the video would be shown to the world, not in their class only. A student who preferred both ways of learning wrote, "The in-class activity allows non-business students to learn new jargons and to become more confident. The YouTube activity opens a window for others to see us, share knowledge, and give useful feedbacks."

Technology has apparently evolved around and gradually intruded in language pedagogy for centuries. As such, people involved in the field should embrace it while pointing out both advantages and disadvantages to our learners. We need to remind ourselves that technology can be used to enhance language teaching and learning. This paper is only one of the preliminary studies to ascertain that technology is keenly anticipated.

## 8. NOTES

We are grateful to Boonchai Hongcharu for allowing us to develop, provide, and improve an English intensive course in our own way. This academic freedom enables us to create non-threatening and lively environs for all our students who will be the future of our nation and the global community. Heartfelt appreciations also go to the *Proceedings of the Fourth Asian Conference on Education (ACE 2012)* taking place in Osaka, Japan during October 24-28, 2012. Full responsibility for any remaining shortcomings is entirely our own.

## 1. Introduction

Iwai and Kawamoto (2011) raised the feasibility issue of teachers using form-focused instruction (FFI) through feedback, particularly whether teachers are able to employ this method easily and unconditionally. Although there are sufficient amount of research that FFI is effective for students to notice their grammatical errors (e.g., Ammar & Spada, 2006; Norris & Ortega, 2000), the researcher feels that teachers cannot achieve FFI successfully, because there are other considerations that teachers have to deal with in the classroom. Therefore, the main purpose of this study is to find out whether teachers are able to FFI under any conditions. The central purpose of this study is to examine whether it is feasible for all teachers to implement FFI in their classrooms. Moreover, this study investigated whether teachers were able to draw students' attention intentionally and effectively to students' errors by providing linguistic feedback while engaged in meaningful language use. In the next section, I will briefly discuss the empirical studies that have been exploring this issue.

## 2. Literature review

According to Ellis (2001), FFI comprises the classical approach, focus-on-forms (FonFS), and focus-on-form (FonF). In the classical approach, such as Grammar Translation Method, this was designed to focus on memorizing grammar rules and translate text word-for-word. FonFS approach focuses on the aspects of all grammatical forms, which includes Audiolingual Method. In contrast, FonF refers to an instruction technique in which the attention to form or forms must be brief and unobtrusive. The key feature between FonF and the other former two approaches is that a main emphasis of FonF is not sacrificing on meaning. By narrowing the definition of FFI, I use Spada's (1997) definition as "any pedagogical effort which is used to draw the students' attention to language form either implicitly or explicitly" (p. 73).

Among the very few studies dealing with the teacher issue of FFI, two studies are referred to. Comparing the experienced and inexperienced teachers, Pica and Long's (1986) study examined the teachers in terms of their ability to modify input and interaction with their students. They examined teachers' use of questions, self-repetition, confirmation checks, and clarification requests. From their findings, they found quantifiable differences between the two groups, i.e., the experienced teachers being more skillful in their use of the target language.

In another study by Mackey, Polio, and McDonough (2004), they compared the experienced and inexperienced teachers in terms of their use of FFI techniques. They found that the experienced teachers used higher frequency of FFI techniques than the inexperienced teachers. The results of the two studies above imply that there is a certain teacher factor that affects the success of implementing FFI in their classroom, and substantial training is necessary for teachers to acquire skills to employ FFI. Although these studies provided a great deal of insight as to teachers' roles in FFI in an ESL context, they have not shown whether FFI can be extended in an EFL setting. In addition, it is not clear whether their findings have shown that FFI requires targeting a selected students' error or errors (FonF) rather than errors in general (FonFS).

While there are a few studies tackling the issue of teachers able to employ FFI under any condition, there are two which were conducted under content-based instruction. Content-based

instruction is designed to teach students about a particular topic that is taught in the L2. The first is Pica's (2002) study that investigated two highly experienced teachers teaching English of adult classes using literature, film, and American culture as content. She examined the effects of feedback, negotiation, and input in a meaning-based context in order to examine if teachers could assist students with difficult forms and structures. The study revealed that the teachers and students had interesting and meaningful discussion that did not require students' accuracy, since the classroom discussions encouraged opinion sharing and allowed students to express their views on the topic.

Zyzik and Polio (2008) investigated whether incidental FFI, students say something erroneous and then teachers correct the form, was effective in advanced literature courses. They examined three tenured-stream faculty members who were trained in literacy and cultural studies specializing in some aspects of Spanish or Latin-American literature. None of these instructors specialized in applied linguistics or language teaching. From their results, Zyzik and Polio noticed there was a lack of interaction between the teachers and students, because the teachers dominated the talk. When students had the opportunity to speak, the teachers provided corrected forms immediately in order for the students not to feel threatened or embarrassed by their errors. Finally, they also felt that the teachers avoided cluing as to where and what the students' errors were, since these types of feedback were lengthy and the teachers faced time constraints to cover the materials within limited time spans. The common factor of this study and Pica's (2002) is that they question whether or not FFI is feasible for teachers to employ FFI under any conditions.

Taking into account that there are very few empirical studies focusing on teacher providing FFI under any conditions, this study investigates the feasibility issue centering on the three research questions below:

RQ 1. Do teachers change their way of providing form feedback under any instructional conditions?

RQ 2. Do teachers differ from each other in the way they provide form feedback?

RQ 3. Do different task conditions affect the way teachers provide form feedback?

### 3. Method

#### 3.1 Materials

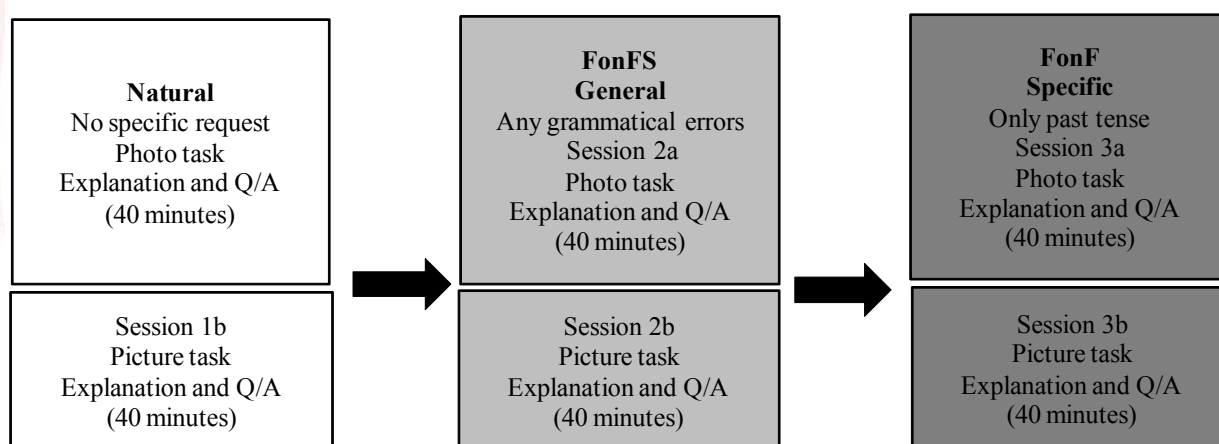

Two picture description tasks, students brought their personal photos (a Photo task) and a daily routine narrative which consisted of pictures of natural sequences of events (a Storytelling task), were used for data collection of teacher-student interaction. The reasoning behind using these tasks was that past events can be used to direct on the past tense forms. In addition, there are three reasons why the past tense was selected as an observation target of this study: 1) many studies used the past tense for this type of research (e.g., Doughty & Varela, 1998; Ellis, 2007; Ellis, Loewen, & Erlam, 2006); past tense is used regularly in conversation; and students often make errors while using past tense (Bitchener, Young, & Cameron, 2005).

For these tasks, each student was engaged in two task conditions. The first was the Explanation condition, in which the student described their picture for one minute. The second was the Q/A condition, where the teacher was requested to ask three questions that I prepared (pre-set questions), and three additional questions were asked by the teachers.

### 3.2 Research Design

Data were collected in February 2008 and January 2009, under quasi-experimental conditions. These conditions are shown below in Figure 1 into three separate instructional conditions. In the data collection, the teachers participated in three different 80-minute instructional conditions (Natural, General, and Specific) individually. In the “Natural” session, there no request was made to the teachers. The “General” session was designed to investigate the grammar forms they corrected – a FonFS condition. Here, the teachers were requested to correct all grammar errors. In the “Specific” session, the teachers were requested to pay attention only to students’ errors in the past tense selectively – a FonF condition. This was the crucial session for this study to observe whether teachers were able to switch from FonFS (focusing on errors in general) to a FonF (focusing on a selected error or errors). The teachers engaged in three instructional sessions, each session involving the same students and two different 40-minute tasks.

**Figure 1: Instructional conditions**

### 3.3 Participants

The participants were comprised two NESTs) (Native English Speaking Teachers), two NNESTs (Non-Native English Speaking teachers), two inexperienced NNESTs; and a total of 24 students. Using the pseudonyms throughout this study is described below:

- 1) John and Mary for the native-English-speaking teachers;
- 2) Taro and Hana for the Japanese English teachers; and
- 3) Fumi and Kayo for the inexperienced teachers.

John, Mary, Taro, and Hana had more than five years of teaching experience, and Fumi and Kayo each had less than one year of teaching experience. There were twenty-four university students who participated in all three conditions. Each teacher had the same four students in all three

instructional conditions in order to facilitate paring of the students, and to observe if there were any changes in the students' utterances in each condition.

#### 4. Results

This section explores the answers of the three research questions that were presented in Section 2. Each section will assess the data with one of the research questions based on the analysis outcome of the Adjacency pairs (ADJs), form-focused feedback (FFF), and meaning-focused feedback (MFF). First, instructional change will be presented to show whether teachers are able to change their instruction, particularly between the General and Specific. Second, the differences among the six teachers will be presented. Finally, the outcomes of the quantitative analysis of task conditions, Explanation/Q/A, will be presented.

##### 4.1 Instructional change

The analyses of the dependant variables presented in this section are intended to describe teachers' instructional change under the three conditions (Natural → General → Specific). Tables and charts illustrating the frequencies are included to provide a description of each condition. The following section will specify the frequency counts of ADJs for all six teachers.

##### 4.1.1 Frequency counts of ADJs

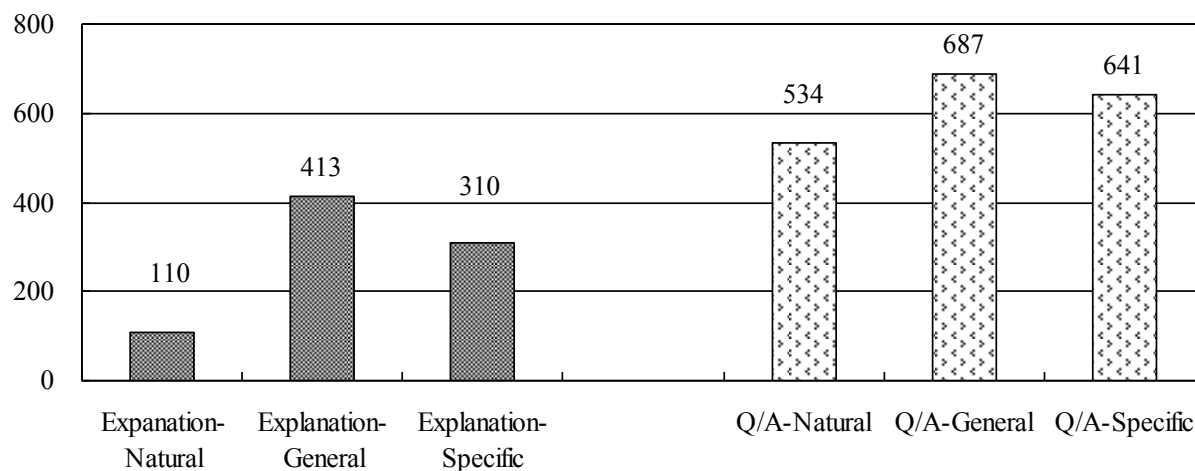

The ADJs illustrate whether the teachers changed their instruction and interaction with their manners under the three interactional conditions. An ADJ is an example of a conversational turn-taking (e.g., Schfirrin, 1987), and one ADJ is composed of two utterances between two speakers. In this study, the beginning of the ADJs was from the students' utterance that provoked a response from the teachers. The example below constitutes one ADJ:

Student: I feel happy. (**Error – past tense**)

Teacher: Oh you felt, felt happy. (**Form-feedback**)

The frequency of ADJs use by the teachers is plotted on the graph for the Explanation and Q/A conditions in Figures 2 below. In the Explanation, the teachers changed their instruction between the Natural to General, and Natural to Specific. The graph shows that there was a decrease between the General and Specific, which indicates the teachers were able to focus on a specific form in the Specific condition. Although there is a similar pattern in the Q/A, there was a slight decrease between the General and the Specific. Therefore, the teachers could, to some extent, change their instructional pattern.

Figure 2: ADJs in Explanation and Q/A

Since a normal distribution of the data was doubtful and the sample size was small, the data were subsequently submitted to a nonparametric test, and this was to examine if there was a difference throughout the sessions. First, a Friedman test was conducted to examine if the means of ADJs in three sessions shifted significantly. This test was selected since there were more than two task conditions and the same participants were used in all three instructional conditions (Larson-Hall, 2010). The results revealed that the means were significantly different in the three instructional conditions in the Explanation ( $X^2 = 7.91, p = .02$ ), but not in the Q/A ( $X^2 = 2.00, p = .37$ ).

Second, by using another nonparametric test, the Wilcoxon Signed Rank test, a follow-up comparison between the two different task conditions, was made. The result revealed that in the Explanation, there was a significant difference between the Natural and the General ( $z = -2.02, p < .04$ ), and the Natural and the Specific ( $z = -2.20, p < .03$ ). However, no significant difference was found between the General and Specific sessions ( $z = -.42, p < .67$ ). For the Q/A conditions, there was no significant difference between the Natural and General ( $z = -1.57, p < .116$ ), General and Specific ( $z = -.73, p < .46$ ), and Natural and Specific:  $z = -1.75, p < .08$ . This means that in the Explanation, teachers interacted with their students more actively in the General and Specific than in the Natural. This also indicates that in the Q/A teachers did not change their interaction significantly in all three conditions.

#### 4.1.2 Frequency counts of FFF and MFF

This section focuses on whether the teachers were able to change their feedback under the three instructional conditions. In Excerpt 1 below is an example of a FFF. Excerpt 2 is one example of an MFF in which the teacher understood the student's utterance:

Excerpt 1:

Student: She want to meet her friend.  
Teacher: OK. Yeah, she, maybe she wanted.  
Student: Wanted to meet her friend.

Excerpt 2:

Student: Especially Japanese...take pose peace, when we are taking . pictures,  
and if you take pictu, when you take pictures . . you take some pose.  
Teacher: Ah~, yeah, we just say "cheese."

Figures 3 and 4 below show how the teachers performed in the Explanation and Q/A using the total frequency counts. Figure 3 illustrates that the Natural condition has significantly fewer FFFs compared to the General and Specific conditions (Natural < General and Specific) in the Explanation and Q/A. Between the General and Specific conditions, there is little difference in the Explanation, and a slight decrease in the Q/A.

Figure 3 FFF in Explanation and Q/A

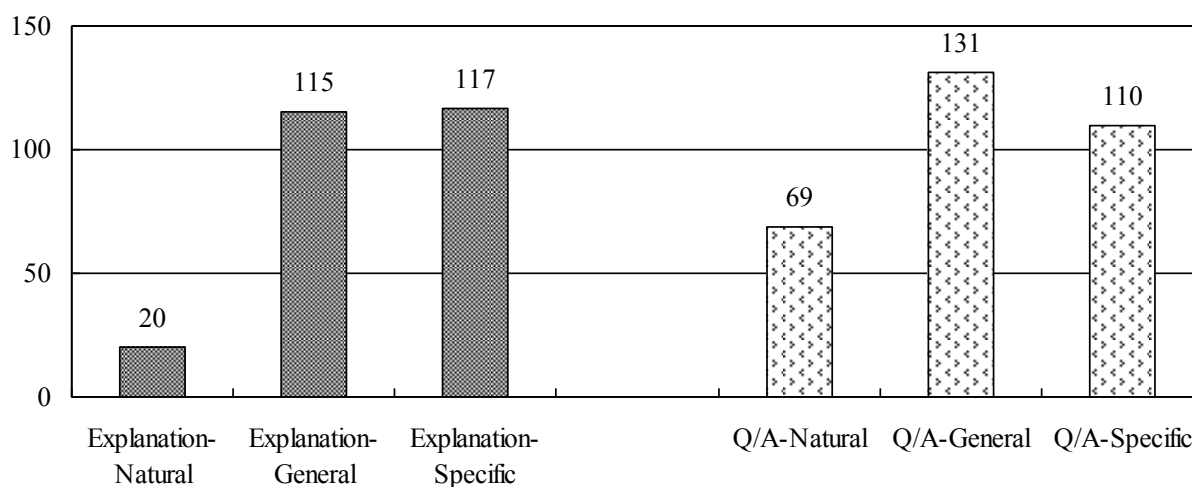

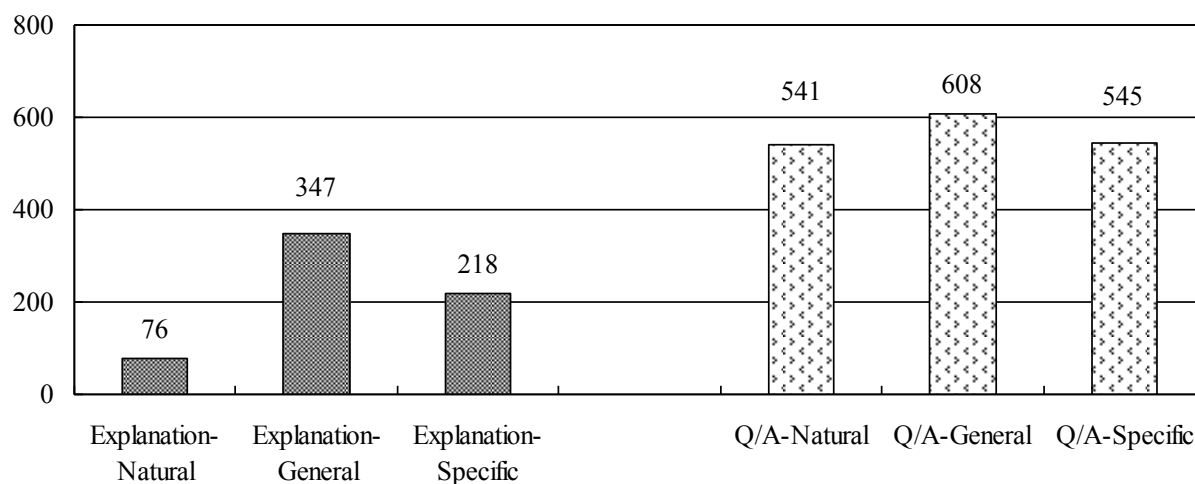

Figure 4 below clearly shows that there is a difference between the Natural and the other two conditions. It also illustrates that during the Q/A, there was no significant effect in all three conditions. There should have been a significant decrease in the Specific condition in the Explanation and Q/A since the teachers were supposed to focus on the form-based feedback.

Figure 4 MFF in Explanation and Q/A

In this analysis, the same nonparametric tests, used in the ADJs, were applied to examine if there was a significant difference across three sessions for both the FFF and MFF. First, the results in the FFF of the Friedman test reveal that there was a significant difference for the FFF,  $X^2 = 2$ ,  $p < .01$  in the Explanation condition. However, there was no significant difference in the Q/A,  $X^2 = 2$ ,  $p = .11$ . This reveals that the teachers were able to change their way when they provide form-based feedback in the Explanation, but there was no effect during the Q/A.

Using the Wilcoxon Signed Rank test in the Explanation condition, there was a significant difference between the Natural and General at  $z = -2.20$ ,  $p < .03$ , and between the Natural and Specific at  $z = -2.21$ ,  $p < .03$ . Yet, for the Specific and General, there was no significant difference at  $z = .92$ ,  $p = .92$ .

Second, the MFF counts from the Friedman test showed that there was a significant difference,  $X^2 = 2$ ,  $p < .03$  in the Explanation. However, there was no significant difference in the Q/A,  $X^2 = 2$ ,  $p = .31$ . As for the Wilcoxon Signed Rank test in the Explanation, there was a significant difference in the Natural/General,  $z = -2.20$ ,  $p < .03$ , and Natural/Specific  $z = -2$ ,  $p < .05$ . There was no significant difference between the General and Specific,  $z = -.94$ ,  $p = .34$ .

Overall, the teachers had the tendency to focus more on the meaning-based feedback than on form-based feedback. There also was no effect between the two crucial conditions (General and Specific) where the teachers were supposed to focus from general forms (FonFS) to a particular form (past tense - FonF) both in the Explanation and Q/A. This shows that the teachers differentiated their frequency either in FFF or MFF more so in the Explanation than the Q/A. In other words, during the Q/A, they could not restrict their attention only to form-related errors, and this would imply that it was not easy for them to focus their attention to errors while engage in a meaning-based interaction.

#### 4.2 Teacher difference

The outcomes of the analysis on teacher difference will be examined in this section. The following section will provide the frequency counts of ADJs for all six teachers.

#### 4.2.1 Frequency counts of ADJs

The data reported in this section show that the teachers used different frequencies of ADJs when giving instruction under the three instructional conditions, particularly under the General and Specific conditions. The frequencies of ADJs used by the teachers are plotted on Figure 5 for the Explanation and Figure 6 for the Q/A conditions. These graphs show that Taro used the highest number of ADJs compared to the other teachers in all three instructional conditions. In the Explanation condition, Taro, John, and Kayo used more adjacency pairs in General since they had the tendency to give more feedback on errors they felt needed to be corrected. However, between the General and Specific conditions in the Explanation the difference was far higher for John (80.0) than for Taro (49.0). In contrast, Taro (54.0) was much higher than John (12.0) during the Q/A. As for Mary and Hana, they used more ADJs in the Specific than in the General; whereas Kayo was almost the same as them throughout the Explanation and Q/A. Fumi showed hardly any change in all three instructional conditions.

Figure 5 ADJs by teachers in Explanation

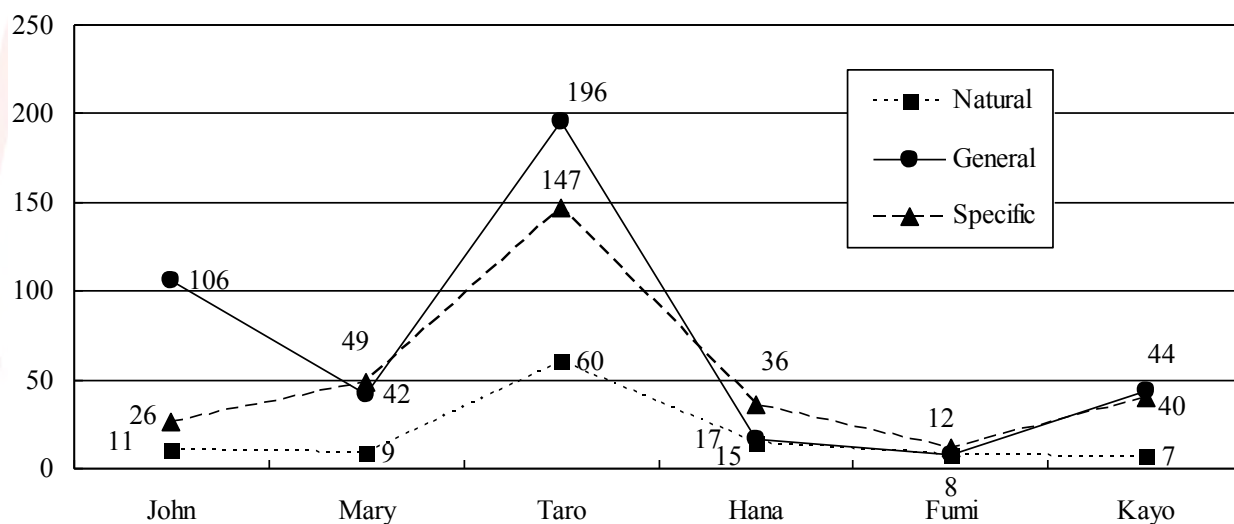

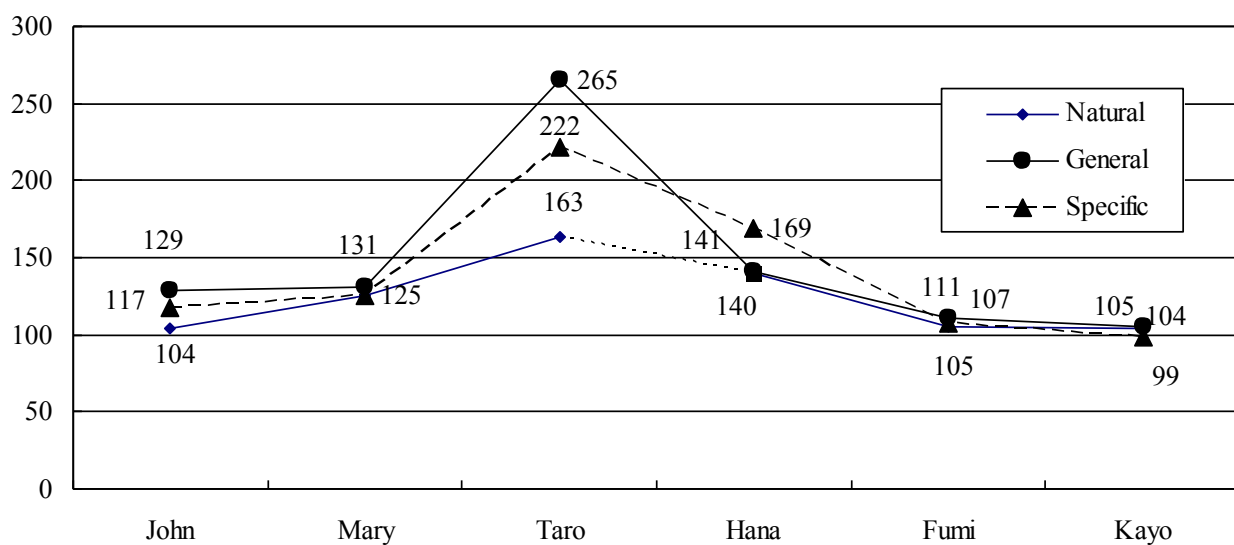

Figure 6 ADJs by teachers in Q/A

In the Q/A condition, Taro, John, and Mary interacted with the students the most in the General; whereas, Hana interacted with her students the most in the Specific. Fumi, and Kayo were more or less the same throughout the three instructional sessions.

To summarize, among the six teachers, Taro's ADJs outnumbered the other teachers in all three conditions. John's total counts increased from Natural to General, and from Specific to General, which was similar to Taro with far fewer counts. Mary and Hana were alike in all three conditions. The inexperienced teachers, especially Fumi, were not as active in their interaction as their experienced counterparts.

#### 4.2.2 Frequency Counts of FFF and MFF

The frequency counts of FFF and MFF will present which teacher had the tendency to focus either on form- or meaning-based instruction or both. In addition, this section will show how different each teacher was when providing feedback.

Examining the teachers in the Explanation condition, shown in Figure 7 and 8, Taro used both the FFF and MFF the most, compared to the other five teachers. He used both the FFF and MFF the most in the General condition, followed by the Specific and the Natural. John had a similar pattern, where he used FFF and MFF the most in the General. However, Mary and Hana were opposite to both male teachers, using FFF more in the Specific than in the General. Regarding MFF, they were different in that Mary did not change much in the General and Specific conditions, and Hana scarcely made any changes in all three instructional conditions. As for the inexperienced teachers, Kayo was similar to Mary and Hana in the FFF, but was similar to Taro in the MFF. Fumi used more FFF in the Specific, but made no changes in the MFF.

Figure 7 FFF by teachers in Explanation

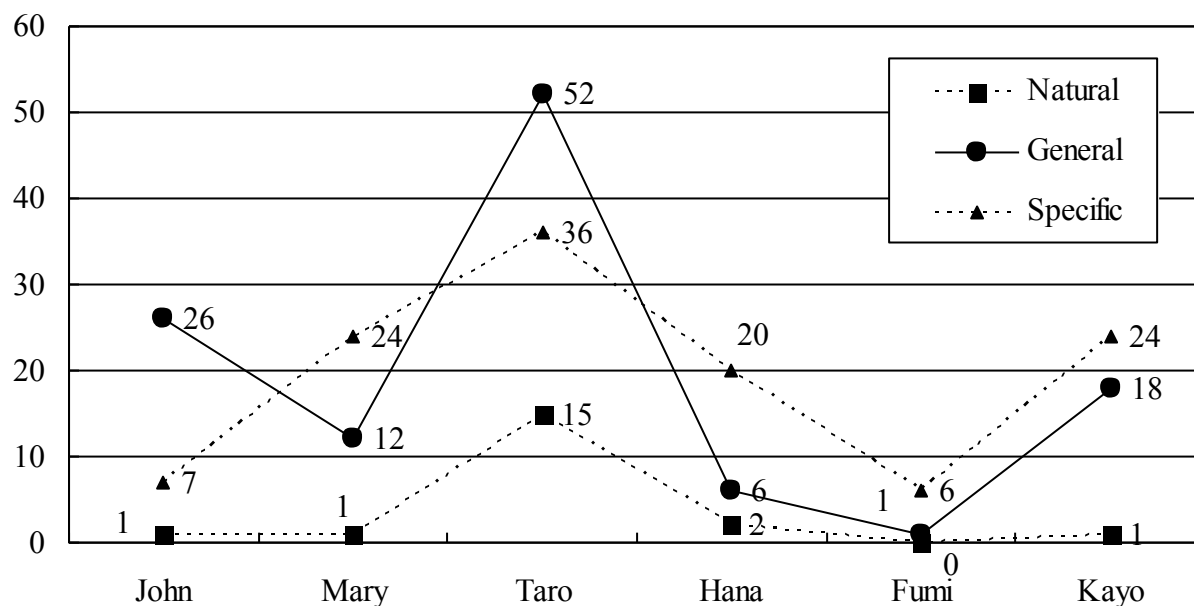

Figure 8 MFF by teachers in Explanation

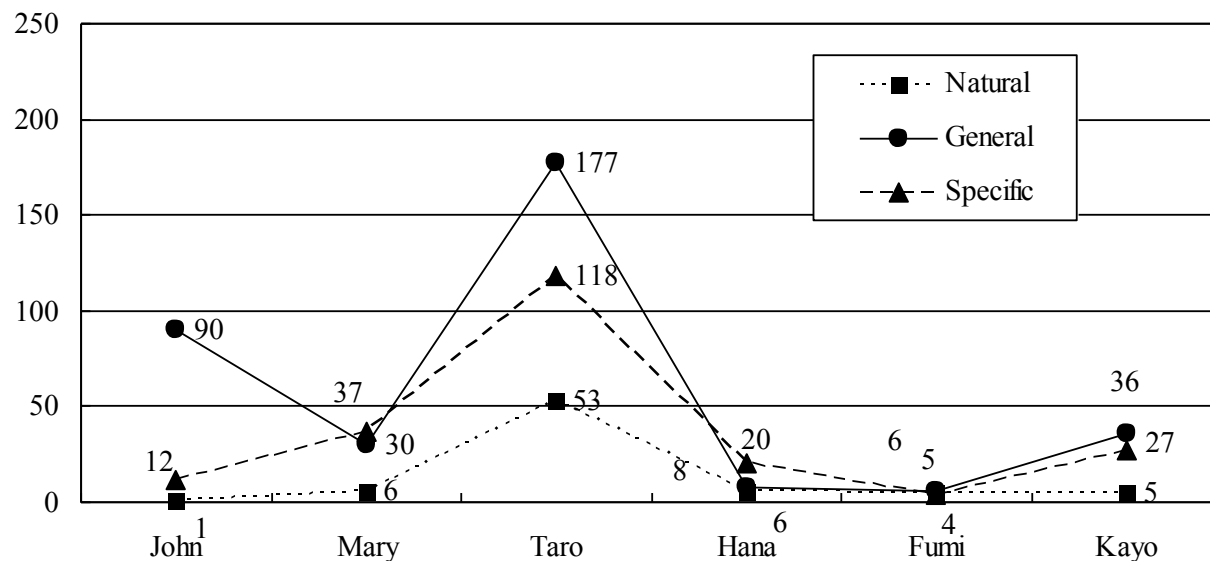

Figure 9 presents the FFF in the Q/A conditions of the six teachers. Taro showed the highest frequency of FFF. Taro, John, and Kayo used FFF in similar patterns in all three conditions, progressing from the lowest to the highest frequency. In other words, the Natural had the lowest frequency, followed by the Specific, and finally the General that had the highest frequency of FFF. Mary and Hana were opposite to them, using FFF the most in the Specific condition and then the General condition. Fumi was less active than the other five teachers in all three conditions.

Figure 9 FFF by teachers in Q/A

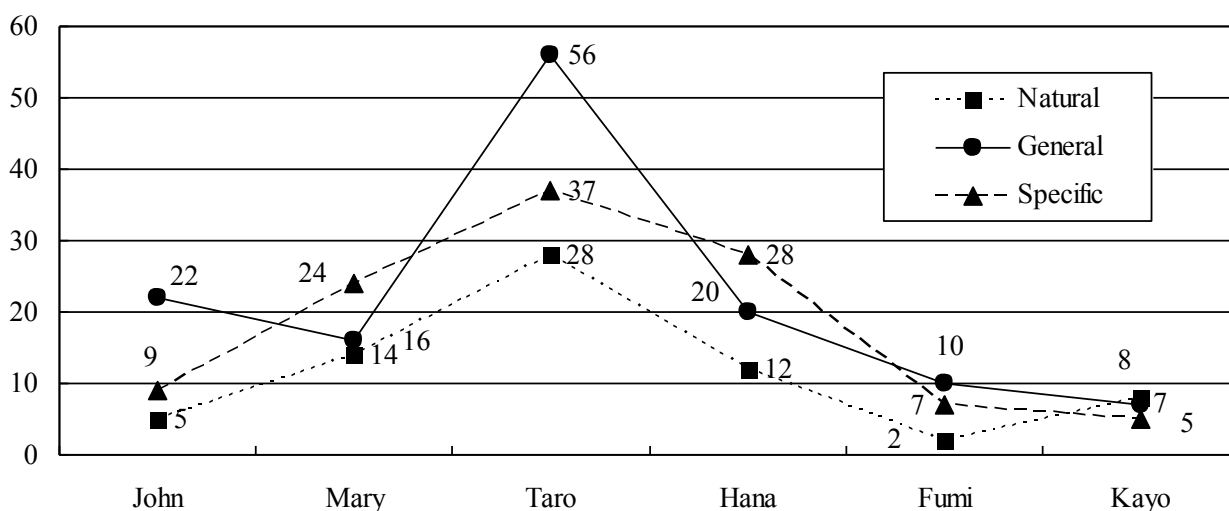

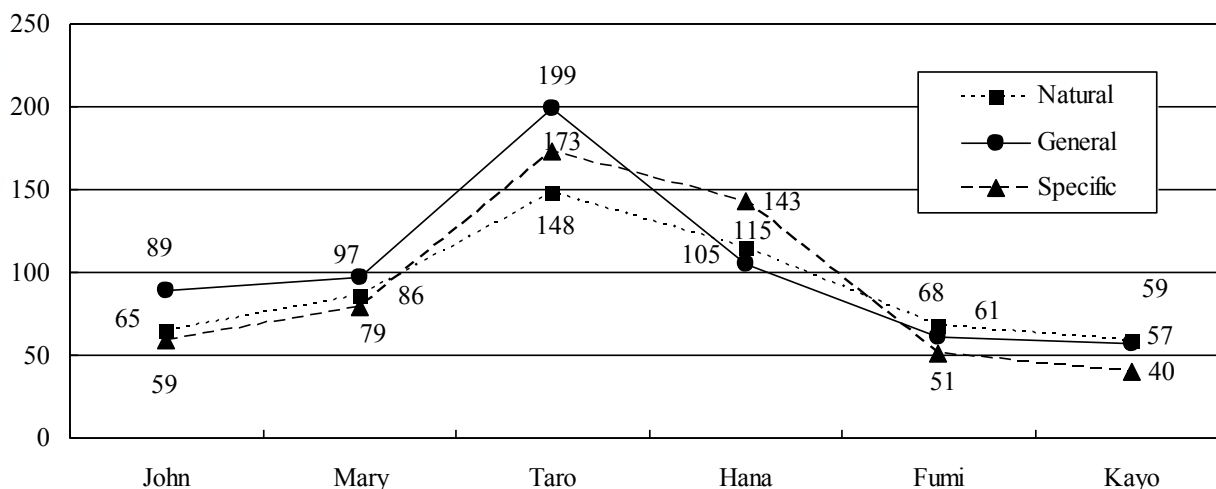

Figure 10 shows the MFF in the Q/A condition. Here, Taro had the highest frequency, followed by Hana. However, Taro used more MFF in the General, whereas Hana used it more frequently in the Specific condition. John and Mary used MFF the most in the General. The inexperienced teachers, for the most part, seemed to provide very few MFFs in any of the three conditions.

Figure 10 MFF by teachers in Q/A

In sum, in the Explanation and Q/A condition, the teachers' individual FFF and MFF patterns were similar, which indicates there is a teacher difference between the male and female teachers. For example, Taro and John presented similar feedback patterns in that they provided the most FFF and MFF feedback in the General, then in the Specific. Kayo was somewhat similar to the male teachers. However, Mary and Hana provided their feedback in the Specific, and then in the General. Finally, Fumi provided the least FFF and MFF out of all the teachers.

#### 4.3 Task conditions

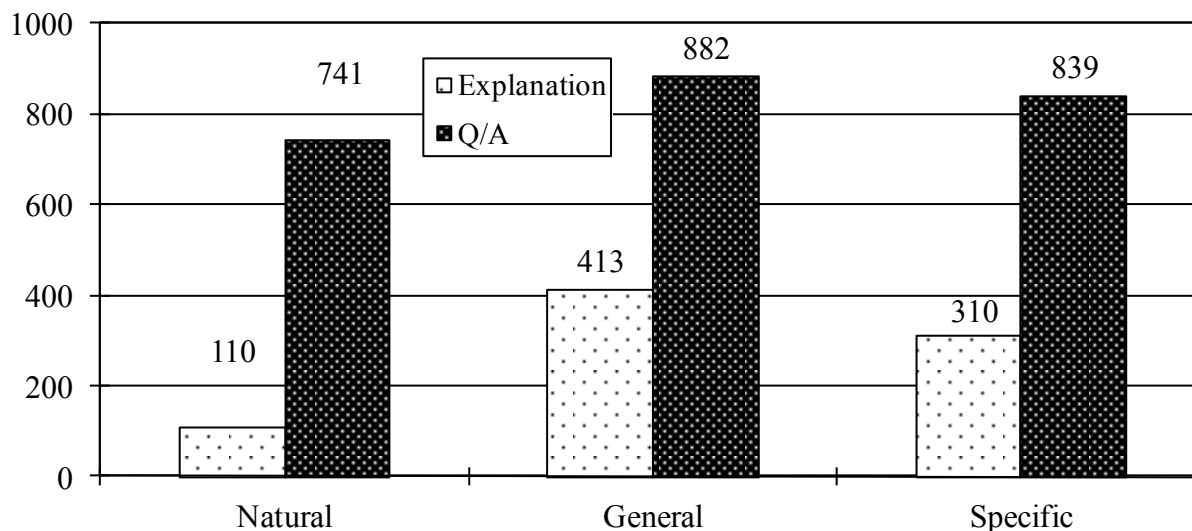

This section will address the question of whether there was a task difference, based on one comparison: Explanation and Q/A.

### 4.3.1 Explanation and Q/A Conditions

#### *ADJs*

This section will show whether teachers' interaction style was affected by the two task conditions. The frequency of ADJ use by the teachers is plotted on the graph in Figure 11. It reveals that the General condition had the highest number of ADJs in both Explanation and Q/A. The lowest number of ADJs was used in the Natural for both.

Figure 11 ADJs of Explanation and Q/A

Finally, the Wilcoxon Signed Rank test was used to compare the two conditions, Explanation and Q/A. The results revealed that there was a significant difference between the Explanation and Q/A in the Natural,  $z = -2.21, p < .027$ , the General,  $z = -2.20, p < .028$ , and the Specific,  $z = -2.20, p < .028$  – Specific). Putting all the results together, there is a significant effect on the way the teachers interact with their students in the Q/A than in the Explanation. In the Explanation, teachers were expected to listen to the students' monolog; however, there were times the teachers had to ask questions to clarify the students' utterance, or they provided some grammatical feedback. In the Q/A, it also seems that interaction played a strong role in assisting students to overcome their grammatical errors. This was the condition the teachers were expected to ask many form- and meaning-related questions to their students.

#### *FFF and MFF*

The question whether the Explanation and Q/A have any effect of teachers' providing FFF and MFF will be examined in this section. The frequencies of FFFs in Figure 12 below, it can be seen that teachers provided more FFF in the Q/A conditions than in the Explanation during both the Natural and General conditions. However, under the Specific condition, the teachers provided more FFF in the Explanation than the Q/A. As for the MFF (Figure 13), the Q/A had the highest frequency counts compared to the Explanation in all three conditions.

Figure 12 FFF of Explanation and Q/A

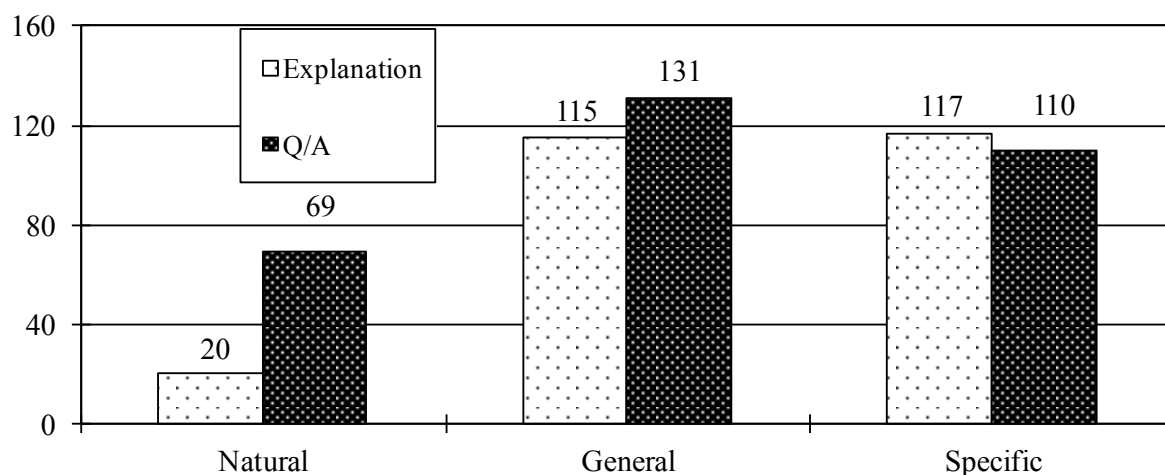

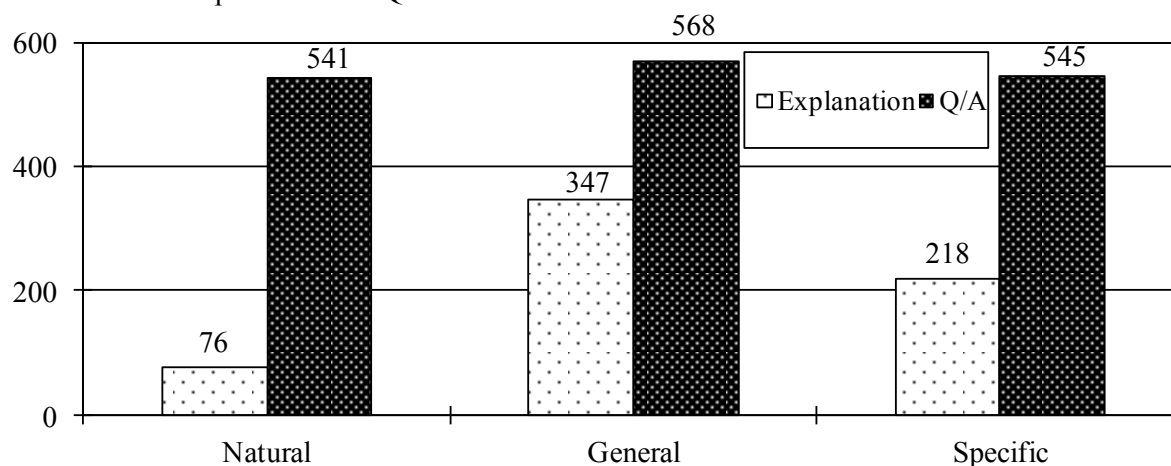

Figure 13 ADJs of Explanation and Q/A

Concerning the Explanation and Q/A conditions, there was a significant difference in the FFF between the Explanation and Q/A during the Natural condition ( $z = -2.21, p < .03$ ); however, there was no significant difference during the General ( $z = -.74, p = .46$ ), and Specific ( $z = -.68, p = .49$ ). Regarding MFF, the Natural and Specific conditions had significant effect between the Explanation and Q/A at  $z = -2.20, p < .028$ , and  $z = -2.21, p < .027$  correspondingly; however, there was no significant difference in the General at  $z = -1.36, p = .17$ . The results indicate that in the Natural condition, the teachers were listening to the students during the Explanation since no request was made for them to provide feedback. In the General and Specific, the teachers were more aware that they had to provide form feedback, which was why teachers were negotiating more with their students during the Explanation.

## 5.0 Discussion

The first research question concerns whether teachers were able to change their instruction in each of the instructional conditions. The teachers in this study changed their way of interacting with their students between the Natural and the other two conditions, General and Specific; however, this was not the case between the General and Specific. In the Natural condition, the

teachers were mostly listening to their students without interrupting them unless there was a problem with their vocabulary. But when the teachers were requested to provide feedback in the General and Specific conditions, then they became more aware of the students' errors than before.

In terms of the FFF and the MFF, the teachers were able to change their instruction style in each of the instructional conditions in the Explanation and Q/A. In addition, the MFF was far more frequent than the FFF in all three instructional conditions, which indicates that meaning-based negotiation was done more often than form-based negotiation even though the General and Specific were concerned with form-related errors. This also may suggest that the teachers were more cognitively loaded in the Q/A than in the Explanation. During the Q/A, teachers had to listen to the students utterances, think about their questions, and figure how to provide feedback. Consequently, they could not always detect the students' problems, both in meaning and forms, as well as they could in the Explanation, where they did not have to think about what to ask the students.

When considering the first part of the second research question regarding teacher difference between the NESTs and NNESTs in their use of FFI, the results suggest that when comparing the frequency counts, there was no NEST/NNEST factor. Instead, there seemed to be more of a male/female difference. The male teachers tended to focus on grammatical form and use clues as to what and where the errors were, and the female teachers tended to focus toward meaning by repeating students' errors in the correct form.

As for the second part of the research question regarding the difference between the experienced and inexperienced teachers, the results indicates there were three causes for the large difference between the experienced and inexperienced teachers. The first was attributed to inexperienced teachers' unfamiliarity with the teacher-student interaction. The second reason was the large difference in the experienced and inexperienced teachers' tactics in asking questions, which required students to extend their thinking and encouraged them to increase their interaction with the teachers. Open questions promoted a collaborative mode of discussion that the experienced teachers often used. Because of this the students became more involved with the conversation. In addition, the experienced teachers frequently used information seeking questions in order to stimulate authentic productions, during which they received long and grammatically complex responses from their students. The inexperienced teachers' interaction with the students was rather simplistic, mainly consisting of Yes/No questions. In addition, the interaction between them and their students typically utilized a simple question-and-answer pattern. Finally, the third cause is the lack of skill and experience in noticing students' errors and providing corrective feedback in their utterances (Andrews, 1994; Numrich, 1996).

In regards to the third research question, whether there was a task effect of teachers' instruction in the Explanation and Q/A, the answer is affirmative since the teachers interacted and provided feedback more in the Q/A than in the Explanation. One reason for this is the interactional features of a two-party relationship, when two participants are requesting and supplying the information, as opposed to a one-party, one participant supplying the information (Pica, Kanagy, & Falodun, 1993). The second reason is that the Q/A is regarded as a *focused task* (Ellis, 1991)

which is aimed to promote communication and elicit production of a particular linguistic form, in this case the tense-related forms. In other words, the teachers used the Q/A session to focus on a form-function-meaning relationship. This resulted in the most negotiation of meaning since the students had to repeat or rephrase in order to make sure their utterances were accurate and understood. Another explanation is teachers asked questions, requiring the students to provide more details, during the Q/A session since students simply explained the events in the pictures in the Explanation session.

## 6.0 Conclusion and Limitations

While the present study sheds light on some important issues in FFI, it has several limitations that should be addressed with the hope that they will be improved in future studies. First, this is an exploratory study with a small group of six teachers. I hope to continue focusing on teachers using FFI by expanding the study to include more participants and other variables. Having a larger number of participants will make it possible to examine other variables, such as the gender, age, and education background. This will increase the reliability and give more concrete evidence about effective methods of providing form- and meaning-based feedback. The second limitation was that the researcher did not investigate other possible verbs and grammatical structures. Further comparative study may consider using a target structure that is more complex which would be obvious for students and have a high frequency of use.

In conclusion, the results of this study reveal that teachers cannot automatically use FFI in their classroom. In the investigation, FFI researchers should take into account the individual differences among teachers in terms of experience. Also, in order for teachers to provide effective form-based feedback, they may need more thorough training and more teaching experience.

## Acknowledgement

This study was supported by the research grants offered by Hiroshima City University (2008 and 2009 Special Academic Research (General Studies)). I would like to thank Chiaki Iwai, Carol Rinnert, Nobuyuki Aoki, and Ian Willey for their help to make this paper possible.

The Hong Kong Institute of Education, Hong Kong

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Given that the concept of community college in Hong Kong has only been introduced 10 years ago, with the new “3-3-4” education structural reform, the leadership in community college will become more challenging. In this paper, the aim is to provide a personal philosophy on how educational leaders should lead in community college settings given the highly diverse student backgrounds. The perspective of why we, as educational leaders, should reflect, reconstruct, and reengineer on community college leadership will be discussed. We will give insights on how different it is between leading in university and in community college, particularly in Hong Kong. Common issues and difficulties encountered by top managements, supporting staff, teachers, and students are identified and explained. The importance of relationship and dialogues in our context of building a true community is presented. The paper will conclude with the notion of how an authentic leader should be in leading community college in Hong Kong. It is expected that the direction of this personal philosophy will have a major impact in the both local and global leadership in education.

## 1. Introduction

Ten years ago, students in Hong Kong had limited articulation options if local universities could not offer admissions to them. That left no alternative choice for them to continue to pursue further study locally. Students of course could choose to fly overseas for study or stay here to find a full-time job, while those students who had just graduated from university were more or less targeting on the same goal. Assuming these students were good and fine candidates, who may simply need more training and learning opportunities to become eligible again for university admission, establishing post-secondary schools was quite reasonable.

In 2000, the Hong Kong Special Administrative Region (HKSAR) Government announced that within ten years, 60% of the senior secondary students would have the opportunity to continue their study in tertiary education [11]. It has been 10 years since the first community college was established, which offers the associate degree programs and other similar level of study programs to local students plus some number of positions for mainland Chinese students.

Frankly speaking, it should not be a surprise at the first place that doubts on the role and the function of community college were raised when this new concept was introduced [11]. Even some educators in Hong Kong who have received their former educations in North America or Europe cannot believe in the perspectives that community college can carry “a diverse range of educational functions and missions as university performs” [11]. Not only among the social community, but also university leaders, stakeholders, teachers, administrative staff, and the most importantly students can hardly comprehend this innovative and yet uncertain educational system.

Based on my observation and experience, this problem of ambiguity still holds true in terms of how to lead this particular type of educational institutions effectively. In this paper, it will provide a personal philosophy on how educational leaders should lead in community college settings given the highly diverse student backgrounds. First, it will draw on the perspective of why we, as educational leaders, should reflect, reconstruct, and reengineer on community college leadership, and how different it is between leading in university and in community college, particularly in Hong Kong. Common issues and difficulties encountered by top managements, supporting staff, teachers, and students are identified and explained. Then, the personal insights will be presented with support from existing literatures on the importance of relationship and dialogues in our context of building a true community. Finally, a conclusion will be drawn on how an authentic leader should be to lead effectively in community college in Hong Kong. The objective is to give a useful framework to educational leaders to Hong Kong to bring community college education to a higher ground.

## 2. Community College in Hong Kong

Before beginning to discuss and define authentic leadership for community college in Hong Kong. The personal observations of the common issues will be presented which educators face regularly based on my background as a teacher in sub-degree education. It is important that we know the general backgrounds in order to understand how to define the authenticity. Once we understand the backgrounds, then we can try to understand our role and responsibility of how to lead them to move forward with common missions. As what Sun Tzu

said in the translated classic Chinese literature “Art of War”, “Hence the saying: If you know the enemy and know yourself, you need not fear the result of a hundred battles. If you know yourself but not the enemy, for every victory gained you will also suffer a defeat. If you know neither the enemy nor yourself, you will succumb in every battle.” [9] In this paper, it will take this approach to address the issues we are facing by understanding both context and then ourselves.

Actually, research about community college in Hong Kong is very limited given that the history can only be traced back to 10 years ago. When the government announced the establishment of community colleges in Hong Kong, many local universities and educational institutions showed their interest to offer these sub-degree programs. However, as it is said in the critics, this sub-degree program is “only a government measure to alleviate the general sense of frustration of those who are not admitted to tertiary education under the existing higher education structure.” [11] At the beginning, most students saw this opportunity as an alternative to university. Not surprisingly, the demand grew significantly from 3790 to 9270 intakes in 2000/01 to 2001/02 academic years [11]. At that moment, students were attracted by the concept that entering to community college would find them a promising path to university.

After ten years, it is observed that a large number of students who are not quite ready in terms of their language proficiency, critical thinking skills, and other necessary competencies for higher education enter these programs. Although some students are qualified for admissions, universities simply do not have enough places to admit all of them. Even worse, students with associate degrees are not widely accepted as an entry qualification for most jobs in the markets due to that fact that this degree is treated as a springboard to degree programs only. Why the educational leaders could not foresee such situations at the first place?

Only recently, the government decided to switch from the old British educational system, where students are required to complete 13 years of primary together with secondary education before entering a 3-year undergraduate program, to a North America educational system, where students are required to complete 6 years of elementary school, 3 years of junior high school, and 3 years of senior high school to be eligible for enrolling to a 4-year undergraduate program. When the sub-degree programs were rolled out ten years ago, it was the same year the government was proposing the new academic structure, called “3-3-4” scheme. Given that secondary students who are not admitted to university under this new scheme, all the existing sub-degree programs need to be redesigned and restructured so as to meet the entry requirements of 3-3-4 scheme. In 2012, it will be the first year of university enrollment under the 3-3-4 scheme. That also implies that students who cannot be admitted to university will possibly begin their first year in community college for articulation. This revolution comes and goes quickly, and people have been wondering with critics that how educational leaders can keep a clear vision and long-term perspective of teaching and learning with the dramatic change in educational structure and policy. What can they do to maintain a good infrastructure of the educational system in the future?

On the other hand, teaching in the community college offers opportunities to understand the typical problems in student learning. Although no statistic is available concerning the background information of our students, such as their family incomes, social status and classes, and educational achievements of parents, it is only appropriate to discuss their performances. Actually, these students usually lack learning motivation and are passive

learners. Their foundational skills such as arithmetic, language usage, and critical judgment are insufficient. Self-confidence and self-assurance are weak compared with students who advance to higher education. In addition, self-discipline is another issue which leads to a serious problem in classroom management for teachers. Indeed, this problem could possibly come from the learning motivation of students, or teacher's effectiveness and creativity in classroom teaching. Perhaps we can find this commonality elsewhere, especially in the North America community college system where it is originated back in the 17th century colonial period. However, it is believed that "the meaning of college and university [to the American public] is often interchangeable. They share an equal status in undergraduate education" [11] while it is definitely not the case in Hong Kong from observation. Thus, it is crucial to fine tune the leadership roles so as to target these particular types of students.

Moreover, most of the administrators and leaders in community college are hired with prior managerial experiences in university, but not in sub-degree sectors. A similar phenomenon can be observed from the special education [5]. As we go over the college academic regulation and policy originally designed by these administrators, they are almost the same as in university for those students who excel in their learning. But how can we justify that this direct application can contribute immediately to students in sub-degree sectors? Their lack of teaching and leadership experience in community college when designing policy in academic regulation, admissions, teaching and learning effectiveness, assessment, and articulation are all illustrated gradually through the voices of students and the outcomes of graduates. Some students told that the college will never understand what they need. If top management had some teaching experiences and training on community college education, they would open their eyes and see better in their visions. If not, something must be done to generate a clear message in order to convey the urgency to these educational administrators and leaders.

### **3. Strategies toward Localization and Mobilization**

What is an authentic leader who can have an influence in this particular type of school? In this type of college, student competency is so diverse, and the educational reform happens so frequently under the government and university influence. How would an authentic leader create a unified atmosphere and learning environment so that students can be trained to become qualified for higher education, and teachers can be effective in teaching? What criteria should the leader consider when making policy adjustments, and how to make changes? Community colleges in Hong Kong should seriously and constantly consider the uniqueness of their challenges and come up with a targetable and tangible approach, not only to help the public accept the concepts of such education but also to promote effective leadership within the college. We need a localized strategy and policy rather than purely relying university management systems.

Currently, most of the community colleges are organized and promoted under the supervision of their affiliated universities. The main problem is that, too much influence (both good and bad) comes from the university who seems to serve as the superior in the board when making every single policy change. Even a tiny change of syllabus requires to be proposed at certain university committees, which are only held twice a year by the management boards. The turn-around effect hinders the effectiveness of changes for good. As what Wheatle claims and recommends, "We need to encourage the creativity that lives throughout the organization, but keep local solutions localized. Most change efforts fail when leaders take an innovation that has worked well in one area of the organization and attempt to roll it out to the entire

organization. This desire to replicate success actually destroys local initiative. It denies the creativity of everyone except a small group...Information about what has worked elsewhere can be very helpful. However, these solutions cannot be imposed; they have to remain local.” [10]

This notion of self-organization or localization that I believe is to be the first phase of the new revolution in the community colleges in Hong Kong. Once the colleges are detached completely from the university, more flexibility and independency will be permitted without hindrances. For the past 10 years, I believe these leaders were trying to solve the issues facing from “the outside in” [10]. Since the managements from the college follow the suggestions and recommendations from the university board who oversaw the college based on the information provided by the college leaders, optimal decision could be restricted with limited visions in these university leaders. As what Wheatley has predicted, this approach is “doomed to fail, and nothing will make them work” [10]. In this situation, Wheatley basically suggests that the organization should be formed “from the inside out, as people see what needs to happen, apply their experience and perceptions to the issue, find those who can help them, and use their own creativity to invent solutions” [10].

Somehow, university leaders have their perspectives on how the college should be run, and it turns out that they become the command and instructional leaders which forms a dominant strategy in the leadership. Sergiovanni argues that this kind of leadership practice “can breed dependency in teachers and cast them in roles as subordinates” [6]. These subordinates would simply follow the commands from the top and rely heavily on their management “rather than acting as self-managers” [6]. Sergiovanni calls that “hardly a recipe for building good schools” [6]. If we follow the notion of his argument, Sergiovanni suggests how the university leaders can transform the command and instructional leaderships to localized leaders, “As leaders of leaders, they work hard to build up the capacities of teachers and others, so that direct leadership will no longer be needed. This is achieved through team building, leadership development, shared decision making, and striving to establish the value of collegiality.” [6]

In fact, the Hong Kong Education Bureau along with other related officials have suggested the community colleges to be separated totally from their affiliated universities but only on the financial aspect. Indeed, the community colleges should become self-organized and self-managed institutions in the near future. That way, college leaders are empowered with absolute authority and authenticity in their productive and creative works. As what Wheatley said similarly, “In the end, you can’t define a list of activities that we responsible for the organization shifting, and you certainly can’t replicate anyone else’s exact process for success. But you can encourage the experimentation and tinkering, the constant feedback and learning, and the wonderful sense of camaraderie that emerges as everyone gets engaged in making the organization work better than ever before, even in the most difficult of circumstances.” [10] Thus, localized adaptation to the needs of teachers and students is fulfilled more effectively and efficiently.

Besides, the concept of *mobilization* can perfectly fit into the notion of localization in leadership and management. The action must be taken and mobilized now; otherwise the impact to the role of community colleges in Hong Kong will continue to be blurry. Being individualized away from the affiliated universities does not immediately imply that we are totally disconnected. A similar notion can be observed from Starratt that an authentic leader should “transform the school from an organization of rules, regulations, and roles into an

intentional self-governing community...In such a community, initiative and interactive spontaneity infuse bureaucratic procedures with human and professional values.” [8] That self-organization for localization coheres with what Wheatley claims. However, pre-condition needs to be fulfilled before this localization can be mobilized in place. Faculty and staff in the college need to first have a clear understanding about the purpose and true values of their colleges and their individual efforts will result in system wide coherence. Once the understanding is clear to everyone, then they can be “free to create and contribute” [10]. It is uncertain how long it will actually take to mobilize everything in place. I believe, as what Wheatley believes that this strategic change could be a multiyear effort [10]. Yet, the concept of localization and mobilization is definitely the first step in this new phase of educational transformation.

#### 4. Building a True “Community” College

To consider what a community college is, I suggest that this is a college within where true communal organization can be found and built through close relationship and constant dialogue. The influence will then be able to manifest to social community as well as other entities. This is what I call *community* college literally. Leaders should constantly renew and reflect on how influential they are in their roles to bring a strong community where subordinates form a permanent bond within each other as well as the leaders among the community. Let us consider the metaphor of *magnetism* in leadership.

Basically, magnet is a material or object that produces an invisible magnetic field which can generate a force of attraction or repulsion. Actually, the force can pull on other ferromagnetic materials, such as iron, and attracts or repels other magnets. Indeed, there are many types of magnetism, and *ferromagnetism* is the strongest type. The magnitude of the force in a magnet also depends on the strength of the magnetic field it can produce. In addition to the ferromagnetism, *paramagnetism* happens when some materials such as platinum forms a weaker magnetic force to the magnet, which is expected to be hundreds of thousands of times weaker than ferromagnetism. Yet, some materials form *diamagnetism* property where they simply generate a repulsive force to the magnet.

Being an authentic leader in a community ought to become a *permanent magnet* which is magnetized and creates its own persistent magnetic field to exert influences to others. Certainly, some people around the community are already ferromagnetic to the influence of the leaders, while some requires a stronger force to pull its attraction. Some people are even diamagnetic by its nature, and yet leaders should never force them to obey and follow. Closer it gets, larger force of repulsion can be felt immediately. To reflect on what Wheatley mentions, “[...]leaders] can’t direct people into perfection; you can only engage them enough so that they want to do perfect work” [10]. Once applying this principle of magnetism into leadership, true community can be realized.

#### 5. Dialogues in the Community

Building constructive dialogues constantly can help form a better relationship in the community. The “banking” concept of education described by Freire and Macedo offers an inspirational thought of how ineffective it can be when giving instructions to students. No communication is actually observed, but only communiqués and serious knowledge deposits into the minds of students such that they can “receive, memorize, and repeat” [3]. This way

of directive commands and teaching will result as “less [students] develop the critical consciousness” and “intervention in the world as transformers of that world” [3].

In order to fix this issue, Palmer suggests the learning of community by building up meaningful conversations through leaders and colleagues [4]. Even the localization concept is introduced, and dialogues can still be possible to interchange ideas beyond the colleges on a common platform. In his book, he points out two primary places leaders can go to if they want to grow further, which is their inner ground and their fellow associates. As it is claimed in the book, “If I want to teach [or lead] well, it is essential that I explore my inner terrain. But I can get lost in there, practicing self-delusion and running in self-serving circles. So I need the guidance that a community of collegial discourse provides—to say nothing of the support such a community can offer to sustain me in the trials of teaching [or leading] and the cumulative and collective wisdom about this craft that can be found in every faculty worth its salt.” [4] Palmer and Freire et al. find coherence in the advocacy of building a community with dialogue and conversation. During the conversations, constructive but open questions can be raised to bring more free rooms to the participants to think, ponder, and reflect on matters. When everyone is committed into the dialogues and understands with a clear objective in minds, conclusions can be drawn much easier.

Moreover, this type of dialogue is described as a *game* by Burbules. Organizing a dialogue is like forming a game platform, and the process should be fun and engaging. These games “involve appropriate rules and moves” [1], and it should be followed by each voluntary participants. I cannot recall any game without rules. Or I should say a game without rules is already a rule itself. A question may be asked, who should define the game rule? Should it only be the responsibility of a leader who presides the dialogue occasion? Or should everyone come and compromise a common rule together? I will say it depends on if everyone is absolutely clear about the aims, objectives, and missions of the organization, as what I have mentioned previously about Wheatley’s vision about what it really means as “meaningful conversations” [10]. At the end, people who come for the dialogue can “develop new levels of trust for one another that show up as more cooperation and more forgiveness” [10].

To expand a few more insights, we can bring numerous principles from Palmer’s “Ground Rules for Dialogue” [4]. In his book, the ground rules should be established so as to “help us respect each other’s vulnerability and avoid chilling the conversation before it can even begin” [4]. In addition to that, the rules should “allow us to be present to another person’s problems in a quiet, receptive way that encourages the soul to come forth, a way that does not presume to know what is right for the other but allows the other’s soul to find its own answers at its own level and pace” [4]. Every leader should see the beauty of asking right questions in the dialogue which can lead everyone from their inner souls to enlightenment.

Furthermore, commitment to complete the game is crucial because others cannot finish it when someone leaves in the middle of it if the game involves two or more participations. Even a game we play ourselves, leaving the game simply implies the conclusion cannot be drawn. In every case, commitment is vital and selfishness should be swapped away. Last but not least, “dialogue is continually created in the act of engaging in it, and every time we create it, it is different. In this, also, it is like a game” [1]. That is the fun side of playing a game, and it is the same as the dialogic approach in leadership.

The most fascinating part in a dialogue is that every participant becomes a leader to edify each other, and the entitlement is broken in the process. Everyone in the dialogue will simply

represent his or her individual self. Particularly, an authentic leader “does not try to be different just for the sake of differences; he or she tries to achieve dialogical truth by realizing his or her unique positions” [7]. Undoubtedly, good relationships can be nourished and trust can be built at the same time if the dialogue is found constructive and informative. In short, true community can be built in the process of dialogue. I can view Palmer’s idea about leadership through his reflection on teaching.

In educational leadership, every leader ought to be an excellent teacher at some point before becoming authentic leaders. If an educational leader fails to teach particularly to students, I believe the dialogue can be simply ended at that point. To quote from Palmer, we can learn that “to teach [or lead] is to create a space in which the community of truth is practiced” [4], and “good teaching [or leadership] comes from the identity and integrity of the teacher [or leader]” [4]. As leaders, we hold the accountability and responsibility to bring out meaningful conversations to the community. By doing so, leaders become teachers and students, and eventually teachers and students become leaders, which should be the ultimate objective.

## **6. Concluding Thoughts: Novel Concept, Magical Effect**

To be an authentic leader, we have an obligation to uncover the potentials of our followers. “Leaders with values and vision tend to believe that other people have the potential to be motivated by the same commitments, not just by narrow self-interest” [2]. I believe community colleges in Hong Kong are mature enough to be separated from their affiliated universities after 10 years of experiments. It is true that we face a challenge of highly diverse group of students, but leaders should accept their differences and help them see better their inner souls through constant dialogues.

We live in a time when differences become conflict, in which the circumstances are not necessary to happen. More often the schools in Hong Kong separate good students and poor students in different classes. They believe such way can provide students with different pedagogies in teaching and learning. No surprise when students grow up and survive in our society, classification among citizens is defined and divided. In fact, there are always two sides of coin. No matter how fine you slice a cheese, there is going to be two opposites. Yet, both perspectives contribute to the entity itself, or the object cannot exist in reality. Palmer's book (2007) talks about the paradoxical thinking, and how important they are to "generate the energy of life" [4]. I personally find the analogy interesting and fitting into the context of educational leadership. As Palmer said, "the ability to discriminate is important - but only where the failure to do so will get us into trouble" [4].

As educational leader, we must learn to accept the differences of our students and community [5]. We find ways to help them through education and the policy within it. We ought to help them see differences and lead them to learn how to live with difference so that we can all make a difference in our society. No doubt, diversity does add variety of favors in our lives, so we must appreciate it and not let it turn into cultural conflict or dilemma. If a leader can help others become leaders, and constantly build a community with constructive dialogues, it will result in a unified community to serve as a knowledge hub for better society in a magical way.

*The Blended Learning Model with Active Learning for Knowledge Construction and Creative Problem Solving Ability for Undergraduate Students in Higher Education*

Noawanit Songkram

0481

Chulalongkorn University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This paper is a report on the findings of a study conducted on the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education. The methodology of this study was R&D research. The subjects were 40 undergraduate students that divided into an experimental group and a control group in Faculty of Education, Chulalongkorn University in the academic year of 2011. The research instruments were a creative problem solving ability assessment, a knowledge construction evaluation form, and an attitude questionnaire. The data was statistically analyzed using mean, standard deviation, and t –test.

The research findings discovered the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education institutions consisted of six components: 1) Experience transfer 2) Collaboration among learners 3) Various leaning methods 4) Learning resources 5) Learning reflection activities 6) Evaluation. Eight creative problem solving processes;

1) Identify problems 2) Explain each issue of problems 3) Identify causes of problems 4) Discover various creative solutions 5) Identify good and bad issues of those creative solutions 6) Find out excellent answers 7) Choose the best answer by giving a good reason 8) Identifying the best solutions for the issue to the students. Six active learning activities composed of 1. Debate in selected topics 2. Pass the chalk 3. Beyond search engine 4. Modify Delphi Technique 5. Group share 6. Learning log and Build new knowledge by writing a Journal together.

## Introduction

Creative Problem Solving is a proven method for approaching a problem or a challenge in an imaginative and innovative way. It is a mental process that involves discovering, analyzing and solving problems and is a tool that helps people re-define the problems they face, come up with breakthrough ideas and then take action on these new ideas. The ultimate goal of problem-solving is to overcome obstacles and find a solution that best resolves the issue. A famous person who studied about creative people, ideas, and creative solutions were Alex Osborn (1967). He wrote a well-known book "Applied Imagination" and more than 50 years later, creative problem solving is known and used worldwide, by hundreds of companies and professional practitioners, and thousands of individuals. For education creative problem solving always mentioned both instruction and learning activities with considering in helping students to discover the value of higher-order cognitive skills and teaching them to become creative problem solvers. The engaging learner methods for promoting creative problem solving should have many active activities. Thus, active learning has an important role to widely known and used in instruction. Active learning refers to several models of instruction that focus the responsibility of learning and complete to believe that it helps a child to be confident, happy, healthy which is a key to their future success in learning achievement. There have several active learning activities in building creative problem solving and knowledge construction such as working in group or pairs, self-reflection, pedagogical techniques and models, using ICT integration in learning and exploring students' willingness activities. As mentioned earlier, the researcher is interested in studying creative problem solving ability and knowledge construction by developing a model with blended learning and active learning to find out answers how learners achieve creative problem solving ability and knowledge construction in higher education.

## The objectives of this study

The purposes of this research were as follows:

1. to investigate components, processes and active learning activities of the blended learning model with active learning for knowledge construction and creative problem solving ability.
2. to create the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education.
3. to study the results of the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education.
4. to present the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education.

## Hypothesis

1. The creative problem solving ability posttest of students in the experimental group after learning by using the blended learning model with active learning activities was higher than the pretest at the .01 level of significant.
2. The creative problem solving ability posttest in the experimental group after learning by using the blended learning model with active learning activities was higher than the control group at the .01 level of significant.

## Research questions

1. What components, processes and active learning activities of the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education?
2. Can undergraduate students create knowledge construction and creative problem solving ability using this model?

## Methodology

The blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education was R&D research. The methodology consisted of the following; the researcher

- (1) Analyzed and synthesized information and research about components and processes of knowledge construction, creative problem solving ability, and active learning activities.
- (2) Created the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education institutions with five experts monitoring this model.
- (3) Studied the results of using the blended learning model with active learning for knowledge construction and creative problem solving ability with 40 undergraduate students, major in educational technology from the Faculty of Education, Chulalongkorn University, academic year 2011. Students were divided into two groups of 20 members each which one group was an experimental group and another was a control group. The subjects were similar in terms of age (ranging from 20-21) and educational background. After trial, the researcher revised, modified this model and followed by considering and approving by five experts in the educational field.
- (4) Presented the blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education in publications.

## Instruments

Instruments of this research consisted of a creative problem solving ability assessment, knowledge construction evaluation form, and an attitude questionnaire. The content validity of these instruments was obtained from three experts. These instruments were revised according to suggestion of the experts.

## Experiment Stages

1. The subjects completed the pretest of the creative problem solving ability assessment prior to starting the processes of creative problem solving ability which followed by active learning activities with online learning and studying in the classroom.
2. The subjects performed instructional activities from blended learning model for 10 weeks (20 hours) as follows:
  - 2.1 The instructor who participated in the research informed objectives, active learning principles and activities, assessment and evaluation to subjects.
  - 2.2 The subjects which the experimental group and the control group took the creative problem solving ability pretest.

2.3 The experimental group students participated in creative problem solving processes which followed by active learning activities and the control group students participated in passive learning activities.

Processes	Contents	Active learning activities	Online/F2F
1. Identified problems 2. Explained each issue of problems 3. Identified causes of problems	Selected topic for debate such as social media: Good or Bad for young students, E book or printed book that suitable in century 21	<b>Active learning activities 1: Debate in selected topics</b> 1. Students debated in selected topic which divided by group 2. Students in each group identified main problems and other issues. <b>Active learning activities 2: Pass the chalk</b> 1. After introducing a topic, “pass the chalk” to a students, instructor allowed the student to speak about each issue of problems and identified causes of problems and then after answering he or she then passed the chalk to the next student and so on.	 Six hr.
4. Discovered various creative solutions 5. Identified good and bad issues of those creative solutions		<b>Active learning activities 3: Beyond search engine</b> 1. Students discovered various creative solutions in internet by suggestion learning resources 2. Instructor gave learning resource such as e-document and website resource. - <a href="http://kcenter.dip.go.th/Portals/0/km272549.pdf">http://kcenter.dip.go.th/Portals/0/km272549.pdf</a> - <a href="http://ilc.swu.ac.th/Portals/127/Documents.pdf">http://ilc.swu.ac.th/Portals/127/Documents.pdf</a> - <a href="http://planning.excise.go.th/knowledge/hr-out-frame.doc">planning.excise.go.th/knowledge/hr-out-frame.doc</a> - Examples of creative solutions.ppt - Instructional activities with ICT.doc - Teaching / Thinking skill process for creativity production.pdf. - <a href="http://www.moe.go.th/main2/article/articlesagob/article45_6.htm">http://www.moe.go.th/main2/article/articlesagob/article45_6.htm</a> - <a href="http://www.nectec.or.th/index.php?option=com_content&amp;view=article&amp;catid=8&amp;Itemid=165&amp;id=440">http://www.nectec.or.th/index.php?option=com_content&amp;view=article&amp;catid=8&amp;Itemid=165&amp;id=440</a> 2. Students chose one paper and read it for identifying good and bad issues of those creative solutions in the paper. 3. Students read the creative solutions of their friends	 Two hr.
		<b>Active learning activities 4: Modify Delphi Technique</b> 1. Instructor mentioned about the selected topic in “Active learning activities 1” 2. In each group, students concluded about the causes of problems and reviewed information about problems	 Four hrs.

Processes	Contents	Active learning activities	Online/F2F
		using social network: Facebook	
6. Found out excellent answers 7. Chose the best answer by giving a good reason		<b>Active learning activities 5: Group share</b> 1. Students wrote creative problem solutions using social network: Facebook; application on Facebook (Docs beta) 2. Students found out five excellent answers in respectively by choosing the best answer with reasonable and good reasons using social network: Facebook ; application on Facebook (Docs beta)	 Four hrs.
8. Identifying the best solutions for the issue to the students		<b>Active learning activities 6: Learning log and Building new knowledge by writing a Journal together</b> 1. Every student wrote learning log in his/her Facebook and distributed the best answer to others. 2. Working In pairs, students wrote a journal together using social network: Facebook; application on Facebook (Docs beta)	 Four hrs.
<b>10 weeks ( 20 hrs.)</b>			

3 The subjects completed the creative problem solving ability posttest and answered the attitude questionnaire.

4 For students' journals, three experts gave scores using a knowledge construction evaluation form.

### Data Analysis

After the subjects in the experimental group wrote journals they were graded and received knowledge construction scores by experts. Knowledge construction scores were measured by a knowledge construction evaluation form which was classified by measuring criteria (as shown in Table 1). The creative problem solving ability was analyzed by using dependent and independent t-test in Table 2 and 3.

**Table 1: The results of knowledge construction scores**

Subjects (student number)	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Scores	120	115	105	105	100	110	110	110	115	120	120	115	105	105	100	110	110	110	115	120
	5	5	5	5	4	5	5	5	5	5	5	5	5	5	4	5	5	5	5	5

5 = Excellence 4=Good 3=Satisfied 2=pass 1=fail

The results from knowledge construction scores showed that eighteen students were excellence and two students were good.

Creative problem solving ability was analyzed using a dependent t- test and this found that there was a significant difference between pretest and posttest in creative problem solving ability at the.01 (See Table 3)

## Findings

The results of this study revealed that:

1. The experts' opinions agreed that the blended learning model with active learning for knowledge construction and creative problem solving ability consisted of six components: 1) Experience transfer 2) Collaboration among learners 3) Various leaning methods 4) Learning resources 5) Learning reflection activities 6) Evaluation. The eight processes consisted of 1) Identify problems 2) Explain each issue of problems 3) Identify causes of problems 4) Discover various creative solutions 5) Identify good and bad issues of those creative solutions 6) Find out excellent answers 7) Choose the best answer by giving a good reason 8) Distribute the answer to others.
2. A t-test comparison of posttest and pretest of the experimental group students showed statistically significant difference at.01 level in creative problem solving ability.
3. The total results of knowledge construction showed that the experimental group students were excellence in journals' writing.
- 4.The experimental group students revealed that they were satisfied with the blended learning model with active learning for knowledge construction and creative problem solving ability.
- 5.The blended learning model with active learning for knowledge construction and creative problem solving ability for undergraduate students in higher education institutions was presented as follows:

## Acknowledgements

First and foremost, it is a pleasure to thank the Thailand Government for full research funding in 2011 and Faculty of Education, Chulalongkorn University for supporting to aboard presentation and I am grateful to thank the peer reviewers for their comments and recommendations about this full paper for presentation and publications.

*Experiencing OBE in Hong Kong Higher Education: Indirect Measure of Generic Skills*

Pamela Kwok, Kiki Chan

0488

PolyU Hong Kong Community College, Hong Kong

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Outcome-based education (OBE) is a student-centered learning philosophy and has become popular in higher education recent years. However, there are only limited literatures to discuss the effectiveness of OBE's conceptions in Hong Kong higher education. This study attempted to explore OBE methods through a qualitative research based on a three-year indirect measure of three different cohorts of a self-financed associate degree programme in Hong Kong.

Graduates with different academic attainment levels (i.e. excellent, good and satisfactory) were invited through a judgment sampling method by the concerned programme leader to attend the focus group discussions on a voluntary basis. The focus group discussions were conducted by an experienced moderator during the period between December 2009 and October 2011.

The findings of the study have reported certain positive indicators of enhancing students' generic skills which can then strengthen their overall confidence in their further education and career although students' awareness level of OBE's conceptions was found limited. In general, students in Hong Kong focus much of their attention on examination grades of their studies. Nevertheless, the application of OBE allows educators to learn more about students' achievements in terms of planned outcomes and offers an opportunity to carry out a continuous reflection leading to the enhancement of curriculum design or teaching pedagogy.

**Keywords:** Outcome-based education (OBE), Indirect Measure, Marketing Students, and Higher Education in Hong Kong

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## **Background of the Study**

Outcome-based education approach has been a popular aspect for majority of territory institutions in Hong Kong. This purpose of this study is to measure the students' learning outcomes after completing a two-year self-financing programme of Associate in Business (Marketing) offered by a tertiary educational institution in Hong Kong.

The findings of this study are a partial work a three-year funded project of the Quality Enhancement Grant Scheme (hereinafter referred to as QEGS) provided by the Education Bureau of the Hong Kong SAR Government. QEGS is set up to fund worthwhile non-works projects or initiatives dedicated to enhancing the quality of teaching and learning of self-financing post-secondary programmes.

Qualitative research was adopted for this study and a project assistant was recruited to organise the focus group discussions during the period of December 2009 to October 2011. All focus group discussions were conducted by this project assistant performing the role of a moderator. A total of thirty marketing graduates with different academic attainment levels (i.e. excellent, good and satisfactory) were invited to participate in the focus group discussions on a voluntary basis.

## **Research Objectives**

Outcome-based education (OBE) is a teaching philosophy that focuses on the attainment of specified learning outcomes. It relates to the potential and actual abilities obtained by students after completing their studies (Spady (1994); Kudlas (1994)). This paper is in an attempt to explore the overall perception of marketing graduates towards their attainments of intended programme learning outcomes in terms of their generic skills. The key findings of the study would facilitate the concerned programme leader to carry out a continuous reflection leading to the programme enhancement (Pretorius (1998)).

There were five generic programme learning outcomes for the Associate in Business (Marketing) which are expected to be attained by students throughout their two-year programme:

1. Critically assess propositions and arguments commonly encountered in daily life and general business setting.
2. Invoke creativity and other problem solving skills in dealing with problems encountered in daily life and general business settings.
3. Effectively use current information technology to carry out tasks commonly encountered in tertiary level studies, general office work, and daily life.
4. Demonstrate a professional attitude in terms of sense of responsibility, integrity, self-confidence, service attitude, and teamwork – at a level expected of a promising associate professional.
5. Effectively communicate in spoken and written English in general business settings – at a competence level required of an associate professional.

## Research Method

Information obtained from quantitative research may not be sufficient to explore the inside feelings and attitudes of respondents towards their programme. The adoption of qualitative study in terms of focus group discussion or personal depth interview can allow researchers to obtain rich data from respondents such as their learning experiences and abilities to perform different assignments and examinations during their course of study. More importantly, the qualitative study also enables the researchers to understand the reasons of their feelings or perceptions (Burns and Bush (2010)).

The data collection of focus group discussions covering three phases and personal depth interviews were adopted by this study. They were organized by the project assistance and carried out at the campus of the Hong Kong Community College, The Hong Kong Polytechnic University. All focus group discussions and personal depth interviews were guided by the project assistant performing as a moderator. Note-taking and tape-recording were used to ensure that key issues were recorded properly.

The target respondents were fresh graduates of Associate in Business (Marketing). These respondents were recommended by the programme leader based on their academic achievements in terms of excellent, good and satisfactory results at the time of graduation. They were contacted and invited by the project assistant to join the focus group discussions on a voluntary basis. During the recruitment process of respondents, it was found that some graduates were not be able to join the focus group discussions although they were eager to participate in sharing their views. As a result, some marketing graduates were invited to share their learning experiences and perception of their study through the arrangements of personal depth interviews. A debriefing was given to each potential respondent by the project assistant at the time of invitation.

### Three Phases of Data Collection

The focus group discussions and personal depth interviews involved thirty marketing graduates by three phases of data collection periods. The detail of data collection schedules was given in following Table 1:

Table 1. A summary of three phases data collection (Dec 2009-Oct 2011)

Phase	Phase One Dec 2009 - Feb 2010	Phase Two Oct – Nov 2010	Phase Three Sep – Oct 2011
No. of group/(n) nos. of graduates	2 focus groups (n=8)	2 focus groups <i>plus</i> 4 interviews (n=12)	3 focus groups <i>plus</i> 2 interviews (n=10)

### Key Findings and Discussions

The findings with the respondents' excerpts based on the five generic programme learning outcomes are shown as below.

## 1. Critical propositions and arguments

This intended learning outcome implies that students can critically assess propositions and arguments commonly encountered in daily life and general business setting. This learning outcome is an essential quality that tertiary education has emphasised.

The respondents perceived that they had developed critical proposition and arguments throughout the two-year associate degree programme. They were given courseworks, such as assignments and tutorial exercises, which required them to employ critical thinking, decision-making, analysing, planning, implementation, recommendation and reflection. They found when there was something related to Marketing in their lives, they became sensitive to those appeals or strategies used. The following excerpts from some of the respondents support these views:-

*“I have developed my analytical ability. Marketing stays close to our daily living. So when I see an advertisement, I may analyse it and see what means have been applied. I am no longer just being an audience but viewing from the mindset of a marketer.”*

*“Blueprint is something with many small checkers listing every step or procedure for a selected industry. Also, we had to decide when and how the steps will be successful or failed. For failure, we got to think of contingency plans as well.”*

*“For the profession, I think I have learned about research. We have learned how to set questionnaires and how to analyse the data collected and design a campaign accordingly. Also, we have to set up a marketing plan. All these are professional knowledge for Marketing.”*

## 2. Creativity and problem solving skills

This learning outcome entails that students can invoke creativity and other problem solving skills in dealing with problems encountered in daily life and general business settings. Creativity is one of the characteristics of marketing students. They need to have their own ideas in order to devise appropriate marketing plans or promotion campaigns to attract target customers' attention. To develop creativity and problem solving skills of students, a diversity of engaging assignments were used in different courses.

It was observed that Marketing programme impressed their students a lot in this aspect. Great autonomy in designing and presenting the assignments was allowed as far as the choice was deemed appropriate. The respondents could still remember and name specific assignments vividly that they found helpful in enhancing their creativity and problem-solving skills. They agreed that being creative and flexible were keys to success for devising attractive or appropriate marketing plans or promotion campaigns. The following excerpts from some of the respondents support these views:-

*“I find my adaptation ability has been improved. In our training, we were suddenly being asked of something we didn't know. Then we learned how to handle such situations but not just telling the others we didn't know. We have learned how to*

*handle such difficult situations. Of course, we can make use of something we learned from Marketing.”*

*“I think Marketing graduates are comparatively having more ideas. I mean original ideas from us. This is because we always need to work out something with our own ideas. That’s different from Accounting. They may just apply the knowledge learned from the books. They have to work based on the books. But we have to come up with our own idea. We really need to generate ideas by ourselves.”*

*“If you are asking about the special abilities possessed by graduates from Marketing programme, perhaps it will be creativity. Other programmes like Mathematics do not need creativity. Management needs creativity. But for Marketing, you must have creativity. First, you need to find a market (segment). Except from that, you have to think about interesting ways to attract customers.... You need to use beautiful words and frames to attract people’s attention. If we lack writing exercise to practice our wording, we may need to spend more time in real life’s work.”*

### **3. Information technology skills**

This learning outcome indicates that students can effectively use current information technology to carry out tasks commonly encountered in tertiary level studies, general office works and daily life. IT skills are useful to the students when studying in their tertiary level studies and after graduation in jobs.

The respondents mentioned that the skills of PowerPoint, Excel and online search could be applied in current study and future work. They could use and train their IT skills through doing assignments and projects. They used the software for various assignments, such as collecting data and doing the analysis in marketing research, designing some graphics in marketing promotion and advertisements, and generating some statistical charts for presentations and reports. The respondents also mentioned the e-learning platform could enhance their learning. The following excerpts from some of the respondents support these views:-

*“Lots of them. Excel spread sheet we learned from the IT course is still useful. We got to plot graphs by using Excel.”*

*“We got to use PowerPoint slides for every presentation. I was the one who mainly responsible for the creation of PowerPoint slides. In the meantime, I got to use Microsoft software as well to facilitate the presentations. That’s quite useful to me to acquire these skills. I am sure we got to possess skills when we work in the future. That’s what I found practical in our programme.”*

*“I have met some lecturers sharing questions on ‘MOODLE’ (e-learning platform). Everyone could share and discuss online. I think it is good method. However, not everyone does that online. It is hard to control because you do that at home. It is unlike that lecturers ask to finish in class.”*

#### 4. Development of professional attitude

This learning outcome emphasizes that students can demonstrate a professional attitude in terms of sense of responsibility, integrity, self-confidence, service attitude, and teamwork – at a level expected of a promising associate professional. Quality service attitude for Marketing programme can be interpreted as satisfying the needs of customers. Time management is also an indicator of this learning outcome. It is the act of planning over the amount of time spent on specific activities, especially to increase effectiveness and efficiency.

Some respondents perceived that two-year training was congruent to this idea of quality service attitude. Good communication with the customers should be achieved in order to plan and provide the most suitable products or services. From the sharing, it showed that such professional attitude could be cultivated by different core courses. The following excerpts from some of the respondents support these views:-

*“For Marketing, we always need to learn and think about what and how consumers are doing. In short, we need to know what our customers are looking for. What sort of (marketing) activities will be able to fulfill their desire and needs?”*

*“...Our research skills help us. Researches refer to investigating the current market needs.”*

*“I found group project fruitful in a sense... Basically, we always think that we are right. However, working with different people will help you make proper adjustment as I might not be 100% correct.”*

*“Marketing covers a wide range of contents. I think... what I learn is about the point of difference. Marketing is needed in our society in order to communicate the point of difference of the products to the target customers. So that’s important to find ways to establish a good communication with customers.”*

*“...Time Management is very important as we work in the community. For instance, you got a project in a department. You need to divide it into different parts and delegate each one’s duties. You have to finish one part before proceeding to other colleagues. Everything has a deadline. You have to keep that.”*

#### 5. Effectively communicate in English

This learning outcome specifies that students can effectively communicate in spoken and written English in general business settings – at a competence level required of an associate professional. Two English subjects, namely, *English for Academic Studies* (EAS) and *English for Workplace Communication* (EWC) are compulsory subjects for all the associate degree programmes at HKCC. English is also the medium of instruction of all Marketing subjects.

The respondents expressed that language proficiency, no matter in written or oral form, was important for their future studies and career. For writing skills, they could learn how to write CV and application letters so that it is helpful for them to seek jobs later. Frequent practice and

requirement of presentation enabled them to be less fearful and build up more confidence in presentation skills and projects including Q&A, quick response, and body language. The following excerpts from some of the respondents support these views:-

*“Personally speaking, I have gained more confidence. Possibly, my confidence has been gained through giving presentations. That’s a kind of marketing for our group. All the projects help in this perspective. We had to write some scripts when giving presentations. Some lecturers told us not to do so. We had better to use simple English for memorizing the contents. That’s good enough to make our presentation smooth and fluent.”*

*“For that subject (EWC), we learned how to write emails. What we had learned was something we needed to do. Also, we needed to write something for activity promotion. We must make it attractive. We had to apply all these skills as a committee member. I really find that important to write good emails to facilitate communication with parties outside. For example, the writing of a good proposal is important to impress the others.”*

*“Sometimes, our English would be assessed when we were in the Marketing programme. What we had learned were something very alike and we got the same or similar articles, but how well we could write in English was crucial. With good English, we could write and had better arrangement of our answers. Well written in English was an advantage. That’s true for doing the assignments.”*

## **Conclusion and Implications**

The application of OBE offers educators an opportunity to focus on the potential and actual abilities of students after they are trained (Faizah (2008)). It also allows educators to carry out a continuous reflection leading to enhancement of curriculum design or teaching pedagogy in long-term.

The findings of this study have reported certain positive indicators that the two-year Associate in Business (Marketing) programme had enhanced the students’ generic skills such as problem solving, critical thinking, IT and communication skills, etc. These generic skills helped to strengthen the overall confidence of the marketing graduates in their further education and future career development. More importantly, the findings also have implied that the existing teaching and learning pedagogies are in the right direction for attaining the generic skills indicated in the intended learning outcomes of the programme (Olivier (1998)).

This study also found that students’ awareness level towards the outcome-based education (OBE) was low in terms of understanding the learning principles of OBE. This implies that educators in Hong Kong may need to pay more attention to this aspect and put more efforts to create an appropriate level of awareness and attention throughout of their study. In general, students in Hong Kong focus much of their attention on assessment grades or marks of their studies. Therefore, assessment methods and rubrics based on those intended learning outcomes may play an important role to engage students’ attention to the principles of OBE (Biggs (1999); Malan (2000)).

## **Limitations of the Study**

Although the key findings of this study have provided positive indicators regarding students' attainment of the five specified generic skills, the researchers of this study would like to draw the attention to the following limitations when reading the key findings and conclusions of this study.

### **1. Resources constraints**

This was a pilot study funded by the Education Bureau of the Hong Kong SAR Government. As a result, the project duration and budget were restricted to three-year period of time. In other words, it lacks of further financial back-up from the government for the researchers to conduct comprehensive follow-up actions based on the research findings.

### **2. Sample size**

Owing to time constraints, limited resources and difficulties in fixing up three phases of focus group discussions with potential respondents, the size of focus group was considered as small compared with a typical group size with seven to 10 people (Lamb, Hair & McDaniel, (2009)). The size of focus group might have some impacts of the overall group dynamic and interactions among respondents. As a result, several individual depth interviews were arranged on a voluntary basis to supplement the key findings by the project assistant.

### **3. Sampling bias and non-response error**

All respondents were recruited on a voluntary basis and students with satisfactory performance (i.e. marginal performance) did not attend any focus group discussions although the project assistant had made effort to invite them to join. As a result, it may create sampling bias and non-response errors in the findings.

### **4. Subjective interpretations by the researchers**

The researchers have made effort to make objective analyses and interpretations; it would be difficult to eliminate all subjective ideas or interpretations by the researchers. Therefore, personal bias might exist when doing analysing of the raw data.

### **5. Sample**

This study only involved the marketing graduates. However, collecting feedback from concerned some other key stakeholders such as articulation partners and employers is also important and therefore inviting these key stakeholders is recommended for future study.

## **Acknowledgement**

The authors would like to express their special thanks to QEGS for providing the grant to carry out this pilot study of OBE. The authors also would like to extend their special thanks and appreciation to Dr. Simon Leung, Dr. So Yin-lun, Dr. Wincy Lee, the QEGS project team members, all concerned subject leaders and administrative staff who contributed their good effort and provided kind support to this project.

Abstracts

The main purpose of this study was to investigate the relationship between principal and teacher leadership and student participation with schools of Bushehr province highschools in2011-2012.The framework for this study conceptualized the two sources of leadership as independent variables. The dependent variables was student participation with school.

Data to test this framework were collected from samples of teachers and students in Bushehr province using two survey instruments(questionair).One survey asked teachers about the status of school organization conditions.The second survey asked students about their participation with school,the status of their family function and the effects of principal and teacher leadership on participation.Regression was the primary method of data analysis used to test the framework.Some results of the study are:There is a significant relationship between principal leadership and student participation.There is a significant relationship between teacher leadership and student participation.There is a significant relationship between family function and student participatin.There are significant differences between the participation rates of boys and girls in schools.

## **Introduction**

Independence and dynamics of each country depend on its leader. Study of history shows that several pages from the Big Book of History, have been determined by such famous and big men. Today, in the third millennium, more than ever, the importance of management and leadership can be felt in different tasks. The environment, even in the classroom, a smart leader can help all students. It is for this reason that the success or failure of an organization or a country, in the fields of business, culture and sports, is based on managerial abilities. (Iymani, 2006, p 124). Writing, literature and research on management and leadership, quantitative findings confirm the nature of leadership and management. Fifty years of research have failed to determine an inherent characteristic or set of characteristics distinguishing non-leader and leader of the people. Studies show that management is a dynamic process, the environment and other environments due to environmental differences between subordinates and managers are different (Hersi & Blanchard, 2005, p 88.) Some authors believe that the true meaning of leadership, iconic in nature, is the opposite of its inherent nature. In other words, in this theory, it is believed that the real decisions and measures that can be taken by the leaders are very small. More importantly, it is a symbolic manifestation of leader behavior can be inferred. Assuming leadership of the staff always takes the time to send birthday greetings to congratulate them. Traditional theories of leadership, relationship-oriented leader behavior as part of such action, and thereby also consider employee satisfaction. While the theory of symbolic behavior offers a more complex picture. For example, if the birthday cards, when sent to be signed by its director have been indicative of the care and attention will be symbolic. As a respected manager with this interpretation is that behavior must conform. On the other hand, suppose the birthday cards are not timely submitted, or to be signed by the secretary, director, and worse, imagine that your name is written in the wrong card to the recipient. This sequence of events indicates a lack of attention and consideration by the manager, and the likely result will be a loss of trust in employees. So, here's the content of the decision, for example, decided to send a greeting card, it is not necessary, but what is important is the symbolic nature of the action (Griffin 1, 2006, pp. 373-374), Jordan (2000). Manager success depends on the manager's technical skills, human relations and conceptual skills. Because most managers skills training, is very complex, they are ignored (Jordan, 2000, p, 19).

## **Problem statement**

According to the school as an educational system, which consists of elements such as principals, teachers, students and parents of students who are in contact with the cross, in today's societies increasing extent, and can be many social and economic trends. One of the success factors of

each school, is the student's participation in school. Students can participate in school field to facilitate their entry into the community.

Some academic studies have found that the teachers do not have the knowledge and skills as possible, do not work. The empirical evidence on the impacts of the school, in general, and the impact of leadership, in particular, the creation of realistic expectations for what is possible in empirical studies of the effects of lead teacher is found to be useful (Leitwood & Jentzy, pp. 415, 34). So Alagheband (2007) states that in order to change the content and quality of education, improve and strengthen the leadership, they are essential. He is addressing the issue of leadership and management of the education system, are important issues, because there are effective and capable leaders in top educational institutions, and are the major pillars for growth and promotion of education (Alagheband, 2007 , p 84). In an era of profound and rapid change characteristic it is for leaders who have a distinct personality and unique ability to penetrate high views tall cognitive component human skills extraordinary able the critical school affair conditions , the best teachers and students are under their influence, and they have high motivation to encourage participation in school affairs. (Smith, 2002). Unfortunately, our schools are still the traditional ways of the past, which were often unsuccessful. This many problems including low participation and commitment of the students and teachers there are very few managers.

Teachers, as they are different, they lead differently. As a teacher of leadership and a wide range of roles to support student achievement should be considered, whether it is formal or informal roles. They improve the overall capacity of the school, because teachers will be led differently. (Harrison & Killion, 2007).

In this study, the influence of personality and human relationships, partnerships, principals and teachers encourage the students' participation are studied. In this regard, family structure, responsibility, encouraging parents, students, parents, partner, parent behavior, behavior, beliefs, desires, perceptions, pedagogical style, the dominant role of parents, including the factors affecting the character and participation of students in their school .Student participation in school activities is classified into seven areas. The groups include:

- 1 - School training affairs
- 2 - School religious affairs
- 3 - School health affairs
- 4 - School administration affairs
- 5 - School cultural and art affairs
- 6 - School entertainment, sports and entertainment affairs
- 7 - School disciplinary affairs

At present study, it is efforts between variables such as principal leadership and student s'participation, teacher leadership and students' participation and the role of parents in students' participation in Bushehr's schools, studied in school year 2011-2012 academic year.

### **Research hypotheses:**

- 1- Between principal leadership and participation in schools affairs, there is a significant relationship.
- 2- Between teacher leadership and participation of students in school affairs, there is a significant relationship.
- 3- Between parent leadership and participation of students in school affairs, there is a significant relationship.
- 4- Between female and male students' participation in school affairs, there is a significant difference.

### **Review on theoretical grounds and literature review**

Experts according to their tastes and attitudes have suggested different definitions for leadership that these definitions are mentioned briefly here. "Leadership is the power of personal characteristics." (Etzioni.1999, p 116). "The leader, is a person which responsible in the task of directing and coordinating the activities of the group" (Fidler, 1999, p 8). "Leadership is the process of influencing the activities of an organized group that aims to shape and desire" (Stagdil, 1998, p 122). Leadership is power and influence in recruiting them, if the people (followers), the voluntary character of a person in a certain conditions, to accept the leadership (Mir-Kamali, 2003, p 74). In George Terry view, leadership is the practice of influencing people so willingly attempt for the purposes of a group (Hersi & Blanchard, 2005, p 101). In other words, "Leadership is the art or science of influencing people so desire, and their desire to reach the goals set in step, or is the ability to create a situation in which employees with confidence and enthusiasm, doing their duties (Iymani, Azarakhsh, Esmail-tabar 2006, p 127). Recently a number of theorists have insisted on the difference between managers and leaders. For example, Benis is believed to survive in the 21st century, we need a new generation of leaders (leaders, not managers). It is important to distinguish between the two. Leaders can overcome the chaotic and unstable. Sometimes they work, we seem to be conspiring against the conspiracy, but if they do leave, they certainly allay unrest. While managers will submit (Benis, 2001, p 7). Management means to take advantage of the innate system - experiences accumulated an institution - now is the time to reach the target. But, following the formation of the present tense, for what will be the future system. Therefore, the system is always being creative, guaranteed. (Jordan, 2000).

Starat (2003) stated that the main task educational leaders in school should communicate with teachers and students, so that a quality learning for all children to rise. Every manager should such a mechanism as the core of the management to consider. Robinson (2006) The meaning of educational leadership as a core teaching and learning contracts. Investigation of two terms would be useful: 1 - It determines that school leaders need to know what, if you are looking to improve teaching and learning in schools. 2 - It establishes school characteristics and culture of teachers and students, the principals the leadership of the school.

By looking at the history of domestic and overseas research shows that many of them, such as Sobhani-nejad (2000), between the parents and the students' participation in school, there was a significant relationship. Also, Rezaali (2003), quoting Sobhani-nejad (2000), noted the effect of human relations teacher focuses on students 'mental health, the results of this study show that the human relations teacher and students' mental health, there is relationship significant. In other words, with 98% certainty, be judged to be a teacher with good human relations can affect the mental health of students. According to research, Hasan Bagllu, and Navid Adham (1993), quoting from Davoodi and Abdullahi, associations and clubs, cultural and artistic growth and development, strengthen the spirit of collectivism, the tendency to group activities, role playing, will be positive and productive, enriching leisure, cultural and educational development of students' participation in the planning. Also, according to the Rokhbakhsh findings (2000), quoting from Davoodi and Abdullahi, the students' participation in various school councils, in addition to enhancing their mental creativity, strengthening their skills in social and political decisions, and the self-destiny. Based on the findings of Sobhani-nejad and Iymani (2003), the rate of participation in social and political committees and councils, students, at least, and the scientific and educational cooperation and health committee, on average, also participation in cultural, religious, sports, business, finance, advertising, and event level are high. Mohgannizadeh (1996), quoting from Davoodi and Abdullahi (2012), in his study, found that few of the students participating in extracurricular activities are professionals. And many of them have not experienced even participate in an extracurricular activity. In this regard, Ghazaei (1996) quoted from Davoodi and Abdullahi (2012), reached the conclusion that 63% of female students in grades three and four high schools in different districts of Tehran aren't willing to work and collaborate in the community and only 27% are interested in this type of work.

Litwood and Jentzi (1999), conducted a comprehensive study to assess leadership, teachers, parents and climate and its impact on schools and students presented the results of this was that the family (parent) and organizational climate. The school students participated at a high level, and the impact of teacher leadership on student participation is low and negligible. Wood (1990), based on the study, believes that despite the stresses and concerns expressed by schools, students are not really growing community involvement. He believes that the way teachers teach school

enterprise search, is a significant element in the growth of social participation of students. Based on findings in Wilms (2000), there are unhappy students markedly in different schools. Correlation between the sense of belonging to the school, and students' participation in school is average, and only 26 percent of students participate in high school activities. This is such a problem because the child lives in a family that has a low socioeconomic level knows, and that live in families that are single parents. He believes that the participation of high school students show a good atmosphere, a close relationship between students and teachers, and high expectations for student success. Indicate a significant difference in the findings of his participation in male and female. According to Finn (1993), a strict enforcement of the school as an important factor in participation as students, and believes that the strict implementation of the law does not apply to the students participation at school. Johnson and colleagues (2001), state that the school environment has a powerful impact on students' participation and sense of belonging to the school considers acquisition and learning and believes that students can not only engage students in school.

#### **Research method:**

The goal of this study is applied, and its method is correlation. The aim of researcher is find the relationships between variables. This means that whether or not there is a relationship between two variables? And what is the significance of the correlation. Therefore, in this study, the role of variables such as principal, teachers and parents leadership in participation of students, in students themselves opinion, have been studied.

#### **Statistical population sample and sampling method:**

The study population included all male and female students in the fourth grade, and high school principals and teachers of Bushehr province, in the 2011-2012 academic year, with a total of 8,700 students, and 1,194 teachers and principals. Among all students, there are 4365 male and 4335 female.

Table (3) distribution of the sample based on their study field

Field	Students			Total
	Experimental	Mathematical	Humanianarity	
Abundance (N)	140	135	140	415
Percent	33.7%	32.6%	33.7%	100%

Table (4) distribution of the sample based on sex

Sex	Students			Principals and teachers		
	Male	Female	Total	Man	Woman	Total
Abundance (N)	210	205	415	210	205	415
Percent	50.6	49.4	100	50.6	49.4	100

To determine the sample size based on Cochran formula sample is 415 high school fourth grade boys and girl students and 415 teachers and principals. In this study, based on the condition, multi-stage cluster sampling was used. For this purpose, at first, researcher divides 9 areas of Education system into three regions: north, south and center, and in each district, schools were randomly selected. Then, in each region or cluster of schools selected randomly based on boys and girls ratio, the population was selected.

#### Data collection tool :

According to the researcher's perspective, students and principals, and teachers, in the present study, two questionnaires were used to collect research data: 1- Student questionnaire; 2 - Teachers and principals' questionnaire. The initial list were faculty members and a number of experts in the field of educational sciences , and while they were asked to comment on the individual components by the write their detail. Thus, the total extractive components of students' participation in school, 27 parameters were confirmed. In this form, the general explanation on how to complete a questionnaire asking students about general characteristics (gender, name of school) has been proposed. In designing the questionnaire, students are trying to make the texts in terms of wording and writing in a way that is designed for being understandable for high school students (though the runtime will be given adequate explanations with appropriate examples students).

So, in this questionnaire, the following explanation in order to gain the trust and confidence of students to accurately honest response range was raised six times in each component, and the students were asked in each case, one of the options by ((never)), ((very little)), ((little)), ((middle)), ((high)), ((very high)) throw mark. Validity was satisfactory. The resulting correlation coefficient was equal to 0.7959, which is significant at the 95% level, and shows that the question as to the ability of students to gather opinions about the considered and trustworthy factors. Also, when analyzing data, the coefficient alpha was calculated for the questionnaire, the number was 0.9624, which represents the reliability of the questionnaire is acceptable.

In order to view comments dungeons secondary school principals and teachers, the principal and teacher leadership and its impact on students' participation in school affairs, it has been

developed in a questionnaire. And aim to achieve leadership effectiveness and teacher participation in school affairs. Components in the form are 30 foelds. Range used for the response, as is a range of 5 times. The initial list of the supervisor of education and a number of experts were, and they were asking about the individual components subject to express their opinion. Having received their opinions, discuss the components were conducted. Thus, the questionnaire was confirmed. In order to check the reliability of 30 of the teachers (students) completed form, were asked within two weeks, and then again to complete the form, visit correlation coefficients were calculated for the first and second. The resulting correlation coefficient was equal to 0.7154, which is significant at the 95% level. However, the validity of the questionnaire was measured with alpha coefficient, the results are equal to 0.6944, which confirms the validity of the questionnaire.

Statistical methods for data analysis:

In data analysis, firstly with using descriptive statistics techniques such as frequency distribution tables, one-dimensional, relative frequency, mean and standard deviation of all variables were described. In inferential statistics, data analysis in two variables and in the analysis of the two variables, each of the research hypotheses using advanced inferential statistics, such as Pearson correlation coefficient for (hypotheses 1, 2 and 3) and t test for hypothesis 4, were studied.

## Results

To achieve results, the rate of students' participation in various school activities was analyzed in Table 5.

Table (5) the rate of students' participation in school activities

Activities	Samples	Mean	Standard deviation
School training affairs	415	4.61	.97
School religious affairs	415	3.23	1.05
School health affairs	415	2.6	1.12
School administration affairs	415	2.1	1.17
School cultural and art affairs	415	2.3	1.08
School entertainment, sports and entertainment affairs	415	3.4	1.02
School disciplinary affairs	415	3.5	.95

Based on data in Table 5, in students' opinion, their participation in educational and recreational activities at a high level, and other activities at a moderate level. Participation of students to

express themselves in such areas as entertainment affairs, religious affairs, education and disciplinary affairs, more than in other areas have shown an interest. While a low level of interest and participation in health care affairs.

Table (6) correlation between principal, teachers and parents leadership with students' participation in school affairs

Variables	Samples	Mean	Standard deviation	r	t	significance level
Principal leadership and students' participation in school affairs	415	42.5	8.1	0.4	8.7	0.05
Teacher leadership and students' participation in school affairs	415	34.7	6.2	0.41	9.15	0.05
Parent leadership and students' participation in school affairs	415	34.8	6.7	0.43	10.7	0.05

Based on the above data, the Pearson correlation and t can be obtained from the students, suggest a somewhat stronger positive relationship between the variables and the participation of leadership, and the participation of the students led teacher, and the leadership in parents and participation in school affairs. This means that much of the support, assistance and cooperation of principals, teachers, schools and parents with students on their participation in schools are greater participation of students in schools is also higher. The relationship is significant at the level of ( $P < 0.5$ ).

Table (7) correlation between principal, teachers and parents leadership with students' participation in the school affairs from perspective of principals and teachers

Variables	Samples	Mean	Standard deviation	r	t	significance level
Principal leadership and students' participation in school affairs	415	39.4	6.1	0.3	5.7	0.05
Teacher leadership and students' participation in school affairs	415	41.7	7.2	0.40	7.15	0.05
Parent leadership and students' participation in school affairs	415	34.8	6.7	0.41	9.7	0.05

As can be seen in the above table, the Pearson correlation coefficient and t the principals and teachers indicated a strong positive relationship between the variable part of the leadership and participation of students, led by teacher and student participation in school affairs. This means

that much of the support, assistance and cooperation of principals and teachers in schools with student participation in higher levels of student participation in school affairs, as more. The relationship is meaningful at the level of ( $P < 0.5$ ).

Table 8. Comparison of female and male students' participation in school affairs.

Sex	Number	Mean	Standard deviation	Degrees of freedom	T value	Significant
Boy	210	24.5	6.9	413	-2.1	0.5
Girl	205	25.8	5.5			

The observed difference between female and male students' participation in school affairs, based on the t test ( $P < 0.5$ ) is significant. Thus, the mean value of female and male students' participation in school affairs, it can be said that the participation of female students is greater than male students in schools affairs.

Regression results all independent variables in the in Table 9 with the participation of students in schools

Stage	Entered variable	R value	R2 value	Value added to R2	B coefficient	Beta coefficient	T value	significance level
First	Parent Leadership	0.427	0.182	-	0.402	0.427	9.6	0.001
Second	Leadership	0.484	0.234	0.52	0.201	0.259	5.3	0.001
Third	Teacher Leadership	0.491	0.241	0.007	0.141	0.139	2	0.001

Based on the above data, it can be said that the three variables of the independent variables entered into the regression equation, and the rest were excluded from the regression equation. First, the leadership of parent variables in the equation, and only 2.18 percent of the variance is explained by students' participation in school affairs. Beta coefficient indicates a positive relationship between the variables of parent leadership and participation in school affairs. This means that much of the support, assistance and cooperation of parents with students in their participation in schools are greater participation of students in schools is also higher. Secondly, the leadership of the variable into the regression equation, and 2.5 percent is added to the explanatory power of the model, and then to 4.23 percent completed. Beta coefficient indicates a positive relationship between the variables of leadership and participation in school affairs. This means that much of the support, assistance and cooperation of school principals with the

participation of students in schools are greater participation of students in schools is greater. The third variable to enter the regression equation is the lead editor 0.7 of the explanatory power of the model is added to 1/24 percent tentative. The beta coefficient indicates a positive relationship between teacher leadership and student participation in school affairs. This means that much of the support, assistance and cooperation of teachers in schools with student participation in schools are greater participation of students in schools is greater. In general, the three variables of the independent variables were entered into the regression equation, 24.1 percent of the variance have explained by the participation of students in the school .

### **Conclusion**

In general, the findings show that the students' participation in school activities, in the students' perspective is high. Participation of students to express themselves in such areas as entertainment affairs, religious affairs, education, and disciplinary matters, more than in other areas have shown an interest. While a low level of interest to participate in the school health affairs. Therefore, the findings of the research did not match with findings of Moghannizadeh (1996), and Ghazaei (1996), and Wood (1999), and Wilms (2000) . However, the results of this research are consistent with findings of Sobhani-nejad (2000), and Litwood & Jentzi (1999), which consider participation of students in high school as high.

Our findings indicate that the between level of leadership and participation in school affairs, there is a significant positive relationship, meaning that no matter how much support the collaboration and assistance the students' participation in school management school more if the amount is greater participation in school affairs. The results of this study did not match with studies of Litwood & Jentzi (1999), and Finn (1993). But are consistent with the results of Sobhani-nejad (2000), and Johnson and colleagues (2001).

Based on these findings, between the level of teacher leadership and participation in school affairs, there is a significant positive relationship. This means that much of the support, assistance and cooperation of teachers and students in schools with higher school participation rate are greater participation in school affairs. The results of this study did not match with Litwood & Jentzi (1999), Fin (1993) . But are consistent Sobhani-nejad (2000), Rezaali (1382), and Wood (1999), and Johnson and colleagues (2001), and Wilms (2000) .

In the findings about parental participation in school leadership, the relationship between these two variables is positive and significant. That support, cooperation and encouragement of parents, have a very important role in students' participation in school affairs. The results of the research are consistent with Litwood & Jentzi (1999), and Wilms (2000), and Sobhani-nejad (2000).

According to the findings, between the participation rates of boys and girls in schools, there are significant differences. The observed difference between the means, it can be said that the

participation of female students in schools is higher than male students. The results are consistent Sobhani-nejad (2000), and Wilms (2000) .

In general, the analyzes made in this study to be said about participation in the school's average in seven areas of the school is too large. This is his favorite spot is the growing level of participation of students with school work.

### **Practical recommendations:**

The students expressed their interest to participate in such kind of entertainment, religious affairs, education and disciplinary matters, more than in other areas. The lowest level of their interest is to participate in cultural affairs, health and school administration affairs. It has to wonder, because on the one hand, they need to explicitly reveal recreation, and the other is a pity that due to the lack of appropriate educational activities, they are not aware of the importance and validity of cultural activities, and the lowest these are matters of interest. Also, they are keen to participate in school health affairs. While it is also very important, and require more attention. Therefore, it is suggested that principals, teachers and parents to engage in these activities, must use appropriate motivational techniques.

The female students significantly more than male students wishing to participate in school affairs schools. So, the principals and practitioners of schools should provide a favorable context for their participation. Principals and teachers in boys' schools should use the optimal stimulus (human relationships, emotional intimacy), to encourage students to more participate.

- School principals and teachers are recommended:

A) To create a warm and friendly environment for students with full commitment and security to their teaching duties, and to respect themselves and others, and to trust each other.

B) To create a school climate in which students enjoy the spirit of the group, and students without aggressive and difficult to work well together.

C) To be flexible and, when necessary, to control students' activities and to conduct honest.

## **Intro**

American Indian students have the lowest educational attainment rates of any group in the United States. Many American Indian students perceive their current classroom experiences as unrelated to them culturally. Insisting that the culture of school is more important than culture of students' homes is form of cultural imperialism. Educational institutions believe that they offer a "culture blind" education to all American students; an education where race and cultural backgrounds of students do not matter, a reportedly culture-free zone.

Researchers have attributed the educational disparity gap that American Indians experience to the lack of cultural relevance in mainstream educational settings. The rate of high school graduation for American Indian students is 46% compared to a national average of 89%. Only 17% begin college, compared to a national average of 62%. Of this 17%, only 4% survive the first academic year. 11% of American Indians have college degrees, less than half the norm for the rest of the country (American Indian Education Foundation, 2011).

The idea of cultural blindness masks entrenched inequality. Educators assume that racial harmony is the norm in cultureless classrooms. Many view the underperformance of American Indian students in education as merely representing the lack of individual hard work and determination. Current educational disparities are viewed as a reflection of individual underachievement and lack of educational potential.

A continuing educational gap in access to higher education, in a knowledge-based economy affects the socio-economic status of families and tribes. Many American Indian families depend on public education as a pathway to upward mobility and increased opportunities. Reservations remain economically underdeveloped, and the full potential of many American Indian students, untapped.

Both Gallup and Kaiser Family polling data indicate that the majority of white Americans believe that racial discrimination no longer exists, that we live in a post-racial, color-blind, or race neutral society (Gallagher, 2012). The myth of color and cultural blindness maintains white privilege by negating the reality of racial and cultural inequality that American Indians face in American institutions.

## **History of American Indian Boarding Schools**

Historically, education has been used as a weapon of colonization against American Indians. The American Indian boarding school system can be described as a war in disguise, a war to attain complete cultural supremacy. Education was used as a weapon to remove and isolate children from their families, diminish tribal populations, and extinguish tribal cultures.

Differences in the perception of education exist among dominated minorities, some resist "colonial education" while others view education as a path to economic security for their families. Boarding schools started as an experiment with Indian prisoners at Fort Marion, in St. Augustine, Florida. The Bureau of Indian Affairs and churches ran boarding schools. Money

was deducted from annuities if children weren't sent away to schools (Reyhner, 2004, p. 47). Tribes suspected that boarding schools were set up to divert their treaty money.

After the Civil War, the Catholic Church developed the largest number of mission schools, using government funding. Cultural repression was emphasized in boarding schools. The term *ethnocide* refers to the destruction of one's ethnic culture. Children were subject to the repression of any previous cultural ties such as their names, languages, and religion. Modeled on the emerging prison system, military style training and corporal punishment were routine. Physical and sexual abuse, and death from disease was rampant (Bear, 2008). Children were removed from their families and tribal communities, as young as the age of five, up to age eighteen (Daniels, 2012). Runaways were returned by law enforcement. The impact of American Indian boarding school practices on parenting skills, families, and tribes, has yet to be fully understood.

The war against American Indian cultures, and for complete assimilation, was waged overtly. The infamous quote of Carlisle Indian Industrial School founder, Richard Henry Pratt, summarized the intent of these schools, "Kill the Indian, Save the Man." (Child, 1998 p. 54). As succinctly stated by Reverend A.J. Lippincott at a Carlisle commencement, "The Indian is DEAD in you. Let all that is Indian within you die! You cannot become truly American citizens, industrious, intelligent, cultured, civilized until the INDIAN within you is DEAD." (Child, 1998, p. 77).

Retaining family bonds was difficult given the cost of transportation to boarding schools. The cost of round trip train fare was over thirty dollars; while per capita annual income for American Indians was eighty-one dollars (Reyhner, 2004, p. 45). Students were a source of cheap labor for local farms. The students sometimes lived with white families in a practice called "outing". The emphasis was on learning a trade or basic skill to become part of an unskilled labor force. The lack of professional training underdeveloped the economic potential of families and tribes.

In 1865, President Grant recommended that American Indian children be removed from their homes in order to achieve the goal of establishing an assimilated cultural identity in government-run schools, instead of church schools (Child, 1998). Protestants fought to end all government funding of mission schools.

In 1923, the Secretary of the Interior formed the Committee of One Hundred, to review Indian government policy, including the practice of boarding schools. They recommended that reservation based day schools be established. (Reyhner, 2004, p. 203). By the 1920s, the Bureau of Indian Affairs changed from a primary focus on boarding schools, to attendance at public schools. By 1923 the majority of Indian children nationwide attended public schools (Reyhner, 2004, p. 200).

The 1928 Meriam Report found that the majority of American Indian schools were inadequate. This report specifically criticized the use of American Indian students as laborers, at a time when child labor laws prohibited these practices in many states (Reyhner, 2004, p. 208).

The Meriam Report supported the development of community day schools on reservations and the phasing out of boarding schools.

One legacy of the era of boarding schools are the high rates of historical trauma experienced in American Indian families. Historical Trauma theory argues that cultural trauma to a society impacts succeeding generations (Sztompka, 2000). Researchers have found that unresolved cultural grief causes generational emotional distress (PTSD).

The basis of historical trauma theory was developed with survivors of the Jewish Holocaust and Veterans of World War I and II. Similar to other traumatized populations, PTSD rates are higher among American Indians (22%), than among the general population (8%) (Brave Heart, 2011). American Indians continue to be exposed to more trauma than the general population. Eighty-five percent of American Indians experience trauma compared to 52% of the general population (Bullock, 2005). Trauma theory changes fundamental therapeutic questions from "What's wrong with you?" to "What's happened to you?" (Bloom, 2004). American Indians experienced colonization through a number of federal government policies including; wars, fraudulent treaties, forced relocations, incarceration on reservations, boarding schools, and tribal termination in the 1950s.

Historical trauma continues in multiple generations because the descendants of genocide are genetically at higher risks of developing PTSD (Kellermann, 2001). Grief resolution can occur through collective mourning, based on cultural rituals, and on a commitment to community healing (Whitbeck, 2004). Cultural practices that are retained, can be used for healing.

### **American Indian Educational Disparity**

The dropout rate for American Indians is three times that of non-Indian students, at a time when a high school diploma is a minimal qualification for entry-level jobs. Over one-third of American Indian young people drop out of high school. Only 46% of American Indians graduate from high school and 17% attend college. Only 13 percent of American Indians earn a college degree (American Indian Education Foundation, 2011).

It is important to look beyond the educational outcomes so many Indian youth face, and also examine the schools they attend. A 2012 ASHE report attributes American Indian attrition rates to the lack of representation of American Indians in curriculum and among teachers (McKinney, 2012). A U.S. Department of Education study identified the top reasons why American Indian students drop out of school: (1) *uncaring teachers*, (2) *curriculum* designed for mainstream America, and (3) *tracking* into low achieving classes and groups (Department of Education, 1991).

The campus climate of schools can be aggressively anti-Indian at times. The use of derogatory American Indian mascots in public schools seems to support the belittling of culturally important figures. Public schools continue to use sports mascots with names like "Savages", "Redskins", and "Fighting Reds". Sports mascots are often crude, cartoon-like depictions of "braves" and "chiefs". Religious symbols like face paint and feathers are used without respect and context, an overt message of religious intolerance and cultural disrespect. Beginning in the

1960s, the National Congress of American Indians (NCAI) campaigned against this demeaning use of native traditions and rituals. In 2005, the National Collegiate Athletic Association (NCAA) required colleges to retire demeaning mascots, but many public high schools still use them.

American Indian students perceive a cultural bias against them in classroom curriculum as well as pedagogical practices. Only 8% of American Indian students who drop out do so because of academic failure. Most complain about boredom, and perceived hostility from classmates and teachers which creates a difficult school climate. (Reyhner, 1995). Standardized testing has narrowed needed curriculum revisions and further disconnects teachers and curriculum from the lives of many American Indian students (Roppolo, 2007).

An analysis of social studies curriculum found that American Indians are largely depicted as victims, rather than recognized for their contributions to American culture (Journell, 2009). Any American Indian history that is covered in schools focuses on a limited time frame of pre-twentieth century history. Contemporary achievements of tribal self-determination are excluded from school curriculums, as well as a substantial pre-Columbian history of ancient civilizations in America. This serves to reinforce media images of American Indians as people who existed in the past. Americans can feel as though they have accepted people who only existed in the past (Willow, 2010). Nearly all states cease their coverage of American Indians after wars in 1860s, creating an incomplete narrative. This creates significant implications for the historical consciousness of all students, and especially for American Indian students.

Non-native teachers teach the overwhelming majority of American Indian students, whether on reservations or urban areas, in both tribal colleges and mainstream institutions. American Indian teachers can serve as important role models, but low educational attainment rates have contributed to a deficit of certified American Indian teachers. Teachers don't need to be cultural experts, but just aware of American Indian students and welcoming to them (Pewewardy, 2003). Good teachers can build upon diverse student cultural backgrounds. Lack of empathy from teachers is cited as a major contributing factor in drop out rates of American Indian students (Pember, 2010). Dropout prevention starts with caring and informed educators, many can benefit from cultural relevancy training.

While some states have passed legislation to support teaching about Americans Indians, no funding to support culturally relevant curriculum changes or teacher training accompany these measures. American Indians have struggled to gain a presence in educational curriculum. In the 1990s, a political "culture war" occurred in the United States regarding the presentation of public school history curriculum. Liberals asserted that a critical reading of national history needed to be presented; while conservatives felt that a celebration of "traditional" American historical accounts should be stressed. National educational standards, developed in 1994, did not expand the presence of American Indians in school curriculum. The original people of the Americas remain associated with the idea of "foreignness". American Indians appear once a year in school curriculum, as part of the mythology of Thanksgiving, where they are "guests" of the Pilgrims, or an occasional Indian massacre or battle is mentioned. American Indians have served in every war, beginning with the American Revolution. A 1988 United States Senate resolution acknowledged the influence of the Iroquois Confederacy on the American

Constitution. Imperial nostalgia has romanticized and belittled American Indians, belatedly showing approval of cultural aspects that were repressed by government policies in the past, yet unable to support the educational needs of American Indians in classrooms today.

Many whites today know little of American Indian history. The invisibility of American Indians in school curriculums supports Anti-Indian sentiments. As Elizabeth Cook-Lynn defines the term, "Anti-Indianism is that which treats Indians and their tribes as though they don't exist, the sentiment that suggests that Indian nationhood (i.e., tribalism) should be disavowed and devalued (Cook-Lynn, 2001, p. x). While overt expressions of racism against American Indians have been reduced, they have been replaced by a romanticized notion and commodification of American Indians (Denzin, 2013). Rather than acknowledging racial hierarchy, race and culture are now viewed as media symbols that can be consumed, and supposedly understood by anyone.

A strong relationship exists between language, culture, and cognition. Different linguistic communities conceive reality in different ways. According to the U.S. Department of Education, schools that support a student's language and culture are more successful in educating those students. The Department of Education Indian Nations at Risk Task Force identified top priorities as the need for culturally and linguistically based education, and the need to train more American Indian teachers (Locke, 2007). Schools can play a vital role in serving student and community needs at a time when American Indian languages struggle to survive as spoken languages.

With higher poverty rates, American Indian families may experience frequent relocations due to family hardships. Government data reveal that 27% of American Indian families with children live in poverty, rates that are more than double those of the general population (National Institute Health, 2012). A high level of absences is often the first evidence of dropout behavior (Reyhner, 2006). American Indian students are often placed in special education and basic skills programs, instead of culturally appropriate programs (Reyhner, 2004, p. 11). School discipline, detentions, and suspensions are higher for American Indian students than non-Indian. American Indian, African American and Hispanic youth are disciplined at higher rates and two to five times more likely to be suspended or expelled (Wallace, 2009, p. 47).

### **Educational Success and Resiliency Factors**

For students to succeed in school they must have positive beliefs about their abilities as students, and about the importance of education to their future opportunities. This correlation may be difficult on some reservations with high unemployment rates and few jobs. Only 6 of every 100 American Indian college students will graduate, and only 2 of these 6 will complete graduate or professional degrees (Alberta, 2001, p. 89).

One response from tribes to high university attrition rates resulted in the development of tribal colleges. In 1968, the Navajo nation founded the first tribal college, Navajo Community College, renamed Dine College in 1997 (Reyhner, 2004, p. 295). Tribal colleges are committed to providing culturally based education on reservations. There are now 32 tribal colleges, most of them two-year institutions, in 12 states. Ninety one percent of tribal college students are non-traditional, often older working parents, and many are single mothers (Williams, 2007). These

students take longer to complete their education due to both financial and family demands than traditional students.

Students at some tribal colleges face a digital divide in their educational pursuits. More than 90% of tribal populations lack high speed Internet access, according to the Federal Communications Commission (PBS, 2011). With less than 10% of tribal lands having access to broadband Internet service, some developing countries have a higher rate of access, according to the Department of Commerce. American Indian students on reservations also need to use limited funds on gas to drive miles to Wi-Fi locations. (Huffington Post, 2012).

Communities also founded American Indian charter schools; there are currently forty-four such schools in the United States (Reeves, 2009). The majority of American Indians are an urban population and do not attend tribal colleges on rural reservations, or charter schools, so there is still a great deal of work to be done to change mainstream educational institutions in order to change educational outcomes for the majority of American Indians students. The need for cultural and language retention programs are acute. Many tribes have reservation based language programs, but the majority of tribal members live off-reservation, without access to Indigenous language classes at mainstream schools and universities.

Developing an academic identity, and perceptions of social support systems are key factors in college persistence (Okagaki, 2009). Many American Indian students are first generation college students who can encounter a less familiar campus climate. Second generation college students have more factual information about college from their family and friends. Students who can successfully develop an academic identity are more likely to persist in academia (Montgomery, 2000, p. 387).

Students who have more positive perceptions of the university environment are more easily retained (Alberta, 2001).

When the factor of social support is examined, the role of faculty mentoring has the most significant impact on college retention. Students with at least one faculty mentor are more likely to succeed in college (Alberta, 2001, p. 96). Yet American Indians remain underrepresented among college faculty. According to the National Center for Education Statistics, nationwide there are a little over 7,000 American Indian faculty on college campuses (National Center for Education Statistics, 2012). American Indian faculty can connect to the important role that extended families hold in American Indian cultures, but they also face many pressures in academic environments which reward publishing more than community commitments. The lack of role models and precedents is revealed in student comments, "Statistically, we're not supposed to be doing this... We're not both supposed to be going to school and getting our education... you know---being Native Americans." (Montgomery, 2000 p. 392). A lack of role models in educational pipelines impacts student aspirations.

Successful American Indian college students learn how to develop a strong academic identity, while retaining strong cultural ties. In addition to the academic challenges that all students face in college, American Indian students will also face cultural adjustments. Those who have a strong sense of cultural identity are more likely to persist (Alberta, 2001, p. 89).

## **Tribal Cultural Values as an Educational Foundation**

Incorporating tribal values into mainstream schools would not only support educational connections for American Indian students, but can also enhance the learning environment for all students. Tribal values focus on how to be *respectful and generous*, how to *live in balance*, how to *withstand hardship*, and how to *receive blessings*. One way to encourage educational attainment may be to encourage more American Indian youth to become involved in their communities. Personal identity is based on how people view you and learning your place in the world with humility and grace. Without sustained interactions, cultural miscommunications can proceed unwittingly. For example, while American schools often emphasize the need to build self-esteem in students, many tribal cultures value humility above the concept of self-esteem (Reyhner, 2006b).

American Indian students need to develop a strong sense of both their tribal identity and also their academic identity. They must view their cultural identity as being compatible with a positive academic identity. Students who have a strong cultural identification and can successfully operate in a majority culture, have the most positive educational outcomes. Academic success does not need to detract from strong cultural identity.

School cultures that are more congruent tribal values will better serve the needs of American Indian students. College degrees can be viewed as an opportunity, rather than a barrier, as a part of life's journey. Education is a pathway of many journeys, schools that embrace tribal values can be an important part of this journey.

## INTRODUCTION

The Indian state of Karnataka is famous for its software industry, centered in the city of Bangalore (Bengaluru), that is transforming India from a lumbering elephant to an economic tiger. Bangalore is also notable for another kind of transformative software: an international educational innovation known as “Twinning Programs”. Pioneered in India in 1997 in a partnership between Christ College in Bangalore, capitol of the state of Karnataka, and Western Michigan University in Kalamazoo (Michigan, U.S.A.), it proved such a success that one hundred “twinning” programs modeled on this trailblazing linkage are now a hallmark of India’s higher education scene.

2012 marks the 15<sup>th</sup> anniversary of the internationalization of Christ College and the inauguration of its “Twinning Program” with Western Michigan University. This paper historically and analytically examines why “twinning” was introduced to India in 1997 through a partnership between a private Catholic college and an American Midwest state university; how together they created an American-model curriculum within an affiliated college that was tied to Bangalore University; how their joint 2+2 program built an academic bridge between Bangalore, Karnataka and Kalamazoo, Michigan that has graduated hundreds of students; and the ways it spurred the “internationalization” India’s private higher education sector.

Ms. Annesha Rai exemplifies this partnership. Ms. Rai is a young Indian woman who was born on the subcontinent, but grew up in the United Arab Emirates on the southern shore of the Persian Gulf. Her family who live and work in Dubai, one of the sheikdoms that comprise the UAE, are NRI’s, i.e. Non-Resident Indians. Many NRI’s desire to maintain their connection with their homeland and its culture, but also want their children to benefit from exposure to higher education in the U.S. and/or Europe. The twinning program jointly offered by Christ University and Western Michigan University offered both benefits.

In 2008 Ms. Rai returned to India to begin her higher education at Christ University in Bangalore, enrolling in the Western Michigan-Christ University “twinning program” in Business that had been initiated in 1997. After two years in Bangalore, during which she completed (60 credit hours in) business pre-requisite courses and general education, she transferred to WMU in Kalamazoo in 2010, and after two years in Kalamazoo, she graduated with a BBA in Finance in April 2012.

“A good amount of seniors who had transferred through the [twinning] program had wonderful things to say and highly recommended it,” says Rai. “I did it for the experience, as I love to travel and explore new cultures; also the quality of education is stellar. I think it’s a great idea because it gives you a very well rounded perspective of the world and culture. In my case, it gave me a totally different perspective on the world of

business.”<sup>1</sup> Ms. Rai, now age 22, has moved back to India and is working at a Singapore-based company named Wealth-X as a research analyst.

## ORIGINS OF TWINNING

Twinning was invented in Malaysia through a partnership between Western Michigan University and Sunway College. The inspiration for it originated in Malaysia's circumstances in the mid-1980s, when the demand for higher education from a growing middle-class outstripped the ability of the government to provide enough seats in its six government universities or scholarships for study abroad for Malaysians seeking a higher education. Prime Minister Dr. Mahathir Mohamad appealed to the private sector to help by creating private colleges that could offer access to higher education at an affordable price. Quick to respond was Jeffrey Cheah, President of the SungeiWay Group, a construction and real estate conglomerate. With no experience in education, he sought a partnership with a university abroad already popular with many government-sponsored Malaysian *bumiputras*: Western Michigan University in Kalamazoo.

Contracting to work together in January 1987, the SungeiWay Group and Western Michigan University devised a collaboration through which they would jointly create a private institution to be called Sunway College. In it Malaysian students could begin WMU bachelor's degree programs in Kuala Lumpur, then transfer to Kalamazoo to complete their studies. Twinning was conceived of as a form of technical assistance, by which an American public university authorized a foreign partner to offer the first half of American-model degree programs by replicating segments of WMU's curricula in a new private college. Through twinning, students could earn 60 credit hours in beginning courses in e.g. business administration, communications, computer science, engineering, psychology, and the physical sciences. Students who successfully completed the twinning program were guaranteed transfer of those credits to Kalamazoo. They could then complete their baccalaureate degree in about two years in residence in WMU. Hence the term “2+2” was used to describe twinning.

With savings of 40% compared the cost a full education overseas, the 2+2 scheme was especially appealing to middle class Malaysians from Chinese and Indian communities, who could not gain admission to local universities because of ethnic quotas, and were not eligible for government scholarships to study abroad.

Sunway College opened July 25, 1987 in rented quarters in Petaling Jaya, an edge city west of Kuala Lumpur and first intake of 67 students, mostly Chinese and Indian Malaysians, began their studies in WMU-model classes. A faculty member from Western Michigan University served on-site as a full-time Resident Director of the Twinning Program. After two years, the pioneer cohort transferred to WMU in 1989 and graduated in 1991. By 1992 the Sunway-WMU program had grown to 350 students. Sunway added

---

<sup>1</sup> “University Keeps Reaching Out to International Students”, Kalamazoo Gazette, August 19, 2012.

twinning programs (2+1 and 1+2) with universities in Britain, Australia, and New Zealand; enrollment burgeoned to 3500.

The SungeiWay Corporation began construction of a 22-acre campus as the centerpiece of Bandar Sunway, a satellite city it developed west of Kuala Lumpur. The new Sunway College was opened by Prime Minister Mahathir in April 1993; with purpose built classrooms and hostels, it was the first private college in Malaysia to offer students the experience of a complete campus environment rather than commuting to classes in converted shop-houses. By its 10th anniversary in 1997, Sunway was largest private college in the country, the WMU 2+2 enrolled 450 students, and WMU had become the top destination in the U.S. for Malaysians, enrolling 700 students from that most pleasant peninsula.<sup>2</sup>

In 2004 Sunway College was upgraded to Sunway University College by the Ministry of Education, able to offer its own 3+0 degrees, and in 2010 was recognized as Sunway University, with Jeffrey Cheah its first Chancellor. Enrollment in Sunway's education institutions now stands at 16,000, with about 30% international students from 80 countries. The WMU-Sunway linkage celebrated its 25<sup>th</sup> anniversary in 2012, but the twinning program has come an end, since Sunway University offers its own degrees. It continues in a new form, as an articulation agreement, that will facilitate transfer of Sunway students who still wish to earn a undergraduate degree , or seek a Masters or Doctoral Degree at Western Michigan University. At last count, there were 93 Sunway students enrolled in WMU.

## **PASSAGE TO INDIA**

The success of Sunway College-WMU twinning program was confirmed with the graduation in 1991 of the first cohort of students who had started in 1987, and transferred from Malaysia to Michigan in 1989. In 1992, with the end of Cold War and Globalization the buzzword of a new era, WMU sought to replicate the Sunway 2+2 model elsewhere in the world.

WMU turned its attention to India, where the Finance Minister, Manmohan Singh, had launched economic Liberalization in 1991. Confronted by a crisis that threatened the country with bankruptcy in 3 weeks, he began the opening up India's protected and heavily regulated economy. Reducing customs duties, removing export restrictions, encouraging direct foreign investment, and promoting privatization, he launched India's joining Globalization. As he began dismantling India's "License Raj", its lumbering elephant of an economy began to speed up. WMU's professors of Indian origin urged exploring the possibilities for academic collaboration.

---

<sup>2</sup> Sunway College, *Collegiate Chronicle: Edge to Excel: Anniversary Issue 2002*, Kuala Lumpur, Malaysia 2002.

A WMU delegation conducted a reconnaissance of India in early 1996. Our mission, which included myself as the Executive Director of International Affairs, visited New Delhi, Bombay, Cochin, Madras, Manipal, and Bangalore. Bangalore is located in southern India, at the center of the high dry Deccan plateau. A garrison town during the British Raj, with reputedly the best climate in India, Bangalore was probably best known as the home of Kingfisher beer, but was beginning to develop as a IT center with home-grown software companies and call centers.

In Bangalore we visited Christ College, a private institution that had been founded in July 1969 as an “affiliated college” under the supervision of the state-run Bangalore University, which set the curriculum and validated its examinations. It was located in a leafy suburb, with a dairy across the street, and cows wandering along the edge of a two lane road.

Christ College was a Catholic school operated by the Carmelites of Mary Immaculate (C.M.I.) The white robed C.M.I. are India’s first indigenous religious congregation for men, founded in 1831 by the Blessed Kuriakose Elias Chavara of the Syrian-Malabar Catholic church. His vision was that people from all walks of life, especially women and the lower strata of the caste hierarchy, should have access to higher education. They have dedicated themselves to building schools and hospitals throughout India and are now an order with a global reach.

We met with the Principal Dr. (Fr.) Antony Karayil CMI and many other fathers of the CMI order. They were highly educated men with doctorates from leading universities around the world; we met one priest with two doctorates, from Columbia and Oxford universities. We toured the immaculate and beautifully maintained campus, with white painted low-rise modern building set in garden-like landscaping. Its 4000 students were neatly turned out: young men in blue blazers and many young women in saris while others wore more casual dresses or blue jeans. Christ College impressed all of us as a “class act”. It was the most attractive, sophisticated, and cosmopolitan of all the schools visited. Our positive take was confirmed by visits to U.S. Educational Foundation (Fulbright program) offices in New Delhi, and U.S. Consulates in Mumbai (Bombay) and Chennai (Madras).

Over the next year we negotiated a 2+2 “twinning program” in business and computer science that would lead to BBA degree in business or BS in computer science at WMU. The WMU-Christ College contract was signed in February 1997. This was Christ College’s first international partnership, and WMU’s first academic linkage in India, commemorated by a large brass plaque that is prominently displayed at Christ University today.

The twinning arrangement authorized Christ College to offer the first half of WMU bachelor degree programs by replicating segments of WMU curricula. Christ College courses were to be clones of WMU courses, using identical syllabi, titles, numbers, teaching formats, texts, tests, and other evaluation methods as their models on campus in Kalamazoo. Through twinning, students would earn 60 credit hours in the beginning

courses of business or computer science and general education. In effect, participants could complete their freshman and sophomore years without leaving India.

Students who successfully completed the twinning program were guaranteed transfer of their Christ College credits into WMU. This meant they could move seamlessly from Bangalore to Kalamazoo with their coursework automatically credited as courses of the partner university. They could then finish their baccalaureate degree in about two years of residence at WMU or through transfer to another institution.

WMU set admission standards for students entering the program, as well as for faculty employed by Christ College who would teach in the 2+2 program. Quality was monitored through regular visits by WMU administrators and faculty, reviews of sample student tests, papers, and projects, and by analyzing the academic progress of transfer students.

The pioneer American twinning program in India began in June 1997 with approximately 50 students. Christ College recruited the first intake of students from throughout India, from neighboring countries including Bangladesh and Sri Lanka, and from the large Non-Resident Indian (NRI) communities in the Persian Gulf area. The first cohort of students transferred seamlessly to WMU in Fall 1999 and the first batch graduated two years later from WMU in April 2001. A delegation from Christ College headed by the Principal, Fr. Sebastian Thekkadathu CMI, was seated on-stage and recognized during the commencement ceremony. Since then hundreds of students have participated in the WMU-Christ University 2+2 program, contributing to WMU's enrollment from India that surged at the turn of the century, reaching 600 in 2001 and peaking at 610 in 2002.<sup>3</sup>

## WIN WIN

Twinning between Bangalore and Kalamazoo has proved to be a “win-win” arrangement for both partners. The advantage to Indian students has been being able to earn a recognized degree from an established university abroad, while their families pay only about 60 percent of what it would cost to pursue a full degree program overseas. Spending the first two years in their home country has also given students, some of whom may be only seventeen years old, time to mature before having to adapt to a foreign environment.

The advantage for Christ College was access to “American-model” higher education with its distinct approaches to curriculum and assessment. A twinning program, like the American university from which it originates, combines a range of disciplines under one umbrella, and through “general education” requires students to broaden their exposure and better understand the interrelated nature of disciplines.

Twinning program students were also subject to the American system using continuous assessment through a variety of means, including term papers, team projects, quizzes and

---

<sup>3</sup> Suniti Phadke, “For that Dream Degree”, *Deccan Herald*, September 26, 2003.

tests, and their final grade represented a cumulative average, rather than having a final mark based on a comprehensive final examination. Exposure to different teaching approaches while still at home eased the transition for Indian students to the U.S. classroom.

The advantage for Western Michigan University was a steady stream of mature, well-prepared students who are acclimated to foreign-style classes, ready to begin their major sequences as upper-division (junior-senior) students. Internationalization of the curriculum was promoted by challenging the faculty to write syllabi to be taught both at home and abroad, and campus life enlivened by the regular presence of students from India, NRI communities in the Persian Gulf and East Africa, and neighboring countries such as Bangladesh, Nepal, and Sri Lanka. The university's fiscal health also benefitted from self-financing undergraduate students who pay out-of-state tuition fees.

### **BANGALORE'S BOOM, CHRIST UNIVERSITY 'S RISE**

My last visit to Christ College as WMU's Executive Director of International Affairs was in March 2004, as Fr. Sebastian Thekkadathu , who presided over the implementation of "twinning", was finishing his term as Principal, and Dr. (Fr.) Thomas C. Mathew was preparing to take the helm as the new Principal. About 250 students were studying in or had graduated from the 2+2 program at that point. Outside Christ College's gate on Hosur Road, Bangalore was beginning to boom as India's IT center, South Asia's Silicon Valley. Construction was beginning for Bangalore's first flyover, foreign IT firms were starting to arrive, and the CMI Fathers were constructing a new classroom building that would become a Junior College.

In 2011 I returned to Bangalore as a consultant for WMU. Returning after seven years, I was struck by all the changes, beginning with a sparkling new airport, 40 kilometers outside of the city (pop. 6 million). As the plane descended on its landing approach, whole new American-style gated communities could be seen, many with swimming pools. A Metro rapid transit system was under construction, and Bangalore was hosting the World Cup of Cricket. The night of my arrival the roar from the stadium was audible at the hotel as India battled England to 318-318 tie.

When the taxi dropped me off at what I remembered as Christ College, I hardly recognized the place. Towering over the entrance gate was a multi-story, glass fronted tower where I began my visit at the Office of International Affairs with Prof. Suniti Phadke, Director, an old friend. It is one of three massive new buildings, dwarfing the garden-like old campus that was Christ College.

Christ College had metamorphosed into Christ University. The University Grants Commission (UGC) conferred Autonomy in October 2004; it was reaccredited with A+ by the National Assessment and Accreditation Council in May 2005; and, most important, granted "Deemed University" status in July 2008, freeing it from oversight by Bangalore University. "The Union Human Resources Development Ministry declared Christ

College as a Deemed to be University as Christ University on July 22, 2008 under UGC Act 1956.”<sup>4</sup>

Enrollment had more than doubled to 10,000 students, and Christ University now offers 35 undergraduate programs; 29 post-graduate programs; 17 M.Phil. and 16 Ph.D. programs. It is the pride of Bangalore, ranked among the Top Ten universities in India, and Number One in Bangalore in ratings by Indian magazines and papers such as *India Today*.<sup>5</sup>

The rise of CU emblematic of what has happened to Bangalore. Fifteen years ago Bangalore was just beginning to emerge as a hi-tech hub. One faculty member who taught computer science at Christ College was Mrs. Sudha Murthy; in 1998 she took me to meet her husband, Mr. N.R. Narayan Murthy, the founder-CEO of a computer service company named Infosys. He recounted how they'd used his wife's dowry of \$500 to help found the company in the early 1980s. By the 1990s Infosys served American clients fixing legacy programs and doing back-office work taking advantage of the 10½ hour time difference between the US and India. Narayan Murthy, who today is billionaire, is credited with inventing the IT outsourcing services model that became a huge success for India, and made Bangalore one of the world's up-and-coming cities.

Once on the edge of the city, with a dairy across the street, Christ University is now right in the “IT Corridor.” A city-block sized Oracle office building has sprouted next door, and another IT company is across from the main gate. The college wall fronting Hosur Road is gone, lost to a widening that added four lanes, and instead of meandering cows there is now horn-blaring traffic headed to Electronic City, anchored by the 40-acre campus of Infosys with more than 30,000 employees on-site (and 153,000 worldwide). A glitzy new mall with 100 stores has opened a few blocks from the university, as well as Manchester United-themed sports bar. Moving about town, I glimpsed the logos of IBM, GE, Honeywell, HP, and Cisco, as well as Wipro, India's other homegrown software giant. In the environs of Christ University, all that remains from the past is a Hindu temple on a black rock jutting into Hosur Road that forces traffic to squeeze around.

Christ University is India's first Catholic University. The crown jewel of the CMI order, like the Georgetown University for the Jesuits or the University of Notre Dame for the Congregation of the Holy Cross. Christ University's motto---“Excellence and Service”---defines its mission. Says Fr. Thomas, the University's Vice Chancellor: “We are committed to our motto of providing holistic education through the development of intellectual competence, personal, interpersonal, and societal skills. We want all of students irrespective of their nationality to grow and prosper in an environment of religious harmony and secularism, which are the core values of the country.”<sup>6</sup>

<sup>4</sup> [www.daijiworld.com](http://www.daijiworld.com), Sept 17, 2012

<sup>5</sup> <http://www.karnataka.com/education/ranking-2012/>

<sup>6</sup> [www.daijiworld.com](http://www.daijiworld.com), September 17, 2012

Under the dynamic leadership of Fr. Thomas, who was the new principal in 2004, and became Vice-Chancellor with University status, Christ University aims to become a world class educational institution. His aims include providing facilities comparable to the best educational institutions in the world, building a qualified faculty with exposure to international standards and practices, and attracting students from many different countries abroad. A special outreach targets NRI parents, who are looking for higher education with international standards but with an Indian cultural ethos. Wooing NRIs works: in 2010 Christ University enrolled 270 students from 37 countries.

When we met in January 2012, Vice-Chancellor Fr. Thomas C. Mathew stressed to me how important and special the WMU relationship has been for Christ University. It was their first international linkage, and through the 2+2 twinning arrangement, [then] Christ College made major changes in its curriculum, calendar, and faculty expectations:

- 1) Christ College changed all of its curricula from year long classes to semesters; it now operates on a two semester calendar.
- 2) adopted continuous assessment in place of the comprehensive final exam at the end of the year;
- 3) adopted grades and the G.P.A. (grade point average) to parallel the Indian system of “marks”, recording both on student transcripts; and
- 4) trained at least 35 faculty in the “American way” of higher education. Faculty learned to incorporate frequent assessment, and move beyond “chalk and talk” lectures to make use of team projects, group presentations, power-point shows, quizzes, and tests. Some traveled to Kalamazoo to meet the professors who wrote the syllabi, observe interactive classes and meet the professors who wrote the syllabi and taught the same courses.

Fr. Thomas said the American-model alternative from Western Michigan University helped the college’s application for autonomy from Bangalore University and ultimately was the “keystone” (his word) for its earning “deemed university” status in 2008.

Fr. Thomas also acknowledged that the benefits of working with an American university gave Christ College experience with international academic cooperation, and in the last 7 years it has developed an extensive array of partnerships including a cooperative MBA with Virginia Commonwealth University in Richmond, VA and a dual degree International MBA with the University of Applied Sciences in Wurzburg-Schweinfurt, Bavaria, Germany. Articulation arrangements have been developed with Griffith University in Australia 2+2; Liverpool Hope University, Sheffield Hallam University, and Swansea University, all in Britain; and the Catholic University of Lille’s School of Management, in Lille, France. Christ University created an India Gateway Program that attracts study abroad students from American and European colleges and universities.

Once Christ University could confer its own degrees, the 2+2 bachelors of business administration program that was the heart of the WMU-Christ University twinning program was no longer as attractive to large numbers of Indian students.

After 2008, Christ University adapted the core of the WMU-model Bachelors of Business Administration curriculum to build the foundation of its own 3-year BBA degree,

allowing the option of transferring overseas to continue for students who could leave after two years. The first class of the Christ University 3-year BBA started in 2008, and graduated in April 2011. Out of its 150 students, only about 10-12 planned to go abroad; the rest stayed in India. CU is now recruiting BBA classes of about 115, and Prof. Phadke estimates that 90% of these students will stay in India, satisfied with their 3 year BBA degree. That meant WMU would no longer be receiving transfer cohorts of 50 to 100 students, but rather a handful at most.

With its 15<sup>th</sup> anniversary this year (1997-2012), the twinning program between Christ College and Western Michigan University is now being phased out. It is being converted into articulation agreement that will facilitate transfer for Christ University students from the new 3-year BBA program as well as many other Christ University curricula. It will also facilitate study abroad opportunities, as well as faculty exchange and research activities.

WMU is very pleased to have received hundreds of students from Bangalore who started in the 2+2 program and graduated with WMU degrees. We are also delighted that the WMU linkage was the “keystone” of the college’s application for “deemed” University status, and that the new BBA founded on the WMU-model curriculum is ranked the Number One BBA program in all of India.<sup>7</sup>

## CONCLUSION

In the final analysis, the twinning programs WMU pioneered in Malaysia and India have proved the most successful “internationalization” initiatives in the University’s history. Between them, the Sunway College and Christ College programs enabled more than 3000 students from Malaysia and India to begin their educations at home and complete their degrees in America. In addition, these two twinning program attracted a much broader international enrollment, drawing students from all over Southeast Asia, e.g. Cambodia, Vietnam, Indonesia, from the Indian subcontinent e.g. Bangladesh, Nepal, and Sri Lanka, as well as the Indian Diaspora in the Persian Gulf and Africa.

WMU was the first international partner of Sunway College and Christ College. The twinning program was a foundation stone of their curricula, ultimately contributing to their rise to university status. The twinning model, pioneered in Kuala Lumpur and Bangalore, inspired emulation in each country and ultimately contributed to the “internationalization” of the higher education sectors in both countries.

The Sunway College-Western Michigan University Twinning Program was the first in Malaysia, and its success encouraged development of a vibrant private sector in education in Malaysia that now numbers over 20 private universities and 40 private colleges. Twinning has become the hallmark of Malaysian higher education. Today 80,000 foreign students from 100 countries are studying in Malaysia’s twinning programs

---

<sup>7</sup> <http://www.karnataka.com/education/ranking-2012/>

and 3+0 degree programs, making Malaysia the regional center for higher education in Southeast Asia.

The Christ College-WMU Twinning Program was also the trailblazer in India. It proved such a success that 100 “twinning programs” modeled on it are now a feature of India’s higher education scene. It opened the way for the development of a vibrant international education sector in India. Today, more than 340 institutes offer degree programs in collaboration with foreign providers.<sup>8</sup>

Looking back at the decade and a half of educational collaboration between Bangalore and Kalamazoo, connecting Karnataka and Michigan, linking India with America, the partnership forged between a small private religious college in south India and a large American Midwest public university has proved to be a “win-win” for all parties, opening the way for new forms of international education in India, and offering a microcosm of the globalization process connecting the south Asia, the U.S., and the world.

Abstracts

This study investigated teacher beliefs regarding learners, learning and teaching, classroom practices, competencies and adolescences as well as the translation of beliefs into their teaching practices. The researcher employed descriptive research survey and case study research design—exploratory and triangulation, which included lower secondary biology teachers (n=13) and students (n=543) for the surveys, selected biology teachers (n=8) for focus group discussion and selected teachers (n=4) for classroom observation from four selected lower secondary schools in Kandal province, Cambodia. Through the uses of five instruments such as LCBTS,LCBSS, COP, LP and FGD, teacher beliefs and the translation of beliefs into their practices were explored. The findings of this study showed that teacher beliefs regarding learners, learning and teaching, and classroom practices were learner centered; however, students perceiving about their teacher beliefs was moving toward learner centered approach. In contrast, teacher beliefs about competencies and adolescences were leaning toward learner centered. Although teachers believed in learner centeredness, the translation of beliefs into their teaching practices was not generally observed. It further explored the main challenges and constraints, which are the obstacles in the application of learner centered approach in their classroom. These observed constraints needs to be addressed in a strategic mean by looking to develop more teacher professional development trainings on learner-centered methodologies regarding learner centered methodology, content knowledge and other related practical factors.

## Background of the Study

Murdoch and Wilson (2008) indicated that building an effective learning community or one school is worthwhile and necessary for constructivist learning. In this regard, teachers and other relevant sectors within the community or organization have to assist students to function well in order to strengthen their understanding, thoughts, inquiries and performances more effective. Three components are involved in this process: (1) producing positive team spirit, (2) guiding students learn how to learn and (3) providing skill development. As the evidences, Wink (2000) recommended that learner-centered methodology, the patterns of collaborative and active learning pedagogies, is more effective than teacher-centered practice. Similarly, K-12 education has gradually changed from traditional instruction (teacher-centered approach) to learner-centered instruction (Cuban, 1993). These recent shifts have also influenced to Cambodian education system since teacher-centered approach was traditionally used in class.

Learner-centered methodology has been introduced to Cambodian education system when the new curriculum has been reformed with the cooperation of Ministry of Education Youth and Sport (MoEYS) and other partnerships with non-government organizations in 1997 (Veerle & Nelly, 2008). Active-learning and learner-centered practice is also employed as national educational reform efforts to promote the equitable, effective and efficient of teaching and learning for nation's students in Cambodia (Bunlay et al., 2010). Remarkably, some challenges and difficulties in the applications of learner-centered approach have been identified and categorized. Veerle and Nelly (2008) marked that there are some challenges to the application of learner-centered approach in the actual instruction such as lacks of communication between teachers and students, lacks of teaching and learning materials, lacks of content knowledge and resources to link the lesson learned to everyday life.

Isikoglu, Basturk and Karaca (2009) suggested that in-service teachers still have gap between teacher beliefs and practices. They prefer learner-centered approach in the curriculum, yet they cannot employ appropriately to the classroom. Teacher education and teaching experience also influenced on learner-centered beliefs. Recently, many efforts have been done around the world to turn out from the passive learning environment to active learning environment. It is a kind of modeling and patterning the active learning to students in order to improve and stimulate their high order thinking skills, knowledge and attitudes. As pointed out by Elkind (2004), the success of constructivist educational reform can be achieved only depending on three kinds of readiness in place: teacher, curricular and societal. To reflect on this issue, teacher education and teacher professional development is the mean to deal with reform of educational system more effective.

In the case of Cambodia, as mentioned learner-centered approach has been introduced for almost 13 years, rote learning is still remained in science classroom in Cambodia. In class, teachers only read from the textbooks and motivate the students to memorize what they said. Teachers rarely give opportunity to student to handle the hand-on activities and observe phenomena around them (VandeWalle et al., 2010). Some barriers are categorized in practicing learner-centered approach in Cambodia such as lack of content knowledge and access to resources, lack of methodological skills, curriculum and textbook related issues and problems related to incentives and national policy (VVOB, 2008). Recently, SEAL project from VVOB program has run from 2008 to 2013 focused on the capacity building and stimulating learner-centered approach in science education in Cambodia. The SEAL project has trained with one Regional Teacher Training College (RTTC) Kandal and four pilot schools (lower secondary level). The study of VandeWalle et al. (2010) focused on four

technical working groups of teacher trainers and teachers (one for physics, biology, chemistry and earth science) have been involved in SEAL project. Scientific reading skills, writing skills, low-cost experiments and hand-on activities to integrate the scientific method in science teaching have been introduced and trained to those participants during the 2008-2009 school year and learner-centered approach also discussed in the training itself and giving feedback from peer teaching and classroom observation.

Interestingly, since there is an intervention of SEAL project on four pilot schools focused on learner-centered approach and the introduction of learner-centered approach many years, it will be useful to assess and explore the teacher beliefs and practices on learner-centeredness of public secondary schools in Cambodia. Indeed, there is very few literature and assessment of this application and how teacher believe and understand about this approach; therefore, it is necessary to look into the real applications and their understanding of this approach in order to improve and develop teaching and learning more effective. To address and assess these constraints, this study intends to examine the beliefs and practices on learner-centeredness and its challenges behind the actual instruction of lower secondary school biology teachers in the context of Cambodia.

The concept of belief in this study is described as teacher beliefs on learners, learning, teaching, adolescence, and their perceptions about classroom practice itself. The constructivist learning theory have been influenced, by various teaching methods for decades, which defined learning as an “active process that learners are active sense makers who try to construct coherent and organized knowledge by themselves” (Mayer, 2004, p.14). This theory plays as a main source for the development of learner-centered approaches (Hannafin, Hill & Land, 1997). In addition to this, Cannon and Newble (2000) described learner-centered approach as the means of thinking about teaching and learning which pays more attention on learners responsibilities, activities and tasks in learning environment than the content of the unit itself or what teachers are teaching.

To emphasize on the learner-centered approaches, several teaching methods have been developed on the student's behavior activities (Baeten et al., 2010; Mayer, 2004) including: problem-based learning (Dochy et al., 2003), self-activating teaching methods (Struyven et al., 2006), discovery learning (Mayer, 2004), powerful learning environments (De Corte, 2000), minimal guidance approach (Kirschner, Sweller & Clark, 2006), open-ended learning environments (Hannafin et al., 1997), case-based learning (Ellis, Marcus & Taylor, 2005) collaborative/cooperative learning (Slavin, 1995) and project-based learning (Dekeyser & Baert, 1999).

The framework of this investigation is conceptualized based on the light of the literature and related studies about learner-centered principles, teaching environment and practices. Based on APA (1997), Weimer (2002), O' Sullivan (2004), Mtika and Gates (2010), Mansour (2009) and Schuh (2004), the learner-centered principle, teaching environment and practice are explored. It implies that learner-centeredness can be observed via teachers' understanding and beliefs in learner-centered principles, teaching environment and practices. In this position, what teachers' beliefs in learner-centered principles, teaching environment and practice will be observed in actual instruction.

This study aimed to examine teacher beliefs and practices on learner-centeredness and the motivations in the actual instruction of lower secondary biology teachers in the context of Cambodia. Specifically, this research intended: (1) to investigate the learner-centered beliefs of lower secondary biology teachers; (2) to probe the translation of learner-centered beliefs of lower secondary biology teachers into their teaching practice; (3) to explore the motivations of lower secondary biology

teachers on learner-centered approach to their teaching practices; (4) to examine the challenges that lower secondary biology teachers face in the application of learner-centered approach in classroom in the context of Cambodia.

The following research questions were sought in the responses of this study:

1. What are the beliefs of lower secondary biology teachers regarding:
  - a. learners, learning and teaching?
  - b. classroom practices?
  - c. competencies?
  - d. adolescence?
2. How do lower secondary biology teachers translate their beliefs into classroom teaching?

### **Significance of the Study**

The result of this study provided empirical study and preliminary literatures about teacher beliefs and practices on learner-centeredness and the motivations behind of lower secondary biology teachers in Cambodia. Remarkably, the learner-centered batteries that were utilized in this study could be a self-assessment of lower secondary biology teachers about their teaching environment. It was also the crucial assessment for Cambodian Ministry of Education Youth and Sports (MoEYS) as well as other science education projects to reconsider the effectiveness of their introduction of learner-centered approach into the curriculum. Interestingly, some challenges and solutions to address the teacher beliefs and practice on learner-centeredness were identified in this study via teacher focus group discussion about the application of learner-centered approach to their biology teaching practice prospectively; therefore, it could be a significant guide and indicator for MoEYS and other international agencies to improve both pre-service teacher and in-service teacher education program as well as the quality of education improvement and development in Cambodia. Furthermore, this study can served as an avenue to reveal the perceptions of teachers and students about their teaching and learning environment. In this manner, this could stimulate biology teachers to recognize their student perceptions on what the tasks and activities that he/she have employed in the classroom. It could make this possible to improve the quality of teaching by teachers themselves, particularly in the application of learner-centered approach.

Moreover, the findings of this study revealed more insights into the true beliefs and challenges of the applications of learner-centered approach into teaching biology environment. It also provided national directions to reconsider the teaching methods that need to be developed/ reformed in various topics in biology education curriculum upon the identification of the challenges in the application of learner-centered approach as well as other science subjects in secondary schools. In this sense, MoEYS were seriously considered strengthening the quality of science education, specifically in biology education based on the results of this study. Significantly, the results of this research could be recognized by biology teachers themselves to develop and improve their teaching methods in different contexts of the topic itself.

### **Methodology**

Descriptive research survey and case study methods,—exploratory and triangulation, was utilized to in this research design. According to Yin (2009), the current research design is described as mixed methods—a case study within a survey. He also claims that one of the entities being survey may be investigated by case study. In the case of this current investigation, 4 case studies of 4 selected

teachers were used to identify the translation of beliefs into their teaching practice. Five tools were employed to accomplish the objectives of this study including: (1) learner-centered battery teacher survey (LCBTS), (2) learner-centered battery student survey (LCBSS), (3) teacher focus group discussion (FGD), (4) lesson plan (LP) and (5) classroom observation protocol (COP). LCBTS was administered and collected from lower secondary biology teachers from the four selected schools and LCBSS was administered to lower secondary school students from the selected schools taught by selected teachers. LP was collected and classroom observation was conducted within selected biology teachers from those schools by using COP. In this study, a total number of 13 lower secondary biology teachers participated in this research after data collection and 543 students from four selected schools were involved.

## **Data Analysis**

All the data were analyzed and interpreted quantitatively and qualitatively. Results of LCBTS and LCBSS were analyzed by using descriptive statistic. For the analysis of LCBTS, mean of each item was calculated and then the 4 categories of LCBTS survey were also identified by summing up mean of the items in each category as well as sub-categories. Similar to the analysis of LCBTS, the mean score of LCBSS were also calculated of all items. Since the mean of all categories had been calculated in both LCBTS and LCBSS, the comparison between category of LCBTS about teacher perceptions of classroom practice and the category of LCBSS about student perceptions of classroom practice were compared to view the relationship with each other. The audio-tape of teacher focus group discussion (FGD) was transcribed and synthesized to reveal and prevail the presently themes/ideas. Lesson plans (PL) were described about the format, and compare between their intended teaching practices and their actual classroom teaching. COP was collated by describing the classroom performance from the beginning to the end of the class. For the total rating scale sections, mean and standard deviation were calculated. Indeed, to interpret the gathered data, it was assumed that the mean score of each item equaled to 1 to 3 was meant to be less learner-centered, and the mean score of each item equaled to 3 to 5 was meant to be more learner-centered.

## **Results and Discussion**

### **In response to research question number 1: Teachers' Beliefs**

Results of this study suggested several distinctions of teacher beliefs regarding learners, learning and teaching, classroom practices, competencies and adolescences as well as the translation of teacher beliefs into their teaching practice.

By utilizing LCBTS, LCBSS and FGD, teacher beliefs regarding to learners, learning and teaching of this study were revealed to be leaning toward learner centered perspective. Although the teacher respondents were of various educational backgrounds and teaching experiences, they rewarded strong beliefs on learners, learning and teaching within the constructivist philosophy.

Similarly, triangulation of LCBTS, LCTSS and FGD on teacher beliefs regarding classroom practices implied that the teachers were moving toward learner centered environments. Although teachers believed about learner centered practices in their classroom (LCBTS and FGD), student perceptions about their teachers' classroom practices were just leaning toward learner centered (LCBSS).

The findings, furthermore, revealed that teacher beliefs about competencies and adolescences were leaning toward learner centered perspective. Teacher beliefs about competencies were learning toward learner centered (LCBTS, COP) while FGD revealed that teachers strongly believed in competencies to be effective application of LCA. Although teachers' responses from LCBTS were just leaning toward learner centered, the other two (LCBSS and FGD) were learner centered on adolescences. It significantly suggested that the levels of teacher beliefs about their classroom practices were not exactly observed in the same way by their students.

Teacher beliefs regarding learners, learning and teaching suggested to be learner centered, which revealed by LCBTS and FGD as shown the result section. However, LCBSS demonstrated that students perceived their teachers' beliefs about learners, learning and teaching just leaning toward learner centered. In addition, teacher beliefs regarding classroom practices were revealed as learner centered beliefs from their responses in the LCBTS and FGD. In contrast, LCBSS, students observed that their teachers' classroom practices were moving toward the use of learner centered approach in teaching. Remarkably, teachers strongly believed that learner centered approach may definitely enhance the instruction. Although teachers strongly stated that learner centered approach can improve the instruction, lacks of knowledge about LCA pedagogy may lead to the instruction to be ineffective and cosmetic. Therefore, the task of LCA provided to the class is just in the sake of engaging students in activities and output was not evident.

On the teacher beliefs regarding competencies, results indicated that teachers were seemingly starting to perceive their learner centered beliefs. In the LCBTS and FGD, teachers believed that their competency in biology is necessary for the effectiveness of LCA application. Results seen suggested that effectiveness of LCA application require competence in the subject matters among the teachers. Similarly, teacher beliefs on adolescences were leaning toward learner centeredness. It emphasized that learners' age may be easily to get influenced and impacted by their peers. It further revealed that the development of student as early adolescences is empowered and impacted by their surroundings, particularly teachers as guides, mentors and facilitators.

### **In response to research question number 2: Teachers' Translation**

There were various backgrounds of teacher respondents. Indeed, the four selected teachers for classroom observation were also differences in term of educational background and their teaching experience. As seen in the results on the contextual background and activities in the classes, each teacher was observed and remarked differently.

T<sub>A</sub> was considered as the most effective in her teaching performance and she also applied learner centered approach in her practices. As shown in her backgrounds, she has been trained many times in trainings/workshops related to LCM. Therefore, she can perform much better by applying her subject matter and pedagogical knowledge to her actual practices. In contrast, T<sub>B</sub> was assumed to be the least effective teacher in applying learner centered approach in the teaching practice. Although she had attended many workshops/trainings, she tended to apply only on the sake of the activities. It seems like what she has learned from the workshops/trainings cannot be applied to her practices. It seems she learns nothing from the trainings/workshops or she has other constraints during her actual performance.

T<sub>C</sub> and T<sub>D</sub> were considered as average teaching performance. These two teachers have only attended 1 or 2 times LCM trainings/workshops as well as some pedagogical knowledge from pedagogical

school. However, they can engage and coach students to be more into learner centered environment based on the classroom observation. More importantly, their teaching practice appeared to be more teacher centered, yet there are some activities that made her class look like learner centered. This result can be inferred that even in teacher centered classroom, learner centered activities also embedded in it. The findings revealed that the formal structure of classroom instructional strategy look is teacher-centered; however, learner-centeredness is embedded into the teacher-centered practice.

The findings on the translation of teacher respondent beliefs into their teaching practices are not regularly observed in learner centered practices. Only one selected teacher applied learner centered approach in her teaching practices. However, all the teachers strongly believed in the effectiveness of LCA application in enhancing instruction. They understand well about learner centered approach, yet they do not generally apply it due to the some constraints and challenges in LCA application. The findings on the translation of teacher beliefs into their classroom practice were seemingly less learner centered in their classes (COP). However, teacher participants believed in the effectiveness of LCA application in enhancing instruction (FGD and LP). They clearly understood about learner centered approach, yet they do not generally apply due to the some constraints and challenges in LCA application.

Interestingly, based on the final capsules of teaching quality, it revealed that although some teachers tended to apply teacher centered approach, the actual classroom seemed to be more effective in terms of promoting students' understanding. It can synthesize that what teacher respondents believed about learner centered approach is inconsistent to their teaching practices due to some crucial challenges in their present schools. Observably, the more structure to prescribed lesson plan format, the less learner-centeredness in their practice. Indeed, the more involvements to professional development program regarding learner centered methodology, the more effective in learner centered practice. Lastly, the analysis revealed that the translation of teacher respondents into their teaching practices was not consistent with what they believed in LCA.

Teacher beliefs, teaching practices and the constraints of LCA application were finally investigated in this study. It can be said that since teachers have strongly beliefs in the application of LCA in enhancing their instructions, the main constraints and challenges were the most difficult obstacles to address in the context of this study. The constraints and challenges that teachers faced in their schools were (1) classroom management, (2) lacks of teaching materials (textbooks), (3) class size (40-50 students), (4) time limitation (spend more times and the lesson is too lengthy), (6) lacks of experiment materials (no laboratory and materials), (7) lacks of professional development on LCA, (8) limited competency on the subject matter (not enough resource materials) and (9) low salary. Finally, teachers provided some valuable ideas in addressing the constraints and challenges they faced as seen in the result section.

The translation of teacher beliefs into their teaching practices of this investigation revealed that teachers did not generally apply learner centered approach in their classroom. Learner centered practice may be applied only if there are availability of resources and times. Although teacher beliefs were learner centered (LP, FGD), the translation of their beliefs cannot perfectly accomplish and achieve in their actual teaching practices (COP). In the case of this study, learner centered classroom was observed only from one of the 4 selected teachers. Remarkably, it seemed clear that teachers who often attend learner centered approach trainings/workshops perform much better than those who

rarely attend. Most importantly, the observed challenges and constraints may be the main obstacles that lead learner centered environment disappeared/ invisible in this study context.

Centered on the discussion and interpretation of data, it finally concluded that teacher participants in this study have strong motivation in promoting learner centered approach in their classes. However, their motivation was seemingly down due to the main constraints and challenges.

### **Recommendations and Implication**

The findings and the conclusions of this investigation paved the way to the recommendations and implications in both practice and research.

Practically, the instruments such as LCBTS and LCBSS that were used in this study could be considered as assessment tools for K-12 teachers and administrators to be more reflective and aware of their basic beliefs and assumptions about learners, learning and teaching, the relationship of these beliefs to their school and classroom practices, from their own and their students' perspectives and the impact of these practices on student motivation learning and academic achievement (McCombs, Lauer and Peralez, 1997). In addition to these 2 instruments, COP that was used as classroom observation checklist to evaluate and assess the actual teacher teaching practices should be further used to capture the actual teaching both pre-service and in-service teachers in terms of assessing the learner centered application in classroom practices.

The findings of this research provided more insight into teacher beliefs regarding learners, learning and teaching, classroom practices, competencies and adolescences as well as the translation of their beliefs into practices. Teacher educators can utilize this information to address more on their beliefs in order to produce effective classroom practices in the manner of LCA application. Significantly, the outcomes of this investigation also revealed that there were gaps between teacher beliefs and their teaching practices. Therefore, teachers, school principals, education department, ministry of education and other NGOs intervention should take into their considerations because there is a need or room to fulfill, improve and develop the gaps in the ways of LCA application. Interestingly, the observed challenges and constraints toward the difficulties in application of learner-centered approach should be extensively taken into account and addressed with the possible solutions. Specifically, professional incentives (salary or bonuses) should be promoted and increased to encourage and motivate teacher's work rather than let them find second job for their livings which also lead teaching quality to be ineffective.

This suggested that there should be crucial stages to promote the constructive changes such as the articulation of learner-centered approach needs to be simply and clearly employed to all levels, and the mechanisms of the reforms/changes of education system is needed to inform to all relevant sectors/stakeholders. These can be the preliminary sources for MoEYS and NGOs to build up and strengthen the teaching and learning quality in learner-centered environment by providing more professional development trainings/workshops. The results of this study also prevailed to teacher education institutes/center to pay more attention to the curriculum particularly on pedagogical content knowledge (learner-centered approach). Teacher education center should consider and integrate learner-centered principles, learner centered environment and learner centered practices to the curriculum in order to develop and improve pre service teachers to be more confident in all the aspects of learner-centered approach. This could be the mean to build up true beliefs in learner-centered approach.

Furthermore, the findings regarding teacher competencies were noticed to be limited. It is therefore necessary for ministry of education or regional teacher training centers (RTTCs) to take into consideration to reinforce teachers' educational background regarding their subject competencies. In this case, content knowledge is needed aside from training in pedagogy that is given to lower secondary teachers. Ministry of Education and RTTCs should consider another year focusing only on content knowledge in addition to two-year training program to being lower secondary school teachers. This could be the best means to strengthen and empower lower secondary teachers to be more competent in their specialization or subject matter.

From a research perspective, although the study only gathered from biology teachers (n=13) in 4 selected lower secondary schools in Kandal province, Cambodia and students (n=543) in the responses to the selected teachers, it clearly revealed the nature of beliefs and their practices in this specific area. It cannot be generalized beyond this. However, it is a core preliminary source for further study and consideration of educational system reform. Since the current study chose only 13 biology teachers in lower secondary schools, it suggested that larger samples. Or further research should be extended to other subjects (chemistry, earth science, physics and mathematics) to commonly generalize to the whole population in lower or upper secondary schools in science education or as a whole.

Since the introduction of LCA in Cambodia has been officially applied almost 7 years (Benveniste, Marshall & Araujo, 2008), the current study prevailed that teacher beliefs and practices of learner centered approach was not cohesive to one another in the context biology teacher at lower secondary school levels. From these finding, it can lead to further research on whether Cambodia is already well-prepared toward the learner centered approach or the readiness of educational sectors on the LCA application classroom practices. It finally proved that teacher participants have motivations in the application of LCA in their classroom; however, the motivation is not really strong enough to achieve due to the constraints and challenges that prevailed above.

Abstracts

Education is the corner stone of modern human civilization. Today, knowledge is considered as a valuable asset, and the process of learning plays an important role in shaping knowledge. Thus, the need to improve the delivery of information must be satisfied since people go hungrier for more knowledge.

This study explored the potential of a learning style-driven e-learning system to help learners. This undertaking was accomplished by determining the learning style model to identify the learning style of learners; determining the learning style model tool to classify the learners based on their learning style; identifying the features of the proposed learning style-driven e-learning so it can adapt to the learning style of learners; and, determining the benefits of using the learning style-driven e-learning.

Data as basis for identifying the learning style model, appropriate learning style model tool, features of the proposed learning style-driven e-learning system and benefits of using the learning style-driven e-learning were gathered from graduating Bachelor of Science in Elementary Education and Bachelor of Science in Secondary Education students, review of published papers, and by pilot testing the developed learning style-driven e-learning system to elementary pupils. During the testing, two groups of learners were identified. The first group proceeded with the traditional classroom setup and the second group used the developed learning style-driven e-learning system.

At the end, the researchers' proved that a learning style-driven e-learning system is a tool in the learning process similarly with the traditional classroom learning.

## INTRODUCTION

Cabrera, Sangra, and Vlachopoulos (2012) stated that the merging of information and communication technology, computer science and pedagogy culminated to the birth of the 21<sup>st</sup> century educational system. They also mentioned that this dynamic educational system resulted to the use of e-learning as one way to deliver knowledge and learn today. In the study by Li, Lau, and Dharmendran (2009), “e-learning is the delivery of a learning, training or education program by electronic means”.

It is evident that today institutions around the world are using technology in the delivery of knowledge to learners. E-Learning as most call it is indeed used both inside and outside the classroom. Formal and informal learning as part of lifelong learning are taking advantage of what technology can offer.

In one study (Watanabe, 2005), e-learning can be used in three categories: type I, students learn and are graded solely through the use of e-learning; type II, students learn and are graded through e-learning and the usual teacher-student interaction; and type III, students learn and are graded by the usual teacher-student interaction with the use of e-learning as supplement. The study concluded that type III is the expected model of e-learning to succeed since it meets the needs of most learners and educational institutions. The study showed the high need of educational institutions to implement the type III e-learning.

Using e-learning as a supplement to the traditional teacher-student interaction help insure that learners are given every opportunity to learn whether inside or outside the classroom. E-learning systems are not bound by the usual constraints of the classroom such as time and space. Though it is still evident that most learners are able to learn well through the guidance of educators, the fact that e-learning is playing an important role to learners of this generation cannot be ignored.

Kannine (2008), studied the importance of learning styles in learning. It was showed that creating e-learning systems must consider the learning style of learners. E-learning systems must be able to cater the learning needs of all learners. This is why planning is important in the creation of e-learning systems. Studying and learning the different learning style models and tools are also needed to identify the suitable models and tools to effectively classify learners. The study concluded the need of e-learning systems that are able to cater different learners by identifying the suitable mode of presenting learning materials. Further, this can be achieved through the merging of e-learning systems and learning styles.

The ability of e-learning systems to cater learners with different learning styles insure that all learners are benefited. It must be noted that unlike the traditional classroom setting where the educator may arrange and accommodate learners needs the e-learning setup is only limited to what are provided by the designers and developers.

In a paper (Manohehr, 2006), the use of learning styles in the traditional classroom setting does not have high impact on the performance of learners. It was showed that learning styles are much applicable to learners in an e-learning setup. The paper concluded that in order for learners to maximize learning through the use of e-learning systems, these e-learning systems must be able

to adapt and cater to the learning needs of learners. This leads to the need of learning styles in the design and development of e-learning systems.

Learning styles show that each learner has a different way to learn and that most learners do not learn the same way as the others. Lane (2000) stated that “all students learn differently due to dominant or preferred Learning Style”. Felder and Henriques (1995) stated that students learn in the form of seeing and hearing; reflecting and acting; reasoning logically and intuitively; and, memorizing and visualizing. While all of these are true, learning style is viewed in a way that a learner has a dominant learning style that enables the learner to digest any information with ease. Fu (2009) stated that “students learn in many ways like seeing, hearing and experiencing things first hand”. Furthermore, Fu said that “but for most students, one of these methods stands out”. Fu believed that students have different learning styles and that every student has a dominant learning preference.

In a paper (Dunn & Dunn, 1978), learning styles have models where each model points out different ways on how learning is affected. These models suggest different learning styles that different learners possess. Some suggest environmental issues, attitudes, personalities, experiences, brain division, own preferences, and ones senses.

There are indeed numerous studies that support the need of designing and developing e-learning systems that are able to cater different learners. These learners are able to maximize the use of e-learning systems if these e-learning systems are able to present the appropriate learning materials to the learners. This is where learning styles would prove useful.

This study generally explored the design and development of a learning style-driven e-learning system. It covered learning styles, learning style models, and adaptive e-learning system. This undertaking was accomplished by (1) determining the learning style model to identify the learning style of learners; (2) determining the learning style model tool to classify the learners; (3) identifying the features of the proposed learning style-driven e-learning so it can adapt to the learning style of learners; and, (4) determining if using the learning style-driven e-learning helped learners.

## **METHODS**

Determining the learning style model to identify the learning style of learners was done by floating questionnaires among 68 Bachelor in Elementary Education (BEED) and Bachelor of Secondary Education (BSED) practicum students of the University of the Cordilleras at Baguio City, Philippines. The questionnaire assessed the knowledge of the respondents on learning style models. Assessing their knowledge would show if they are qualified to determine the appropriate learning style model to identify the learning style of learners. The questionnaire then inquired the appropriate learning style model to be used to determine the learning style of learners. This was done by showing a list of the common and widely used learning style models from published studies.

After determining the appropriate learning style model, review of literature was done to determine the learning style model tool to classify the learners. The learning style model tool of

the identified learning style model to classify learners was based on common and widely used tools of published studies. These published studies used the identified learning style model tool.

The features of the learning style-driven e-learning so it can adapt to the learning style of the learners were based on the features of common e-learning systems and other e-learning systems that consider the needs of learners. Some of these e-learning systems are available over the Internet, some are used in the University of the respondents, and e-learning system projects of students of the respondents' University. Features that allow the learning style-driven e-learning to determine the learning style of learners and present the appropriate learning materials based on the identified learning style were then determined.

The learning style-driven e-learning was pilot tested among 104 fourth and fifth grade pupils of La Trinidad Nazarene Learning Center at La Trinidad, Benguet, Philippines. The pupils were presented a sixth grade lesson on Science and Technology based on the actual lesson plan of one of the Science and Technology faculty of the school. Two groups with 52 randomly identified students each were created. The first group was asked to stay in a lecture room and the pupils were presented the lesson using the traditional classroom setting. A special education faculty from another school was asked to present the lesson using the different learning styles based on the identified learning style model. The pupils on the first group were presented the lesson using all the different sets of learning materials. On the other hand, the pupils on the second group were left at the computer laboratory room of the school and were supervised by the school's computer teacher and the researchers. Unlike the first group, the pupils on the second group were presented the lesson using the learning materials that are appropriate to their learning styles. No faculty intervened with the students of the second group during the pilot testing. The pupils on both groups were also asked to take a pre test and a post test before and after the class. The results of the pre test and post test of the two groups were used to determine whether pupils on each group learned or not. Using a one-tailed dependent t-test, the researchers identified whether the knowledge of students in each group increased or not.

## **RESULTS and DISCUSSIONS**

The questionnaire revealed that all the BEED and BSSED students were all knowledgeable on the concepts of learning styles and learning styles models. Of the 68 respondents, 24 have high understanding on learning style and learning style models, 40 of the respondents have moderate understanding on learning style and learning style models, and 4 are familiar with learning style and learning style models. It was fortunate that nobody from the respondents was unfamiliar with learning style and learning style models.

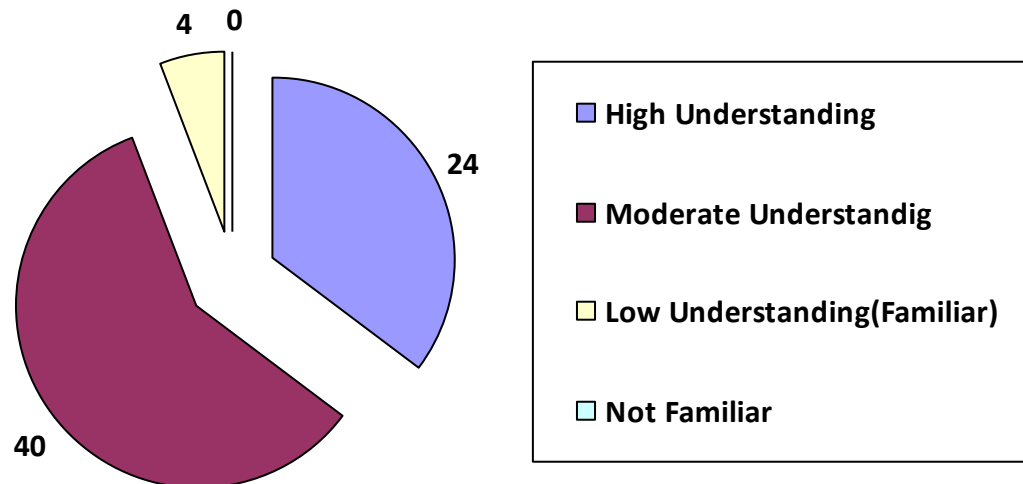

Figure 1: Understanding of BEED and BSED Practicum Students on Learning Style and Learning Style Models

After determining that the respondents are all familiar with learning style and learning style models, the respondents identified the appropriate learning style model to classify learners. The result shows that 55 of the respondents recommends the VAK Learning Style Model as the appropriate learning style model to determine the learning style of learners. 7 of the respondents recommends the Kolb's Learning Style Model. The Dunn and Dunn Learning Style Model was recommended by three of the respondents. The Grasha and Reichman Learning Style Model was recommended by one respondent. The Honey and Mumford Learning Style Model was recommended by one respondent. Another respondent recommended the MBTI Learning Style Model. No one from the respondents recommended other learning style models.

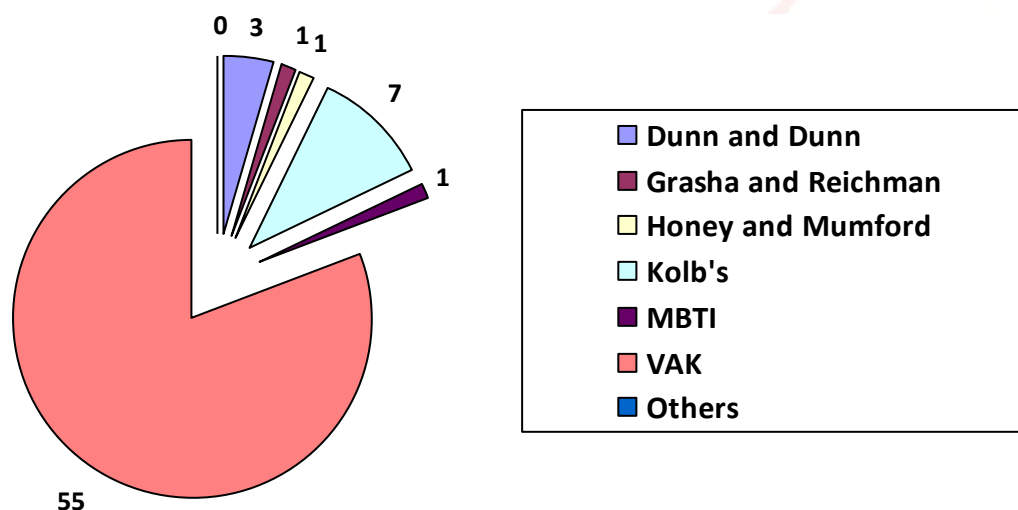

Figure 2: Appropriate Learning Style Model to Classify Learners

Examining published studies that used VAK Learning Style Model resulted to the use of the VAK Learning Style Self Assessment Questionnaire. This VAK Learning Style Model was developed by Victoria Chislett and Alan Chapman. This self-test is composed of 30 multiple choice questions. The choices for each questions corresponds to one of the three learning styles according to the VAK Learning Style Model. Fu (2009) used this questionnaire in his study entitled “A Study of Learning Styles, Teaching Styles and Vocabulary Teaching Strategies in Chinese Primary School — How Do They Differ and How Can They Be Integrated?”. Hamtini, Al Fayez, & Ahmad (2011) used this questionnaire in their case study entitled “An Adaptive e-Learning Hypermedia System for Teaching Entity-Relationship Diagrams: a Case Study”. Deeb & Bin Hassan (2011) wrote a research entitled “Towards Designing E-learning Materials based on Multi Learner’s Styles” used the same questionnaire developed by Chislett and Chapman.

The learning style-driven e-learning has four identified main features. These features include: classifying learners according to their learning style; presenting the appropriate learning materials for each type of learner; and, assessing the learner’s improvements through pre tests and post tests. To determine the learners’ learning style, the system provides first time users a learning style assessment questionnaire. After a user logs-on to the system, first time users will be assessed using the VAK learning style self assessment questionnaire, this will be their first experience on the system. In the assessment, 30 questions are needed to be answered so that the system can determine the learners’ learning style. After answering all questions, the system will then classify each learner accordingly. The system is designed, following the mechanics of the VAK learning style self assessment questionnaire to cluster each learner into three types: visual learners, auditory learners and kinesthetic learners. The system’s next job after determining the learning style of each learner is to provide appropriate learning materials. Learners classified as visual learners are provided with learning materials that depicts a lesson through images, texts, graphs, charts, illustrations and videos. Auditory learners are provided with learning materials that utilizes sounds and videos that simulates lectures. Kinesthetic learners are provided with learning materials that depicts a lesson through games and puzzles to simulate hands-on learning. The first assessment or pre test is taken before taking the provided lesson. This is to check if the target population has a background on the topic to be presented. The second assessment or post test is taken after finishing the provided lesson.

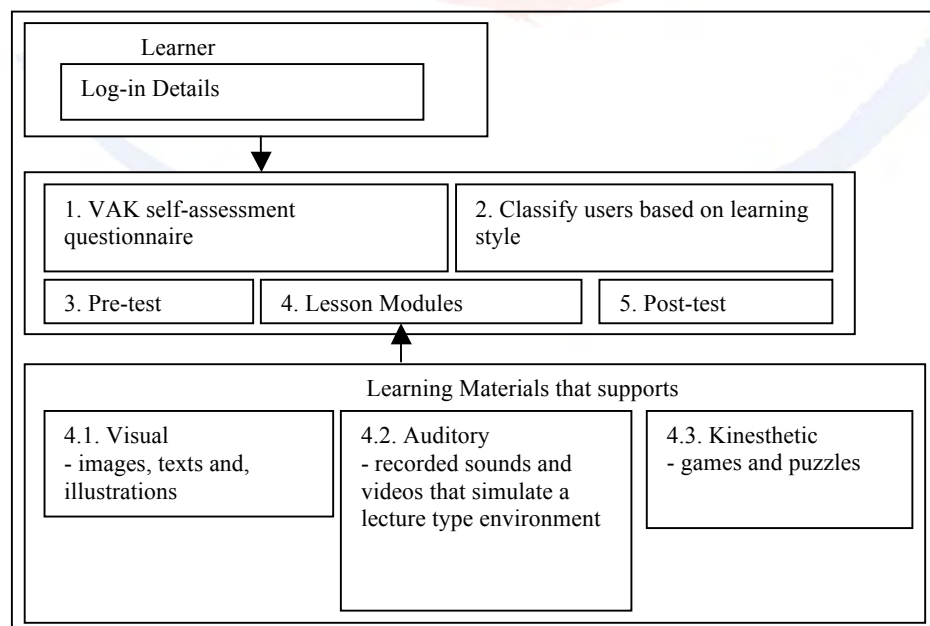

Figure 3: Framework showing the logical structure of the Learning Style Driven E-Learning System

The pre test and post test of the two groups of pupils resulted to rejecting the null hypotheses of the study for the first and second groups. It was found that the knowledge of students on the first group increased as well as the knowledge of the students on the second group. The table below shows the pre test and post test score of the pupils on both groups.

Group	Average Pre Test Score	Average Post Test Score
Classroom Group (1 <sup>st</sup> )	6 out of 20 points	18 out of 20 points
E-Learning Group (2 <sup>nd</sup> )	4 out of 20 points	15 out of 20 points

Table 1: Average Pre Test and Post Test of the Test Groups

It should however be noted that some observations may have affected the results of the study. For the first group, the group that did the traditional classroom setting, it should be emphasized that the pupils were all presented the same lesson three times using the learning materials for the three types of learners according to the VAK Model. While the pupils for the second group, the group that used the learning style-driven e-learning, were presented the lesson once using the appropriate learning materials according to the VAK Model. It should also be recognized that the students on the first group were facilitated by a faculty member, therefore the usual classroom atmosphere and rules were observed. On the other hand, the students on the second group were not facilitated by a teacher and were left to study and learn on their own. The computer teacher and the researchers simply facilitated the use of the computer and the learning style-driven e-learning.

## CONCLUSIONS

An existing learning style model can be used to assess learners and be able to provide them the appropriate learning materials. It should also be noted that the concepts of learning styles and learning style models are not new to educators.

To effectively use these learning style models appropriate learning style model tools must be used. These tools are used to classify the learners in order to identify the appropriate learning material for specific learners. The use of learning style models would not be effective without successfully classifying the learners using the learning style model tools.

E-learning systems can be designed and develop in order for it to be able to cater to the learning needs of learners with different learning styles. These adaptive e-learning systems can identify the learning style of individual learners and use the information to present the appropriate learning materials for the learners.

Students can improve their knowledge by studying and using learning materials that are appropriate to their learning style. This is true whether the learner is in the traditional classroom setting or in an e-learning environment.

## **FUTURE WORKS**

Validity may be strengthened by testing the learning style-driven e-learning on other set of populations. Cultural background, age group, and technological knowledge may be considered. Testing the learning-style driven e-learning for different subject matters should also be considered. It should be noted that there are subjects that could be best presented using limited learning materials only.

Implementing the learning style-driven e-learning on a mobile platform should also be taken into consideration. Looking at learners today, most of them are already engaged in the use of these mobile devices.

It may also be interesting to study the effect of implementing and observing the traditional classroom setting rules on the conduct of classes while using the learning style-driven e-learning. It may be that the system is capable of implementing these rules and facilitate the entire class or a faculty member still be present to facilitate the class.

Official Conference Proceedings 2012

Abstracts

The purpose of the study was to explore the implementation of school-based management in selected public primary schools in Cambodia with an emphasis on the rationales, devolution of decision making authority and challenges emerged. The study utilized multiple case study design which was grounded on triangulation as a data collection method. A total of 45 respondents who are principals, teachers, school support committees, the parents and community members from three public primary schools in different districts in Kampot province engaged in the study. The findings demonstrated various roles of the stakeholders in initiating and implementing school-based management centrally and locally. Participatory decision making approach has promoted the participation of key local stakeholders in decision making. The findings highlighted that the success of school-based management in Cambodia is particularly determined by principal leadership, the active participation of the local stakeholders and direct support from non-government organizations. The study concluded that to successfully accomplish the indicated objectives of school-based management, clear framework of policies, standards and accountabilities should be developed and greater autonomy should be decentralized to the school stakeholders. Leadership and management preparation or systematic professional development should be provided to school principals to help them acquire necessary skills and knowledge to implement the program effectively and more active involvement of relevant stakeholders would be ensured.

## 1. Introduction

Because of the recent challenges, complexities and competition caused by the innovation of technology and science, political and economical transition and societal change, schools are required to be more transparent, accountable and efficient. School governance and decision making needs to be changed to respond to the pressures (Sackney and Dibsiki, 1995). Greater decision making authority is devolved to local education stakeholders including school principals, teachers, parents and community members to determine the strategy that best meets the needs of the children (Gamge and Zajda, 2009). This new reform strategy is called school-based management which school operation lies in the hand of local stakeholders, but they have to comply with the centrally indicated framework, policies or regulations (Caldwell, 2005).

Even though school-based management has been established since the 1960s, only recently has it become the centrepiece of the current wave of education reform (Sackney and Diski, 1995). With technical and financial support from the World Bank, Cambodia has introduced school-based management program known as Education Quality Improvement Project (EQIP) since 1998 (World Bank, 1999). The primary aim of the program was to enhance the quality of basic education through “participative decision making approach”. The program furthermore sought to improve planning and resource allocation of scarce resources (Pellini, 2007) and to reduce the cost burden on the poorest families in order to decrease the dropout of the children in basic education. Shoraku (2008) noted that the program has made significant contribution to achieve Education For All (EFA) and Millennium Development Goals (MDG) for education in Cambodia.

Despite the wide practice of school-based management in Cambodia, the coordinated national decentralized policy of school-based management is not clearly defined. The decision-making authority transferred from the central government to the school level remains ambiguous and the involvement of the local stakeholders in decision making is uncertain (Samith, 2003). This ambiguity leads to a downside of school-based management and unlikely produces its potentials (Wohlstetter and Odden, 1992). In addition, misunderstanding and tensions between the central level and local level likely happen. Chapman (2002) stressed that when lines of responsibility and authority for education management are confusing; weak and poor management of education possibly arises.

## 2. Literature Review

### 2.1. School-Based Management

School-based management is a wide education reform strategy among policy makers globally. The definition of school-based management varies across countries particularly based on the nature and goal of the program (Caldwell, 2009), influenced by culture and political context (Gamage and Zajda 2009, p. 4). Sackney and Dibsiki (1995) viewed school-based management as a “proposal to decentralize and de-bureaucratize school control” in terms of shared decision making, involving parents and other stakeholders (p. 30). School-based management can also be defined as a form of decentralization by putting primacy on the individual schools that function to constantly improve and sustain the school effectiveness and efficiency within a given decision making authority and responsibility (Malen et al, 1990, p. 290). According to the expert of school-based management, Caldwell (2009), “school-based management in a system of public education is the systematic and consistent decentralization to the school level of authority and responsibility to make decisions on significant matters related to school operations within a centrally determined framework of goals, policies, curriculum, standards, and accountabilities” (p. 55).

The literature has demonstrated that school-based management has been a global education reform strategy driven by several shared reasons (Grauwe, 2005). The first reason is that school-based management is evident to show democracy in which teachers and parents are given space to participate in decision making process. The second supportive reason proves school-based management to respond to the needs of local stakeholders. While authority for decision making is closer to the local people, the addressed can be met better. The third reason is that school-based management reduces the practice of bureaucracy in the system. Problems can be solved quickly among local stakeholders. Finally, school-based management allows for greater accountability by giving schools and teachers greater authority held directly to parents and the community.

Because of the positive impacts of school-based management, many countries around the globe especially Asia and Pacific region have implemented various school-based management programs. School-based management in Hong Kong under the name of School Management Initiative (SIM), for instance, was introduced in 1991. It was aimed to improve quality of education by encouraging the participation of all concerned stakeholders (Wong, 2003). The program in addition promoted a quality culture, emphasizing on learner-centred, school-based and accountable strategy (Gamage and Zajda, 2009). In practice, schools were allowed to flexibly utilize the necessary resources and to clarify the functions and responsibilities for the delivery of education (Huen, 2003).

In an attempt to improve quality of education and country's competitiveness, Thai government decentralized decision-making power over fiscal management, personnel management, utilization of resources monitoring and evaluation of the administrators to school board to take control over school management (Gamage and Zajda, 2009). The school board which is comprised of 7-15 members among of whom are teachers, parents, local community members, local authorities and alumni not exceeding two from each group, relying upon the school size was created to take over school operation (Gamage and Sooksomchitra, 2004; Santibanez, 2006).

In 2001, Indonesia introduced school-based management nationwide, mainly focused on four aspects namely quality, equality, relevance and efficiency (Shoraku, 2008). Several approaches have been implemented to achieve the indicated desires. School approach placed more autonomy to the school principals while community approach connected both school and local community which in turn made significant contribution to the success of school management and student achievement (Indriyanto, 2003).

The practice of school-based management in the Philippines was intended to improve shared governance, democratic decision making, accountability and transparency and communication among the stakeholders (Guzman, 2003). The central and regional levels devolve the authority for decision-making to school divisions in the provinces and municipalities among of which share educational responsibilities with relevant stakeholders such as local government units (LGUs) and parent-teacher associations (PTAs).

The extant literature not only indicates the driving forces of school-based management, but also explains the general aims of school-based management. Although there have been various school-based management programs influenced by cultural, social and political factors (Santibanez, 2006), they may fall under any of the following aims which are (1) to involve parents and communities in schools; (2) to empower school administrators and teachers; (3) to build local level capacity; (4) to create accountability mechanisms for site-based agents and to improve the transparency of process by decentralization of authority; and (5) to enhance quality and efficiency of schooling which in turn raise learning quality (Gertler et al, 2007).

## *2.2. Decision-Making Authority in School-Based Management*

The general principle of school-based management is that the authority for decision-making is shifted from the central government to the school level accordingly, made up of school principals, teachers, parents, in some case student and school community members (Barrera-Orsorio et al, 2009; Cheng and Chan, 2000; Santibanez, 2006). However, these stakeholders with devolved decision making power have to comply with a set of framework, policies or regulations indicated by the central government (Caldwell, 2005, 2009; Grauwe, 2005).

In general, the areas of decision making shifted to the school level vary, specifically based on the nature of the program, political and cultural context. Interestingly, in the review of various aspects for which responsibility and authority for decision- making decentralized to schools in different countries, Di Gropello, (2006) drew some practical aspects of decision making authority shifted to the school level stakeholders namely (1) personnel management, (2) instructional management, (3), budget management (4) maintenance and infrastructure, and (5) monitoring and evaluation.

The review indicated that power for making decision over personnel management which transferred to the school level people include establishing incentives for teaching and non-teaching staff, recruiting and appointing teaching and administrative staff, monitoring and evaluating personnel, and funding professional development (Gamage, 2008; Gamage and Zajda, 2009; Herman and Herman, 1994; Nir and Miran, 2006). In Thailand, decision making over professional development for teachers and administrative staff has been empowered to manage at school levels (Gamage and Sooksomchitra, 2004). The principals can fund teachers for further professional advancement and supervise and evaluate them.

According to Di Gropello (2006), instructional area is primarily concerned with “setting classroom hours by subject, selecting textbooks/curriculum, setting the method of instruction, and setting the school calendar”. Besides, Herman and Herman (1994) indicated that it is furthermore associated with determination of curriculum, testing and assessment procedures, student grading procedures. For example, the school principals in Taiwan (Lo and Gu, 2008), Hong Kong, Japan (Cheng and Chan, 2000; Huen, 2003), South Africa, Thailand, and Spain (Gamage and Zajda, 2009) are empowered to develop their own teaching-learning environment relevant to their needs and to supervise and evaluate the instruction- process of teaching and learning. Chapman (2002) supported that the school principals are empowered to supervise and monitor the teaching-learning process in the schools. School principals are therefore seen to have significant capacity to enrich the quality of teaching and learning (Grauwe, 2005).

The study explains that the budget management is more focused on overseeing budget, allocating budget, and establishing school fees (Di Gropello, 2006). In more details, Herman and Herman (1994) specified the coverage of this area by including three main sub-areas namely determination of employee salaries; construction of building budget; and determination of expenditures of building budget such as supplies, equipment, staff development, co-curricular activities, maintenance, transportation, and food service. In some countries such as Hong Kong, Thailand, South Africa (Gamage and Zajda, 2009) and Israel (Gaziel, 1998; Nir and Miran, 2006), budget allocation is made the school level and approved by the school governing body.

In the study of the budget resources of Israeli schools, Nir and Miran (2006) found two main issues involving in the budget dimension which affects the equity. The first issue is concerned with the distribution of budget from central government to school. The budget distribution is computed based on the population of students locating in the schools. Generally, schools with bigger population can increase the budget whereas smaller schools are unlikely to increase. It therefore negatively affects the pedagogical practice. The second issue is that giving schools permission to

receive resources autonomously which may negatively impact the vertical equity among schools in considering the differences in their assumed ability to obtained resources form self-generated sources.

The existing literature has presented that the decision making authority over maintenance and infrastructure is the responsibility of school level stakeholders who have to ensure that school building and environment are safe and friendly for student learning (Di Gropello, 2006). This usually include the areas of building or maintaining school and buying school materials In New Zealand, the school council made up of principals, teachers, parents, community and students can decide which type of infrastructure is established to help student learn better (Gamage and Zajda, 2009).

In the aspect of monitoring and evaluation, the school level people have been empowered to make decision over two main aspects namely administrative and pedagogical activities (Di Gropello, 2006), more specifically staff, instruction, budget, curriculum and infrastructure (Gamage and Zajda, 2009). In general, the principals hold significant domination over the decision making in the area of monitoring and evaluation that can be found in many countries which implement school-based management program.

Herman and Herman (1994) suggested that policy area should be made at school level. In this sense, the schools should be allowed to determine the building policies related to students, employees, and other matters which can be differed from the district or provincial policies. For example, in Australia, school level is allowed to set its own policies which suit the school while schools in Spain can develop the rules and regulations for organizing school (Gamage and Zajda, 2009).

In summary, the focal practice of school-based management is the shift of authority for decision making from the central government to the local stakeholders namely principals, teachers, school board or school support council, parents, the community members and sometimes students. The general decision making authorities decentralized to the school are personnel management, budget management, instructional management, maintenance and infrastructure, policy development and monitoring and evaluation.

### **3. School- Based Management in Cambodia**

The contemporary education in Cambodia has commenced after the collapse of Khmer Rouge regime in 1979 (Chhin and Dy, 2009, p.113). All social infrastructures were immediately reconstructed and education development has been put bold emphasis. The then education system was shortened to a 10-year education system made up of four years of primary education, three years of lower secondary education and three years of upper secondary education to meet the urgent needs. The Ministry of Education, Youth and Sport (MoEYS) later added one more year to primary education to improve quality of education system. This education system was widely practiced from 1986 to 1996 (Pellini, 2007). An updated twelve-year education system containing six years of primary education, three years of lower secondary education and three years of upper secondary education has been nationwide implemented since 1996. The new system increased number of teaching and learning hours across all grade levels.

With strong and continuous commitment of the MoEYS with regard to improving educational sector, the MoEYS introduced school-based management known as the Education Quality Improvement Project (EQIP) in 1998, financially and technically supported by the Wold Bank (World Bank, 1999). The overall goal of the program was to establish and implement a “participatory approach to school quality improvement and performance-based resource management” (Benvensite and Marshall, 2007; World Bank, 1999, 2004). The participatory

approach specifically involved two beneficiaries. The primary beneficiaries of the grant were students and their families, teachers, and school directors, functioning as collaborators in developing quality improvement grants. Other stakeholders including the MoEYS personnel at national level, provincial and district level, NGOs, and other donors functioned as consultative role through National Committee on Effective Schooling and support to provincial management (World Bank, 1999).

The project principally encompassed two objectives. The first objective is that all concerned schools should progressively display characteristics of effective schools which ultimately demonstrate improvements in student enrolment, attendance, student flows and achievements. The experience learned from the practices served as valuable sources to notify sector-wide policies to enhance teacher motivation, cost efficiency in education, reduce recurrence and dropout and expand the time available for teaching and learning (World Bank, 1999, 2004).

In practice, school clusters were developed to identify problems and solutions in their own schools and in the development of cluster improvement plans to be used as the basis for preparing grant proposals. A school cluster grant program was initiated in Takeo province in 1998 with a pilot group of ten clusters and later expanded to include around 1,000 schools in three provinces between 1998 and 2004 (World Bank, 2004, 1999). A school cluster is a group of school geographically situated near each other that can provide mutual technical and material assistance to make teaching and learning more effective (Marshall, 2004; Pellini, 2007).

The evidence has shown that the MoEYS has been in the process of decentralization of education by devolving closer decision-making authority and responsibility to local education stakeholders. However, little is known about the actual implementation of school-based management at school level. The national decentralized strategies or policies of school-based management regarding decision making authority and school autonomy are not clearly defined. The knowledge gap what is actually happening at school levels will hamper our ability to help those stakeholders effectively implement the program.

#### **4. Statement of the Problem**

The study therefore sought to explore the implementation of school-based management in selected public primary schools in Cambodia. The study was aimed to establish the framework of school-based management in the selected public primary schools by examining (1) reasons for implementing SBM; (2) operational aspects of SBM; and (3) challenges in SBM.

Specifically, the research attempted to answer the following questions:

1. Why do schools engage in School-Based Management?
2. How are school-based management aspects operated in terms of decision making authority and participation of the stakeholders including principals, teachers, parents and community members?
3. What challenges do they confront in the implantation of School-Based Management?

#### **5. Method**

##### *5.1. Research Design*

The study is a qualitative case study which is essentially based on the Multiple Case Study Method expounded by Robert Yin (2003). According to Yin (2003), case study is “an empirical inquiry that investigates contemporary phenomenon within its real life context, especially when the boundaries between phenomenon and context are not clearly evident; and in which multiple sources of evidence are used” (p. 13). The author further explains that a case study inquiry relies on multiple sources with data needing to converge in a triangular fashion.

## 5.2. *Participants*

Grounded on purposive and convenient sampling techniques, forty five participants including six principals, twenty-one teachers (teaching and non-teaching), nine school support committee and nine parents of the students and the community members from three public primary schools in Kampot province, Cambodia were included in the study. The participating schools were selected on the following criterion. The schools (1) were established practitioners of school-based management accord to the Ministry of Education, Youth and Sports; (2) had been practicing school-based management for at least five years; (3) contained large number of teaching and non-teaching staff and students; (4) were considered as outstanding and effective schools in the implementation of SBM and (5) were convenient for the researcher to conduct the study. Based on the indicated criterion, two public primary schools located in different districts were chosen.

The key respondents were chosen based on the following conditions. The principals and teachers (teaching and non-teaching) must have a minimum of five years service in the school across grade levels. The school support committee members included in the study must have at least three years of experience in the school. The parents and community members selected for the study must have active participation in school activities. The parents referred to the parents who have child/children enrolled in the school while the community members are whoever lived in the community and participated in school. They all should be available during the conduct of the study. The participants were selected with the specified minimum years of experience because they likely knew better about the practice of school based management as well as school history. To protect the confidentiality of each school in the study, the researcher employed code names- A, B and C to represent the participating schools.

## 5.3. *Instruments*

The instruments utilized in the current case study were mainly bounded on the triangulation method which included (1) interview, (2) internal documents and (3) data from parents and government. In-depth interview was the primary tool used to gather more comprehensive information of the study. The in-depth interview allowed the researcher to learn more about the facts and opinions of the events of the respondents. The researcher applied informal interview with director of district of education office and deputy director of provincial education office to further explore their perception of school-based management. The recoding tools were very significant for interview and transcription stages. In the context of this study, an audio-tape was mainly used to record the interview script appropriately.

According to Yin (2009), documents become the most important sources in the case studies. The documents are helpful in verifying the correct spellings and titles or names of organizations that might have mentioned in the interview and provide other specific details to corroborate information from other sources. The documents are therefore stable, obstructive, exact and broad coverage. In this study, the researcher gathered letters, memoranda, agendas, announcements, minutes of meetings and other written reports, administrative documents, formal studies or evaluation of the same case and news clippings from the schools for analysis and validation.

For validation purpose, the researcher carefully collected the data from parents and School Support Committee through interview to support the result of the study. The researcher approached various concerned government organizations to obtain some necessary documents regarding with the examination. For sure, the researcher visited the Ministry of Education, Youth and Sport (MoEYS), provincial education offices and district education offices to receive some related documents of school-based management.

#### 5.4. Data Analysis

The data obtained from the interviews, other related documents were analyzed into two main stages. The first stage was called within case analysis or single case analysis which was the process of studying the data of each individual case. In this stage, the data was processed, managed and transcribed into master units. The researcher therefore conducted critical reading of interview transcript, notes, documents, and other important materials. The researcher examined the emergent concepts and clustered them accordingly. The second stage was called cross case analysis which was used to compare and contrast the data in every single case. In this phase, the researcher established the patterns from all cases about the current practice of school-based management in Cambodian public schools.

### 6. Findings and Discussion

#### 6.1. Rationales of School-Based Management

The introduction of school-based management in the selected public primary schools in Cambodia is not different from what Grauwe (2005) identifies as influenced by the internal (national political reform, policies and strategy) and the external (international development agencies and education experts). The Ministry of Education, Youth and Sport (MoEYS) has shown commitment in improving education sector through various education reform initiatives. As evident, Education Strategic Plan (ESP) 2006-2010 and 2009-2013, originally established in 2000 emphasizes three key aspects: (1) equitable access to education services; (2) quality and efficiency of education services and (3) institutional development and capacity building for decentralization. The education reform has begun with technical and financial assistance from various international agencies. The World Bank and Asian Development Bank have played important role in supporting the process of education policy formulation. However, these organizations have no any direct influence or involvement at school level in which the SBM has been practiced.

The joint efforts of the government and international development communities have brought various school-based management programs which include Education Quality Improvement Project, Priority Action Program and Program-Based Budget in 2001-2003, 2001-2006 and 2007 respectively. The implementation of school-based management has thus far aimed to (1) improve quality education by making necessary instructional materials available at schools; (2) to expand access to education by eliminating start-school fee year policies; (3) to promote the participatory decision making approach by delegating decision-making authorities to various local stakeholders and (4) to increase the efficiency and effectiveness of budget management at schools.

In the practice of school-based management, the participatory decision making approach has been encouraged through the establishment of School Support Committee which has brought relevant key local stakeholders together. All schools have the School Support Committee which is composed of (1) a representative of local authorities at village or commune level or head of monk; (2) school principal; (3) one community representative who is admirable and charismatic; (4) one member of parent association; (5) one accountant (elected from among members); (6) one treasurer (elected from among members) and one secretary (elected from among members). The functions and roles of the committee include (1) enhancing the enrolment of children through education campaign and encouragement of parents; (2) taking part in revenue mobilization and budget through school development plan; (3) improving school maintenance and property; (4) involving in school construction and repair through fund raising and engaging parents; (5) preventing irregularities inside and outside the school; (6) participating in school planning and implementation and (7) monitoring student learning through community-parent meeting.

As described by Grauwe (2005) that the participative decision making approach has promoted the concept of democracy among local stakeholders as they become participative in school development. The current study particularly supports the importance that community members and parents have been more involved in the school activities. The participation of these stakeholders signifies a characteristic of decentralized education system which has appealed the public and research support school management (Gamage and Zajda, 2009, p.3). It becomes noticeable that non-governmental organizations have played very important roles to support the school development and management through technical and financial assistance. For example, Volunteer Service Overseas, Non-Governmental Organization Educational Partnership, TIMA, SAWA, World Education and SVA have supported in the areas of school environment (building playground and gardens), life skill program and training, teaching and learning materials, and extra-curricular activities (sports).

The extent to which the School Support Committee, parents and community members and non-governmental organizations take part in school development characterizes the uniqueness of the participating schools. The school with active involvement of the School Support Committee, parents and the community as well as direct technical and financial assistance from various non-governmental organizations proves better improvement in environment and infrastructure, instructional materials and staff involvement while the school with less or no direct support seems to have minimal improvement. The study indicates that in order to demand involvement and direct support from the organizations, strong school leadership is especially crucial as addressed by Grauwe (2005) that the principal capacity and leadership style is significantly related to quality of education and school improvement. He added that the principals engage the community in school activities and get them to understand the situation, constantly building trust.

The findings especially demonstrated that the relation between school-based management and access to education, environment and infrastructure and instructional materials among participating schools. Access to education has been significantly expanded since the implementation of school-based management. The enrolment rate in the participating schools has considerably progressed to slightly over 90 per cent. The education statistics and indicators of MoEYS identified that there was a considerable increase in enrolment rate in primary school from 77.8 per cent to 92.1 per cent between the 1996/1997 and 2006/2007 respectively (Chhin and Dy, 2009, p. 117). Also, school environment becomes safe and friendly. It becomes evident that instructional materials are more available to support the process of teaching and learning at schools. The development of necessary teaching and learning materials has been made at school cluster which is a group of schools geographically located near each other in the same community and works to address the priorities for school development. In practice, teachers in the cluster assemble to design some important materials accordingly and exchange in the cluster.

## *6.2. Operational Aspects of School-Based Management*

The transfer of decision making authority from central government to school level decision makers is very fundamental in the practice of school-based management as a way to accomplish the desired objectives in education. A special attempt therefore was made in this study to examine various decision making authorities and responsibilities that are devolved to local education stakeholders and the extent to which those people take part in the decision making process.

The findings demonstrated a similar practice of school-based management defined by Caldwell (2005) that school-based management in a system of public education is the systematic and consistent delegation of authority and responsibility from higher education level to the school level to decide on day-to-day school operation by complying with an indicated framework of goals,

policies, curriculum, standards, and accountabilities (p.55). In this study, the extent to which power for each decision making area devolved to the school level people differs accordingly.

One of many decision making authorities transferred to the school level stakeholders is planning and development. The principals and teachers reported that they have greater power to decide on what should be the agenda of the school operational plan and how this should be implemented. As indicated by the respondents that there are several regular meetings held at the beginning of the academic year that the principals, teachers and SSC assemble to develop the school plan by integrating the ideas collected from the participants, aligning them to the national education policies. Those stakeholders are free to go for their school vision-mission, structure, and date of various meetings grounded on their decision agreed by the participants. The findings are to some extent consistent with the suggestion by Herman and Herman (1994) that the local stakeholders should be allowed to make decision over the establishment of regulations related to students, employee, and other matters that differ from the given set of guidelines, but are relevant to the needs and practicalities of the context.

The quality of learning greatly depends on the relevance of the curriculum and quality of instructional preparation and the degree of decision making given on how the instruction should be designed to assist the students learn productively. The findings indicated that even though the teachers have to use the curriculum designed by the MoEYS, they have been empowered to review and adjust the curriculum to the needs and relevance of the student. However, a few teachers went through the review and many of them mentioned the limited knowledge of the curriculum, time constraints and shortage of necessary resources. As reported by the teachers that some of the lessons and learning activities are not relevant to the needs of the children in the schools that the flexibility of choosing new learning lessons related to the interests and needs of the learners needs to be made. In addition, it becomes observable that the teachers have been empowered to develop necessary instructional materials, use transformative teaching approach, conduct classroom assessment, design extra-curricular activities and set flexible timetable for learning. Many elements mentioned by Di Gropello (2006) and Herman and Herman (1994) have emerged in the study, except the selection of textbook and curriculum which is decided by the MoEYS.

The successful implementation of school management is driven by how the human resources or the personnel are placed to fit the school vision-mission, school structure and their expertise in the field. The findings presented that authority for decision making on personnel management and mobilization transferred to the principals remain weak. The principals claimed that they have no power to recruit or fire any staff in the school, but mobilize them as posted by the provincial office of education in accordance with needs of the school. The principals have been empowered to assign task and responsibility for teaching and non-teaching staff based on their expertise and to nominate the staff for promotion and award. The findings seemed contrary to what Di Gropello (2006) found in the practice of school-based management that the establishment of incentives for staff, recruitment and appointment of teaching and non-teaching staff, staff performance appraisal and funding professional development are made at school stakeholders.

The findings indicated that the distribution of the budget known as Program-Based Budget to the schools is mainly computed on the population of the students regardless of school size, location, and needs. It is no doubt that the schools with larger population likely receive greater amount of budget whereas the schools with smaller population receive less budget. In other words, greater amount of budget may make considerable progress to the schools because their needs are better met. The main issue in budget management is that the budget allocation is centrally pre-determined and allocated into various codes and sub-codes leaving the school stakeholders minimal room to make decision but to comply with. This is contrary to the findings by De Gropello (2006) that the budget management is made by the location education stakeholders so that their needs are fulfilled. In

addition, the principals and teachers mentioned that the budget usually arrives irregularly that some activities and programs are delayed. The study moreover found out that supplementary budget is contributed by donors, generous people in the community and parents of the students.

The decision making authority over school environment and infrastructure has been greatly empowered to the local school stakeholders. It was agreed that there has been significant improvement of both classroom environment and around school environment. All participating schools have good learning classrooms which are well-designed with friendly atmosphere. Also, the school buildings have been established and renovated to provide safe and healthy learning space for learners and this eventually promotes student learning quality. It becomes noticeable that the schools surrounded by community that is supportive and participative as well as assistance from non-governmental organizations make better progress in terms of school infrastructure. The results seemed to put more emphasis on the leadership of school principals.

Even though the study revealed that the authority for decision making over school assessment and evaluation which include instructional and non-instructional staff and budget expenditure, there has been little preparation and training organized for the principals. This new responsibility demands necessary skills and ability to effectively assess and evaluate. As indicated by the school principals that they have confronted administrative and pedagogical constraints which they have never experienced and they have received very minimal training. Noticeably, the school principals reported that they did not receive any school leadership and management preparation prior to their posting and minimal support has been provided to them when a new program is introduced. This has presented that the government failed to address the actual obstacles challenged by the principals and teachers to carry out the missions.

The findings evidenced that with the transferred authorities for decision making, the degree of participation of local school stakeholders significantly varies. The principals play the leading role and responsibility in all aspects of school decision making. The teachers have most authority and responsibility on teaching and learning, planning and development as well as environment. The School Support Committee representatives, usually the director, have been empowered to take part in some aspects of school operation including planning and development, budget management and maintenance and infrastructure. The issue on the participation of SSC in school decision making is that many of them do not have the knowledge of school management and they seem to rely the principals and teachers to decide. For schools in which SSC representatives are knowledgeable about school management, the participation would be better. The parents do not have any participation in school decision making process, but they have taken part in various school activities such as opening school ceremony, fund raising, teacher-parent meeting, and awarding ceremony at schools.

In order to better understand the participation of school stakeholders in school management, it is good to learn the models of school-based management developed by Leithwood and Menzies (1998) who categorized four models of SBM. The first model is known as administrative-control SBM in which the principals take most control and participation in the school operation. This is expected to improve the efficient expenditure. Second is professional-control SBM in which the teachers are given most participation and control over school operation in order to promote efficiency and effectiveness of teaching. Third is community-control SBM in which the parents and community dominantly control the school governance. It is believed that the parents and community have better understanding of the school operation. The last model is called balanced-control SBM in which the teachers and the parents and community have equal participation and authority to make decision over school management.

It becomes obvious that professional-control SBM, community-control SBM and balanced-control SBM can make better use of teachers' knowledge in decision-making and it in turn enhances the

accountability to parents and community. In this study, there seems to be a mixed approach of school-based management. In principal, the participatory decision making approach which engages the principals, teachers, SSC members, parents and community in the school management is encouraged in the participating schools. However, the principals are the main decision makers who usually take most control over staff management and monitoring and evaluation, leaving marginal gap for the teachers and SSC members to make decision. Cheng and Chan (2000) noted that administrative control SBM has been adopted by many principals in Hong Kong. These principals actually do not decentralize the authority and responsibility power over the utilization of the resources to teachers and parents.

### *6.3. Challenges in School-Based Management*

The results of this study showed that several challenges have emerged in the practice of school-based management. First, even though the participation of teachers, School Support Committee and parents is perceived to have increased, it remains low. The principals indicated that it is sometimes difficult to get teachers and especially School Support Committee involved in school management though they all had agreed earlier. In addition, the knowledge and understanding of those people on school management is questionable and they seem to rely on the principals to decide whatever decision. For example, the representatives of School Support Committee acknowledged that some school management aspects are tough to understand and they would leave this to the principals to take control. The principals also acknowledged that they have difficulty in dealing with this new responsibility. They were not familiar with the program and orientation was not organized that they had to go through error and trial along the way.

Pre-determined guidelines which leave minimal space for the school to take part are considered as a big challenge. The evidence demonstrated that the school stakeholders find very minimal room to decide on budget management as the Ministry has already set the code and sub-codes how the budget should be allocated. As expressed by the principals and teachers that the budget given does not meet their needs and priorities because the Ministry has already determined the budget allocation. In addition, teaching and learning resources to support the process of instruction seem limited that the teachers have minimal flexibility to adjust the curriculum and other instructional materials to meet the needs of learners. It not only relates to the matter of minimal decision making over curriculum but also the availability of necessary teaching and learning resources to support the teaching-learning process. The findings indicated that many students still do not have enough textbooks and supplementary learning materials to use while the shortage of instructional materials becomes problematic.

Culture and religion is found to have impact on the implementation of school-based management in two participating schools in which there is a mix of both Buddhist and Muslim students. The school principals and teachers sometimes find it more challenging to invite the parents of those children to participate in school activities. Moreover, Muslim students are sometime absent from classes due to religious practices and some of them especially girls drop out of school because their parents do not allow them to continue due to the religion practice.

## **7. Conclusion**

In exploring the implementation of school-based management in public primary schools in Cambodia, the study addressed the interrelationship among key stakeholders from the central level and school level. The central government represented by the Ministry of Education Youth and Sport works closely with the international development agencies to initiate the policies and framework of school-based management. The Ministry directly impacts the practice of school-based management at school level by providing technical and financial support and delegates

various decision making authorities to the local stakeholders to take over school operation. At school level, the success of the school-based management lies in the hand of the school stakeholders comprised of principals, teachers, School Support Committee and parents. The participatory decision making has been encouraged with the lead of school principals who work to ensure the participation of relevant stakeholders in school management. The involvement of local community and non-governmental organizations is perceived to have influenced the success of school management. The practice of school-based management is believed to have improved the concept of transparency and accountability in education.

The results of this study coupled with the extant literature of the field have drawn several major recommendations that should be taken into account for the progress of school-based management in Cambodia. First, it is recommended that framework of goals, policies, curriculum, standards, and accountabilities of school-based management should be clearly developed to guide the local education stakeholders in the implementation of the program. The legal guidance should provide greater authority and power to make decision making over school management school level people who are believed to have known the needs of learners better and been able to design more responsive strategies. The power for decision making over budget management, personnel management and the flexibility to adjust the instructional materials and curriculum should be greater devolved to those local people.

Second, leadership and management preparation for school people, especially school principals should be conducted. More responsibilities have been transferred to school people, especially school principals and transparency and accountabilities are expected from them, but minimal support has been available. This has put many school principals in hot spot in which many problems have appeared without any appropriate solutions. In this regard, the school principals need to be equipped with necessary skills and knowledge through pre-service and in-service training.

Third, a more participative decision making approach at school level should be enhanced. It has noted that the participation of teachers and School Support Committee in school management remain low. In this regard, the principals with the devolved power have to ensure that the teachers and School Support Committee are engaged in school management by reserving more space for them. In order for them to have a better understanding of school management and especially newly introduced program, orientation and workshop should be organized for them so that they would have a better awareness of the situation and prepared for the involvement.

## **Acknowledgement**

The authors would like to thank and acknowledge Asia Pacific Scholarship Consortium for providing financial support for this research and Open Society Foundations for the financial support to present the paper at ACE 2012. Also, acknowledgement goes to faculty members of Education Department, De La Salle University-Manila, the Philippines for comments and feedbacks on the study.

Abstracts

The study sought to ascertain the perceived level of importance and perceived level of satisfaction of college students on 16 student services commonly provided in a tertiary education setting within any University which include a) University Instruction, b) University Admission, c) Guidance Office, d) Accounting Services, e) Dean's Office, f) Bookstore, g) Library, h) Canteen Services, i) Computer Laboratory, j) Science Laboratory, k) Student Affairs Office, l) Campus Security, m) Clinic, n) Janitorial Services, o) Audiovisual Services and p) Overall Campus Facilities. The study was furthered by identifying specific services among the 16 listed student services that serve as determinants to a learning-friendly school environment in the tertiary level on the basis of an existing significant relationship on the perceived level of importance and perceived level of satisfaction of students on indicators embedded along the 16 student services identified. Item analysis was conducted on the services identified as determinants to a learning-friendly school environment to determine the items that serve as the specific determinants to a learning-friendly school environment on the basis of student satisfaction. The research was conducted with 399 students enrolled in Saint Louis University distributed in accordance to the population distribution of students in the different colleges within the said University.

[www.iafor.org](http://www.iafor.org)

The 21<sup>st</sup> Century Educational Goals suggest a reconstruction on the different educational principles which to a degree of urgency include citizenship preparation, inclusion, and creation of an optimum learning environment (Laguardia and Pearl, 2009). While citizenship preparation is to be more of an outside-school concern, Inclusion and the Creation of an Optimum Learning Environment are the core focus of any educational institution for that matter.

Inclusion is defined as the approach whereby students with disabilities receive all instruction in a general education classroom while support services, like specialists, are expected to come to the student (Hardman, Drew & Egan, 2006) while the Learning Environment, which serves as the subject of this research, pertains to any formal or non-formal setting where students gain knowledge and skills to be used in their daily lives such that it may take form of schools, colleges, cultural centers, hobby centers and social clubs from which definition extends from the confined idea of buildings, infrastructures and machineries to the quality of service and efficacy of workforce inside an educational institution (UNESCO).

As inferred from different researches that were conducted, the learning environment is composed of 4 particular elements: Teacher-Student Relationship, Atmosphere of Inclusion, School Facilities and Services, and School Departments and Bureaucracies (Coll and Draves, 2009; Laguardia and Pearl, 2009; Stebleton, Huesman and Kuzhabekova, 2010; Roberts and Styron, 2009; Johnson, 1997; Umbach and Porter, 2002).

Additional feature of the 21<sup>st</sup> Century Educational goals is the promotion of learner-friendly school environments which is determined by the evident existence and interplay of the 4 elements of the learning environment which implies the full-scale existence of all student services in the learning environment (Gulosino and Lubienski, 2011).

In the Philippines, it is a normative practice by most Colleges and Universities to assess one variable of the learning environment, which is instruction, and make this as the sole basis in improving the learning environment. Moreover, national citations, accreditations and civil service examination passing rates are perceived as the basis of the effectiveness of the school environment in promoting learning to the students (Corpus, 2003).

However, these traditional practices of assessing the learning environment of a school are seen futile as these undermine the importance of direct understanding of the working system of the learning environment. The dangerous side encountered in such techniques of assessing the learning environment includes the ability to prepare and improve the learning environment before accrediting agencies, civil service examinations and categorical citations come into event.

This kind of scenario doesn't exempt that locale of this study, Saint Louis University, from the roster of Philippine Colleges and Universities practicing such. As far as status quo is concerned, the only area of the learning environment that students have a direct say is the time when students get to assess their instructors using a standard test that rates their teaching methods and strategies, instruction and attitudes towards the student and the subject. While for the other three areas identified, a clear and systematic student feedback is not solicited, hence, one can say that no particular improvements are done in the other components of the learning environment in basis of students' perceptions.

Hence, it is suggested that students are the best evaluator of the learning environment as students are knowledgeable with the daily transactions happening inside the school. Moreover, due to the students' direct encounter of the learning environment, no form of preparation can alter the working knowledge of the students with regard the school environment such that feedback of students on their learning environment is seen as more reliable and more authentic.

With the existence of myriad theories on the psychology of satisfaction, the necessary task to fulfill is to identify the theories of satisfaction and to narrow down roster of options and to scrutinize on these theories which fit best under well established criteria of relativity, interconnectedness and function correlation.

Following the said consideration, the theories that were adopted in this research includes the S-O-R Theory, the Satiation Cycle and the Theory proposed by Vohs and Baumeister.

The Stimulus-Organism-Response Theory incorporates the value of the individual variables of organisms, like one's personal beliefs and idea, cognition and emotion, in terms of receiving, processing and responding to certain stimulus (Algharabat, 2007) —this form of belief is called introspective or subjective psychology of satisfaction.

As for the Satiation Cycle and the theory by Vohs and Baumeister, both speaks of satisfaction as a correlated function with motivation except that the former espouses an indirect relationship between motivation and satisfaction as rooted on its target which is the short run event of things while the latter speaks of a direct relationship between the two on the basis of the long run effects of things (Vohs and Baumeister, 2008).

Having been able to identify the components of the aforementioned theories, a hybrid concept is constructed identifying the S-O-R theory as the guiding structure of the event of satisfaction and the satiation theory and Vohs-Baumeister theory as the working components which describes the psychological process of satisfaction in this way: there is an existence of a clear desire, which extends to the development of a motivation, and there exist to be a stimulus in the environment from which, a reconciliation of event happens and so if the stimulus fits the desire then satisfaction occurs and if otherwise happens, then dissatisfaction comes into event.

In the context of education, the stimulus is identified as the learning environment which comprises the different student services meaning the basis of educational satisfaction is the degree to which the learning environment provides viable and complete services to students.

Since educational satisfaction centers on the quality of services provided by the school and that the measuring stick identified is level of satisfaction students have on these service, it is only but proper to identify the different considerations students have in identifying a satisfactory forms of services.

This can be done by examining Maslow's Hierarchy of Needs, the Valence Variables of Gender, Age and Culture and Gardner's Theory on Multiple Intelligences. The Hierarchy of Needs by Maslow assumes that there are existing needs that are categorized in a hierarchical manner;

hence, each level of needs comprise different variables that needed to be satisfied (Steve, 2007) so that if we take this concept in the context of a learning environment, different services which satisfies the physiological, safety, shelf-esteem and other needs of students should be in personal experience by students.

The idea of Age as a factor to a personalized system of satisfaction is in consonance with the theory of Development by Piaget and Erikson which says that the satisfaction of people gets into a complex state as a person gets into higher stage of cognitive and psychosocial development (Lucas and Corpuz, 2007). The element of Sex and Culture on the other hand is supported by the role congruity theory and the cultural system principle respectively. The theory of role congruity suggests that there are different needs embedded in people in the basis of their gender as gender roles and functions sometimes define the nature of work of people (Deikman and Eagly, 2008). Also the system of culture by people sometimes defines the expected values harbored by group of people and extending their constituent needs.

Lastly, the Multiple Intelligences Theory by Gardner supports the idea that different students, in line with their field of specialization, manifest different kinds of needs for the purpose of their skill acquisition and development.

In its very sense, the satisfaction of students varies for different reasons concerning their individual needs, state of existence and the like.

The stimulus is powered by the interconnectedness of the 4 different given variables of the learning environment which are (1) Teacher-Student Relationship, (2) Atmosphere of Inclusion, (3) School Facilities and Services, and (4) School Departments and Bureaucracies. All of these 4 represent the expected general atmosphere of any educational institution. An extended function of these four is the determination of an authentic learning-friendly environment. Hence, no single element is indispensable to the other in assessing the school's learning environment (Laguardia and Pearl, 2009).

### *Purpose Statement*

This study aims to identify the major predictors affecting student satisfaction along student services provided in a university, particularly its locale that is Saint Luis University.

Since the aim is geared towards knowing the level of satisfaction and perceived level of importance on the student services as perceived by the students, the essential questions of this research are identified as:

- What is the perceived level of importance of students on the different services of the school? Services include (A) University Instruction, (B) University Admission, (C) Guidance and Counseling Office, (D) Financial/Accounting Office, (E) Dean's Office, (F) Bookstore, (G) Library, (H) Food/Canteen Services, (I) Computer Laboratory, (J) Science Laboratory, (K) Students Affairs Office, (L) Campus Security, (M) Clinic, (N) Janitorial Services, (O) Audio-Visual Rooms and (P) Over-all Campus Facilities.
- What is the level of students' perceived perceive along the same identified services?

- Is there a relationship in the student's perceived level of satisfaction of the student services and their level of importance?

Extension to these questions is the task of identifying programs that would enhance the student services of an educational institution by utilizing student satisfaction as standard.

## DATA COLLECTION AND ANALYSIS

This research, centering on knowing the variables that determine a genuine learner-friendly school environment involved the assessment of all the 9 colleges—namely the School of Administration and Business Management (SABM), School of Computing and Information Sciences (SCIS), School of Engineering and Architecture (SEA), School of Humanities (SOH), School of Law (SOL), School of Medicine (SOM), School of Nursing (SON), School of Natural Sciences (SNS) and School of Teacher Education (STE)—present at Saint Louis University as its target population. Respondents included the population of Saint Louis University in the 3<sup>rd</sup>, 4<sup>th</sup> and 5<sup>th</sup> year collegiate levels. Such was so because of the running assumption that students on these year levels, at least, have a first-hand experience and working knowledge with regard the different offices, services and operations present in the university.

Population sampling was used to get the total number of respondents as the representative figure of the entire population. The calculated number of respondents resulted to a total of 399 students from the varied colleges of the university. The administration of questionnaires was held using random floating of questionnaires in cooperation with the respective deans of each college.

The instrument employed in gathering data was thru the use of three-column survey questionnaire from which left most column tried to assess the perceived level of importance of students on the given items and the right most column assessed the level of satisfaction of students on the given items.

The items or determinants were placed between the column for the perceived level of satisfaction and column for the perceived level of importance by students.

There are 267 items contained in the questionnaire which were distributed among the 15 different services/facilities identified as Instruction (22 items), Admission (10 items), Guidance Office (13 items), Accounting Office (13 items), Dean's Office (20 items), Bookstore (14 items), Library (30 items), Food Services (15 items), Computer Laboratory (20 items), Science Laboratory (26 items), Students Affairs Office (16 items), Campus Security (10 items), Janitorial Services (10 items), Audio-Visual Rooms (8 items) and Over-all Facilities (30 items).

Statistical formulas employed include the use of Weighted Mean (WM) and Regression Analysis (r).

In answering problem number 1 and problem number 2, the general weighted mean (WM) of items were used to which results were interpreted in the following manner: 1.00-1.74: Not Important (NI)/ Dissatisfied (D), 1.75-2.49: Slightly Important (SI)/Slightly Satisfied (SS), 2.50-3.24 : Important (I)/ Satisfied (S) and 3.25-4.00: Very Important (VI)/Highly Satisfied (HS).

In treating question number 3, Regression Analysis (r) was used to derive the possibility of an existing relationship between the items and the significance of the relationship was validated by using a P-value of .05.

After deriving the existence of relationship between areas, item analysis was conducted using Regression Analysis (r) to identify items that serve as major predictors of student satisfaction in line with student services.

In terms of answering the different problems of this research, the researchers tried to incorporate local and international literatures to substantiate claim.

Also, since this research concerns students' satisfaction, researchers incorporated the perceptions, students of the locale of this research. The suggestions of students and the programs that were gathered thru informal interviews were incorporated to come up with a single suggestion for each program/service that was assessed in the research. All in all, the methods mentioned are the ones employed in the completion of this research.

## RESULTS AND DISCUSSION

*What is the perceived level of importance of students along the different services of the school?*

Students' perceived level of importance on the different university services garnered weighted means for individual items in the different areas that were identified that lie within the range that corresponds to a descriptive equivalent of "very important" except for two items. This means that 265 of the total items in the questionnaire were considered as "very important" in determining a learning-friendly environment while 2 items were considered as "important" determinants of a learning-friendly school environment.

**Table A**

Overall weighted mean of students' perceived level of importance of the school services

Areas	OWM	DE
A) University Instruction	3.63	VI
B) University Admission	3.50	VI
C) Guidance Office	3.57	VI
D) Accounting Office	3.59	VI
E) Dean's Office	3.62	VI
F) Bookstore	3.53	VI
G) Library	3.59	VI
H) Canteen Services	3.62	VI
I) Computer Laboratory	3.58	VI
J) Science Laboratory	3.44	VI
K) Student Affairs Office	3.57	VI
L) Campus Security	3.64	VI
M) Clinic	3.57	VI
N) Janitorial Services	3.59	VI
O) Audiovisual Services	3.63	VI

P) Overall Campus Facilities	3.58	VI
------------------------------	------	----

In Table A, it can be seen that all of the groups of services that were identified were considered as “very important” in its very existence

Results above suggest that the qualification of a learning-friendly school environment is based on its ability to provide the different needs of each student in the maximum possible level.

Since students’ educational needs vary according to different introspective standards, then the components of a learner-friendly environment should be considered as multivariate. This means that it the learning-environment should comprise of different services that are perceived by students as important in their learning.

Most likely, if this holds to be true, then additional ten or more items would still be perceived to be important or even very important determinants of a learner-friendly school environment. This is so because of the idea that a learning-friendly environment should provide the complete package of learning services to the students meaning the more services that are included in the learning environment then the package of learning services gets to be more complete.

With this function of an academic institution to provide the diverse needs of students, then the balancing element to fulfill such function lies on the sensitivity of the school to provide the needs of students.

The ability to sense the needs of the students is the very foundation of all learner-friendly services. This because the consideration of students’ perception on the creation and modification of student services allow the establishment of services that is initially student friendly.

Only when the school knows what are the real needs of students can a school improve on its services and provide the necessary services because of the idea that it would still be the students who are to utilize the services at the very end and would be the one to identify whether the service is satisfactory or not.

*What is the level of satisfaction of students along the different services of the school?*

**Table B**

Overall weighted mean of students’ level of satisfaction of the school services

Areas	OWM	DE
A) University Instruction	2.72	S
B) University Admission	2.83	S
C) Guidance Office	2.71	S
D) Accounting Office	2.60	S
E) Dean’s Office	2.85	S
F) Bookstore	2.63	S
G) Library	2.65	S
H) Canteen Services	2.41	SS

I) Computer Laboratory	2.58	S
J) Science Laboratory	2.61	S
K) Student Affairs Office	2.59	S
L) Campus Security	2.69	S
M) Clinic	2.70	S
N) Janitorial Services	2.81	S
O) Audiovisual Services	2.47	SS
P) Overall Campus Facilities	2.49	SS

In reference to the table above, it can be seen that students expressed different levels of satisfaction towards the student services. This can be verified on the services where students expressed a slight satisfaction on the area provided.

It can be seen that there are three areas which garnered a “Slightly Satisfied” form of response which include the Canteen Services, Audiovisual Services and Overall Facilities of the University. This only means that these areas need the most focus by the university in terms of service improvement and development.

Specific reasons given as to why these areas were least satisfying students are due to the reasons that: a) canteens in the university don’t consider the suggestions of students in coming up with the daily menu, b) there are shortages of units and rooms for audiovisual services and c) miscellaneous services like elevators, online enrollment and vending machines are not located within the university premises

Common reasons why students didn’t express full satisfaction or highly satisfied response on the student services is due to the absence of some services in some university, the presence of slow and obsolete forms of services and issues concerning the approachability of school staffs.

*Is there a relationship in the student’s perceived level of satisfaction of the student services and their level of importance?*

The importance of knowing if a significant relationship between the level of satisfaction and perceived level of importance by students do exist lies on the purpose of knowing the major predictors of student satisfaction. By this, the services crucial to the satisfaction of students can be easily identified which will allow the identification of services the needs utmost focus by school administration.

In reference to Table C, there are only 6 areas which were identified with an existing significant relationship and these are: C) Guidance Office, I) Computer Laboratory, J) Science Laboratory, L) Campus Security, M) Clinic Services and N) Janitorial Services. The other ten areas resulted to an insignificant result meaning the areas do not have a significant relationship at significance level of .05 and cannot be subjected to further tests to explain existing relationship so that on these items, students don’t consider their level of satisfaction in determining whether the determinants or items in the said area contributes to their consideration of variables contributing to the determination of a learning-friendly school environment.

Therefore, the next task to be done is to identify which specific items serve as major predictors of student satisfaction through item analysis.

**Table C**

Regression analysis on the perceived level of importance and level of importance on students' services

*Major predictors of student satisfaction*

*Guidance services*

In the area of Guidance Services, the major predictors of satisfaction includes a) the presence of extension services like scholarships, exchange student programs and student organizational networking, b) the issuance of printed results of tests and c) the availability of staff during working hours.

The nature of counseling includes the prevention and correction of students' misbehavior through student monitoring techniques, direct student intervention programs, collaboration with school educators, assisting in the implementation of school instruction and providing miscellaneous activities that will develop the motivation of students to develop good interpersonal relationship with other people and motivation enough to sustain survivability in the university (Jones and Jones, 2001).

The availability of extension services like scholarship programs and exchange student programs was considered as the most important indicator of student satisfaction in the said area of service as it embodies the very essence of direct relationship and genuine student support given by the school to the students.

### *Computer laboratory*

In the computer laboratory services a) the adherence of computer laboratory instructors to school policies regarding computer use and ethics in accessing information, b) the giving of manuals on rules and policies regarding computer use and reservation and c) the presence of monitoring and inspection of laboratory facilities were considered as the major predictors of satisfaction in the area of computer laboratory services.

These items were considered as major predictors of student satisfaction along the field of computer laboratory services because it provides for the preemptive measures in promoting the good state of computers and its peripherals.

The adherence of computer laboratory instructors to school policies regarding computer use and ethics of accessing information is seen as an indicator of student satisfaction was considered as the most important indicator of student satisfaction on the said area as it provides for the protection of the personal information of students utilizing the computer services.

### *Science laboratory*

Among the specific services provided in the area of science laboratories, items that were considered as major determinants of student satisfaction includes a) the conduct of experiments that are only authorized by the school, b) the proper explanation of written laboratory directions to student before execution of any activity and c) the presence of enough water supplies and faucets in the laboratory.

The first item, though having the nature of restraint in the students' free and full-scale use of science laboratories, was considered as the most important determinant of student satisfaction as it deals with the protection of students in the use of laboratories.

The limitation of activities that can be performed inside science laboratories is very important indicator of student satisfaction as it indirectly serves as a mechanism to protect students from possible harms that may take into account due to the pure egalitarian and free use of services contained therein.

### *Campus Security*

Specific items that were considered as major determinants of satisfaction in the area of campus security include the assurance that security guards are a) equipped protective skills, b) well-groomed and c) well-disciplined.

The idea of security involves the idea of defensive and protective skills as the paramount value that is upheld. This serves as the most important determinant of student satisfaction in the area of campus security as it involves the protection of students within the university.

### *Clinic Services*

In the area of clinic services, items that were considered as major determinants of student satisfaction includes a) the sterilization and cleaning of clinical equipments, b) the availability of doctors in the clinic at anytime of the day and c) the approachability of staff.

The presence of sterilized and clean clinic equipments was considered as the most important determinant of student satisfaction in the area of clinic services as it concerns the clinic apparatus used in treating students. This is the most important determinants of student satisfaction as it serves as the tool to diagnose and treat ailments concerning the health of students.

### *Janitorial Services*

In the area of janitorial services, items that were considered as major determinants of student satisfaction includes a) the friendliness, honesty and approachability of janitors, b) the presence of cleaning materials and tools inside the classroom and c) the presence of janitors in all areas of the school.

The friendliness, honesty and approachability of janitorial staffs was considered as the utmost determinant of student satisfaction as it incorporates the factor of utilitarianism meaning that only in cases where janitorial staffs allows the establishment of rapport between the service and the students will be the only time where the said service be deemed functional in line with its function of promoting the welfare of the learning environment.

The role of the identified major predictors in relation to student satisfaction is that it allows the easy identification of student services that have a strong effect in the satisfaction of students. In this way, the multivariate component of the learning environment can be truncated into specific services that are composed of the most crucial elements that determine the level of satisfaction by students.

Also, because of the identified major predictors, the primary focus of development and modification of student services can be directed to services that have a strong and direct influence in determining student satisfaction.

*What suggested programs should be implemented to further enhance the university's student services?*

It was said that students are the best evaluator of the learning environment due to some reasons identified. This only means that the best way to ensure an ongoing assessment of the effectiveness of the services provided in the learning environment, as provided by an educational institution, is by creating and implementing programs that incentivize on the satisfaction of students.

#### *Pre-graduation satisfaction assessment program*

This program is a mandatory requirement that will be given to all graduating student as a pre-requisite for their graduation which has the aim of assessing the learning environment through the students who, at the very least, have first-hand experiences as regards the different services provided in the university.

The program requires all the graduating students of the university to undergo a uniform test to assess the satisfaction of the graduating students on the various student services found inside the university for the sole purpose of assessing which services least satisfied students and for the purpose of injecting necessary changes in the identified services.

To facilitate the speedy administration of the program, the Dean's office for each school and the Guidance office of the university are suggested to work hand-in-hand to which the administration and collection of the test will be delegated to the various Dean's Offices of the University while the task of processing and interpreting of the said test questionnaires will be delegated to the Guidance Office.

The program is intended a) to determine areas of the university where students are least satisfied and b) to develop services necessary as determined by the administered assessment. These two objectives can be measured using the average weighted mean of students' responses on the said assessment tests and the observance if an evident increase in the satisfaction of students is seen every batch of graduating students.

#### *Freshmen expectations assessment program*

This involves the identification by freshmen students of the services they expect to be present in the university in line with the degree the students are trying to pursue and in line with students' personal needs. The identification of the services needed by the students will be placed in a form that will be provided by the Registrar's Office. Afterwards, the forms will be forwarded to the Guidance Office for the purpose of summarizing reports that will be sent to the different offices concerned on the suggestions made by the students.

After collating the student suggestions, forms will be directed to the respective Dean's Office to which college the freshmen students belong.

The forms will be released by the various Dean's Office to the concerned students so that students will be able to assess personally the progress of the services they identified during their first-time enrolment.

A feedback form will be given to the students to identify the progress of their requested services to which feedbacks of the progress by the students will be sent to the Guidance Office for the purpose of collating and distributing the results of the students' feedback to the concerned students. This will be done every after the semester to report progress or non-progress of students expected programs from their first-time enrolment.

#### *Student quasi-accreditation program*

This involves the active participation of the KASAMA/SSC towards promoting student learning. In this program, the KASAMA/SSC is obliged to create a pool of student who will accredit the services provided in the University. The pool of students will be chosen in accordance with the ability of the student to give clear volition as regards to the nature of the task which is to accredit the school in terms of the services provided.

The Accreditation Program will use a personalized checklist of items which is devised by the KSAMA/SSC to test areas of the learning environment that needs improvement.

The Accreditation, with the same nature of identifying the level of the services that are present in the university, is not an accreditation to promote the University of any Status but an accreditation to inform the university offices as how students tend to view the level of services provided.

The program will be performed every school year and results will be summarized by the KASAMA/SSC and will be communicated by the same to the offices concerned as regards the accreditation done by students.

## **CONCLUSION**

From all of the results, discussions and recommendations that were revealed in this paper, the function of student satisfaction as a means to assess and to identify the effectiveness of services provided by an educational institution is considered as the most effective and most reliable tool of measure.

Hence, in determining the quality of services provided, student satisfaction should be considered as the primary tool of measure as it solicits authentic and objective information about the learning environment.

*Analysing the Influence of Student Talk in the Meaning Making Process in a Religious Education Classroom in India*

Shirin Huda

0529

University of London, UK

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This article is a snapshot of an action research study conducted to develop student talk as a meaning making tool in a religious education classroom in India; where most of the students came from a passive learning environment. It examined the role of talk in student learning and the various factors that enhanced or hindered talk in classroom. A range of teaching/learning strategies were implemented to stimulate talk within classroom. This research is embedded in Vygotsky's theory of 'Social Constructivism', where he asserts that learning is influenced by social interaction. The data was collected through student work, teacher's reflective journal and focus group discussion. The outcomes of the study suggested that when students develop the requisite skills and are provided with opportunities to dialogue within a classroom; student talk helps in contextualising the content and facilitates students to create a personal meaning of the content.

**Key words:** student talk, dialogue, discussion, meaning making

## 1. Introduction

*“The relation of thought to word is not a thing but a process, a continual movement back and forth from thought to word and from word to thought. In that process, the relation of thought to word undergoes changes that themselves may be regarded as development in the functional sense”. (Vygotsky, 1986, quoted in Haneda, 2009)*

Vygotsky believed that to develop thoughts and express them in words is a process and it requires a continuous movement of going from word to thought and thought to word. I have often experienced this kind of exchange of thoughts to words and words to thoughts as a student in the class, and observed it when my students in UK were asked to discuss things during pair share or group activity. During this dialogue there was an exchange of thought among different students, this exchange of thoughts served as a cognitive stimulation to understand the concepts and generate new ideas. It helped students to realize their role of being partners in construction of knowledge.

During my practicum in the UK Religious Education Center (REC), I have practiced small group activities in classroom. I observed that this practice gives an opportunity for the students to interact with each other, discuss their understanding of the content, fetch in examples to contextualize it and construct their own understanding of the content. This became a tool for assessing; the student understanding and application of the knowledge acquired.

The approach to learning in most schools in India is still through transmission of knowledge and rote memorization (Alexander, 2000; Clarke, 2003), where students rarely express themselves verbally. In this kind of an approach the teacher is believed to be the repository of knowledge and the students are considered to be the recipients of knowledge. Here the student rarely makes any active contribution towards learning. This approach is the result of many factors ranging from the larger number of students in a class, time constraint, low quality of teaching and teacher education, and grade centered approach.

### 1.1 Hypothesis

This small scale research study was an effort to investigate how student talk during the various activities in a classroom enhances the meaning making process of the students in the Indian REC classroom. It mainly focused on analyzing the nature and extent of interaction among students who rarely have such opportunities in classroom. It also observed the influence of various factors like group dynamics, pedagogy, and the topic of the talk; on the construction of knowledge through talk.

### 1.2 Context

The study was conducted as a part of the two year course Masters of Teaching (MTeach) as a participant of the Secondary Teacher Education Programme (STEP)<sup>i</sup>. It was an action research conducted in REC of the *Ismaili*<sup>ii</sup> community, situated in the western suburbs of Mumbai, India. The REC classroom was a blend of students, it would be interesting to study how the group which is so heterogeneous in terms of gender, school background, social background, and different learning styles; converse in classroom. The study was conducted over a span of five weeks with three hours of classroom teaching per week. The eighth grade class of 16 students consisting of six girls and ten boys, of age 12-15 years, was selected on the basis of random sampling. Due to secular coaching

classes, the attendance of the students was inconsistent, ranging from nine to twelve students in the class. The module taught to these students was “On the wings of words”, containing pieces from Muslim Literature. There was no specific reason for teaching this content, but it was in continuation of the module taught by the host teacher.

## 2. Literature Review

Extensive research studies have shown that the process of thinking and talking undergoes changes and helps an individual to develop their own thoughts and knowledge over a period of dialogic exchanges with each other (Barnes *et al.*, 1969; Britton, 1970; Nystrand *et al.*, 1997; Mercer, 2000). A range of literature and studies have defined various forms of talk such as dialogue, discussion, debates, as student talk. In the context of this research ‘student talk’ has been understood as, “any on task verbal/oral expression of the students in the classroom, in form of whole class discussion, dialogue with teacher, and talk among students during the small group or pair share activities”. A brief understanding from the quantum of literature encountered is presented below which helps to understand the various facets of student talk in teaching/learning process.

### 2.1 Learning through talk

The construction of meaning among students is not only the result of the encounter between the newly acquired knowledge and their prior knowledge, but it also arrives from their interaction with others. This interaction is crucial not only for their understanding of the subject knowledge, but it also plays a role in ‘*the development of their identity, their sense of self and worth*’ (Alexander, 2006). Talk is considered as one of the effective ways through which we can gauge the ‘*thinking, feeling or learning*’ of a student (Fisher, 2009). Sfard (1998, quoted in Haneda, 2009), proposes the two metaphors of learning; ‘*acquisition*’ and ‘*participation*’, which are very crucial as they provide complementary perspectives on learning. He propounds that only acquiring knowledge in isolation is not learning, learning in a classroom takes place when all the participants participate to achieve the objectives.

Fisher (2009) lists the benefits of talking together in groups in a classroom. It helps students to:

- *ask questions and pose problems*
- *investigate and solve problems with others*
- *think more widely and deeply*
- *learn collaboratively as a part of a group*
- *develop dialogic skills*
- *practice social and cooperative skills*

All these benefits of talk give the students an opportunity to think, understand and make meaning out of their own learning in the class, which further enhances their cognitive and social development. Research has shown that not all talk in the classroom helps in the construction of meaning making and nor does it necessarily lead to enhanced learning and getting mentally challenging responses

from the student. The research further suggests that conversations which include discussions or dialogue result in the most effective learning (Fisher, 2009).

## 2.2 Dialogue and discussions enhance learning

Discussion-based learning has led to achieve '*subject mastery, reading comprehension, conceptual understanding, problem-solving ability, moral development, attitude change and development, and communication skills*' (Henning, 2008). Alexander (2006) describes dialogic teaching as harnessing the power of talk to stimulate and extend pupils' thinking and advance their learning and understanding. Bakhtin (1981) proposes that dialogue is very important, because it provides with an avenue where there are no fixed meanings but there is a perpetual exchange, possession and creation of new meanings.

Gambrell (1998, pp.31) on the basis of his examination of various studies asserts that, "*student-led discussions allow to try their own thinking and engaging in exploratory thinking, resulting in more extended and more elaborate mental representations and higher level of analytical thinking.*"

## 2.3 Learning Communities

*"The classroom is seen as a collaborative community: Joint activity, by definition, requires us to think of the participants, not simply as a collection of individuals but also as a community that works towards shared goals, the achievement of which depends upon collaboration"* (Wells, 2000, pp.54).

Lave and Wenger (1991) emphasizes that learning is not an independent activity, which can be achieved in isolation, but is achieved through participation in '*community of practice*'. They further insist that the community in which the individuals participate should be able to extend assistance in terms of values, knowledge and skills that are practiced in the community. Hence classrooms in longer run can be viewed as community of practice where it becomes a place of '*potential change and renewal*'. Every situation in the classroom is challenging and requires the students to indulge into a joint effort to construct solutions which are innovative. Hence, classrooms can be interpreted as Vygotsky's '*zone of proximal development*' (ZPD) – zone where the individuals achieve more with assistance than individually (Moore, 2000).

Wells (1995) recognizes the two roles a teacher should play in the learning community, first is the teacher should act as a *co-inquirer* with the students and second the teacher as leader and organizer of the community's activities. Here the teacher is responsible for selection of the activities and ensures the use of appropriate resources to achieve the aimed objective. "*Teacher instruction should always be accompanied by teacher-student and student-student dialogue. In this social context, the internal (and therefore 'invisible') 'developmental processes' set in motion by instruction are able to develop and flourish until the student possesses them. When this happens, the processes are 'internalized' (Vygotsky 1978, pp.90) and 'becomes part of the child's independent developmental achievement'".* (Moore, 2000, pp.16)

Although not much literature was found on student talk in RE classroom, it is interesting to note the study conducted by Schihalejev (2009), where the author examines the possibilities and hindrances in the use of dialogue in RE lessons. He finds that learning through dialogue is seen as valuable for self-understanding, mutual understanding, and understanding concepts. He further asserts that the teacher plays an important role in designing and facilitating the whole process of dialogue in the classroom. Kukanboev (2009) carried out a similar study in STEP class in Khorog, expresses that the

flexibility of the STEP curriculum in terms of what knowledge to give and how to give it also favors the talk in classroom which results in construction of knowledge.

The literature review provides an overview of the various studies which indicates the role of talk as a powerful learning tool. This study had particularly used the dialogic and discussion approach to lead the student talk and analyzed how these pedagogical strategies enhanced meaning making in RE classroom in India.

### **3. Methodology**

A qualitative approach was adopted in the study, as it mainly dealt with the qualitative data gathered, i.e. the data to be analysed was a transcript of the talk of the students. As in the analysis of qualitative data, in this study also the 'raw' data collected during the practicum was interpreted and analysed by the researcher (Denscombe, 2007). The drawback of using qualitative analysis is the threat of not being objective with the data; often researchers tend to become subjective (Hopkins, 2008).

#### **3.1 Action Research**

This was an action research study, where I implemented, reviewed, evaluated, modified and again implemented the strategies, as per the student responses in the subsequent classes (Mills, 2003, in Hopkins, 2008, pp.48). Various teaching strategies were applied to provide numerous opportunities for students to converse in the classroom with their classmates and the teacher. This timely evaluation and modification of strategies ensured that the focus of the study remained intact.

#### **3.2 Ethical considerations**

The study is utilizing the student conversation as major data; therefore it is important to get the consent of the parents, since the students are minor. During the study, at some points video recorder was used in the class and certain parts of which were documented in the report. A parent's orientation meeting was organized wherein the parents were informed about the aims and purpose of this research and their consent was taken. Each student was given a pseudonym, to uphold their confidentiality while documenting the data in the report. A constant dilemma which continued throughout the study was balancing out the role of being a researcher and a teacher. As an ethical researcher I have tried to report fair, accurate and relevant data from the study, trying to keep out my personal bias while analyzing and presenting the data (Norton, 2009).

### **4. Data Collection Method**

The data collection methods selected aimed at capturing talk of the students in the classroom during the lesson where they were interacting with their classmates or the teacher in the class. Three data collection methods were used to form triangulation of data, to assure the utmost validity and reliability of the data collected (Denscombe, 2007).

#### 4.1 Teacher's Reflective Journal and Field Notes

The reflective journal was maintained on a day to day basis, to capture the critical incidents (Tripp, 1983) in the classroom. This presented a narrative of the classroom and the contribution of each student during the lesson. Since action research dominated the methodology of my research, reflective journal was a very helpful tool to evaluate and review the lessons for the subsequent classes. Journal entries can tend to be subjective as it is the writer's interpretation of the things witnessed in the class (Hinds, 2000). Unlike the video recording, the journal entries were inefficient in capturing every word uttered in the classroom, as it was subject to human memory and field notes taken during the class.

#### 4.2 Student Work

The daily activities in the classroom culminated in producing some kind of student work in the form of filling up activity sheets, making presentations in groups and creative writing in groups (Hopkins, 2008). This work demonstrated how students adapted and benefited from the various strategies which stimulated talk in classroom. It also helped in recognizing the role of talk during the lessons in the construction and application of knowledge; hence it helped in assessing the student learning.

#### 4.3 Focus Group Discussion

The focus group helped in conducting in-depth interaction with students, who had practiced in this learning approach in the classroom. It is a forum which opens up the arena for the students to express their views in detail (Cohen et al, 2007). This group discussion helped to communicate the students' view points, interpretation and meaning of classroom dynamics. Although it is used as qualitative data, it only helped to establish the student perceptions at that very particular time (Wilson, 2009).

### 5. Findings and Analysis

The presented data reflects the implications of the various strategies implemented during the lesson to enhance learning through talk. The analysis of data brought forth the various parameters which either influenced or hindered the students' construction of knowledge through conversation. A thematic presentation of the findings is given below along with the analysis.

#### 5.1 Adapting to the shift in learning

Communication starts with a task assigned in the classroom and the students build on their ideas. However, during this study my observation and the notes in my reflective journal (RJ) in week one suggests that:

*"When the students were paired up to do the 'think pair share' activity, most of them filled up their own individual activity sheets, without really talking to their peers".*  
(Reflective Journal (RJ), 31<sup>st</sup> May 2010)

Further reflecting on this, I felt that the aim of pair share activity was for students to discuss with their partners and bounce their ideas back and forth, resulting in 'interthinking' (Mercer, 2000), and then writing their individual thoughts on their individual activity sheets, which did not take place.

*"There could be various reasons for sticking to individual work rather than sharing with others, the individual activity sheet could be the indication of achieving individual task and therefore there was no shared goal to achieve between the two. This restricted them from having a feeling of a common goal and hence they relied on self knowledge to achieve the given task. The simplicity of task could have been a factor, resulting in limited conversation or no conversation between partners". (ibid)*

On further speculation, students were not used to working with peers. The students were unsure what to talk. The talk captured was either very superficial or was off task, and there was no deep discussion on the task. The secular schools and RE classes prior to STEP did not provide ample opportunities to converse and learn from peers, this was indicated by students during the focus group discussion (FGD). Hence peer talk was not valued within the students.

During the second week, it was observed that, there was a slight shift in students, when they were in groups of three/four. It was observed that during the activity the students came together to perform the task. Recalling from the reflective journal:

*"It seems that the complexity of the task could be a driving force for the students to collaborate with the group members to accomplish the given task (Watkins, 2001). While I was going around groups to observe them and facilitate them, it was noticed that the students initiated the task by deconstructing the meaning of similes and metaphors, which were taught to them in their earlier classes, they started recalling it by drawing examples". (RJ, 6<sup>th</sup> June 2010)*

After having a shared understanding (Barnes, et.al, 1995) of the terms, they actually had to recognize the metaphors and similes in the poem. It was observed that the cohesiveness of the group increased with the complexity and difficulty of the task assigned. This increased the length of discussion between them, and their collective thoughts and ideas were presented together on a chart.

The students in FGD elaborated that in an active learning environment they were presented with an opportunity to talk and discuss rather than just filling out the activity sheets. Hands on activities such as role play, model making and debates provided them with an opportunity for collaborating and learning from others, and constructing their own knowledge out of this experience. Active learning environment thus facilitates in the meaning making process of the students in the classroom, where they learn and reflect to make sense of their learning (Watkins 2001).

## 5.2 Contextualizing the content

The dialogue in classroom indicated how students were contextualizing the content, by drawing on from the examples of their own context and life experiences; leading to a better understanding of the concept.

*“Some of the pupils had an expression of surprise on their face. Sahil then brought in the example of a ‘Shok Sabha’ (obituary meeting) especially followed in Hindu tradition, where after a death of the person, the family and friends of the deceased person come together, and sing poems or present a speech as a tribute to the person. The students were further lead to think of such an event in Islam. Karim, and Falisha said ‘Muharram’iii; with some uncertainty. It was then unpacked by relating to the event from the Islamic history, which the students have learned in their previous classes. They then reflected on how it is being commemorated among other Shia Muslims, by reciting poems and prayers, and giving sermons on the qualities and life of the Imam.” (RJ, 31st May 2010)*

## 5.3 Application of the Acquired Knowledge

The RJ brings out another incident of learning through discussion, from the fourth week of the practicum.

*“The lesson was based on prayer. The “hook” activity started, by asking each student to pick up a piece of paper on which one of the letters from the word prayer was written. The student had to give one word starting with that letter related to or connected to God / Allah; for example Kashina got E and she said enlightenment. In this way each student gave one word which could be connected to God and then they were asked to reconstruct the jumbled word to form the word ‘PRAYER’. Moving forward I asked the students to think of the themes they would include in a prayer. There was a list of things the students came up with like thankfulness, shower blessings, Deedar (enlightenment), praise, asking for mercy, forgiveness of sin, expressing gratitude, showering peace and Rehmat (bounty), express love for God. All these were jotted on the white board.” (RJ, 20<sup>th</sup> June 2010)*

The students were then put into groups and were asked to write a prayer picking up some of the themes written on the board. The student work presented in the class, displayed that they came up with beautiful poems, where in they picked on one or more themes discussed. It was also evident that the students had written the prayer in the form of a poem, which they learned in their earlier lessons and also made use of appropriate literary elements like metaphors, similes, and rhyming schemes. This student work demonstrated the learning during the present and the previous classes was retained and recalled and culminated in the application of that knowledge in their own meaningful piece of creation.

## 5.4 Group Dynamics impacting talk in the classroom

It was the third week of the practicum. The group members had to read the content and understand it, deconstruct the meaning and then illustrating it on paper. During the presentation they also had to critically analyze the literary elements in the passage. It was observed that within a group there were some individuals who voluntarily took the role of group leader and took initiatives and instructed other group members.

The following excerpt from the FGD and RJ reveals what students feel about the composition of groups and how it affects their learning:

**Karim:** *I like working with those people who are of my ideas and thoughts, open minded, those who understand my ideas and agree with me*

**Faayaz:** *Sometimes, I feel very disappointed, when you get a topic to work on, which I am very interested in, but my group members of the group, they are very mischievous, they are not bothered about others in the group, and they are just roaming about themselves, that is very disappointing that it is such an interesting topic, we can do many things out of it, but the group members are not coordinating with me (FG, 3<sup>rd</sup> July 2010)*

## 6. Discussion

The study analysed the extent of the meaning making process facilitated through talk in terms of creating learning communities, enhancing learning while interacting with peers and effectiveness of group work. In this section I would discuss the limitations and challenges, and also some components of student talk which have emerged from the study.

### 6.1 Research Methods

This research being a participatory action research helped me to experience the classroom dynamics during the process. It helped me to reflect on every stage of the research and thus gave me an opportunity to improve my practice and modify the research elements as the need arose (Hopkins, 2008, pp. 47). Being a participant my observations and reflections, aspired me to collect accurate data. The challenge with the practice of observation is, there is a possibility to incorporate ones own personal bias. The duration and the design of the research restricted my observation of student talk when students are in a different classroom or among another set of students.

The reflective journal was referred to most of the times while analyzing the finding. It was used as the primary source of data, as it captured the processes of the classroom through field notes, and my own reflections and comments on the classroom processes. It was a quite reliable data; only noting down the conversations among students and teacher, so as to maintain the objectivity of the journal. This commentary was analyzed further through my reflections, which helped to modify my strategies to shape the course of talk in the classroom, and to increase the learning opportunity for students.

The findings from the focus group to a great extent corresponded with the findings of the reflective journal. However, question can be raised on the validity of the discussion. Only five students out of

the selected eight represented the group, this restricts us from generalizing these responses for other students in the class. One factor which strengthens the reliability of these responses is that, students' behavior during discussion was not different from that in the class. Hence, it can be said that although there was a small representation but the finding were significant and complementary to those of the reflective journal, when triangulated.

## **6.2 Learning through talk during dialogue and discussions**

Dialogic classroom opens up the conversation for the whole classroom. This gives an opportunity for every child to speak and contribute to the learning of the whole class. This helps in creating an atmosphere which is conducive for forming a community of learners. This was evident from the lessons in the first week of the study. The reflective journal clearly demonstrated that my role here was to act as facilitator for continuing the dialogue in the classroom. It was noted that I as a teacher had to build on every students' response. The students brought in their prior knowledge and were trying to connect it to the present discussion. This process of connecting prior knowledge to a new idea materializes in creating new meanings for the learners (Myhill et al, 2006).

During the whole class discussion the teacher acts as the focal point through which the dialogue with the students continues. The course of dialogue depends heavily on how and where the teacher wants to lead the students to think. The skill of questioning and the quality of questions the teacher asks are very crucial in the meaning making process. The teacher directs the learning of the students by adopting the higher order questioning techniques (Fisher, 2009). To keep the learning perpetual I further build on their knowledge by asking them questions leading towards the content of the curriculum. The planning of questions plays a vital role in taking the discussion further. Here I had planned to take them from known to unknown, unfolding the learning at every stage. The student responses lowered as the continuum of questions moved further towards the unknown.

Debates, gave them an opportunity to look at the point with another perspective, where they had to defend their ideas to challenge the other group. Discussion also reinforces the learning as there is repetition of ideas within the group and between different groups. It brings about clarity and there is a better understanding of concepts taught. Discussion in contrast to explanation helps in better understanding of learning, as it provides a spectrum of different perspectives and students make meaning through them.

During the focus group discussion, the students elaborated on the advantages of discussion; by stating that discussion and debates enhanced their social skills. It helps them to think critically and creatively to present a perspective which is acceptable to others (Lindfors, 1999). The process of presentation; constructing ideas, organizing them and justifying them in front of the group members sharpen their communication skills and boost their self-confidence. Working in group and talking within the group strengthens their social skills.

## **6.3 Community of Learners**

As discussed earlier in the literature review this study was influenced by Vygotsky's theory of social constructivism (Moore, 2000). Talk in the classroom can lead to form a community of inquiry (Wells, 1999; Fisher, 2009) in the classroom. It was observed that the group dynamics affected the participation of students in the group. The group composition affects the participation of the members of the group, the achievement of the group task, and thereby their learning (Edwards & Westgate, 1994). However, it was expressed by the students that they would prefer working with

likewise people in the group, and feel they learn better this way. This response directly affects the principles of community of inquiry, where every person is an expert in one's knowledge; collaborative learning in the group brings the emergence of new knowledge; and social skills develop while working in group. This leaves the teacher with a question of, so do teachers form the same group every time? Does learning from group members means learning from people of similar calibre? How does collaborative learning work in groups of mixed ability learners? (Edwards & Westgate, 1994) Learning in groups is an inception of forming a learner's community, where the students develop their own skills and knowledge to contribute in the community, creating new meaning of knowledge for themselves and the community (Wells, 1999).

#### **6.4 Inculcating the practice and skills to talk**

In the Indian context since student talk is not being given much importance as a tool for building knowledge (Smith, et.al, 2005), this also emerged from the focus group discussion. The contribution of students is not valued, and therefore the students do not value talk in classroom. Thus they were not equipping the skills of talking and sharing with peers, within the classroom. Alexander (2006), emphasizes that it is important to develop the repertoire of learning talk among students to enable them to narrate, explain, argue, reason, justify, etc. Therefore initially the talk remained on a superficial level of sharing information, then sharing knowledge. However, these skills were developing gradually through the task assigned, but were not exclusively developed due to the short time of the study.

Mercer (2000, pp.52) asserts that learning through talk is guided when the teacher practices, '*recapitulation, elicitation, repetition, reformulation and exhortation*'. To bring that shift from sharing information to sharing their ideas and thoughts, I had to plan activities which were more complex, where they had to indulge in discussion with each other to achieve the task. This scaffolding of information led them to internalize, which led in contextualizing, and personalizing the learning (Myhill, et.al, 2006; Thompson, 2008). Since this practice was new for the students in the Indian context, the study witnessed how students were adapting to the culture of talk, but the conversation during a whole class discussion was still mediated through the teacher. The students did not take ownership of dialogue; in terms of challenging peers or commenting or responding to peers in the class. The classroom was not fully transformed into '*dialogic inquiry*' (Wells, 1999).

### **7. Conclusion and Recommendation**

The research was conducted over five weeks, which is very short time to gauge the impact of talk on students' learning. Learning through talk requires various skills like dialogic skills, collaborating, accommodating in group, linguistic skills, critical thinking skills, and skills for presenting one's knowledge. It was not possible to equip the students with all these skills in such a short span. In the context of this study I feel the students were introduced to the various forms of talk and the skills required to dialogue. The development of these skills and practice of talk requires continuous efforts from the teacher and students. The biggest drawback of talk is it does not have any written student records (Wells, 1999). The teacher needs to assure to conclude a talk with some kind of written work, which will help the students to consolidate their thoughts and retain their learning for a longer duration. Talk in the classroom requires proper planning and facilitation on the part of a teacher, thoughtful questions or probing is essential to get a deeper insight from the students.

This study reaffirmed most of the findings of previous research conducted on the subject. However, it emphasized the value of talk in the context of Indian REC which is distinct from the context of its previous studies. This study therefore provided an insight for RE teachers for including dialogues and discussions as an essential part of their lessons and classroom practice, so as to form a community of learners, who come together to construct new knowledge. The fuzzy generalizations (Bassey, 1998) from the outcomes of this study, lead me to assert that, the findings of this study are not context specific and it may be applied and practiced in any other context, with a different set of students; will have similar results, with slight variations depending on the skills of teacher and student. The findings will also largely depend on the values of teaching and learning practiced by the institution, school, and teachers, where there is flexibility of curriculum taught, and students are provided with space and time to reach their own understanding.

Thus I conclude that student talk is valuable in meaning making process in the classroom. Talk as a pedagogical tool to enhance classroom learning, largely depends on the interplay of context, curriculum, student competency, and teacher skills.

---

Abstracts

Nature conservation is an area for action, but also a scientific branch (called conservation biology) shaped with increasing specificity of environmental issues. As an area of action, nature conservation has reflected for a long period the research results. Initially, were used information provided by the natural sciences - biology, ecology, geography - and then were focused on its results of conservation biology. Delineation of protected areas, establishment of species requiring protective measures, formulation of conservation objectives, allocation of financial resources were made using scientific information from the areas of knowledge mentioned.

Accelerating biodiversity crisis, increasing human pressure on natural ecosystems, increasing environmental activism and scientific results have turn management paradigms of nature conservation, such that for substantiation decision has been drawn on new scientific information provided by sociology, anthropology, economics, philosophy, and information provided by traditional knowledge or obtained through experience. Science is meant to specify restrictions on obtaining social benefits, while setting goals is a political process that balances the gains and losses perceived according the society matrix value.

Recognition of needing the economic valuation of natural contributions to human welfare was followed by a concentration of research efforts in this direction. This paper presents the most important achievements for the economics of ecosystems that are required to be implemented in learning for sustainable development.

**Keywords:** sustainable development, research priority, ecosystem services

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

The economic size of nature conservation is recognized at the global, regional and country level as having an important role to increase the effectiveness and the efficiency of policies, strategies and action plans. The issue of economic quantification of ecosystem services research is most important in relation to development policy needs (Nijkamp and associates, 2008).

To achieve the objectives of the United Nations Framework Convention on the conservation of biological diversity (multilateral agreement for the development and implementation of nature conservation policy, ratified by Romania in 1994), the Fifth Conference of the parties (Nairobi, 2000), *The Ecosystem Approach* action strategy was approved. Economic size is expressed in the 4<sup>th</sup> Principle of such approach: *understanding the economic context in which you act in order to ensure that possible management gains are possible*. Compliance with this principle implies the correct sizing of the economic incentives for conservation and use, reduction of market distortions affecting biological diversity and internalization of costs and benefits.

The *Athens* Conference (27-28 April 2009), dedicated to defining the European priorities for the conservation of nature after 2010, underlines the need for the *economic justification of the conservation of biodiversity*. Thus, the Conference had a special section – economy and Finance –where issues related to the economic assessment of biodiversity, nature conservation, financing costs of protection and sustainable use of biodiversity and ecosystems were debated. The message from Athens, which summarizes the conclusions of the debates, underlines the need to improve the methods and techniques of quantitative assessment (priority I, II, VII), understanding through these methods of quantification and economic value of ecosystem services.

*Priority I. A vision to answer to the question: „Why biodiversity matters?“*

It is necessary to develop and communicate a better understanding of why healthy ecosystems deliver tangible benefits that underpin our economic, social and cultural well-being. The message needs to be clear and the sense of urgency in addressing its loss conveyed. The EU institutions and Member States should:

- Develop a clear target regarding biodiversity. The post-2010 target should be ambitious, measurable and clear.
- Ensure that the post-2010 target developed for the EU includes sectoral sub-targets that address the key challenges.
- Mainstream the findings of the study on The Economics of Ecosystems and Biodiversity (TEEB) to demonstrate the strong economic rationale for conserving biodiversity.
- Make biodiversity conservation a priority for future communication programs.
- Communications need to emphasize the co-benefits possible from tackling biodiversity loss and climate change in an integrated manner.
- Develop alliances with key stakeholders who are directly affected by biodiversity loss.

*Priority II. A better understanding of where we are and what more we need to do*

The scientific work of the Intergovernmental Panel on Climate Change has shaped the political response to climate change. A strong science-policy interface is also needed with regard to biodiversity – particularly since the drivers for biodiversity loss are more complex than for climate change and the direct impacts are harder to measure. Given existing gaps in scientific knowledge the application of the precautionary principle is particularly important. The EU institutions and Member States should:

- Improve the effectiveness of monitoring the status and trends of biodiversity in the EU;
- Further develop biodiversity indicators based on "SEBI 2010";
- Develop a biodiversity baseline against which progress can be assessed;
- Improve the science-policy interface, also through supporting the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES);
- Give a higher priority to biodiversity within EU and national research programs.

*Priority III. A functioning network of protected areas*

Protected areas contain our most precious species and ecosystems. They represent the foundation of biodiversity conservation in Europe and their effectiveness has been scientifically proven. The EU institutions and Member States should:

- Complete the terrestrial Natura 2000 network by 2010 and the marine network by 2012;
- Ensure the effective management of the network – which will require adequate funding being made available;
- Support the development of similar networks in overseas territories;
- Improve the connectivity between protected sites with a particular consideration to adaptation to climate change;
- Ensure that the Birds and Habitats Directives are enforced more effectively;
- Improve communication efforts with regard to the Natura 2000 network.

*Priority IV. Biodiversity outside of protected areas*

Protected areas are essential – but they do not exist in isolation from the rest of the landscape. The state of biodiversity in urban gardens, parks and green spaces, as well as rural areas, is extremely important. This is the biodiversity that most of the European population is aware of and can contribute to. The EU institutions and Member States should:

- Ensure the effective implementation of EU environmental policies;
- Use the restoration and renewal of terrestrial and marine biodiversity as a driver for economic development and the renewal of depressed areas;
- Progressively develop a policy approach based on the conservation of entire ecosystems and the protection of Europe's "Green Infrastructure" within a multi-functional landscape;
- Develop EU policies for tackling Invasive Species including, where appropriate, new legislation;
- Implement effective measures to protect Europe's soils which are essential not only with regard to the conservation of terrestrial biodiversity but also for crucial ecosystem services.

*Priority V. Biodiversity and Climate Change*

We cannot halt biodiversity loss without addressing climate change. It is equally impossible to tackle climate change without addressing biodiversity loss. Climate change policy needs to be fully complementary with biodiversity policy and these two policy areas must be developed in an integrated manner. The EU institutions and the Member States should:

- Actively support the process of Reduced Emissions from Deforestation and Degradation (REDD) to stop global deforestation;
- Ensure that climate mitigation and adaptation measures are fully compatible with the objective of conserving biodiversity;

- Promote the implementation of “triple win” of measures that conserve biodiversity while actively contributing to climate mitigation and adaptation;
- Ensure that international climate negotiations respect the above principles;
- Develop and implement adaptation measures for nature conservation.

#### *Priority VI. Global Biodiversity*

At a global level the EU is a leading player with a significant influence in international discussions. However, Europe's consumption patterns mean that our "biodiversity footprint" in third countries is large and is growing. The EU institutions and Member States should:

- Support improved governance structures at the international level for the protection of biodiversity;
- Take measures to assess and then reduce the impact of European consumption and production on global biodiversity loss;
- Increase cooperation with development institutions and partner countries to maximize the positive contribution that the conservation and sustainable use of biodiversity can make to poverty reduction;
- Support efforts to complete and implement the global network of protected areas – in particular, in marine areas that are beyond national jurisdiction;
- Work to protect vulnerable international marine ecosystems;
- Ensure that biodiversity concerns are fully taken into account by bilateral and global agreements on trade and investment;
- Work to finalize an agreement by 2010, in the context of CBD, on an international regime facilitating access to and equitable sharing of benefits from the use of genetic resources.

#### *Priority VII. Integration of biodiversity into other policy areas*

Effective integration of biodiversity concerns into other policies is needed to (i) minimize damage (ii) maximize the positive contribution to nature conservation objectives and (iii) realize the potential of co-benefits resulting from the maintenance and enhancement of healthy ecosystems. Building the EU's 2006 Biodiversity Action Plan the EU institutions and the Member States should:

- Review the impacts that EU policies, and EU funds, have on biodiversity – including biodiversity loss in third countries. Take measure to address negative impacts;
- Ensure, taking the TEEB study as a starting point, that the real value of ecosystem services are taken into consideration when designing relevant EU policies.
- Extend policies on sustainable consumption and production to cover the sustainable use of natural resources;
- Reduce fishing pressure within EU waters to sustainable levels in order to improve biodiversity in the marine environment;
- Promote investment in biodiversity as a part of efforts to "green the economy" and fully exploit the potential that biodiversity restoration and conservation offers in terms of job creation;
- Encourage market mechanisms that take biodiversity concerns into account (e.g. Green Procurement and labelling of sustainable agriculture, forestry and fisheries products) and promote policies that allow EU businesses to profit from protecting biodiversity.

#### *Priority VIII. Funding*

Many EU and national funds open the possibility of providing financial support for protecting biodiversity. However, the actual level of financial resources allocated to biodiversity conservation remains small (especially when compared to the welfare benefits that ecosystem services provide). The EU institutions and the Member States should:

- Evaluate the success of the "integration" approach. If there is evidence that it is not working, then propose a specific funding instrument for biodiversity;
- Mobilize private funding building on experience with climate change and other environmental finance initiatives;
- Involve the finance and banking sectors systematically in the development and implementation of EU biodiversity policy;
- Review the opportunities for making progress on biodiversity a pre-condition for access to some Community funding instruments;
- Ensure sufficient funding for biodiversity conservation in the EU budget-review;
- Identify, and reform, subsidies that have a negative impact on biodiversity.

In *Romania*, the preliminary assessment carried out by the UNDP-GEF *Support for Compliance with the National Strategy and Action Plan for Biodiversity with the Convention on the Conservation of Biological Diversity and the achievement of Clearing-House Mechanism*, highlights a number of barriers that can be overcome through economic approach to conservation issues. For example, it is considered that the lack of awareness and the absence of political will can be overcome through economic assessment of protected areas and the formulation of programs to raise awareness of the authorities and the public.

Nature conservation is a field of action, but also a science branch (also called conservation biology) contoured with increasing specificity. As a field of action, nature conservation has reflected the results of long term research. Initially, it used the information provided by natural sciences such as – biology, ecology, geography, and later this branch emphasized on the results of its own conservation biology. Delineation of protected areas, the establishment of species requiring protective measures, conservation objectives formulation, and allocation of financial resources is realized using exclusively scientific information in the fields of knowledge mentioned.

Accelerating of the biodiversity crisis, the increase of the anthropogenic pressure applied on the natural ecosystems, the intensification of environmental activism, as well as scientific results have turned the management paradigms of nature conservation, in such a way that in the fundament of decision taking appeal was made to the new scientific information, provided by sociology, anthropology, economics, philosophy, but also to the information provided by traditional knowledge or obtained through experience. Lackey (1998) points out that science's purpose is to specify constraints for obtaining social benefits, while goal setting is a political process that balances the perceived gains and losses according to the value of the society.

Recognizing the necessity for the economic assessment of the contributions of nature to human welfare was followed by a concentration of research efforts in this direction. *Economy of Ecosystems and Biodiversity* project (TEEB) is relevant evidence to a prompt response from the scientific community to the informational needs of the process of elaboration of policies and strategies for the conservation of nature. The most important achievements for the economy of ecosystems/biodiversity are:

- I. Economic Assessment of ecosystem services – the most significant result is global economic valuation of ecosystem services, carried out by Costanza and Cooper. (1997) by quantifying the contribution of 17 components of natural capital;
- II. Analysis of the relationships between natural systems and human welfare – the subject of

the report of the Millennium Ecosystem Assessment (2005) achieved the UN project, through the participation of 1350 of experts from 95 countries. 24 ecosystem services have been described and evaluated and four scenarios were postulated taking into account the prevalence of transition processes (regionalization or globalization) and how to approach the management of ecosystems (reactive or proactive);

III. Methodologies for assessing ecosystems/nature/protected areas – starting from the identification of the components of the total economic value were made to quantify their methodologies depending on data availability. The methods differ depending on the existence of market prices;

IV. Analysis of the possibilities of sustainable use of ecosystems in protected areas – research based on the premise that prevention of the destruction of natural ecosystems and biodiversity depend on enabling new usage values. Through new uses of safeguarding benefits that will outweigh the benefits of the exploitation or replacement (conversion) through improvements for agriculture or for civil engineering;

V. Effectiveness and efficacy of the use of financial resources;

VI. Sizing economic incentives for conservation and use;

Although significant, these achievements do not allow the formulation of comprehensive answers to crucial questions in the economics of ecosystems and biodiversity. How to distribute the benefits of protected areas between holders of interests and on spatial and temporal scales; What is the size of the benefits for protected areas; Which are the costs of the management of protected areas; What are the costs of inaction or delay of effective actions; What is the structure of benefits; Which is the correct size of economic incentives for the conservation and sustainable use.

In addition, there are numerous issues of concern regarding the economic assessment of methodologies, and of the quantification of ecosystem services, particularly in the field of their adequacy to the specificity of economic, environmental, social and cultural that manifests itself at different spatial scales. In Romania, economic valuation of ecosystems and biodiversity is in its infancy, without a coherent and comprehensive approach to enable realistic estimates.

*A Phenomenological Study about Integrating Technology into English Language Curriculum*

Majid Al-Amri

0550

Yanbu Industrial College, Saudi Arabia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This phenomenological case study was designed to investigate an English language professor's perceptions about integrating technology into English Language Curriculum. Seidman's in-depth, phenomenological interviewing method was used. The participant reveals that both teachers and students need to acquire not only the technical knowledge but also the pedagogical and content knowledge as the most profound in integrating technology effectively into the curricula. Also, the participant thinks that it is impossible for teachers to teach with technology everything they know to be of value to challenge established power relationships in textbooks and tests. Instead teachers need to be flexible and open to handle the shift in power and control inside their classrooms to create a genuinely cooperative learning environment in which students keep questioning, researching, exploring and manipulating to create and enhance knowledge. Furthermore, the participant emphasizes the role of administration in integrating technology into the curriculum.

**Key words:** Learning Technology, English Language Curriculum, Language Learning and Teaching

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## Introduction

Practitioner' preconceptions and understandings about integrating technology into the curriculum is a valuable source for pedagogical practices, curriculum developments and administrative policies. This is the purpose of the present qualitative study. The study is designed to investigate an English language professor's perceptions about integrating technology into the curriculum. Even though the study is a case study which is not designed for the purpose of generalization, reflecting on an English language professor's perceptions would not only help us realize the complexity of integrating technology into the curriculum, but it also makes us reflect on pedagogical practices, curriculum developments and administrative policies for the purpose of changing and reforming in education.

Seidman's (2006) in-depth, phenomenological interviewing method was used in the study. Seidman's method involves three ninety-minute in-depth interviews with the participant. The time between the three interviews was one week to three weeks. The time allows the participant to remember and reflect on their comments in the previous interview. It also helps the researcher to check for the internal consistency of what the participant said. As I read the transcripts carefully, I identified and marked important and meaningful themes. Then I highlighted the most pertinent themes for the purpose of the study. A cut-and-paste system was then used to create a profile for the participant.

The participant is a 42-year-old Saudi university professor. He is recognized by his colleagues and the administration as "an excellent teacher". He has a PhD in education from the United States. He has been teaching English courses for more than twenty years. He is now teaching three undergraduate courses: Teaching Methodology, Academic Writing, and Testing and Assessment.

I think his reflections speak most clearly standing alone without my interpretations or references to professional literature. I offer it to other teachers who may be moved by it as I was.

## The participant's Reflections

My English language students need to learn technological skills to advance them into the real world and prepare them for life outside academia. I think that technology is a huge force or rather goal for educators. I must learn the technology and teach my students how to use it. It can open a floodgate of learning opportunities for me and my students. It can provide me a different approach to teaching. I can use technology to teach my students complex ideas that are abstract. I can also use technology to help my students organize thoughts in a graphical ways, analyze a text, and communicate with classmates . . . I can use things like e-mail and discussion boards. They can give me and my students a forum for constructive feedback on papers. There really are endless possibilities!

While I was working as an instrumental designer for a government, I consistently saw this battle between the expert and the students that were trying to develop new technical skills . . . I have learned the hard way in my classes and it has taken trial error to become an expert teacher in my field. I had a hard time teaching someone else how to use a software program

and design skills, especially online . . . I am trying to discover new ways to help my students acquire the new knowledge they need.

Student preconceived knowledge can help teachers facilitate learning by building on student pre-existing knowledge . . . This can be utilized as a starting point for teachers and eventually luring students into learning the concept/skill. And this can be easily accomplished in a learner center, knowledge-centered, and community centered classrooms . . . This is absolutely a challenge for me, especially with a huge diverse number of students.

Sometimes teachers cannot permit this shift in power, control. They resist . . . They should see the benefit of changing roles in the classroom; otherwise, their classrooms will remain boring and uninteresting to future students . . . It is extremely easy to say I should integrate technology in the classroom. It is nearly impossible to see it in action if you do not full heartedly embrace the opportunity for change in instruction and allow the student to take an active role in participating as a learner and classroom leader. Teachers have to accept change. Change is unavoidable. It is not a problem, but those that face difficulties need direction to best serve their student.

The work I'm doing now at a university is so much more rewarding than when I was at school . . . Most of my English language students are over the age of 20 and they bring life experience into the classroom. The advantage is that they have real life experiences or expertise that they can use to assist them in making meaningful connections that will help them in the transferability of knowledge. The disadvantage is that having expertise can sometimes mean you lack the flexibility and openness to see other options.

Technology integration requires that I and my students be comfortable in relying on each other . . . A commonly seen scenario; it is the beginning of the semester, and 'Ali' has entered his computer application class only to find out that there is a new teacher, and I am not familiar with a particular software package. Ali offers to install, configure and help me get the class going in the right direction . . . Both the student and I are thrust into different roles and ultimately experience learning at different level. This is a great scenario depending on the attitudes of three separate entities: the teacher, the student, and of course, the administration.

In utilizing technological tools for research, exploration, and manipulation to create and enhance products, it is not the end results that are important, but problem based project learning and the process that are of utmost importance . . . As these new technologies develop and are integrated as work tools, I should constantly remind myself that technology comes hand in hand with obstacles that require me to be patient and create a sense of humor.

In problem and project based learning environments that were collaborative, challenging, relevant, contextualized and intensely personal, I observed students develop into increasingly sophisticated and empowered thinkers. My students sometimes constructed understandings because they had a need to know. For example, understanding how to critically analyze a text makes more sense when that knowledge is necessary in determining sources of power in different types of genres!

Memorization is not the norm, student interests drive the curriculum, and students are expected to think critically. Also, students will be seen helping each other solve problems which will build a sense of comfort with questioning rather than knowing the answer and can develop a model of creating new ideas that build on the contributions of individual members.

Furthermore, the types of assessments given in these environments will promote critical thinking skills versus memorization.

Student preconceived knowledge can help me facilitate learning by building on student pre-existing knowledge . . . This can be utilized as a starting point for me and eventually luring students into learning the concept/skill. And this can be easily accomplished in a learner center, knowledge-centered, and community centered classrooms . . . This is absolutely a challenge, especially with a huge diverse number of students.

It is the responsibility of administration to get the latest and greatest technology and then train teachers how to incorporate it into their curricula. Workshops and conferences help and need to be attended. There needs to be an open share of information about teaching approaches, learning theories and the use of technology. I also believe that there needs to be more research on the “how’s” and the “why’s” technology makes learning better. I think with the advancement of our modern lives, education must advance with it. Not only are we trying to train or students to be productive members of our society, we are training them to become productive members of a technological advanced society.

## **Conclusion**

The participant thinks that both teachers and students need to acquire not only the technical knowledge but also the pedagogical and content knowledge as the most profound in integrating technology effectively into the curricula. Also, the participant argues that it is impossible for teachers to teach with technology everything they know to be of value to challenge established power relationships in textbooks and tests. Instead teachers need to be flexible and open to handle the shift in power and control inside their classrooms to create a genuinely cooperative learning environment in which students keep questioning, researching, exploring and manipulating to create and enhance knowledge. Furthermore, the participant emphasizes the role of administration in integrating technology into the curriculum.

*A Technology/Website for Speech and Text Synchronization Useful in the Training of  
Listening Comprehension in Foreign Language Learning*

Ren-yuan Lyu, Wei-Jie Huang, Ci-yin Mao, Wei-chi Cheng, Chun-han Lai, Wun-fei

Shie, Jing-yong Huang, Bo-ting Chen

0552

Chang Gung University, Taiwan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

iafor

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## 1. Introduction

In non-English speaking world, particularly in the East Asian region, such as Taiwan, Japan, Korea, and even China, learning English is almost a national campaign. Students of English as a second language in the area usually feel more difficult in listening and speaking than in reading and writing.

## 2. Motivation

In this study, we have a very simple motive: i.e., we as English learners and computer engineers, hope to utilize the computer speech and language technology to assist language learners in learning a foreign language, especially in listening comprehension and speaking fluency.

## 3. Accessibility to Learning Material in Internet

Because of the popularity of the Internet, we can now easily access to many useful audio material, with the corresponding text in foreign language. These audio/text material can be well utilized to be helpful in language learning, especially in listening comprehension. Examples include a free audiobook website, LibriVox [ref.01], and a commercial language training website, JapanesePod101 [ref.02].

Let's take a look at LibriVox

An example from LibriVox

Let's take a look at JapanesePod101.com

An example from japanesePod101.com

Some convenient tools are also provided

Human conversational interpretation

Vocabulary Flashcards

Learner's Voice Recorder

Line-By-Line Audio Transcript

One of the most wonderful tools

## 4. New Features Expected ...

As a language learner, I appreciate the website mentioned above very much.

But as a critical user, I also hope they can provide more convenient tools for learners to digest the learning materials.

One of the desired/expected functions is ....

the Karaoke (カラオケ)-style audio/text synchronization in the word level.

An example of Karaoke (カラオケ)

## 5. Techonology Involved

Speech / Audio Processing

Speech / Text Synchronization

Speech Recognition

Web/Mobile Application

Speech/Text Synchronization can be achieved in different levels

Chapter level

Adopted in most audio books

Convenient for storage and transmission

Paragraph level

Convenient in recording session

Sentence level

Adopted in many language learning sites,

e.g., japanesePod101.com

Word level

Adopted in Karaok-style lyrics

Still hardly seen in language learning material

because it is not convenient to achieve

Sub-word level

Syllable level, Phoneme level, Acoustic level, etc.

Very hard to achieve and just found in research labs

## 6. How to achieve Speech/Text Synchronization

For an audio file with corresponding text, we need to produce a ‘Timed Text’ file, where the time for each audio event should be recorded.

Several formats for ‘Timed Text’ have been proposed, including

TTML (Timed Text Markup Language) by W3C

SMIL 2.0 specification adopted in ePub

SubRip format for closed captioning in Video

LRC format for song lyrics

TRS format (used in Transcriber, based on XML)

Some examples of Timed Text

## 7. A Software for manually generating Timed Text

## Transcriber

a tool for segmenting, labeling and transcribing speech [ref.03]

### The timed-text file in Transcriber

the '.trs' file format  
xml-based

It is not difficult for manually segmenting speech in sentence levels  
because of the existence of the obvious silence segment.  
However, it is very hard or tedious for human being to do segmentation in word level  
because no obvious visual cue exists in word level.

### 8. Speech/Text Synchronization in Word level

Speech recognition technology has made a great progress during the past decades.

One of the major successful techniques is Hidden Markov Model (HMM).

HMM is a statistical approach to model speech features, usually a HMM represents a speech unit, such as sentence, word, syllable, or phoneme.

### 9. HMM Toolkits (HTK)

Given a speech utterance, it can be well aligned with a sequence of speech units by 'forced alignment' techniques in the HMM approach.

A set of HMM Toolkits, called HTK, provided a convenient way to utilize the HMM approach. [ref.04]

### 10. An Introduction to Forced Alignment in HTK

### 11. Doing a Viterbi Search for the optimal path (alignment):

### 12. Performance Measure

Testing Example:

'The Adventures of Tom Sawyer'  
from LibriVox

Counting in words of Text

Mis-Aligned: 9.14% (6,446 words / 70,496 words)

### Measuring in time of Speech

Mis-Aligned: 8.97% (2,187 sec / 24,382 sec )

13. CguAlign: A website to demonstrate Speech/Text Synchronization

14. Technology in CguAlign

Text and Audio material come from public domain website, such as LibriVox, JapanesePod101..., etc

Synchronization is done by HTK-based CguAlign technology.

The '.lrc' file format is adopted as the Timed-text format.

JavaScript language is used to construct the dynamical website.

15. Conclusion

This website demonstrate a technology to do Speech/Text Synchronization in word level.

Currently, about 9% mis-alignment rate is achieved, using HTK-based Forced Alignment technique.

It can grow to a general-purpose language training service, especially focused on listening comprehension.

*Using Thai Folk Plays to Develop Mathematics Concepts of Pre-School Children*

Siriporn Srichantha

0555

Loei Rajabhat University, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This independent study was to investigate the using of Thai folk plays to develop mathematics concepts of preschool children at Chumchon Ban Naduai, Loie Province. The study employed one group pretest-posttest design experimental research which took 20 sessions of 4 weeks consisting. The instruments used included the 7 lesson plans, test of mathematics concept for pre-school students. The concepts were included in the Ministry of Education's 2008 Pre-school Curriculum which covered counting and numbers 1-30, even and odd numbers, comparing in terms of more than, equal, and less than, number adding of less than 10 result, and subtracting of less than 10 numbers. The statistics used to analyze the data included mean and standard deviation. The analysis was presented in table followed by description. The findings reveal that plans using folk play could increase the preschool students' mathematics concepts in every aspect.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## **Backgroud and Significance**

Early childhood development is at the beginning of every aspect of human life. The development and construction experience to children by means of accurate and appropriate. Will encourage children to learn things. And development around the areas. To the members of the family, community and nation

Experiences for the early childhood curriculum early childhood education is key. Development for early childhood education is the most important thing. Children should have the opportunity to develop a realistic perception of creativity and imagination (Ministry of Education, 2003)

Activities for preschool children should be in the form of "I was learning to play" because of the nature of children this age like to play more. The children will enjoy playing it. Meanwhile, the children will be learning together with (Dechakup, 1985)

Mathematics is highly important to development of the human mind. It enables a person to acquire skills in creativity, logic and systematic and methodical thinking, and allows one to carefully and thoroughly analyse various problems or situations, anticipate, plan, make decisions, solve problems and accurately and appropriately apply mathematics in daily life. Mathematics serves as a tool for learning science, technology and other disciplines. It is therefore useful to one's life, enhances quality of life and enables a person to live in harmony with others (Ministry of Education, 2008).

We should do the math to young children since. And develop basic mathematical concepts on the basis of the understanding by providing children with their own hands. This will be the situation in the daily lives of children. Requires planning and preparation for the event of an effective teacher. Opportunities for children to practice and Learn many things. Self as much as possible. It will allow children to develop skills and basic mathematical concepts. That can be used as a basis for living in the present and the future (Yielu, 1998)

Mathematics as a cultural heritage that has been passed down from generation to generation, and that creativity is the subject that enables human thinking is organized and assists in solving problems in daily life (Pog wongpanya, 2001)

## **Purpose of the Study**

A study Using Thai Folk Plays to Develop Mathematics Concepts of Pre-School Children

## **Hypothesis of the Study**

Thai Folk Plays to develop the concept of early childhood to higher mathematics

## **Definitions**

The following terms have been used throughout the present study, and defined below for clarity in their application to this study

**Thai Folk Plays** means Thai Folk Plays that have been transmitted from our ancestors. Playing with the rules of both the lyrics and dialogue. Movement. The competitive nature of the game and with the age of the child.

**Mathematics Concepts of Pre-School Children** means The idea that a person can have one arising from the accumulation or collection of facts to be learned In this research, including Counting and number 1-30 Knowing the number and odd number Comparison than less than equal Positive elements 10 Deletion elements 10 By the situation Thai Folk Plays

**Pre-School Children** means Kindergarten students are studying two years Age 5-6 years, 10 students in the first semester of the 2012 academic year Chomchonna Duang

### **Expected Application**

1. The concept to Develop Mathematics Concepts of Pre-School Children by Using Thai Folk Plays
2. Study as a guide for teachers and early childhood personnel involved in its application to teaching and learning to Develop Mathematics Concepts of Pre-School Children

### **Research Methodology**

This independent study was to investigate the using of Thai folk plays to develop mathematics concepts of pre-school children at Chomchonna Duang, Loie Province. The study employed one group pretest-posttest design experimental research. The following sequence of steps to implementation. This research is targeted, kindergarten students are studying two years Age 5-6 years, 10 students in the first semester of the 2012 academic year Chomchonna Duang

### **Tools used in the research**

Planning of activities Thai Folk Plays 7 activities and use time activities about 25 minutes. Test of Mathematics Concepts of Pre-School Children include Counting and number 1-30 Knowing the number and odd number Comparison than less than equal Positive elements 10 Deletion elements 10

### **The statistics used for research**

The statistics used to analyze the data included mean and standard deviation. The analysis was presented in table followed by description

## Results of Data Analysis

**Table 1 Number and percentage of the personal characteristics of the sample (N = 10)**

Gender	Number	Percentage
Boy	6	60.00
Girl	4	40.00
<b>Average</b>	<b>10</b>	<b>100.00</b>

**Table 2 Mean, SD and t-test to compare mathematics concepts of including Counting and number scores of students (N = 10)**

	Mean	Standard Deviation	df	t
Pretest	3.90	.994	5.60	
Posttest	9.50	.527		
				16.474**

**\*\* p < .01**

According to the results given in Table 2 , mathematics concepts of including Counting and number Averages scores obtained before and after of students were 3.90 and 9.50 and SD were .994 and .527 respectively.

It was found in the comparison between the differences of mathematics concepts of including Counting and number scores before and after to activity that , mathematics concepts of including Counting and number scores of students after to activity were increased with statistical significance at the level of .01

**Table 3 Mean, SD and t-test to compare mathematics concepts of Knowing the number and odd number scores of students (N = 10)**

### **Conclusion Discussion**

This independent study was to investigate the using of Thai folk plays to develop mathematics concepts of preschool children at Chumchon Ban Naduai, Loie Province. The study employed one group pretest-posttest design experimental research which took 20 sessions of 4 weeks consisting. The instruments used included the 7 lesson plans, test of mathematics concept for pre-school students. The concepts were included in the Ministry of Education's 2008 Pre-school Curriculum which covered counting and numbers 1-30, even and odd numbers, comparing in terms of more than, equal, and less than, number adding of less than 10 result, and subtracting of less than 10 numbers. The statistics used to analyze the data included mean and standard deviation. The analysis was presented in table followed by description

The findings reveal that plans using folk play could increase the preschool students' mathematics concepts in every aspect.

*The Effect of Bi-Modal Input (text and sound) on the Development of Second  
Language Listening Comprehension*

Yan Wang, Lin He

0556

Xi'an International Studies University, China

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

When second language learners are exposed to a continuous speech, they more than often find the segmentation of where a word ends and where the other begins beyond their ability, especially given that English has so many specific issues in lexical segmentation. (such as reduced forms, assimilation, elision etc.) The second language learner would be more than happy to “see” a clear-cut or pause between two words, just like how the sentences are written down.

This project intends to investigate whether bi-modal input (text and sound) can have beneficial effects on second language listening comprehension. This research designed a series of interviews and assessment questionnaires to modified group A (involved in bi-modal input listening course) and control group B (involved in traditional listening course). Feedback from research was used to analyze the case of using bi-modal input in listening course. Also, comparison on listening ability improvement between the modified group and control group was made.

For the contribution to academia, second language teachers can be made more aware of how students perceive and memorize words when they listen and how is this process different from the recognition of words via reading. As a result, more efficient way of improving second language listening skills may be found and implemented in current course teaching modal.

## Introduction and Literature Review:

As an essential part of second language acquisition, listening is a comparatively difficult one to improve for quite a lot of people. Listening to others' talking in native language, one may assume the process is a rather simple task since it seems to be automatic and effortless for people to apprehend a sequence of continuous words. But actually the comprehension of spoken words is a demanding process, in which the continuous stream of speech input signals have to be mapped accurately onto a lexicon of tens of thousands words before they are encoded and form any interpretation on the hearer's mind. For the second language learners, the listening part of studying is especially essential because it is the most frequently used technique people need in daily life. At the same time, it is also equally difficult to learn as well as to teach. The combination of "bottom-up" and "top-down" in listening can be quite a big problem for the beginners or even for the intermediate second language learners. According to my three years teaching experience in China, the people who are not having problems in reading or taking exams, they do have great difficulty in the perception of a continuous 'informal style' of public speech (Brown, 1990, p.5). That makes the question of how to improve listening ability in second language acquisition appear more challenging.

Most people consider the rate of speaking can exert a decisive effect on the understanding of a second language, therefore those people have the tendency of "blaming" others talking especially fast when they have difficulties in the listening process. In fact, it has been estimated that human can encode speech at the rate of around 25 to 30 phonemes per second though we are not able to do the same with other types of sounds such as buzz, hiss or siren. (Liberman, 1970) This demonstrates that the ability of one's working memory should be sufficient for the processing of continuous sentences in spite of the fastness.

The segmentation of word boundaries makes the major contribution to the problem at stake and the strong syllable approach is usefully adopted for solving the problem in English. One of the most prominent characteristics of speech is that the signal input varies through time. Not like the written form of language, the speech vanishes after it is uttered and that makes the speech transient. In addition to that, although the units of the input such as phonemes, syllables and words appear to follow one after another in time, the feature of linearity is not found in the physical signal. So it is generally considered that the speech signals fail to meet the linearity condition, which means there are actual overlaps and co-occurrences in the acoustic signals. (Miller & Chomsky, 1963) Thus, the problem of how listeners are able to separate the overlapped linguistic units within the limited time becomes one of the popular topics in this field.

The recognition of isolated words is already hard. The listener needs to be able to select the right word the speaker intended in spite of the speaking rate, dialect or accent and sometimes even the background noise in particular situations. What makes it more complex is that the lexicon from which the word should be selected contains tremendously numerous similar words, differing from one another often by no more than one distinctive feature. Of course, the problem becomes even more severe when it comes to the recognition of continuous

speech. Besides the difficulties stated above, new obstacle arises. As discussed in previous paragraph, since the speech is in continuous utterance, how can the listener tell where one word ends and where the next word begins? So it is asserted that the central problem in the recognition of continuous speech lies in the fact that there is no perfectly reliable cues to word boundaries. (Cutler et al., 1997) And this leads to the problem of segmentation, which means the 'difficulty in the parsing of the acoustic waveform into discrete linguistic units'. (Nygaard & Pisoni, 1995, p.65)

When second language learners are exposed to a continuous speech, they more than often find the segmentation of where a word ends and where the other begins beyond their ability, especially given that English has so many specific problems in lexical segmentation. (such as reduced forms, assimilation, elision etc.) Most psycholinguistics argue that the prosodic features like intonation and word stress are important for the perception of a connected speech because those features help listeners to segment the connected words and influence how the listener would chunk the acoustic information they heard and then put them into meaningful interpretation. Though so many methods of words segmentation in continuous speech have been discussed and explored, still the second language learner would be more than happy to "see" a clear-cut or pause between two words, just like how the sentences are written down. As Gilliam Brown asserted:

*Most literate people find it very difficult to disassociate knowledge of how a word is spelt from how it is pronounced. (Brown, 1990, p.3)*

In this essay, the main concern will be focus on whether bi-modal input (text and sound) would have any beneficial influence on the learning of English as a second language.

### Designed Research and Questionnaires:

Two years ago, the department I worked at in China set up a course called "Audio-Visual" to supplement conventional listening courses. In "Audio-visual" course, it combines listening to the conversations in videos and reading the transcripts simultaneous by showing students some visual materials. The basic design involves the utilization of projector and computers to show students some English movies, documentaries and TV news, using subtitles at the same time. We change the subtitle from English to Chinese sometimes. Very often, we found the subtitles (both English and Chinese) help students' general comprehension. In this research, by adopting different methods of teaching (using subtitles and not using it) in two groups of students who have equal backgrounds in English learning, and testing their listening comprehension at the end of the research, we discovered some new factors that may lead to some difference in one's listening ability.

The duration of this research is designed for one semester, which in China is eighteen weeks, with 10 hours of audio-visual courses evenly distributed in five days a week. Group A ((involved in bi-modal input listening course) and control group B students (involved in traditional listening course) are deliberately selected in terms of their age, educational background, foreign language level, and interest in learning. Both the groups are high school

graduates, with an average English score of 70 (full score is 100). All the students are keen in learning English since they are about to go abroad and further their study. After a semester of Audio-visual class, a formal achievement test with multiple choice and blank-filling question patterns is given to both of the groups, based on the listening materials they learned. In addition to that, questionnaires are delivered to all students, evaluating their responses and appreciation towards the conventional approach (no subtitle input) and the alternative approach (bi-modal input). The questionnaires are designed with slight difference for group A and Group B in accordance to the distinctive nature of two approaches.

Questionnaire for Group A (bi-modal input) is designed as follows:

Evaluation Questionnaire for Audio-visual Course									
Name:					Class:				
Please answer the following questions or give your personal opinions.									
1. Have you ever take part in any audio-visual class with bi-modal input (with subtitles for the listening material)? If yes, where and when?									
2. On the scale of 1 to 10 (10 being the most helpful), how do you evaluate seeing the subtitle while listening to it? Tick the box for appropriate.									
1	2	3	4	5	6	7	8	9	10
3. Compared with teacher's explanation of every sentence, do you feel actually seeing the sentences as subtitle more clear and helpful? Why?									
4. Can you keep up with the pace of the subtitle?									

5. Do you find bi-modal input can help you improve your memory, thus you can remember more material after the course?

6. How much do you understand the listening material? Tick the box for appropriate.

10%	20%	30%	40%	50%	60%	70%	80%	90%	100%

7. Do you have any further suggestion towards this course?

Questionnaire for control Group B (traditional audio input) is designed as follows:

Evaluation Questionnaire for Audio-visual Course	
Name:	Class:
Please answer the following questions or give your personal opinions.	
1. Have you ever take part in any audio-visual class before? If yes, where and when?	
2. Do you find the teacher's explanation of every sentence very helpful in terms of facilitating the understanding of listening materials?	
3. Besides the teacher's explanation, what other aids would you prefer to help you understand the listening material?	

4. How much can you understand the listening material? Tick the box for appropriate.									
10%	20%	30%	40%	50%	60%	70%	80%	90%	100%
5. Do you have any further suggestion towards this course?									

Altogether 60 questionnaires have been distributed, and 59 collected with valid data. After the investigation and interpretation of the 59 questionnaires, we rendered that to a great extent, audio visual course with bi-modal input is superior to the conventional listening course in terms of improving students' understanding as well as memory.

In regard to the question "how much you understand the listening material?", 21 out of 30 of Group A students ticked 70% or above, with 8 of them ticked 90%. On the other hand, most of Group B students only tick 50%~60%, with only 4 of them ticked 70%. This differentiated result is also reflected in the final exam, in which Group A students scored 20% better than Group B students averagely.

Towards the question "do you find teacher's explanation helpful", most of Group B students said "yes, but it does not cover all the listening material." At the same time, Group A students also find teachers' explanation helpful but the subtitle supplemented it perfectly since the teachers sometimes omits some details.

For Group A students, 26 out of 30 acknowledge bi-modal input in audio visual course can facilitate their study quite well by tick the box of "8" or above in question number 2. On the other hand, when Group B students were asked "what other aids do they need besides teacher's explanation", 18 of them answered that they would like to listen to the material one more time or to have reading materials supplementing this course.

From the analysis of the questionnaires, we draw the conclusion that bi-modal input in audio visual course is welcomed by the students, and can in fact enhance their confidence and may eventually improve their listening capacity. In addition to that, bi-modal input can facilitate teachers in a classroom, by providing more explicit details in the listening materials.

The question "do you have further suggestion towards the course" is poorly design in this questionnaire, since most students are too timid or hesitating to raise any valuable improvement suggestion. 48 out them simply put down "No" for an answer. In our future

research, a list of designed answers will be listed as potential possibilities, from which the students can choose from.

## Conclusion:

For the second language learners, seeing the “clear-cut” of two words makes them able to segment the sentence and thus understand better. By adopting the bi-modal input approach instead of convention method in listening capability training course, second language teachers may better design their material and the second language learner can hold more confidence in their listening ability thus understand more.

For the contribution to academia, second language teachers can be made more aware that students perceive and memorize words better if both of visual and audio mechanisms are activated. By providing them bi-modal input, we may activate both mechanisms and enable the segmentation of English words more convenient. This should be considered more efficient way of improving second language listening skills and implemented in current course teaching modal.

In the daily practice of teaching English as a second language, teachers should shift their idea of single modal teaching to bi-modal, even multi-modal teaching. When it comes to persistent difficulties such as listening obstacles, innovative approaches should be adopted, targeting at students’ weak point, rather than holding onto the conventional way of tape-recorder listening.

Of course, the problem of segmentation of a continuous speech is far from resolved. Bi-modal input may facilitate second language learners in a positive way, but there are still many undecided factors involved in this process. For instance, should the visual input be demonstrated all along with audio input or should it be after audio input? When is the suitable cue to pause in the process of demonstrating the material? How to prevent the second language learners focusing on the visual input instead of the audio input? In our future study, these factors shall be take into consideration, and a larger sample group shall be included in the survey.

*Learning at Work - A discussion of Work Based learning at the University of  
Portsmouth*

Fiona Message, Colin Gilbert-Wood, John Bishop

0557

University of Portsmouth, UK

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

For the last twenty years the University of Portsmouth has delivered a Work Based Learning degree, and in the last five years numbers on the programme have grown rapidly; in 2012, 160 students graduated with either an Undergraduate or Master's degree. The ethos behind the programme is that students design their own learning profile at either undergraduate or master's level, with credit being awarded for evidential experience gained in the workplace. To gain prior learning credit, students are required to complete a portfolio matching the learning gained through experience with learning outcomes declared on units delivered at the University of Portsmouth. Students then accrue additional credits (as required to achieve the award) by a series of work-based projects. For each one they must write a series of personalised Learning Outcomes and the reports must show evidence that these have been met. Experienced tutors are assigned to each student to help them deliver at an appropriate academic level. The document that their studies are based on is known as the Learning Contract. This is the first item they must submit for formal approval and assessment. The Learning Contract may be submitted for approval to one of several professional bodies. This paper focuses on the advantages of gaining qualifications using the Learning at Work pathway. The benefits to the student, in gaining higher educational qualifications and future career progression, and to employers, who gain professionally qualified employees with focus and commitment, are discussed.

## Background - 'Angels in Concrete'

Michelangelo believed that the Angels he carved already existed within the unsculpted block of marble – they were just waiting to be released (Gustati (1863)). Trowler (1996) liked the analogy and saw how it could apply to students; in a paper on 'Accrediting Experiential Learning', he describes students as being 'Angels in Marble'. He quotes Evans (1987) who says

*'Hidden within all students...lies a mass of knowledge and skills acquired in a wide variety of ways and distributed between heart, head and hands....The task of both student and teacher is to bring this mass out into the open, to identify it through appropriate assessment, to record it...and put it to use.'*

Two academics working at the University of Portsmouth picked up on the analogy as they developed work-based learning. However they considered that marble suggested exclusivity and preferred, instead, the title 'Angels in **Concrete**' (Lyons & Bement (2006)):

**Frank Lyons** was a lifelong learner at the University. He taught sociology from 1968 to 1990 before becoming Associate Dean (Curriculum) in the Faculty of Technology. He subsequently took on the role of Director of the Centre of Excellence in Teaching and Learning in 2005.

**Mike Bement** was Director of Postgraduate studies and convened the group that set up the Partnership (Learning at Work ) programme. A former Engineering Designer who moved into tertiary education, his publications focus on learner managed education and learning measurement.

Preliminary investigation of employer support for a partnership programme led to funding from Shell and the UK government in 1989. This enabled the concept of such a degree to be explored, initially targeting young people who had left school with few formal qualifications.

The degree was to provide a balanced, integrated experience including independent task based learning with University attendance for some classes. This suggested a three way partnership between the student, employer and the University.

As the project was further developed, it became apparent that the proposed programme was better suited to more mature and experienced individuals. The pilot year enrolled seven students, all of whom had some formal qualification as well as experiential learning.

The staff appointed to develop the programme worked with the Higher Education Quality Control Group and with the Southern England Consortium for Credit Transfer and Accumulation to develop an academically rigorous credit rating for experiential learning. This added credibility to the programme so that the University, initially dubious of the idea of Work Based learning, gradually came to support it.

The programme grew and expanded to include a Master's route to allow those with higher qualifications and/or higher levels of experiential learning to further develop their educational level. The evolution of the degree was led largely by student (and employer) feedback to become the robust structure it is today. The work of Frank Lyons was rewarded with the award of a National Teaching Fellowship in 2003.

The initiative was also recognised in the government report written by Sir Ron Dearing. Entitled 'National Committee of Enquiry into Education' it talks about the need for lifelong learning to be an integral part of Education in Britain. In chapter 12, paragraph 23, of the report, Dearing notes:

*For some years now, many institutions have been producing tailor-made programmes for local businesses. The University of Portsmouth, for example, offers a degree programme for people who work in local companies, which incorporates credits towards the degree based upon the individual's learning at work and his or her previous qualifications, organised and delivered in a way that fits in with the individual's employment.*

The original motivation for designing the new programme was a growing realisation that alternative methods of learning existed. Again, Dearing's report supports the initiative to look beyond the traditional classroom learning environment. In his introduction he says

*Over the next 20 years, the United Kingdom must create a society committed to learning throughout life. That commitment will be required from individuals, the state, employers and providers of education and training.....We see the historic boundaries between vocational and academic education breaking down, with increasingly active partnerships between higher education institutions and the worlds of industry, commerce and public service.*

The traditional model for University teaching is that a team of academics design a syllabus, prescribe the curriculum and dictate the *Learning Outcomes* (see below) for any particular course, and teaching unit within it. In other words, the learning is entirely controlled by the institution. Even final year projects, where learning is more individual, often tend to be led by the interests of the project supervisor.

Bement and Lyons came from a different approach and considered how the student could be given control of his own learning. The student (in full time employment) could use Work Based projects to provide the credits for his degree. The projects were required to enable students to achieve the appropriate levels and the report would be subject to the same academic assessment as any campus based student report.

The experiment was a success. Students engaged with their own learning and with guidance, wrote their own Learning Outcomes. In other words, they designed their own degree, specifying what was required to complete it and were in full control of their learning. This led to a highly motivated cohort who performed extremely well, when measured against traditional students.

In fact, Lyons et al. were ahead of their time. In 2004, Lord Leitch was commissioned by the government at the time to write a report on 'what the UK's long term ambition should be for developing skills in order to maximise economic prosperity, productivity and to improve social justice.' This was commissioned as a response to the perceived skill shortage in the UK when compared against other European countries. The report (published in 2006) recommended

- **Focus on Economically Valuable Skills.**  
**Skill developments must provide real returns for individuals, employers and society. Wherever possible, skills should be portable to deliver mobility in the labour market for individuals and employers;**
- **Demand-Led Skills.**  
**The skills system must meet the needs of individuals and employers. Vocational skills must be demand-led rather than centrally planned;**
- **Adapt and Respond.**  
**No one can accurately predict future demand for particular skill types. The framework must adapt and respond to future market needs;**

In other words – he described the fundamental ethos of a work based learning programme!

#### How it Works Today

Prospective students make an application to the University in the normal manner, declaring a wish to undertake a Bachelor or Master degree in a variety of subject areas including Engineering, Management or Business. Any student wishing to register who cannot find a suitable title may register for a degree in 'combined studies'. The student is also asked to identify appropriate project areas in order that a suitably experienced tutor can be assigned. On the application the student must also state how many prior learning credits they are claiming. This is known as *Accredited Prior Learning* (APL) and is a key component of the partnership degree which is worth considering further:

#### **Accredited Prior Learning (APL)**

There are three ways in which students enrolling on the programme may claim prior Learning Credit.

The easiest way of claiming credit is by certificated learning or by a recognised rank or other military achievement. In these cases no portfolio is required. For instance, a Foundation Degree or Higher National Diploma (if current and relevant to the course of study) will automatically be awarded 240 credits which equates to the first two years of an Undergraduate course. As an example, in the British Military services, a rank of

Warrant Officer 1, a senior non-commissioned officer rank with high levels of responsibility, if held for at least 2 years, carries an automatic 120 credits at Master's level, thus requiring the student to complete only 60 credits for a Masters degree.

All appropriate United Kingdom armed forces military ranks have been credit-rated. The resulting equivalencies are the result of consultation between the armed forces, the University and the City and Guilds. Military personnel at higher career points are eligible to apply for recognition of their training and experience with the City & Guilds. The awards are at three levels; Licentiateship, Graduateship and Membership.

The number of military personnel continues to grow and credit equivalents have been expanded to cover all armed forces ranks, using NATO equivalents. This means that credit rating can now be applied to international forces. The department currently has a large number of Omani students studying with it, and is in the process of credit rating Merchant Navy roles.

If recognised credit is not available, then any student may submit a portfolio of evidence demonstrating accrued learning at either undergraduate or postgraduate level. The student may be able to 'match' the learning gained in the work place with Learning Outcomes as stated on any Portsmouth taught units. If appropriate evidence is submitted credit can be awarded 'as if' the unit had been studied. If a suitable unit cannot be found then the student may demonstrate that he has gained credit by giving evidence of meeting suitably worded Learning Outcomes.

The department provides guidance on building a portfolio on an individual basis, but its construction can be time consuming and carries a financial cost, so would only be worthwhile if the number of credits claimed was significant.

The advantages of claiming prior learning credit are obvious: The degree will take less time to complete and the course of study will cost less, as the student fee is calculated on the number of credits required – not the length of time of the degree. In fact, a student presenting with no prior learning would be advised to seek a formal taught qualification first – such as an HNC, HND or Foundation Degree, as the course is really only suitable for students with some experience in the working environment.

Once APL has been agreed, the student then has to agree with the University how the remaining credits are to be accrued. These will be made up from:

- Work based projects, which will account for the majority of the remaining credits (after APL).
- Taught Units from the University of Portsmouth (or elsewhere); some students opt to take these as part of their degree but time-tabling constraints and the limited availability of distance learning units mean that they are not widely used.

- The Learning Management (LM) Unit which is the only compulsory element of the programme and consists of the construction of the degree (as evidenced by the Learning Contract), together with periodic progress reports.

To initiate newly enrolled students, they are invited to the University for a one day course that includes the development of Learning Outcomes and the discussion of suitable project areas. For any students that cannot attend, all the material is available through the on-line University Learning Environment. The first submission for all students is the Learning Contract.

### **The Learning Contract**

Once students have registered they are required to construct a personal 'Learning Contract'. They must give details of their APL and outline how they will gain the remaining credits which are mostly accrued through work based projects. The students must outline their plans for each project, detailing how many credits they deem it to be worth and writing a set of Learning Outcomes for each one.

Once the contract has been drafted it is reviewed by a *work place mentor* (see below), an academic tutor, and a 'Learning Management' tutor. The mentor and tutor will be expected to comment on the project specifications; the Learning Management tutor will give more detailed feedback on the choice of Learning Outcomes and the general structure of the document. Together with the draft, the students must also submit a *reflective report* (see below) indicating initial progress and comments on the introductory Learning Management course.

A definitive contract is then submitted which is formally assessed by the Learning Management tutor. This first mark counts as half the assessment for the Learning Management Unit.

It is expected that each student will work closely within the boundaries given in his contract, with any changes resulting in a formal amendment, requiring acceptance by both tutors.

### **Learning Outcomes**

An explanation/definition of a Learning Outcome is given by Adam (2004):

*A learning outcome is a written statement of what the successful student/learner is expected to be able to do at the end of the module/course unit, or qualification. Learning outcomes are concerned with the achievements of the learner rather than the intentions of the teacher (expressed in the aims of a module or course). They can take many forms and can be broad or narrow in nature.*

Overton (2005) writing a paper for the Higher Education Academy states that

*‘Learning outcomes should:*

- be written in the future tense*
- identify important learning requirements*
- be achievable and assessable*
- use clear language easily understandable to students’*

From the point of view of the Learning Management tutor, they must be measurable, achievable and at the correct level. For instance, the verb ‘Understand’ is not considered a suitable basis for a Learning Outcome (LO) at level 6 or 7 (at which the majority of our students are working). The Learning Management Handbook, an on-line easily accessible resource, gives advice on suitable verbs to use at each level. Broadly speaking, cognition is not a higher level outcome, whereas ‘evaluate, analyse, critique, and argue’ etc are. In addition to the project based LO’s, general LO’s are required, outlining learning that it is hoped will be achieved in the course of the programme. Typically these are transferable skills encompassing (for instance) time management, report writing, communication etc.

### **Reflective writing**

An important element of every project, and an integral part of the Learning Management Unit, is the submission of reflective reports. The students are required to assess their own learning, as measured against their Learning Outcomes, and give consideration to how their approach to work, and proposed career development, have been enhanced by participation in the programme.

### **Work Place Mentor**

It is the responsibility of each student to appoint a ‘mentor’ within the work environment. The role of the mentor is to give guidance and encouragement to the student, and to comment on each submission without having to provide a formal assessment of any report. The Learning at Work Department provides guidance notes for mentors to help them understand their role. Mentors have the advantage of knowing the company, and the work in which the student is involved, and their comments are usually incisive and helpful. However, as they are not chosen by the University, it is supposed the value of each individual one may vary a great deal.

The student will complete his degree upon achievement of his remaining credits. The final submission is a reflective report commenting on the student’s experiences on the programme and should demonstrate how their General Learning Outcomes have been satisfied. The following are comments from the student cohort of 2012:

#### Student Feedback

Extracts from the End of Contract reports:

*The project complemented my prior learning and the business needs of my company. I think I am now seen as a person who leads and influences policy within my company. (MSc)*

I feel the partnership programme is a very good method of study. The ability to link in work based projects allows for full time employees to participate whilst their employers do not feel they are losing man hours to the study and research time. (BSc)

*Overall I found the Learning at Work (LatW) Partnership Programme to be a great method of achieving a degree for those in full time employment as it allows people to set their own deadlines through the management of their course. (BSc)*

.....and by his mentor

*A's professional standing within the department has significantly increased due to his learning through the WBL programme and BSc in Engineering Studies. This is evident in his application to tasks, the level of competence and where his peers are seeking his advice and direction where the path is not always clear. A chose his learning outcomes very wisely, as he considered current and future tasks, his new skills picked up along the way will no doubt serve him well.*

### Accreditation

Many Learning at Work students have an engineering background and the department has a good working relationship with the main U.K. Engineering Council institutions. Whilst the degree cannot be accredited wholesale, as each student takes a different path, the department has a well established protocol for registration with the professional bodies.

Students are encouraged to declare that they are using the Learning at Work degree to gain professional qualifications. The Learning Management tutor can then guide them to develop a definitive Learning Contract that will be acceptable for submission to the relevant institution. The contract will then be examined and discussed by the institution and feedback will be given to the student.

The institute will then inform the student if the contract is a suitable alternative to an accredited degree, or whether amendments are required. If accepted the student will automatically go to the next stage (normally the Professional Review Interview) on completion of their degree.

### Student Cohort

Many of the students enrolled in Learning at Work are in the military or from associated industries. They are mostly highly motivated in their ambition to gain a qualification before they leave the armed services, in order to improve their career prospects in a civilian setting.

The result is that the department award a high number of first class undergraduate or distinction at master's level outcomes.

The armed forces involved also benefit from revitalised, higher qualified staff who, in the course of their educational programme, will have reported upon complex technical and managerial issues. A cultural shift from 'it has always been done this way' to 'what would be the best way of completing the task' has often resulted in a more cost-effective, streamlined solution to an old, common problem.

Other students come from a variety of civilian industries. Most applicants have at least 180 credits as Accredited Prior Learning, with an additional 180 more credits required for a BA/BSc award. The nature of the degree means that it is not ideal for a student starting with no APL and they would be advised to gain a Higher National Certificate or Diploma before joining the programme.

### Conclusion

Learning at Work programmes developed through the Partnership Programme aim to equip students to progress within their specific fields of practice and to be able to apply their skills and knowledge in new areas. More generally, the programme aims to:

- provide learning relevant to the career development of people in work.
- provide learning which is at the leading edge of technology and professional practice and which is relevant to the career development of people who are in work.
- value and accredit the student's relevant prior learning.
- provide a quality assured framework that enables negotiated study programmes, encapsulated in personal Learning Contracts, that include university and work-based study to result in named university awards.
- ensure flexibility within the programme that meets the variable time constraints and changing strategic needs of the world of work.

The overall philosophy of the Partnership Programme is to encourage and reward career related lifelong learning by:

- accrediting career relevant and self-managed learning that is at graduate or postgraduate level.
- enhancing the scholarship of work-based learners, by requiring the development of a range of self-managed, conceptual and analytical skills applicable to practical problems within their professional fields.
- assisting in the personal and professional development of students so that they may improve the contribution they can make to the organisations in which they are employed.
- furthering the University's plans for expanding work-based learning and widening participation, through the provision of education that is relevant to the economy (local,

national and international) and maximise learning partnerships between the University and industry, commerce, the services and voluntary sectors.

- encouraging industry and commerce to become partners in developing their employees' technical and business competences.

Currently the programme is thriving, with 160 students graduating in 2012 (the highest number since the department began) but no one can predict the future. Cuts in the defence budget and economic recession mean that funding for lifelong learning might be vulnerable. However, in the light of the government report (Leitch (2006)) advocating more vocational education, and the large fees charged for full time students, the belief of the department is that there is a growing need for the provision of work-based degrees and, provided the high academic standards are maintained, the programme will continue to recruit successfully for the foreseeable future.

The logo for the International Association for the Advancement of Freedom of Religion (iafor) is centered on the page. It features the word "iafor" in a light blue, lowercase, serif font. The text is enclosed within a large, faint, light blue circular arc that is partially visible. A red, curved line also arcs around the text, intersecting the blue arc.

*An Overview in Qualitative Study : Practices As Instructional Leaders among  
Secondary Schools Principals in The State of Pahang, Malaysia*

Jamelaa Bibi Abdullah, Jainabee Md Kassim

0567

Universiti Kebangsaan Malaysia, Malaysia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The study tries to explore the pattern of principal's practices as instructional leaders in six types of schools in the state of Pahang Malaysia. The practices as instructional leaders among principals was based on four dimensions, i) define and establish school goals, ii) manage instructional program, iii) promote learning environment and iv) create friendly and cooperative school environment. Interview data collected from six principals and six teachers was analyzed using NVivo. The findings show that the practices of instructional leadership occur in the six types of schools in Pahang. However, the dimensions of managing the instructional program being practiced rarely in all type of schools. Findings of the study indicate a wide difference in the principal's practice as instructional leaders between Boarding Schools, Special Model Schools and Daily Schools as compared to Religious schools and Technical/Vocational Schools.

**Topic :** Educational Vision, Policy, Leadership, Management and Administration

## 1.0 Introduction

Instructional leadership came to light 25 years ago starting with the study of an effective school by Edmonds (1979). Instructional leadership model has been developed since the 1980s by western scholars such as Hallinger and Murphy (1985, 1987), Bossert (1988), Murphy (1990), Weber (1996), Southworth (2002) and Hallinger (2000). The model of Hallinger and Murphy (1985) often used in the research on instructional leadership. Hallinger (2011) states that starting in 1980 until 2010, a total of 130 studies have been conducted using the model of Hallinger (1985).

Instructional leadership in Malaysia gets attention among the school principals as it very significant in creating an effective school (Sazali, Rusmini, Abang Hut & Zamri 2007). In the 21st century, the practices of instructional leadership are still relevant and useful in contributing to the school performance (Hallinger 2005; The Department of Prime Minister 2010). The effectiveness of instructional leadership practices were set out in the Education Development Master Plan (KPM 2007) and The Department of Prime Minister (2010). Alimuddin (2010) describes an instructional leader as an agent of a change and create conducive school environment which has significant impact on the student's achievement. According to him, the responsibility of the principal as an instructional leader is to ensure that teaching and learning and academic activities are planned and implemented well, conducted in a good and orderly manner and carry out academic management in order to help teachers to teach effectively (Educators 2010).

However, in reality the role of principal is less effective in guiding and sharing goals with the teachers and thus leads to the failure in the planned teaching to achieve the aims of the school (Academic Management Sector 2009). Hallinger and Heck (2001) in his study found that this problem caused by lack of clear goals which made it difficult for the school staff to share the same goals. According to Hallinger (2000), the element of establishing a clear school vision can lead the direction of principals in accomplishing a successful teaching and learning process.

Workloads restrict the efforts to accomplish the principal's role as an instructional leader, especially in monitoring and supervising the teaching process. Accordingly, the principal often places the responsibility of supervising and monitoring to the Senior Assistant and Head of Field (Hallinger, 2005). However, the principal's responsibility in the areas of monitoring and supervision is crucial to ensure an effective teaching and learning (Robinson, Lloyd, Rowe, 2009). Supervision is also an important aspect of evaluating the content and teaching methods to ensure it is in accordance with the needs of the curriculum (James & Balansandran 2009).

An Increase of the principal's task in managing the various fields limits the time allocated for planning, organizing, leading and controlling the implementation of the school curriculum. This gives rise to the failure to overcome the problem of teacher's absence and eventually limits teaching and learning process. Academic Management Sector Monitoring Report, (2009) showed several factors that lead to a deficit in a curriculum which mainly caused by the absence of teachers during teaching hours in order to fulfill the need to attend school organized events such as meetings (36.04 percent), the course (17.20 percent), seminars (4.81 percent), workshops (10.24 percent), sports / games (8.60 percent), co-curriculum activities (8.66 percent) and extra-curricular activities (7.49 percent). Some of the problem associated with the instructional supervision among secondary school principals has led researchers to undertake research on the instructional leadership practices.

## **2.0 Research Framework**

The framework of this research is based on the Instructional Leadership Model of Hallinger (2000) and Murphy (1990). Hallinger (2000) defined the instructional leadership of principal in three main dimensions which are defining the goals, managing the instructional program and promoting school climate. Dimensions were discussed based on ten elements. The first dimension, defining the goals was represented by two elements (i) develop school goals and (ii) clarify school goals. The second dimension, managing the instructional program was represented by three elements (i) supervise and evaluate teaching, (ii) coordinate the curriculum, and (iii) monitor the progress of student. The third dimension of promoting school climate was represented by the elements of (i) preserving teaching time, (ii) always visible, (iii) provide incentives for teachers, (iv) promote professional development and (v) provide incentives for student's learning.

Instructional leadership model by Murphy (1990) has four dimensions and sixteen elements, the first dimension of cultivating mission and goals has two elements, namely (i) develop school goals and (ii) deliver the school vision. The second dimension of educational management has five elements, (i) promote quality of teaching, (ii) monitor and evaluate learning, (iii) provide and protect instructional time, (iv) coordinate the curriculum activities and (v) monitor the progress of student. The third dimension, promotes academic learning climate has four elements, (i) establish standards and positive expectations, (ii) maintain a high visibility, (iii) provide incentives for teachers and students and (iv) promote professional development. The fourth dimension of creating a friendly and cooperative environment in schools has the elements of (i) creating a safe and orderly learning environment (ii) provide meaningful opportunities for student's involvement, (iii) foster cooperation and cohesiveness among the staff, (iv) obtain external resources to support the school goals and (v) build a good relationship between home and school.

This study will explore the practices of instructional leadership among principals based on four dimensions, i) define and establish school goals ii) manage the instructional program, iii) promote learning environment and iv) create a friendly and cooperative school environment.

## **3.0 Methodology**

The main purpose of this study is to explore the instructional leadership practices of principals in six schools in the state of Pahang. Thus, this study attempts to answer the question of how instructional leadership has been practiced among principals in these six schools.

The design of this research is qualitative, emphasizing the exploration method as recommended by Creswell (2008) by using three methods for collecting data of structured interviews, observations and document analysis. There are two sets of interviews were conducted, the first involved six principals in six schools and the second type involved a total of six teachers who gave their perceptions of leadership in their schools. Observations made directly to the subject of the study which is the practices of instructional leadership of principals. Document analysis is conducted by looking at the monitoring documents from the State Education Department and the Inspectorate. The sample was selected after a review of the need of the research to find the school with the highest mean.

## **4.0 Findings**

The study was carried out on six types of secondary schools in the State of Pahang as follows:

School A: Daily school (SMK) is a school located in a rural area, led by female principal which also an 'Excellent Principal'.

School B: Special Model School (SM Model Khas) is a school located in a rural area, led and controlled by male principal.

School C: Boarding school (SBP) is controlled by the management of boarding school. This school is a high performance school and led by 'Excellent Principal'.

School D: Technical / Vocational school (SMT / V) is controlled by the school Vocational Technical Division, led by male principal.

School E: Religious School (SMKA) is controlled by Islam Educational Sector, JPN Pahang and led by female principal.

School F: Religious School with Government Assistance (SABK) is controlled by the State Religious Department, originally it was a Public Religious School (SAR) and has been taken over by the Ministry of Education in 2002. The school is led by male principal.

Overall, instructional leadership practices occurred in all these schools, School A, B, C, D, E and F. However, instructional leadership practices implemented were not comprehensive in terms of the four dimensions proposed by Hallinger (2000) and Murphy (1990).

#### **4.1 Define and establish school goals**

Generally, the principals in all six schools, A, B, C, D, E and F adopted a consistent practices in terms of defining and establishing the school goals and also managed to involve the school community together in the success of achieving the school goals. Table 1 describes the practices of designing the school goals and found that the principals of A, B, C, D, E and F take into account academic achievement in formulating school goals. However, only the principals of B, D, E and F make sure goals are easily understood and applicable to all the staff in the school. Meanwhile, the principal of school C does not involve directly in the process of developing the school goals.

Table 1 also describes the findings for the practices of delivering the school goals to ensure that the goals are acceptable by all the staff in the school. The study found that the school principals of A, B, C, D, E and F ensure that the goals that have been built communicated verbally through speech and repeatedly reminded in the assembly or any gathering. All school principals were found to make sure goals were posted at the place which can be seen easily by school community. The principals of B, D, E and F often discuss school goals with their staff in the meetings with teachers. The study also found that the principals of B, D and E ensure school goals are always appreciated by the school community. Surprisingly, the study shows only the school principals of A, C, D and E make sure that academic goals were adopted in the curriculum program such as curriculum meetings.

Table 1 Analysis of interview: Theme of defining and establishing the school goals

Main Theme	Sub-Theme	SCHOOL PRINCIPALS
Designing And Clarifying School Goals	Take Into Account Academic Achievement Understandable Applicable	A, B, D, E, and F B, D, E and F B, D, E and F
Deliver School Goals	Discussion Internalized Adopt Into Curriculum Program Verbal Printed	B, D, E and F B, D and E A, C, D and E A, B, C D, E and F A, B, C D, E and F

#### 4.2 Manage the instructional program

Overall, the study discovered the school principals of A, B, C, D, E and F were lack of commitments in terms of managing the instructional program. Some of the principal practiced the dimension of managing the instructional program in a collaborative way by involving school administration committee to work together in supervising curriculum. The complete details of the practices of managing the instructional program can be found in the Table 2.

In terms of instructional supervision and evaluation, the study shows that the principals of A, B, C, D, E and F have been delegated the task of supervision to the Senior Assistants and head of field. Also, the principals gave approval to the Senior Assistants to praise the strength of teachers and provide guidance on the weaknesses of teachers. The study also found that the principals of D and E assigned Senior Assistants to do focus observation to fulfill the required number of supervision of teachers. The findings demonstrated that the school principals of A, B, C and D handed over the task of student's note book observation to the Senior Assistants because they are busy with the management matter. The analysis observed that the school principals of B, C, D, E and F did supervision in the form of unstructured supervision which is known as MBWA (Management By Wandering About).

According to the study, the school principals of A, B, C, D, E and F have been delegated the practice of coordinating the curriculum, which is organizing the curriculum program to the Senior Assistants and 'head of field'. Based on the findings, the school principals of A, B, C and D handed over the task of coordinating the curriculum program to the Senior Assistants. Meanwhile, the school principals of B leave the job of monitoring of teaching materials to the 'head of field'.

The school principals of A, B, C, D, E and F are involved directly in the process of monitoring student's progress to observe the student's progress. Principals are also available to meet with the students to find out the difficulties in the learning process and spend time to motivate students. However, only the school principals of A, B, C and F showed an interest in doing the debriefing or post mortem of academic in order to improve student's performance.

In an effort to promote a quality teaching, the school principals of A, B, C, D, E and F chaired a curriculum meeting to encourage a quality teaching process. However, the study found that only the principals of A, C, E and F showed an effort to increase teacher's professionalism

Table 2 Analysis of interview: The theme of managing the instructional program

Main theme	Sub-Theme	SCHOOL PRINCIPALS
Supervise and evaluate the instructional time	Delegation supervision (GPK)	A, B, C D, E and F
	Focus observation (GPK)	D and E
	Parallel objectives	B, C, D and F
	Observation of student's note book (GPK)	A, B, C and D
	Formal	B, D, E and F
	Unstructured supervision	B, C D, E and F
	Strength and weaknesses of teachers (GPK)	A, B, C D, E and F
Coordinate curriculum	Curriculum program (GPK)	A, B, C D, E and F
	Coordinate program (GPK)	A, B, C and D
	Teaching materials (GPK)	B
Monitor student's progress	Informing the students	A, B, C D, E and F
	Academic Debriefing, Post Mortem	A, B, C and F
Promote a quality teaching	Chaired the meeting	A, B, C D, E and F
	A quality teacher	A, C, E and F

### 4.3 Promote learning climate

In general, the school principals of A, B, C, D, E and F practiced effectively the dimension of promoting learning climate in the school. This explains that, the responsibilities of a principal are to know the learning climate and manages school to be an excellent school. Table 3 shows the practices of principals in promoting professional development, establishing standards and positive expectations, provide incentives for student's learning, protect teaching hours, provide incentives for teachers and always visible.

The findings explain the practice of protecting teaching hours and found that the school principals of A, B, C, D, and E ensure that teaching and learning time was used well and avoid any interference by internal or external school activities. However, the school principal of F is quite lenient in controlling and preserving teaching time due to the lack of firmness in the administration.

The findings also indicated that the principals of A, C, D, E and F always available in the school when they are needed. The study also showed that the school principals of A, D, E and F ensure their presence at the school is not only spent in the office but also used to interact with teachers to discuss school issues. However, in terms of the practice of providing incentives for teachers, only the principals of A, D, E and F reflected their appreciation to the teachers in the meeting or in any acknowledgement event.

The study also found that the school principals of A, C, E and F promote the professional development of teachers by allocating time in the meeting to share ideas, provide support for teachers to use the skills acquired from in-service training in the classroom, ensure all service activities attended by school staff are consistent with the academic goals of schools and provide professional development opportunities.

The study also showed that the principals of B, D, E and F provide incentives for student learning including giving recognition to the student and contacting parents to inform their children excel. The findings also indicated that the school principals of A, B, C, D, E and F encouraged teachers to form the standard and positive expectations by showing the accuracy of time management in all activities, inform the students about their expectations of the performance of school and guide teachers in implementing the academic policy.

Table 3 Analysis of interview: The theme of promoting the learning climate

Main theme	Sub-Theme	SCHOOL PRINCIPALS
Protecting teaching hours	Using time allocate for teaching	A, B, C D and E
	School Policies and Procedures	A, B,D, E and F
	Disturbance Control	A, B, C D and E
Always visible	School issues discussion	A,B, C D, E and F
	Interaction	A, B, D, E and F
Provide incentives for teachers	Reinforcement	A, D and F
	Appreciation – acknowledgement	D and E
	Appreciation – meeting	A, D, E and F
Promote professional development of teachers	Staff meeting to share ideas	C
	Support skills in the classroom	A
	Provide opportunities – professional development	C, E and F
Provide incentives for student learning	Students acknowledgement	C, D and E
	Contact parents	B, D and F
Form standard and positive expectations	Timeliness	A, B, C, D, E and F
	School expectations	D and E
	Academic policy	B, C, D, E and F

#### 4.4 Establish a friendly and cooperative school environment

In general, the school principals of A, B, C, D, E and F were able to form a friendly and cooperative school environment. Table 4 describes the practices of principals in creating a safe and orderly learning environment, providing meaningful opportunities for student participation, foster cooperation and cohesiveness among the staff, outsourced to support school goals and foster relationships between home and school.

The findings showed that the school principals of A, C, E and F showed a concern in the safety aspects by ensuring the damaged buildings and infrastructure were repaired, monitor Hem Unit, the safety committee, hostel wardens and security guards to make sure they carry out duties efficiently. The study also indicated that the principals of A, B, C, D, E and F encouraged students to set the niche, organize brilliant sharing for critical subjects and gave instructions to the relevant teachers in encouraging students to participate in co- academic and certain programs.

The findings also indicated that the principals of A, B, C, D, E and F foster cooperation and cohesiveness among the staff. However, the principal of D showed the determination of influencing Senior Assistants to gain the support of other teachers and have a family relationship through even a

small appreciation, taking care and advice the staff, celebrate the teachers and willing to accept comments and suggestions from the teachers.

The study found that the principals of A, B, C, D, E and F outsourced to support the school vision and foster relationships between home and school. The principals always seek help from external funds to support school goals, including the PIBG, district office, Yayasan Pahang, politicians, ministries, colleges community, associations of former students (ALUMNI) and university students. The principals also established a good relationship between home and school to ensure that the trustees have knowledge of information about child under their care through website that displays information of their children's activities to make the information transparent. They also built a good relationship with YDP, share staff's phone numbers with the school custodian, transparent and always meet the parents of the children who attend special remedial classes.

Table 4 Analysis of interview: The theme of developing a friendly and cooperative school environment.

Main theme	Sub-Theme	SCHOOL PRINCIPALS
Create a safe and orderly learning environment	School environment and appreciate culture	A, E and F
	Safety	C
	Teaching & Learning, and co-academic without intersuperviseruption	B, and D
Provide opportunities for meaningful student involvement	Co-academic activities	A, B, C D, E and F
	Academic excellence program	B, C, D, E and F
	Students skill program	A, B and C
Foster cooperation and cohesiveness among the staff	A friendly and warm atmosphere	A, E and F
	Collaborative discussion	B, C and D
	Cooperation	D
	Accepting teacher's idea	D
Outsourcing to support school vision	Outside speakers were invited	A, D and E
	Outside support	B, C, D, E and F
Build a relationship between home and school	A good relationship between parents and school	A, B, C, E and F
	Discussion of learning problem	C, D, E and F
	Involved in activities and programs	C, D, E and F

## 5.0 Discussion

The findings showed that all six secondary school principals in the State of Pahang adopted the four dimensions of instructional leadership, however, the dimension of managing the instructional program, rarely practiced by the principals of all types of schools. Overall, the findings also indicated that there was significant difference in the practices of instructional leadership among principals of boarding school (SBP), Special Model School (SM KHAS) and Daily School (SMKH) compared to the Religious School (SMKA), Religious School with Government Assistance(SABK) and Technical /Vocational School (SMT / V).

The principals in all types of schools in the State of Pahang ensured that the school vision and mission were delivered and appreciated in the meeting directly and indirectly. The Principal uses an

open mind approaches that require teachers to think the importance of vision or goals for school's improvement. This finding is consistent with the Clark's study (2009) who found, the principal who prioritizes academic goals although did not involve directly in the teaching process can improve student's achievement through collaboration of teacher's attitudes.

The study also describes the dimension of managing instructional programs in all six schools in the State of Pahang only focused on the direct monitoring in every examination and every month to see the student's progress directly and meet them in the class with their examination's results. The principals made post mortem or debriefing based on the examination's result to see the academic strengths and weaknesses of student's achievement. Instructional leader must always show a meaningful interaction with students and use examination data to make decisions related to the teaching and learning process. This scenario shows the secondary school principals in the State of Pahang looked in details the headcount in student's performance and continues to make improvements where necessary to achieve school goals. This coincides with the academic sector, the State Education Department (2010) which emphasizes on the academic profile of students which shows in details the achievement of every student in every subject. However, in managing instructional programs, the secondary school principals in the State of Pahang delegated the task of supervision and observation because they are busy with other task or work and lack of skills in certain topics. Nurahiman and Rafisah (2010) described the quality of supervision depends on the factors of knowledge, skills, interpersonal and technical skills. According to Clark (2009), the principals practiced and delegated some duty such as student note book's observation to the senior assistant, teachers, other staff and did unstructured supervision in order to assist schools in achieving the objectives and subsequently improved their school's performance.

Instructional leadership practices among the secondary school principals in the State of Pahang which promotes student learning dimension yielded some interesting findings. The study found that the principals of Religious School (SMKA), government-aided religious schools (SABK) and Technical /Vocational School (SMT / V) focused on encouraging staff development to increase opportunities for staff to gain knowledge in pedagogy and teaching skills. According to Islamic Education Sector Monitoring Report (2011), most of the teachers of SABK are still weak in pedagogy and teaching skills. Thus, following the acquisition of the Ministry of Education Malaysia, SABK management and teachers are encouraged to follow a compulsory course in Teacher Training Institutes to improve knowledge and teaching skills. The study also found that the principals of all types of schools in the State of Pahang encouraged the teachers to form standards and positive expectations. This is consistent with the Ministry of Education Malaysia's target in the examination program of School Examination Analysis System (SAPS) which emphasizes student headcount from Take of Value (TOV), down to the targeted Expected Result (ETR) to monitor individual student's achievement for each subject.

Instructional leadership practices among the principals in the State of Pahang in developing a friendly and cooperative school environment also yielded an interesting finding. The study concluded that the principal of SMT / V prioritizes cooperation and cohesiveness among the staff. According to Abdul Ghani and Tang (2006), a leader that emphasizes collaborative relationship with the staff is able to develop and achieve the vision of school. Deborah (2002) in her opinion suggests that the leader should be wise in organizing instructional strategies to gain teacher's cooperation to improve teaching and learning process. The study also found that the practices of principals of all types of secondary schools in the State of Pahang were further reflected in terms of acquiring external source to support the school and foster relationship between home and school. According to

Lambert (2002) the ability of the principals to share in building the vision, knowledge, responsibilities collectively and collaboratively can lead to the excellence in the organization under his leadership. According to Deborah (2002), instructional leaders must be creative to get the resources to support school's improvement. Zulkifli, Jamilah, and Ismi Aminah Arif (2011) in their study described an academic discussion of parents showed an improvement on the student's academic performance. Department of Education and Skills (2002) suggests that parents should directly involve in the education of their children in school to affect the student's progress on an ongoing basis and help their children succeed in the academic.

## 6.0 Conclusion

The study emphasizes qualitative exploration methods using three methods for collecting data of structured interviews, observation of main subject of the study which is the principal and document analysis. In conclusion, the study found that the principals of daily school (SMKH), special model school (SM KHAS), boarding school (SBP), Vocational / technical school (SMT/V), religious school (SMKA) and religious school with government assistance (SABK) practiced all the dimensions of instructional leadership although not comprehensively practiced. However, all the principals agreed that the instructional leadership is capable to generate school's performance.

Abstracts

A trend of the modern age is that people like to express their views about specific interests and connect with others through the use of numerous Internet platforms that provide personal blogs, photo albums, and message boards. In particular, Twitter is a microblogging service that allows the quick exchange of information to different social groups. Some studies and numerous reports have suggested that Twitter is a convenient tool for learning and has educational value. The existing studies of the application of Twitter to educational purposes indicated the increase of learning engagement and social interaction among the peers and instructor. The application of Twitter is based on social learning theories. The platform has the potential to facilitate learners' collaborative learning and experiential learning. Furthermore, most of the studies suggested that Twitter could enhance learners' learning motivation through interactive activities. Although the existing studies provide useful insights regarding Twitter and its application for improving course engagement, there is not much literature on Twitter as a potential EFL/ESL teaching and learning.

This paper aims to review existing studies in related to the use of Twitter in education from the perspectives of asynchronous learning, social learning theories, social interaction framework, and language acquisition theory in order to build a rationale for the use of Twitter for ESL/EFL writing instruction. Pedagogical suggestions for ESL/EFL educators will be provided as conclusions.

## Introduction

People in modern age like to express their views on specific interests and connect with others through the use of numerous Internet platforms that provide personal blogs, photo albums, and message boards. In particular, Twitter is a microblogging service that allows the quick exchange of information to different social groups. It is frequently used by individuals to communicate briefly and quickly with each other and with groups.

Twitter posts, known as tweets, are limited to 140 characters including spaces and punctuation, which concentrates the language accuracy and communicative precision (Grosseck & Holotescu, 2008). Members can track each other's personal updates and post 140-character maximum replies. "Twitter is the most popular microblogging application, with almost one million users, called Twitterers, who can send and receive messages via the web, SMS, instant message clients, and by third party applications" (Grosseck & Holotescu, 2008, p. 1). The setting of Twitter allows users to follow or to be followed in a virtual community which serves as a daily virtual conversation platform for people to talk about work, sports, politics, music, and so forth. Twitter provides a more anonymous medium of communication for those who may not like to express themselves in public. On the other hand, Twitter can also be used as a platform for high profile users, such as celebrities or politicians, to promote themselves or to update followers on their personal thoughts and life agenda.

Twitter is mainly used for asynchronous interaction among users and followers (Dunlap & Lowenthal, 2009; Grosseck & Holotescu, 2008). The characteristics of microblogging on Twitter focus on higher frequency of personal updates compared with regular blogs and also provide swift dissemination of information. Twitter also offers a platform for quick communication that could play a role as a catalyst for language learning by means of improving target language communicative ability (Borau, Ullrich, Feng, & Shen, 2009).

Unlike the synchronous written communicative environment of a chat room, Twitter is mainly used for asynchronous interaction among users and followers (Dunlap & Lowenthal, 2009; Grosseck & Holotescu, 2008). Twitter offers a platform for quick communication that could play a role as a catalyst for language learning by means of improving target language communicative ability (Borau, Ullrich, Feng, & Shen, 2009).

Adopting technology to enhance learning efficiency has been studied and proven to be useful when the course structure and content are well-organized and well-blended with the use of the technology in a cyber-environment (Lee & Rha, 2009). The use of asynchronous and synchronous mediums of communication as venues for learning has become more prevalent in today's society and also more important for educational purposes. Current educational

technology specifically enables communication that facilitates collaborative discussion, exchange of opinions, and critical thinking.

Twitter as an educational tool provides an enhanced social presence, which is an important element of Second Language Acquisition (SLA) theory. In Twitter-assisted learning, the method of engaging in social interaction, discussion, and collaborative learning is based on an asynchronous form of written communication (Borau et al., 2009; Dunlap & Lowenthal, 2009). Tweets allow instructors to track each learner's writing progress and ideas. Posting comments offers students a chance to practice using the language for situational communication while also giving teachers a chance to observe the actual performance of students' comprehension in their target language (Borau et al., 2009). When Twitter is being utilized for class discussion, it facilitates students' skills of summarization by consolidating their thoughts with concise and precise syntactic structure and vocabulary in their tweets (Bart, 2010).

## **Literature Review on the Significance of the Study**

### ***Social Interaction in Computer-Assisted Learning***

Cyber learning environment heavily relies on the social interaction. It is important to recognize the significance of social interaction and its positive effect on language learning in terms of cooperative learning in which weaker learners receive assistance from stronger learners in well-organized environments with mutual learning objectives (Tsai et al., 2008). Twitter-assisted learning satisfies users' intrinsic needs for social communication, and the interaction creates habitual information or emotion sharing through the behaviors of tweeting, retweeting, and following people (Chen, 2011). Therefore, the possible collateral benefit of adopting Twitter in language learning is that users will have sufficient exposure to their target language and will learn to deliver their thoughts in a concise and organized syntactic structure across tweets for their social groups (Borau et al., 2009). The more time spent on Twitter, the more one's sense of social connectivity will be satisfied through the process of tweeting (Chen, 2011). The environment of Twitter could stimulate users to utilize reading and writing in order to engage in social interaction and support communicative competence in English learning (Borau et al., 2009).

Many educators have asserted that information technology can be a tool to reinforce linguistic competence in global communication without geographic restriction and to enhance individual social engagement (Cummins, 2000). Further, there are certain benefits to social interaction in the target language (Lu & Yeh, 2008). For instance, learners can be stimulated by having interactive conversations with their peers (Borau et al., 2009). Vygotsky

(1985) noted that during social interaction, weaker learners have an opportunity to be inspired by their stronger peers, and this process facilitates learners' cognitive development. The most important benefit is that communication activities in the socialization process lead to language internalization. Technology in language learning is intended to enhance learners' interaction and engagement (Yang, 2011), and computer-assisted methods could facilitate language learning by giving purposeful interaction and constructive feedback (Borau et al., 2009; Dunlap & Lowenthal, 2009; Murphy, 2007; Yang, 2011).

Web-based writing, including blog writing or discussion board commenting, offers a stimulating and enjoyable method of communicative practice. The collaborative work and interactive message-based conversations can motivate students in their language learning process (Al-Jarf, 2004). From an educational technology perspective in teaching and learning, some recent studies indicate that, as more teaching practices utilize educational functions of technology in the EFL classroom, students who have learned through these communicative devices have significantly greater frequency and opportunity to practice their writing skills (Al-Jarf, 2004; Chuo, 2007; Heinrich, Milne, & Moore, 2009; Stevens, 2008). Using web-based writing stimulates students' critical thinking through social interaction, and this creates more communication and more opportunities for learners to be exposed to real situational texts (Chuo, 2007). Al-Jarf compared traditional in-class writing methods with a method that combined traditional practices and web-based writing exercises and found that the computer-assisted learning approach significantly enhanced students' syntactic structures. Furthermore, the students in the experimental group with computer-assisted learning method also exhibited more fluency in their written sentences for communicative purposes and were more expressive in their ideas for essays.

In social groups' discussions, an asynchronous discussion platform has the capacity to facilitate learners' efficacy in language learning while also promoting social interaction that results in higher language achievement and problem solving capabilities (Borau et al., 2009; Lu & Yeh, 2008). It could be beneficial to implement the web-based asynchronous approach to language learning methodology as an assistant tool for creating extensive interaction, which is normally restricted to traditional class structures. Foreign language learners need effective social interaction in order to produce the actions they see being modeled. Authentic language usage that is pertinent to the contextual situation is important so language learners can recognize modeled stimuli (Lave & Wenger, 1990). Social interaction can lead to the recognition of certain social stimuli and can help develop the individual's ability to synthesize the new information (Chiou & Yang, 2006). In an asynchronous learning environment, language learners are often required to actively give meaningful and topic-related feedback in the online conversation. Therefore, interaction is based on

student-to-student and student-to-teacher communication.

The process of modeling is perceived as imitating others through positive reinforcement, which results in reproduction of the imitation in responding to external stimuli and elicitation. Bandura (1977) wrote that the complexity of responses often reflects the progress of cognitive development in social learning. Social interaction can lead to the recognition of certain social stimuli and can help develop the individual's ability to synthesize the new information (Chiou & Yang, 2006).

The application of Twitter in language learning is a project-based approach in which learners are working on common objectives collaboratively in an authentic language setting. Eskrootchi and Oskrochi (2010) noted that incorporating computers in the classroom significantly improved engagement, social interaction, and contact with real-life resources and allowed peers to learn from one another and aid weaker learners through constructive, scaffold, and collaborative learning. In their study, a project-based e-learning platform enhanced communication through peer collaboration and helped break the communication barrier for those students who tend to be more reserved. However, careful instructional design is important to maximize learning performance. Eskrootchi and Oskrochi concluded that it is the instruction and curriculum implementation that boost efficacy, not the technology itself. The quality of interaction is often influenced by the instructional design. Clear guidelines are needed so that all students must do is follow the rubric and work on their assignment collaboratively. Well-organized instruction was the core element for maximizing the effect of interaction that determines learners' satisfaction and receptive learning achievement. More specifically, interpersonal interaction facilitated communication and critical thinking in the structure of a web-based learning environment (Lee & Rha, 2009). Effective interaction requires clear guidance if it is to inspire critical thinking and communicative language skills. An effective teacher must create collaboration among learners so that students can learn to build their constructive thinking through replying to the questions on the course blogs and engaging in interaction with their peers.

In terms of Twitter's potential advantages for enhancing social interaction, learning experiences on Twitter can be described as experiential learning. Hedin (2010) and Kemp (2010) stated that experiential learning engages learners in activities in which they have the ownership of learning autonomy and can experience and develop social presence and problem solving abilities. Incorporating Twitter into a class creates a new way of communication that stimulates the learner's cognitive process in perceiving and handling new tasks or information. Twitter contains a constructive and positive learning community that guides students' learning objectives by encouraging them to tweet intellectually or

emotionally. Student engagement is facilitated by the instructor, and performance is the result of a constructive and experiential process throughout the Twittering.

### ***Studies on the Educational Uses and Potential of Twitter***

First-time Twitter users may consider the function of Twitter to be for trivial things in life, such as updating personal daily routine. However, Twitter has a unique function compared with instant messaging applications: its capability to broadcast to mass receivers instead of sending messages to an individual on instant messaging applications (Galagen, 2009). The purpose of applying Twitter is to increase opportunities for interaction (Dunlap & Lowenthal, 2009). Dunlap and Lowenthal found that Twitter is a bridge that increases students' learning engagement because its characteristics of promptness and conciseness attract users around the world and suggested that it could enhance collaborative learning and act as a quick information exchange platform in a virtual classroom.

When Twitter is used in an academic setting, users are told to participate in the activities, such as answering questions, sharing thoughts, and commenting others' posts. It can also be utilized in project collaboration and to promote literacy skills (Grosseck & Holotescu, 2008). Interpersonal communication can be created by incorporating Twitter as a bridge to connect students and faculty that allows for quick responses regarding students' projects, assignments, and ideas (Bart, 2010). It is not only helpful for improving learners' social presence by participating in course tasks but also a potential tool for language teaching (Dunlap & Lowenthal, 2009).

Yang (2011) has discussed the problems of English learning in Taiwan. In some big classes with 50 to 60 students and limited meeting times, it is difficult for students to communicate with the teacher or with one another. Twitter provides a platform for those who are too shy to voice themselves (Bart, 2010) and to establish relationships by sharing personal updates, news, thoughts, and hobbies (Brown, Hendrickson, & Littau, 2011). In their study of Twitter for language learning, Borau et al. (2009) showed that students can practice their target language (i.e., English) on Twitter and that tweeting actually let students produce authentic communication. Despite the limited time of the study, huge differences in the students' English level, and the large size of the class, Borau et al. were able to enhance their participants' communicative competence mainly in three areas: grammatical, sociolinguistic, and discourse competence. Moreover, Twitter can raise users' cultural awareness by allowing interaction with native speakers of the target language. In addition to helping students develop communicative competence, Twitter can be used as a blended learning community in which learners can meet their classmates both in person and online. Twitter-assisted learning reinforces learners' sense of the learning community so that learners will comply with group

learning objectives and manners.

Tweeting also allows students to express their interests openly and to work on the same project collaboratively (Dunlap & Lowenthal, 2009) and allows teachers to check everyone's comments and responses. Students can also view their classmates' tweets and provide feedback. Galagen (2009) mentioned that users can actually obtain advice by tweeting their questions to followers who provide their thoughts or experiences and noted that Twitter is a strong social connection tool that links students and teachers after class hours.

From an educational technology perspective, Young (2010) noted that there is another advantage in adopting Twitter for educational purposes, which is that introverted students may feel more comfortable producing and contributing their efforts without the fear of ridicule. In addition, Twitter has features that facilitate the teacher's interaction with students, and the teacher can monitor students' feedback as well as provide corrections or suggestions. Wright (2010) demonstrates an example of the benefits of utilizing Twitter for enhancing social presence in educational purposes. Wright asked education majors to participate in a discussion of pedagogy, curriculum planning, and teaching-related issues on Twitter. As they used Twitter, participants made progress on their reflective thinking, and the Twitter discussion activity also consolidated the students as a learning community. Furthermore, the 140-character limitation required them to make their points more precisely.

Learners' course engagement in using Twitter is one of the main research questions regarding the value of applying Twitter to the academic setting (Chen, 2011; Junco, et al., 2011). Chen (2011) found that Twitter facilitated course discussion in and out of class and allowed introverts to express their opinions with less stress. Moreover, it helped students to connect with their classmates or instructor and provided personal support. Junco et al. (2011) noted that Twitter fulfills users' needs and desire to make connections with others in that the longer users communicate through tweets, the stronger their sense of belonging will become.

The significance of Twitter in terms of educational value and its potential usage for education are discussed in the literature with findings that students are inspired to actively participate in Twitter discussions because their opinion is being noticed and critiqued (Dunlap & Lowenthal, 2009; Grosbeck & Holotescu, 2008; Johnson, 2011; Stevens, 2008; Wright, 2010). Twitter provides learners an insight into multifunctional and multicultural perspectives as they exchange their opinions or interact with each other on Twitter.

## Summary

Twitter-assisted learning has the potential to motivate the language learners and increase the interaction in and out of class. Although many people have criticized that 140 characters limitation could hinder the flow of idea conveyance, it is undeniable that Twitter indeed attracts users' desire to follow other Twitterers. The irresistible charisma of Twitter could serve as a medium for the learners to discuss course content, assignment or project. Despite the fact that Twitter is new to most Asians, the students could use the platform to practice their English writing and read more English texts once the students discover the wide-spread social communities on the sites and its tight connectivity. Furthermore, there are a lot of cases that Twitterers can always split up their writing into several tweets. Studies have showed that the strongest advantage of applying Twitter to EFL writing or reading in class is the increase of social interaction. From the perspectives of language learning, interaction is the key to acquire a language. Nevertheless, more investigation on the application of Twitter in language learning is needed in terms of the data results from quantitative or qualitative research.

Abstracts

This paper examines Florida’s long and ugly history of school integration and how this history fits with Florida’s image as a moderate southern state. This paper attempts to place Florida within the context of other southern states during the civil rights era.

In 1845 as Florida joined the Union, the state legislature promulgated a law which stated that any “assemblies . . . by free negroes and mulattoes, slave or slaves, shall be punished . . . with a fine not exceeding twenty dollars, or stripes, not exceeding thirty-nine.”<sup>1</sup> This measure, along with extensive and punitive slave codes, virtually eliminated opportunities to establish African-American schools in the newest slaveholding state. Florida, like most Southern states, wanted to eliminate opportunities for slaves and free blacks to congregate and to pursue education for their children. Although based on the deep and pervasive racial codes of the antebellum South, the efforts by white Floridians to deprive African Americans of equal opportunity education would last up to and even through the modern civil rights movement of the 1950s and 1960s. This study will explore that history of educational inequality between the races and how the Sunshine State’s reputation for moderation in Southern race relations and school desegregation does not, in fact, match its record. In this endeavor, this study also focuses on the centrality of grassroots Floridians in the Southern struggle to combat educational segregation in the mid-20<sup>th</sup> century, as augmented by the pioneering legal work of Thurgood Marshall and the NAACP.

During the Civil War, the Union military and the Freedmen’s Aid Society created the first formal schools for blacks in Florida. In 1864, Dr. Esther Hawks, a Northern physician and philanthropist, was authorized by the latter organization to create a school in Jacksonville, at that time under Northern occupation. The school opened shortly thereafter and by early 1865 had 150 black students and four teachers. Within months of Hawks’s opening of the school, the Jacksonville *Florida Union* newspaper stated that in “the progress of their studies” the young pupils “compare favorably with the children in other [white] institutions of learning.”<sup>2</sup>

The historical record reflects that freedpersons in Florida, along with their counterparts throughout the newly emancipated South, desired education for their children. Their wishes were combined with the building and financing of black schools and philanthropic efforts of paternalistic Northerners like Hawks and societies such as the African Methodist Episcopal

Church, American Missionary Association, AME Church, African Civilization Society, and the American Freedmen's Union Commission, to create thirty actual or prototype schools whenever and wherever possible.<sup>3</sup> With the help of these organizations, despite their sometimes onerous racial stereotypes, African-Americans created their own "book larnin'" schools as an educational foundation for freedpersons took root. The freedpersons soon pressured local and state leaders to establish a public school system in Reconstruction Florida. To ignore their demands would have placed the state in jeopardy of increased federal and military occupation and interference in the state's internal affairs. Despite its long history of racial injustice, post-war leaders for the first time bowed to the agency of the black community, albeit the military occupation of the state after the war helped set the stage for that historic event.

In 1866, Florida passed legislation authorizing the first state-sanctioned education for African Americans. In short order, Edward B. Duncan rose as the initial Superintendent of Common Schools for Freedmen. That school year witnessed an immediate increase to sixty-five in the number of African American day and night schools (almost all in urban areas), and there is evidence that black children outnumbered white children in many schools throughout the state. The number of freedmen teachers increased to thirty-two with a corresponding student enrollment of 2,726. The "teachers have been mostly colored, of good moral character, delighting in their work, maintaining good discipline, men of energy, and many well qualified" Duncan wrote in his first year-end report.<sup>4</sup> The first State Superintendent of Education, C. Thurston Chase, was recorded as stating that, "With the great mass of them [blacks], the avidity to learn was most intense with these first opportunities."<sup>5</sup> By all measures, blacks desired an education and pursued all chances of such with vigor and commitment, a pattern that continued unabated for generations of African-Americans in the Sunshine State.

After passage of the 1868 State Constitution, Florida again broke with its Old South past by offering free public education to all residents. Copying the "Systems of the older States," legislators voiced their version of a "system of Common Schools" and a "Common School Fund" in the new constitution. This provision was codified into law in January 1869, when the Florida legislature outlined sources of public funding in its new "School Law." It called for "separate schools for the different classes in such manner as will secure the largest attendance of pupils, promote harmony and advancement of the school, when required by the patrons." Thus

<sup>5</sup> Quoted in William N. Sheats, "Administration of Superintendent Chase," in *Bi-Ennial Report of the Superintendent of Public Instruction of the State of Florida for the Two Years Ending June 30, 1894* (Tallahassee: John G. Collins State Printer, 1895), 12.

the new school code superseded the freedpersons' schools and sanctioned a caste-based public school system in the State of Florida.<sup>6</sup>

As post-war Florida entered the 1870s, Governor Ossian B. Hart (1873-1874) appointed African American Jonathan C. Gibbs, a graduate of Dartmouth College and the former Florida Secretary of State, as State Superintendent of Public Instruction. This was a bold step for an ex-Confederate state like Florida, but yet a savvy one by the governor as he sought to solidify Republican support and to project a progressive and compliant state in an effort to slip Florida out from under Washington's yoke of Reconstruction. Even as Gibbs feared the reactionary violence of the Ku Klux Klan in Florida, he rendered "all the assistance in my power" to create opportunities for "the education of the whole people of the South, without reference to race, color or previous condition." The black community (almost one-half of the state's population) responded by committing large numbers of youth to the emerging educational system. Under Gibbs, black students came to account for one-third of all the students in Florida, albeit they attended segregated and inferior facilities.<sup>7</sup>

Despite segregated schools, most whites in Florida still opposed any measures designed to provide quality education for blacks. When the reactionary Democrats (Bourbons) regained control of Florida in the mid-1870s, whites rejoiced in the belief that the racial codes of the Old South would be reinstated, including the historical denial of educational opportunities to blacks. African Americans were initially disheartened by the election of the reactionary George Franklin Drew to be Florida's, and the Bourbon's, new "home rule" governor. Paradoxically, the governor (1877-1881) argued that, "Only through the schools could the colored race become fit to exercise the privileges of voting intelligently, to perform all the sacred rights of freedmen, to enjoy their liberty, to become wise and good citizens." He added that a meager education for blacks was cheaper than prisons and poor houses for them. In the end, however, Drew was more interested in mercantile concerns than he was in racial policy. He thus championed academic education for whites as a means of expanding the economy and vocational education for blacks as a means of contributing labor to his new economic order.<sup>8</sup>

<sup>8</sup> Quoted in Arthur O. White, "State Leadership and the Public Education in Florida: The Evolution of a System," in Ronald K. Goodenow and Arthur O. White, eds., *Education and the Rise of the New South* (Boston: G.K. Hall, 1981), 238.

While serving during the Drew Administration, the superintendent of schools, William P. Haisley, made a much-publicized tour of Florida's schoolhouses. He thereafter made several recommendations to update the state's system of education, including the establishment of a separate system for blacks. The evolving racial divide continued with the exclusion of blacks from any school administrative positions in the state and the appointment of Confederate veteran "Col." Albert J. Russell as Sate Superintendent of Public Instruction in 1884. Thus, by the mid-1880s, the Sunshine State had eschewed any semblance of moderation on the education issue and embraced its antebellum concept of race oppression throughout the echelons of state government and its now white-controlled public education system. Where once the school house door offered hope and vision for Florida's African Americans, it now insinuated exclusion and inequality.<sup>9</sup>

In May 1885, lawmakers met in Tallahassee to write a new state constitution. The document embodied the changing attitudes of white Bourbons towards the Reconstruction-era's notions of African American equality and education rights. Article 12, Section 12 stated, "White children and colored children shall not be taught in the same school. . . ." To protect themselves from Northern criticism and legal challenges from African Americans, lawmakers in Florida also mandated—although the mandate proved hollow—that "impartial provisions" be provided for both races.<sup>10</sup>

In retrospect, the 1885 Constitution and its local iterations set the enduring pattern of a "dual" school system in Florida and degrading black educational affairs for most of the decades between the 1880s and the landing of an American on the Moon in July of 1969. Yet white elites in Florida were not satisfied with this sole measure of oppression. In 1889 state lawmakers wrote a new school law, which further strengthened by statute segregation for all of Florida's public and private schools. In 1895, Tallahassee lawmakers once again underwrote established procedure by declaring any such mixing in an educational setting as "a penal offense." That same year, Superintendent William N. Sheats acknowledged in his bi-ennial report the statistical and qualitative imbalance between black and white schools and dismissed the situation by stating that the "recent denizens of the cotton patch" simply exhibited "a minimal of interest in all that pertains to progress or intellectual advancement."<sup>11</sup> Thus, the notion of separate-but-unequal

was part of the state's racial behavior long before the *Plessy v. Ferguson* decision provided the legal basis for this in 1896. Even though the law mandated separate but equal, as in most former Confederate states, local officials in Florida ignored the equal provision of the law.

Many scholars trace the explosion of school injustice to the nadir of race relations following the *Plessy* decision of 1896. Yet, as noted, Tallahassee had set in motion "separate and unequal" treatment of blacks well before the ruling in the Constitution of 1885. That same document provided for a poll tax, and Florida became the first state of Dixie to adopt this measure as well as a convict-lease system. With little opposition, Tallahassee had nullified the spirit and practices of Reconstruction, and in ensuing statutes in 1905, 1913, and 1939, strengthened these practices or created similar race-based measures. When whites desired even further oppression, they often resorted to violence and mayhem in reactionary Florida. Michael Newton in *The Invisible Empire: The Ku Klux Klan in Florida* has characterized the Sunshine State as "one of the Klan's strongest and most violent realms . . . ."<sup>12</sup> This type of racial brutality would effectively freeze in place the state's color line for generations, including the polarization of the races in separate and inferior schools.

In the midst of these racial disparities, virtually every school district in Florida practiced systematic discrimination, not only in school assignment but also in the allotment of educational funds, term of academic year, student per capita funding, and, most glaringly, in pay for teachers. By the eve of World War I, Florida allocated \$12.50 per capita for white schools versus \$2.87 per capita for black school construction and maintenance, and \$8.35 per capita versus \$4.92 per capita between the races for educational programs. Even though blacks comprised roughly 41 per cent of Florida's population in 1910, the state invested \$2,067,356 in white schools and \$184,255 in black schools, or roughly 8.2 per cent of what the state spent on the total allocation for school property in 1910. Moreover, not one accredited high school for blacks existed in the state's major urban areas of Jacksonville, Tampa, and Pensacola.<sup>13</sup>

Into the 1920s, the average annual pay for black teachers was much lower than that for white teachers. For example, in Gainesville, Florida, the annual salary was \$562 for blacks and \$970 for whites. Across the state, white female teachers averaged \$115.20 per month and white male teachers averaged \$169.20 per month, while black female teachers earned just over \$60 per month and black male teachers earned roughly \$80 per month, with some Florida counties paying blacks a paltry \$30 monthly. In the practice of pay disparity, Florida did not prove exceptional but rather conformist when compared to the practice in other former Confederate states. Black teachers in Mississippi in 1890 earned \$23 per month while white teachers earned about \$33 per month, and in Alabama in 1900, blacks tended to earn \$17.66 a month and whites about \$25 per month. From 1911-13, the average yearly salary in Virginia was \$322.69 for a white teacher, and \$172.63 for a black teacher. Similarly, in Georgia during the same years, a white teacher earned \$318.63 a year, while a black teacher earned \$119.35 per year. White teachers in South Carolina earned \$333.28 a year during the same time, and black teachers earned \$110.54 per year.<sup>14</sup>

Additionally, Florida provided black schools (generally one-room school houses) with dramatically less funding than that given to the state's white schools. For instance, in 1897-98 white schools statewide were budgeted \$565,465. That same year, black schools were budgeted only \$171,486. The amount of money spent per student also differed significantly in other states of the Deep South as well in "moderate" Florida. In Beaufort County, South Carolina in 1910, the average expense for each white student was \$40.68, while only \$5.95 was spent for each black student. The same was also true in Alabama. In 1910, Macon County, Alabama spent approximately \$39.99 per white student. Each black student, conversely, received only \$3.89. In North Carolina in 1914-15, \$7.40 was spent for each white student, while \$2.30 was spent on each black child. In Amelia County, Virginia in 1915, \$11.63 was spent for each white child, and \$0.94 was spent for each black child (in terms of salaries for teachers). By the time of the crash leading to the Great Depression, little had changed in Florida; Tallahassee budgeted \$703,454 for the state's 37 per cent black population and \$11,364,476 for the state's white population. Thus, Florida endeavored to keep pace with its Jim Crow counterparts in miserly support for black education. The Pittsburgh Courier decried the situation to its widespread

audience in the following headline: “Negro Education in Florida Needs Help: Amazing Situation Revealed.”<sup>15</sup>

For its part, the NAACP, America’s oldest surviving civil rights organization, pursued an aggressive strategy to expel Jim Crow from American society, initially by focusing on these types of education disparities in the courts. Black educators and local branches of the NAACP in Florida consistently pushed the NAACP legal staff to move on school equalization suits at many levels. In 1937, representatives of Florida’s African American teachers contacted the NAACP’s executive director, Walter White, requesting that he file a suit through the NAACP’s Legal Defense and Education Fund on behalf of Florida’s segregated and inferior black educational system. White, though, was leery of moving too fast and wanted to ensure sustainable data for the case prior to litigating it. The NAACP’s legal staff also feared that state officials would argue that black teachers had a lower cost of living and therefore needed less pay. The NAACP worried, as well, that its lawyers would not be able to find plaintiffs willing to file suit. Indeed, across the South, as Adam Fairclough has determined in his massive study of the issue, the NAACP witnessed in state after state white elites “tenaciously [pursuing] a battery of tactics, some nakedly aggressive, others cunningly subtle” to thwart legal challenges to their white supremacist school systems. Attorney Simuel Decatur McGill of Jacksonville directed most of the NAACP cases in Florida. He was nearly sixty years old and had been practicing law for over thirty years and had earned a national reputation for successfully fighting “legal lynching” in the Sunshine State when the national office of the NAACP finally sent a teacher equalization suit to him. Florida would, in turn, prove no exception to Fairclough’s assessment of Dixie as a whole.<sup>16</sup> In retrospect, there should have been little difficulty in proving discrimination in Florida. In the midst of the Great Depression, over half of Florida’s 67 counties had no public high school for African Americans, and only 16 per cent of all black children ages 14-17 attended any form of advance school as compared to 67 per cent of white children of the same cohort. As James D. Anderson has found in his useful study of the subject, this practice effectively excluded blacks “from the revolution in public secondary education that characterized the nation and the region during the period 1880 to 1935.” There were other obvious schoolhouse discrepancies for the

Sunshine State's 430, 000 plus blacks, including outdated textbooks, no school buses, leaky school roofs, poorly ventilated and heated buildings, lack of indoor restrooms, and no formal coordination for the 866 black schools in the state. Moreover, the Great Depression of the 1930s and its economic constrictions at the local level affected African American schools disproportionately. Overcrowding became such a problem during the inter-war years in African American schools that most of them were forced to operate double sessions. What had been a substandard condition for black school in Florida had become a dire condition by the eve of World War II. These types of educational inequities continued through the war and into the late 1940s.<sup>17</sup>

By the time of war, the historical disparity between the races in Florida's educational practices had changed little. For example, Florida's school budget allocated \$800 annually per white teacher for salaries, while it allocated roughly \$510 a year for the services of a black teacher, with the average salary for white teachers at \$1,202 and for blacks at \$605 per annum. Proving such salary discrimination would not take much effort; even Northern newspapers such as the *Pittsburgh Courier* recognized the gross disparity of benefits for Florida's black minority and spoke out for the cause of the over 3,000 black teachers "waging a relentless battle for equalization of salary." As the *Pittsburgh Courier* stated to its readers across the nation, "The outcome of [their] case . . . will have much to do, not only with better pay for teachers but better educational opportunities for Negro children in the South."<sup>18</sup>

Originally, lawyers representing African American teachers asked that their clients earn the full allocation for teachers across the state. But the legal goals evolved to fit the particular circumstances of Florida. Counties ranging from St. Johns in the north to Dade in the south to Hillsborough in the west closed black schools in various months of the academic years to allow students to work as field hands harvesting fruits and vegetables. Since white schools did not experience such closures, blacks operating through local teachers associations and the NAACP began to challenge these "strawberry" and "bean pickers" schools as discriminatory and harmful to the education and psyche of black children. In one notable action, the NAACP branch in Fort Lauderdale raised \$3,500 to begin actions under the direction of Thurgood Marshall to attack the School Board's closing of schools for "bean pickers" from December 1 to July 1. When confronted with these types of challenges, many county officials refused to discuss the issue. NAACP lawyers modified their legal strategy to pressure large, urban counties to equalize pay and terminate abbreviated academic years, hoping that this would force smaller rural counties to follow suit. Concurrently, NAACP lawyers sought to litigate the glaring pay inequity in Florida,

but they had difficulty finding a teacher willing to put his or her name on such a lawsuit. Harry T. Moore, a state NAACP activist, convinced John E. Gilbert, an eleven-year teaching veteran and principal of the segregated Cocoa Junior High School, to underwrite the first legal challenge to pay inequity in the Deep South. As the news circulated in a number of major African-American newspapers, now often the “voice” of local protesters, the Florida State Teacher’s Association stepped forward and agreed to compensate Gilbert once he was fired.<sup>19</sup>

On the eve of World War II, attorney McGill accompanied Gilbert in filing his suit to equalize teacher’s pay in the Sunshine State. Eventually, the school district fired Gilbert after he lost the case and the Florida Supreme Court refused to overturn the lower court’s ruling, based in part on the recent U.S. federal court’s ruling in *Alston v. School Board of City of Norfolk, Virginia*. That ruling had the effect of shifting the equalization fight to local courts, forcing county-by-county struggles, many of which became centered on the large, urban counties. Gilbert appealed the state court’s decision to the U.S. Supreme Court. While his appeal was pending in November 1941, Mary White Blocker, a sixty-nine year old school teacher in the heavily populated County of Duval, sued the public school system over its unequal pay scales for African American teachers in Jacksonville. Almost simultaneously, George H. Stark and the Teachers’ Association of the less-populated Marion County in Central Florida, with Thurgood Marshall of the NAACP as one of the plaintiff’s attorneys, filed a suit over racial pay disparity against the Board of Public Instruction and Superintendent Broward Lovell as defendants. Although these legal actions did not in themselves destroy the wall of pay inequity for teachers in Florida, they did create a small fissure in that wall that would eventually crumble of its own inequitable weight.<sup>20</sup>

Moore, America’s First Civil Rights Martyr* (Gainesville: University of Florida Press, 2005), 40-41; *George H. Starke, and the Marion County Teachers’ Association, a Voluntary Unincorporated Association vs. Board of Public Instruction for the County of Marion, State of Florida, a body Corporate, and Broward Lovell, Superintendent of Public Instruction for Marion County, Florida, in the District Court of the United States*, No. 42 Ocala—Civil, vs. District Court, Jacksonville Division, July 22, 1942,

Because Jacksonville was Florida's largest city at the time, the NAACP focused its resources on Blocker's lawsuit. Several events occurred just as the case was to be argued before the Court. The school district hastily retired Blocker in an attempt to undermine the case. However, the 285 African American teachers in Jacksonville voted to pay Blocker's salary, a benefit they provided until her death twenty-three years later. The school district's plan failed, and McGill argued the case with the assistance of a special NAACP counsel, Thurgood Marshall, who would later gain national fame for becoming the first African American seated on the U.S. Supreme Court. The NAACP combined the Duval County case with "guinea pigs of democracy" cases from Marion, Tampa, Miami, Palm Beach, and Escambia Counties. Presiding Judge Louis W. Strom, whom Marshall found exceptional inasmuch as he "went with it [the law]" unlike many Southern jurists, chose the Duval County suit as the representative case for the combined arguments.<sup>21</sup>

Marshall and McGill structured a compelling argument in favor of the African American teachers' position. Their brief noted that the state's local school systems were violating the law with a race-based dual pay scale, which paid white teachers sometimes double the base salary of black teachers. Also, white teachers received one-third more money for years of college completed and white principals earned a much larger stipend than black principals. As the news of the case spread, the *Baltimore Afro-American* newspaper included Florida in its condemnation of regressive states unwilling to part with their Old South customs. To the dismay of old-line leaders in the Sunshine State, educational inequalities, so long entrenched in the state's and the region's infrastructure, were now playing out in unflattering ways on a national stage.<sup>22</sup>

Teacher equalization suits posed not only a national embarrassment for Florida, but represented a possible economic hardship for the state as well. The NAACP had already waged a five-year struggle to correct these inequities in other states that produced more than \$25 million in salary adjustments for African American educators. The U.S. Office of Education estimated the cost of equalizing educational facilities in the South at more than \$35 million. In Maryland and Virginia alone, the NAACP helped force state officials to spend \$629,000 equalizing teacher's pay. Equalizing teacher's pay in Florida would cost taxpayers roughly \$1,588,104 annually. This

sobering financial projection did not settle well with lawmakers in a state priding itself on low taxes (and low services).<sup>23</sup>

After it became obvious that it was going to lose the fight, the Duval County Board of Public Instruction became the first district offering what it deemed a nonracial salary plan. The equity plan called for a salary rate based on countywide teacher examinations and level of training. Teachers “satisfied” with their pay could have their salaries frozen or take the exam and receive an adjustment based upon the results. Marshall argued that the plan unfairly advantaged white teachers, who could have their salaries frozen at the higher rate while African American teachers would have their salaries determined by an exam, which may or may not be administered fairly. After some initial balking, NAACP lawyers reluctantly accepted the Board’s plan. Though not a total victory, this equalization suit put the state on notice that discrimination was going to be challenged; the salary dispute symbolized the first volley in an upcoming battle to purge racial discrimination from all areas of education practices and policies in the Sunshine State. Indeed, within short order, African American plaintiffs filed more pay-equalization suits in as varied locales as Pensacola, Tampa, West Palm Beach, and Miami. The NAACP won the suit in Pensacola (Escambia County) for equalized monthly pay in what the *Pittsburg Courier* labeled “a first victory in the Deep South . . . in a series of suits for the payment of equal salaries to teachers in public schools.” Thus, the agency of African Americans in the Sunshine State created one of the first critical stress point in the wall of educational inequalities that would widen to unparalleled proportions following the earthshaking decision in *Brown*.<sup>24</sup>

However, these victories came with a price and were ultimately dependent on courts enforcing the settlements. State officials, for their part, often found ways to circumvent the agreements by using merit ratings based on discriminatory guidelines and implementation. Moreover, teacher equalization suits generally benefited teachers in large urban settings and often did not affect teachers in smaller, rural counties where judges were less inclined to support such measures. As the reported in the *Pittsburg Courier* in 1945, even the federal government bore responsibility for “such a system that grants so complete a sovereignty to a county, especially [given] the deplorable school condition for Negroes. . . .”<sup>25</sup> By the early 1950s, however, in the nation and in the South, and in Florida as well, the priorities and activism of the black community had

reached new heights of energy and activity—the educational inequality of the past was no longer to be perpetuated under any guises or circumstances.

Casual observers may overlook the connection between World War II, the reinvigorated African American civil rights movement, and Florida's habit of ignoring or deferring racial equalization measures. However, the record reflects numerous ways that the war set the stage for racial permutations. The massive effort expended to end the racist mayhem of Nazi Germany and Imperial Japan reawakened within black leaders the need to attack racial prejudice and discrimination in America. The war made America a superpower, challenged its hollow commitment to equality, and initiated the nearly forty five-year struggle between the Soviet Union and the United States over ideological domination of the Third World. As a result of the new "Cold War," the Soviet Union effectively used propaganda to excoriate America's racial bigotry. These criticisms focused negative light on the United States and embarrassed its leaders in their efforts to win the hearts and minds of people living in Third World countries. As a special investigative committee on civil rights reported to President Truman, "we cannot escape the fact that our civil rights record has been an issue in world politics," and that international critics "have stressed . . . our shortcomings [they] have tried to prove our democracy an empty fraud."<sup>26</sup>

Accordingly, during and following the conflict, the federal government slowly came to support new civil rights measures (and leaders) as Washington, including the federal judiciary, sought to deflect criticism from behind the Iron Curtain. Historian John Hope Franklin's interpretation of the era is that, "The courts . . . took cognizance of racial questions and rather frequently ruled in favor of equality. The executive branch, sensitive to both domestic and foreign pressures, exerted considerable influence in eradicating the gap between creed and practice in American democracy." The shift in federal opinion encouraged African Americans in the Sunshine State to dramatically accelerate ongoing litigation to permanently end racial inequality there.<sup>27</sup>

As the national expectations changed, so did the expectations of the black community on a number of fronts, particularly regarding education for black youth and inferior teaching conditions. What had been a nascent civil rights movement in the courts and the states in the 1930s and 1940s would grow to national proportions by the mid-1950s. School desegregation was at the forefront of that burgeoning movement. Despite Tallahassee's stubborn refusal to comply with newly mandated school integration measures and court orders in the 1950s and 1960s—what scholars have recently termed Florida's "Down South" stonewalling of the inevitable—the Sunshine State was at a crossroads regarding its almost century-old unequal

educational practices and policies. Even so, the white leaders of the state continued to delay the inevitable.<sup>28</sup>

Florida's extremist past did not bode well for a "moderate" response to the myriad challenges arising from the landmark U.S. Supreme Court's 1954 *Brown* decision, finding segregated schools "inherently unequal" and subsequently ordering desegregation "with all deliberate speed." Even in the face of such a dramatic and forceful directive as *Brown*, Florida, like other entities of the Deep South, clung tenaciously to its long-standing practices of white supremacy and racial segregation. Historians have theorized that the "Yankee" in-migration and economic strides in this emerging Sunbelt State, as well as a lack of political and geographical homogeneity, had worked to mitigate the Sunshine State's racial fault lines; recent studies have challenged this assumption. Despite the unstoppable tide of *Brown*, Florida's leaders, like their compatriots in other Deep South states, simply chose to ignore or derail the inevitable. Nevertheless, reform would come to the recalcitrant state, starting with new equality demands at the schoolhouse doors.<sup>29</sup>

The Court's ruling in *Brown* forced the question of educational race mixing of young children into new levels of political discourse and actions. Throughout the South, state leaders immediately condemned the ruling and instituted policies to repudiate it. Florida helped lay the groundwork for that regional defiance. Acting Governor Charley E. Johns, following the breaking news on *Brown*, arose as one of the first Deep South leaders to suggest extraordinary legislative sessions on school segregation. Johns attended regional conferences on segregation, arguing in concert with other reactionary officials that the vast majority of Southern blacks and whites in the South favored separation. Johns subsequently submitted a proposal to the Southern Governors Conference that would have amended the U. S. Constitution to require in perpetuity "separate but equal public schools for the races."<sup>30</sup>

<sup>30</sup> "Johns Rules Out Legislative Session Now on Segregation; U.S. Capitol Readies Charge," *Tampa Morning News*, May 19, 1954; "Johns Considers Special Session of Legislature," Fort

For their part, Florida's blacks (now 22.3 per cent of the state's population) quickly organized after *Brown* and instituted direct-action marches and similar measures, placing them at the forefront of the earliest actions against Dixie's massive resistance. Indeed, the *Brown* decision raised the collective consciousness of blacks throughout the South, especially invigorating black parents to challenge the entire edifice of segregation and unequal education. Their agency in the Sunshine State met with the typical white virulence observed across the South. As a result, in the short run, no Florida school districts undertook efforts to integrate African Americans—students, teachers, and administrators—into white, majority schools.<sup>31</sup>

One researcher has characterized this Florida-style stonewalling as essentially a case study of Dr. Martin Luther King's admonition, "'Wait' has almost always meant 'Never'." Florida Supreme Court Chief Justice William Glenn Terrell declared from the bench that, "segregation . . . has always been the unvarying law of the animal kingdom," and that, "we are now advised that God's plan was in error and must be reversed." The report of a special advisory committee to the legislature and governor recommended, reminiscent of an earlier states' rights movement, a frontal attack on the powers of the Court itself for "abrogating the powers of the States to control their system of education [to] destroy the system of dual sovereignty . . . as the fundamental basis of our Union." Although he styled himself a moderate and uttered statements on segregation less inflammatory than those of Governor Johns, his successor, LeRoy Collins, nevertheless embraced a deferral framework based on Florida's bifurcated racial experience. Using the code words of the white South much like his often presumed "moderate" counterpart in North Carolina, Governor Luther Hodges, Collins stated to the legislature in the spring of 1955, "Segregation in our public schools is a part of Florida's custom and law. I will use all the lawful power of the Governor's office to preserve this custom and law." Three years later, the governor was quoted as saying, "We propose to choose what part [of the Constitution] we will accept and what part we will reject. We're moderates." To which the ever-vigilant black press retorted, "Governor Collins proudly calls himself a 'moderate.' If this is moderation, the word has certainly taken on a new and ominous meaning. . . ."<sup>32</sup>

<sup>32</sup> Lise M. Steinhauer, "'Wait' Has Almost Always Meant 'Never'," in Winsboro, ed., *Old South, New South or Down South?*, 155-75; "Terrell Says Mix Mandate Reverses God," *Orlando*

In latter life, Collins recounted Tallahassee's reaction to *Brown*, "the legislature passed many bills patterned after the most radical segregationist actions taken in other Southern states." In his monumental study of *Brown* and its aftermath, *Simple Justice*, Richard Kluger has stated that Florida's attorney general submitted the "most extensive and spirited brief" to the High Court in an attempt to "slow the desegregation process" of *Brown*. Florida's U.S. Senator George Smathers criticized *Brown vs. Board* as a "clear abuse of judicial power."<sup>33</sup>

Although frequently recalled as a "moderate" like Collins on the desegregation issue, Florida Superintendent of Public Instruction Thomas D. Bailey also assumed a defiant position on *Brown*: "We have a lot of people down here who hate to be pushed around, whether the state or federal government is doing the pushing." Bailey soon suggested that counties allocate disproportionate budgetary funds on new schools designed to be "equal" yet segregated. The purpose, Bailey would later state, was to equalize educational facilities, thereby eliminating the need to desegregate the state's public school systems. In a subsequent report ordered by Governor Collins, his advisory commission suggested the extreme position that the "Legislature could propose an amendment to our State Constitution which would permit the abolition of the system of free public schools" in Florida.<sup>34</sup> Collectively, these types of state-level stonewalling measures and statements set a pattern for reactionary officials at the county and local levels across Florida.

Henceforth, both public and legal actions in Florida centered on circumventing *Brown* through stonewalling or token actions. The *Pittsburg Courier* summed up the situation this way, “Florida defiantly has aligned with other states in the South determined to return the status of the Negro to the inhuman days of Reconstruction following the bloody Civil War.” Even though this led to further law suits, over a decade later, Florida State Department of Education findings on the post-*Brown* years reported that the decision had “no [substantial] effect on Florida.” This did not change until local activists, frustrated and aggrieved by Florida’s deferral, began to file suits in federal rather than state courts to “push” for compliance with the Civil Rights Act of 1964. Still, the period leading up to the new federal measure of 1964 reflected more delay and deferral rather than what can be reasonably defined as moderate progress on school desegregation in the Sunshine State.<sup>35</sup>

In the lead up to these forced changes, Florida’s political leaders embraced a two-pronged strategy on public school integration. They publicly acknowledged that integration was inevitable but they privately opposed desegregation. On May 31, 1955, the Supreme Court rendered a second ruling on desegregation in *Brown II*. The ruling established neither timetables nor deadlines; it simply ordered desegregation as “soon as practicable.” Without a Court-mandated deadline for desegregation, the State of Florida found just cause to continue non-compliance. Indeed, Governor Collin’s signed into law Florida’s Pupil Assignment Law, “deemed expedient after consideration of recent decisions of the Supreme Court,” mandating that counties assign students to schools based on sociological and psychological factors, the very day the Court issued *Brown II*. The law did not mention race but allowed pupils to transfer between schools only if they were “qualified” and matched the moral, psychological, and socioeconomic background of the pupils in the school of admission. Many white legislators believed that this would stop most African American children from transferring to white schools. Conversely, the powerful rural and reactionary element of the legislature argued that more drastic measures were needed to prevent race mixing in Florida’s schools and elsewhere. Florida, like most Southern states, supported such pupil placement laws as a subterfuge to *Brown* and a method of ignoring the inevitable court orders and changes Washington would demand. Despite the appearance of a new school improvement movement in this “state on the move,” and intermittent talk about moderation and progressive education, Tallahassee lawmakers remained insistent on projecting the illusion of school reform while they practiced separate and unequal as the norm in their communities for decades to come.<sup>36</sup> The illusion of moderation had once again overshadowed Florida’s racial reality.

<sup>36</sup> *Brown v. Board of Education*, 349 U.S. 294 (1955); see Donald G. Nieman, *Promises to Keep: African-Americans and the Constitutional Order, 1776 –to the Present* (New York: Oxford University Press, 1991), 155, 158-159; Kermit L. Hall and Eric W. Rise, *The Federal District Courts of Florida*, 134-39; Thomas A. Bailey, “Florida’s School Assignment Law” (Report, Tallahassee: State Department of Education, 1956), 14-18. In many state of the South, the Pupil Assignment Laws became commonly known as the Pupil Placement System.

As resistance to *Brown* swept throughout the South and the Sunshine State along with it, Collins, Bailey, and state Attorney General Ervin, ramped up their efforts to convince the media that Florida was pursuing a non-radical policy in the wake of *Brown*. Their plan was to delay desegregation as long as possible while convincing the courts that Florida was developing an action plan. Tallahassee's leaders made the regional stratagem of pupil assignment laws a cornerstone of their deferral tactics and attempts to placate federal officials.<sup>37</sup>

In 1957 the Pork Choppers, a group of ultraconservatives representing twenty-two rural North Florida counties, attempted to pass a strict segregation bill. The unsuccessful "Gang" took advantage of the furor over the possible qualification of a few African American children to attend white schools under the Florida pupil assignment measure. With the help of the Senate President and House Speaker, the ultraconservatives passed a defiant interposition resolution in unison with seven other Southern states based on the charge that Washington and Courts were usurping state powers. Governor Collins denounced the legislation. The "states' rights" legislature struck back by passing a "last resort bill," enabling a vote of 25 percent of the property holders in a district threatened with desegregation to abolish their public schools. Collins vetoed the legislation, referring to its supporters as agitators. The legislature failed to override his veto and the school crisis seemed averted for the moment. Nevertheless, Attorney General Richard Ervin observed that the Florida legislators, "did almost all [they] could to prevent integration. By pursuing such race-based measures and proposals, as W. D. Workman, Jr. found in his study on the topic, Florida had established its brotherhood with the seven other Southern states that had actually increased their resistance to desegregation since the decision in 1954."<sup>38</sup>

Concurrently, some Southerners organized violent demonstrations in new efforts to dissuade state officials from modifying existing school structures. As noted in the black press, there was a series of bombings throughout Dixie aimed at "bastions of integration." Between January and May of 1958, there were forty-five racially motivated bombings in the South. The last two were

in Jacksonville, Florida, where shadowy figures bombed the all-black James Weldon Johnson Middle School.<sup>39</sup> Despite its reputation for moderation, the Sunshine State pursued many of the very same strategies against integration that characterized the former Confederacy at large. In the midst of it all, some areas of Florida bowed to the inevitable and began the process of integrating their schools as local affairs. In 1959, the thoroughly segregated Dade County Public Schools initiated Florida's first desegregation plan. Local officials in Miami integrated their public school system ahead of anticipated Federal Court mandates requiring such and thereby hoped to circumvent federal interference in the local schools. Even though most of the white residents in the soon-to-be integrated neighborhood moved, the plan represented an historical leap for the Sunshine State. This action, however, by garnering both national and state attention, returned educational desegregation to the top of the Florida's agenda and simultaneously re-energized the anti-integrationist forces, especially the proponents of pupil assignment actions as a way to circumvent full compliance with *Brown*.<sup>40</sup> Even as the new decade dawned, the struggle over colorblind schools yet influenced the educational, political, and social climate of Florida.

Farris Bryant rose to power as Florida's new "staunch segregationist" governor in 1961. Unlike his predecessor, Bryant did not make education the capstone of his legislative agenda. Bryant's major constituents were industrialists who wanted him to reduce spending and decrease the state budget. To these constituents he once uttered, "I don't propose to collect taxes," adding as if to court segregationists, "and I don't propose to enforce civil rights."<sup>41</sup> As the governor uttered these words, only six of the state's 67 counties had move to integrate their schools. Thus, by the 1960s educational issues were increasingly sinking to low priority items in the state's agenda at precisely the time when the regional integration process was gaining momentum. State officials knew that they could not stop integration, but they hoped that they could delay it until the political tides turned in a more favorable direction. Focusing on the lack of progress in the decade, historian Raymond A. Mohl concluded, "With only a few exceptions, Florida's political leaders through the 1960s strongly supported segregation . . . ."<sup>42</sup>

Colburn and Jane L. Landers eds., *The African American Heritage of Florida* (Gainesville: University Press of Florida, 1995), 347.

Public school integration was coming to Florida, but state officials enacted delay after delay in efforts to sidetrack or unravel the school integration ordered in *Brown*. By 1964, a decade after *Brown* and repeated NAACP suits in Florida, fewer than 2 per cent of the Sunshine State's school districts had instituted more than token desegregation measures, and only 1.53 per cent of Florida's African American children attended class with whites. In 1966, Governor Hayden Burns convened a Conference on Education; neither Burns's lengthy charge to the group nor its subsequent report to the governor even mention the state's deplorable record on desegregation and the myriad federal suits and federal actions now forcing Tallahassee and local districts into a new era of school realignment. For the governor and state education and political leaders, deconstructing the color line in public schools appeared to be a non-issue. It was clear that widespread desegregation of Florida's public schools would not occur unless some new factor emerged. That factor originated not in Florida but in Washington, D.C.<sup>43</sup>

Titles IV and VI of the Civil Rights Act of 1964 provided the federal government and Courts with the power of school desegregation enforcement and accountability that they had heretofore lacked. Moreover, governmental agencies, now seen as allies to the black community, had the power to withhold federal funds for school districts that practiced segregation or otherwise adopted mechanisms to despair academic achievements between or among social groups.<sup>44</sup> The Department of Justice (as opposed to often reluctant individuals) could now initiate suits under the Act and moreover could act as plaintiff to force school districts to comply with federal desegregation guidelines. Responding to the new federal mandate, which effectively defused gubernatorial and legislative pro-segregation policies, Tallahassee faced a new reality regarding its delay and stonewalling tactics.

Even in the face of Florida's governor and attorney general quietly advising officials on how to "dodge" the new law, the Act notably coalesced grass-roots opponents of segregation and spurred them on to a new phase of legal militancy. Capturing the spirit of the time, one seasoned senior black educator in Fort Myers recalled the stark transformative effect of the new measure, "The Civil Rights Act of 1964 changed it all." This latest phase of black activism stimulated by the Civil Rights Act of 1964, was eventually augmented by higher court case precedent, in particular the *Green* and *Alexander* decisions, in which the High Court not only struck down "freedom of choice" plans but also delineated the responsibility of local school boards to abolish dual attendance zones. The cases spawned legal challenges in Florida, manifested themselves in a spate of new NAACP and local protagonists' filings against segregated school districts in as geographically and demographically disperse regions of the state as Alachua County in the north,

<sup>44</sup> United States Civil Rights Act, 1964 Title VI, 42 USC " 2000d B 2000d-7, available at [www.usdoj.gov/crt/cor/coord/titlevistat](http://www.usdoj.gov/crt/cor/coord/titlevistat) (accessed February 15, 2012); see "Civil Rights During the Kennedy/Johnson Years," *Pittsburgh Courier*, February, 15, 1986;

Pinellas County on the west coast, Monroe County at the southern extreme (the Keys), to Brevard County on the east coast. As late as 1969, one such suit had led the U.S. Supreme Court to order Florida to stop delaying desegregation of its schools.<sup>45</sup>

Yet reactionary Florida was still not ready to accept the inevitable. In 1967 GOP Claude Kirk, Jr. entered the governor's office as a staunch segregationist, who felt little incentive to make the Civil Rights Act of 1964 and its evolving iterations priorities of his administration. Kirk, a Richard Nixon "law and order" Republican, also emulated Nixon in pursuing ultra-conservative fiscal and social policies, including actively working against the use of cross-neighborhood busing to achieve racial integration in Florida's yet color-coded schools. No only did Kirk openly defy court-ordered school desegregation, but he brazenly betrayed his Old South delay and stonewalling tactics by suspending the school board of Manatee County and appointing himself school superintendent in an effort to derail the impending desegregation of that school district. As if this gesture of local defiance were not enough for Kirk, he took his petition-waving protests against school desegregation to the steps of the U. S. Supreme Court in Washington, D.C. in an event that captured national headlines. In so doing, the governor possibly read well the mood of his electorate in the Sunshine State; in the presidential election year of 1968, Florida voters had registered 40.5 per cent of their vote for the racially insensitive Richard Nixon, 30.9 percent for the pro-civil rights Hubert Humphrey, and 28.5 per cent for the racial demagogue George Wallace. As the Sunshine State had entered the decade with dual and unequal schools, it so capped the decade, punctuated by the defiance and self-described "confrontation politics" of Governor Claude Kirk.<sup>46</sup>

In retrospect, the sweeping Civil Rights Act of 1964, by essentially codifying many of the school equalization goals and invalidating the South's roadblocks to desegregation, fueled another equality drive, and by so doing strengthened the resolve of anti-segregationists in the 1960s to finally tear down the wall of bigotry between dual and unequal schools. This occurred most notably when Old South Florida finally moved into a new era of political reality as the "old

school” of political leaders gave way to a “new school” of World War II and post-World War II Democratic state leaders like Governor Reubin Askew (1971-1979), who had begun their public careers in the era of *Brown* with the realization that Florida must shed its Dixie persona in order to grow as a national business and tourist mecca. Indeed, Askew, representing this new vision of progress and race relations, appointed the first blacks to the Florida Supreme Court and to the state cabinet since Reconstruction. These were unprecedented acts designed in part to move Florida out of segregation and exclusion into the political and economic realities of the waning 20<sup>th</sup> century. Askew’s successor, Governor Bob Graham (1979-1987) of south Florida and Governor Lawton Chiles (1990-1998) of central Florida continued this forward vision as the Sunshine State finally abandon its educational pattern of racial deferral and attenuation for the educational realities of the post-*Brown* decades.<sup>47</sup>

Nevertheless, school equalization in Florida still unfolded slowly. In the late 1960s, over 90 per cent of students attended segregated schools and about half of the state’s school districts faced litigation in the federal courts to repudiate actual of vestiges of public school segregation. As Florida entered the 1970s, 76 per cent of its counties conducted school affairs under federal court-ordered desegregation or Health, Education, and Welfare (HEW) plans of reasonable timetables, compliance, and associated goals for desegregation. Because most of the displaced or dismissed administrators and teachers in the slow integrating process were, in fact, blacks, the black press found the process to be less “integration” and more “outegration.” When busing of students to achieve court-mandated desegregation plans arose as a divisive educational and social issue in the period, Florida voters by a margin of roughly three-to-one approved an anti-busing resolution in a public referendum on the issue. In effect, the Sunshine State had deferred or stonewalled public school access, matriculation, and social restructuring precisely as long as the more violent and defiant states of the Deep South.<sup>48</sup>

As the need for compliance with the federal Civil Rights Act of 1964, and increased black demands and court cases, resulted in the final demise of historically segregated schools by the decade of the 1970s, the state yet faced a wave of unofficial segregation as “white flight” reinstituted the color factor in the state’s educational settings, especially in the urban areas. As white flight compounded the Sunshine State’s rendezvous with unitary school districts (i.e., districts devoid of inherently unequal schools) new and often bitterly divisive issues, such as

student assignment, controlled choice, magnet schools, district-wide busing, and the state's parsimonious funding of its public schools, arose as proposed or enacted measures to institute district-wide integration and diversity of schools. That district-wide diversity would result not only positive sociological goals but also in merging student populations' claim on scarce resources and lifetime opportunities. Despite the historical struggles for desegregation, recent testing data and subsequent scholarship on the subject suggest that Florida continues to sustain its historical black-white student equalization and achievement gap that characterized and divided the "inherently unequal" schools of this "moderate" Southern state since the antebellum years.<sup>49</sup> Although officially ended by the 1970s, the Sunshine State's long and troublesome history of school segregation continued to be an issue well into the new millennium, as, congruent with the South as whole, race divisions and black mobilization underscored the historical patterns, practices, and opportunities of the state's Old South and Down South educational experiences.

Abstracts

The study integrates concept cartoons with two-tier tests in hopes that those cartoon images presented in the aboriginal culture will not only help aboriginal students understand the meaning of the questions, but also gain interest during the test. Concept cartoons refer to cartoons are drawn by daily life scenarios with the scientific concept. Learners will produce different cognitive perspectives and be stimulated to think deeper. Two-tier tests include two to four multiple choices in the first tier test, and the reason options in the second tier test as references for the learners to select correct answers in the first tier test. This mechanism not only evaluates the correctness of students' concept, but also helps learners, whether they truly understand the background knowledge. Research results indicate the two-tier tests integrated with concept cartoons based on aboriginal culture significantly benefit students' scientific concepts.

## 1. Introduction

The current mainstream of science education is pluralistic science education or science education for all. Science education focuses on helping students from different social and cultural backgrounds and with different worldviews to learn science, and learn to recognize the contribution and value of different cultures, ethnic groups and genders to science [2]. Although there is growing awareness of emphasis science education for aboriginal students from elementary to middle schools in Taiwan, it is still an issue draw our attention in current stage. The development of science courses in the elementary and middle schools in aboriginal tribes should be based on students' experiences in their daily life, so that they may understand the meaning of their traditional culture, values and perspectives in science from societies and geographic environments they live in. It should also help them understand how to view the culture and value science, to convert it into their perspective to the world, while learning scientific knowledge at the same time. This process should drive middle to elementary school students to ponder on their traditional culture and foster a sense of responsibility to revitalize traditional culture, and continuously inject new life into aboriginal culture [5].

The purpose of this study is to develop an online test module that incorporates aboriginal culture. It uses two-tier online test tools integrated with concept cartoons to display questions, offering elements closer to the daily lives of aboriginal students. This study then explores whether if the online test module that incorporates aboriginal culture benefits aboriginal students in understanding scientific concepts.

## 2. Literature Review

### 2.1 Two-tier test

Two-tier tests consist of multiple-choice questions and are divided into three types based on how answers are presented and how subjects may choose from the answers [3]:

1. Questions for both the first and second tiers are multiple choices with multiple answers; options of the second tier do not change along with the choice made in the first tier.
2. Questions for both the first and second tiers are multiple choices with a single answer; options of the second tier do not change along with the choice made in the first tier.
3. Questions for both the first and second tiers are multiple choices with a single answer; options of the second tier change along with the choice made in the first tier.

Each type of two-tier test has its advantages and disadvantages when it comes to answer analysis. Although the first type offers many options, it generates data that cannot be analyzed and often results in too many pairs of answers. Analysis of the second type is relatively simple compared with the first type where there are multiple answers for each question; it is also easier to determine whether if subjects randomly responded to questions. When the third type is developed into a computerized test, questions are more concise compared with the other two types.

### 2.2 Concept cartoons

Concept cartoons refers to cartoon drawing through daily life scenarios into scientific concepts that the learners produce cognitive conflict by different perspectives and stimulate them to think deeper. Concept cartoons are a teaching strategy of constructivism, and use cartoon figures in daily life scenarios to describe different perspectives of scientific concepts, creating visual stimulation and conflict of perspectives [1, 4]. The conflict of concepts and visual stimulation created by concept cartoons cause students to propose their own perspectives, and further search for supporting arguments.

### **3. Research Methods**

#### **3.1 Test bank**

Questions and concept cartoons designed by this study are as follows:

**3.1.1 Two boars of different sizes in Yilan County Nanao Township Nanao Village are fighting over territory. If only the magnitude of force is considered and not the direction, which of the following descriptions regarding force and acceleration during collision is true?**

##### **3.1.1.1 First tier questions**

1. The large boar sustains greater force and therefore has greater acceleration.
2. The small boar sustains greater force and therefore has greater acceleration.
3. Both boars sustain the same force and have the same acceleration.
4. Both boars sustain the same force, but the small boar has greater acceleration.

##### **3.1.1.2 Second tier questions**

###### **3.1.1.2.1 If the answer for the first tier was “A”**

1. The large boar has greater mass and greater force during collision. From the law of motion that action force equals reaction force we know that the larger boar sustains greater force and therefore has greater acceleration.
2. The large boar has greater mass and velocity. From the law of motion that action force equals reaction force we know that the larger boar sustains greater force and therefore has greater acceleration.

###### **3.1.1.2.2 If the answer for the first tier was “B”**

1. The large boar has greater mass, so the small boar sustains greater force and has greater acceleration.
2. The small boar was knocked back a greater distance, so it sustained greater force and had greater acceleration.

###### **3.1.1.2.3 If the answer for the first tier was “C”**

1. When the two boars collide, from the law of motion that action force equals reaction force we know that the two boars sustain the same force and have the same acceleration.
2. When the two boars collide, we know from the work and kinetic energy theorem that the two boars sustain the same force and have the same acceleration.

###### **3.1.1.2.4 If the answer for the first tier was “D”**

1. When the two boars collide, from the law of motion that action force equals reaction force we know that the two boars sustain the same force, but since the small boar has smaller mass, we know from  $F=ma$  that the small boar has greater acceleration.
2. When the two boars collide, from the law of motion that action force equals reaction force we know that the two boars sustain the same force, but since the small boar has smaller mass, thus the larger its velocity the greater its acceleration.

Figure 1 Explanation of System Screens

**3.1.2 A flying squirrel in Yilan County Nanao Township Nanao Village sets off a trap and is hanged by a tree, which of the following descriptions are correct?**

**3.1.2.1 First tier questions**

1. When the flying squirrel reaches the highest point, its velocity is zero.
2. When the flying squirrel reaches the highest point, its acceleration is zero.
3. No matter how long the rope hanging the flying squirrel is, its swing period is the same.
4. The larger the mass of the flying squirrel, the longer the swing period.

**3.1.2.2 Second tier questions**

**3.1.2.2.1 If the answer for the first tier was “A”**

1. Based on the law of energy conservation, kinetic energy is converted to potential energy, so when the flying squirrel reaches the highest point, its velocity is zero.
2. When the flying squirrel reaches the highest point, it is not affected by gravity, so its velocity is zero.

**3.1.2.2.2 If the answer for the first tier was “B”**

1. The flying squirrel is motionless when it reaches the highest point, so its acceleration is zero.
2. When the flying squirrel reaches the highest point, its velocity is zero and its acceleration is also zero.

### 3.1.2.2.3 If the answer for the first tier was “C”

1. The swing period is related to the flying squirrel's mass, but not related to the length of the rope.
2. The swing period is related to the flying squirrel's velocity, but not related to the length of the rope.

### 3.1.2.2.4 If the answer for the first tier was “D”

1. The larger the mass of the flying squirrel, the greater the acceleration because of gravity, so the longer the swing distance, the longer the period.
2. The larger the mass of the flying squirrel, the greater the acceleration because of gravity, so the longer the swing time, the longer the period.

Figure 2 Explanation of System Screens

## 3.2 Concept cartoon two-tier online test module

The design of the online system focuses on integrating concept cartoons with two-tier test, hoping that questions presented using concept cartoons based on aboriginal culture will not only help aboriginal students better understand questions, but also gain interest during the test. The two-tier test of this system asks multiple-choice questions for both tiers, the second tier's options do not change along with answers of the first tier. Flash software is used to make the concept cartoons for the question and each answer. Furthermore, each option in the second tier according to the meaning of the questions is in animation, and provides the function of repeatedly viewing by students.

## 4. Research Results

### 4.1 Research subject analysis

This study conducted the tests in two sophomore classes in Nanao High School, Yilan County; one class for the experimental group, one class for the control group. An analysis of research subjects is as shown in Table 1.

<i>Group</i>	<i>Number of Subjects</i>	<i>Gender</i>	<i>Identity</i>
<i>Experimental Group</i>	34	<i>Male:</i> 18 <i>Female:</i> 16	<i>Aboriginal:</i> 18 <i>Non-aboriginal:</i> 16
<i>Control Group</i>	13	<i>Male:</i> 6 <i>Female:</i> 7	<i>Aboriginal:</i> 12 <i>Non-aboriginal:</i> 1

Table 1 Research Subject Analysis

### 4.2 Mean of scores of the experimental group and control group

The experimental group (16.5 points) performed better than the control group (7.6 points), proving that two-tier tests integrated with concept cartoons can help aboriginal students understand the meaning of questions, and further understand the scientific knowledge to each question, as shown in Table 2.

<i>Group</i>	<i>Number of Subjects</i>	<i>Mean</i>
<i>Experimental Group</i>	34	16.5
<i>Control Group</i>	13	7.6

Table 2 Mean of Scores of the Experimental Group and Control Group

### 4.3 Mean of scores of the experimental group by gender

Female subjects (23 points) of the experimental group performed better than male subjects (11 points), indicating that two-tier tests integrated with concept cartoons benefit female students more than male students in helping them understand the meaning of questions, and further understand the scientific knowledge to each question, as shown in Table 3.

<i>Gender</i>	<i>Number of Subjects</i>	<i>Mean</i>
<i>Male</i>	18	11
<i>Female</i>	16	23

Table 3 Mean of Scores of the Experimental Group by Gender

#### 4.4 Mean of scores of the experimental group by identity

Aboriginal students (24 points) performed better than non-aboriginal students (9 points), proving that two-tier tests integrated with concept cartoons benefit aboriginal students more than non-aboriginal students in helping them understand the meaning of questions, and further understand the scientific knowledge to each question, as shown in Table 4. Cartoons of this study were designed based on aboriginal culture, and evidence shows that they were more beneficial to aboriginal students.

<i>Identity</i>	<i>Number of Subjects</i>	<i>Mean</i>
<i>Aboriginal</i>	18	24
<i>Non-aboriginal</i>	16	9

Table 4 Mean of Scores of the Experimental Group by Identity

#### 5. Conclusions

This study develops an online test module that incorporates aboriginal culture. It uses two-tier online test integrated concept cartoons to display questions, providing elements that are diverse and closer to the daily lives of aboriginal students. Research results indicate that this system greatly benefits aboriginal high school students, especially female students in understanding the meaning of questions, and further understanding the scientific knowledge of each question.

Abstracts

This study attempts to apply two teamwork learning patterns, Cooperative Learning and Collaborative Learning, to the online game-styled computer-assisted learning system. Four units of fourth-grade elementary math are implemented into the games; that students are engaged in. In addition, the study explores whether these two online game mechanisms help students with math studies in a significant way. The study employs the quasi-experiment method to evaluate teaching achievements. Outcomes of the pre-test and post test T-test, as well as variable analysis revealed that the learning achievements of these two approaches are superior to conventional stereotypes. Studies in the correlation between genders and the two learning patterns found that boys are more suitable to participate in collaborative learning while girls act well in both teamwork-learning patterns.

## 1. Introduction

Many have the impression that as long as a teacher divides students into several groups, panel discussions, and, later, the conclusion considered as team learning. This kind of grouping approach; however, can easily lead to nominal teamwork learning in which more capable students are given more responsibilities while less competent students are relegated to token roles [8]. As a result, more capable students will learn faster than less competent students, and as the vicious circle repeats itself high-achievers will be better and better and low-achievers will only be moving toward the opposite direction [5]. To rectify this problem, we plan to characterize learning methods based on different teamwork learning approaches, bring out effective responsibility sharing and exact cooperation to students, in order to achieve substantial learning objectives...

As described above, the purpose of this study are as following:

1. To engage in four studying aspects: volume, fraction, angle and length.
2. To explore, which learning mode either Cooperative Learning or Collaborative Learning is more helpful in assisting fourth-graders math studies.
3. To examine whether the cooperative environment of online math game enhances students' willingness and ability, in hopes that research outcomes as a reference for teachers in developing teaching methods.

## 2. Literature Review

### 2.1 Definition of Teamwork Learning

The idea of teamwork learning is not new. Since the ancient past there have been scholars advocating the concept of teamwork learning. "Those who study alone without friends tend to be narrow-minded and uninformed," said Confucius. "Where there are as few as three people, I can find someone to teach me something." The great philosopher was referring to the fact that the power of self is weak and that the strength and wisdom of every member of the group needs. Palincsar indicates "teamwork learning" is about assigning students to small groups in which they learn through cooperation [10]. Students work together to accomplish the objective. Through discuss, interact with each other, encourage separate criticisms, adjust the point of view, all the students of each group can learn the designated materials. Teamwork learning is the essential component of constructivism. It is a concept of teaching design that encourages students to continue to discuss with others and exchange opinions with others in the learning process in order to construct knowledge that is meaningful to the students [7].

### 2.2 Categories of Teamwork Learning

There have been numerous studies on teamwork learning, yet few have attempted to define the category of teamwork learning. In terms of two learning methods, cooperative learning and collaborative learning collectively refer to cooperative learning, but has differences of original meaning. The following is a brief explanation of the two types of teamwork learning. Cooperative Learning: Cooperative learning is often applied to group learning. Through group discussions students solve the problems [3]. In group learning of uneven task distribution, responsibility sharing is often relegated to mere formality possibly because of the fact that high-achievers for fear of being slowed down by the low-achievers choose to

attain the goal alone that is meant for group completion and thereby deprive teamwork learning of its meaning. Conversely, it is also possible that in order to evade heavy responsibility high-achievers will purposely hide their ability and shift the burden to others. To avoid this situation, we need to separate “team learning” from “cooperative learning”. “Cooperative learning” means every student of the team to assume the responsibility of accomplishing a part of the learning objective. Every part is equally important. It requires all to pool their efforts together in order to accomplish the mission of the team. That is genuine cooperative learning [1]. Johnson & Johnson believe cooperation is a relationship of reciprocal assistance that requires individual responsibilities. Every member of the group needs to learn and develop communication skills and makes decisions through communication and mutual trust [6].

**Collaborative Learning:** This is clearly a social process among group members who could adopt various strategies for resolving differences including asserting dominance, acquiescing, or some form of reciprocal sense making. An important aspect of collaborative learning is the move from assimilation to construction [9]. Collaborative learning in practice, therefore, is allowing a group of learners to explore learning problems through active interaction and remove these problems [4]. In this type of teamwork learning, there is no clear distinction between the role of a teacher and that of a student. The conventional teaching approach is not followed. No longer is a knowledge provider, the teacher there to give students guidance. No specific responsibility-sharing structure is prescribed. Through interactive discussions, all learners work together to establish consensus on learning objectives and solve common problems. The classroom is not the only place where collaborative learning takes place. The practice can be expanded to the entire society. Any place that allows learners to discuss and work with one another is appropriate for collaborative learning. In essence, collaborative learning researchers tend to employ the method of constructivism. So collaborative learning is in line with the approach of the “constructive teaching method” [2]. Whipple presents the following characteristics of collaborative learning: In the process of education, both the counsellor and the learner are active participants. There is no hierarchical difference between the counsellor and the learner. The group consensus needs to be established. Knowledge is constructed not directly transmitted. Knowledge is positioned as one of the five fundamental essences including the group [11].

### **3. Research Design and Method**

#### **3.1 Research Framework**

This study evaluates teaching achievement mainly through the quasi-experiment method. Before the experiment, both the experiment group and the control group received the pre-test on “the four math units of the Fall Semester of the Fourth Grade”. The four-week experimental teaching followed. After the experiment concluded, they received the posttest on “the four math units of the Fall Semester of the Fourth Grade”. The design of the experiment is shown in Table 1:

Teams	Pre-test	Handling of Experiment	Post- test
First Experiment Team	X	X1	X2
Second Experiment Team	Y	Y1	Y2
Control Team	Z	Z1	Z2

Table1. Brief Table of Experiment Design

X、Y、Z: both experiment team and control team take Pre-test.

X2、Y2、Z2: both experiment team and control team take Post-test.

X1: “Cooperative learning of online math games” is used by First Experiment Team to support math learning.

Y1: “Collaborative learning of online math games” is used by Second Experiment Team to support math learning.

Z1: Control Team uses traditional learning method

### 3.2 Cooperative Learning Interface

On the server-end screen there are three options including “those who have not form teams”, “teams that have been formed” and “teams that are calling” as shown in Figure 1. It is designed to enable the researcher to stay on top of student activities. On the user-end screen, the researcher designed a few control choices including the mechanism to call partners for team organization, the pull-down menu for selection of answers, the discussion mechanism for cooperative learning, and the teacher’s feedback when a wrong answer is given (see Fig.2). In this system, the questions are provided dynamically from the databank for the two students of each team to answer the two-step math questions with the one writing down the first step and the other writing the second step and the final answer.

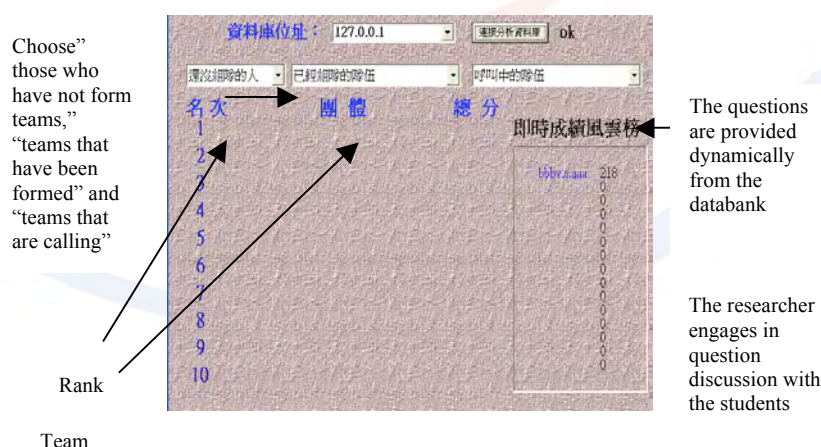

Fig1. Cooperative Learning Server-End Screen

Fig2. Cooperative Learning User-End Screen

### 3.3 Collaborative Learning Interface

On the server-end screen, the researcher can easily engage in question discussed with the students. The questions are provided dynamically from the databank, but the researcher in accordance with the students' status can present questions any time to give guidance. Staying fully aware of the students' activities, the researcher can intervene to provide assistance as shown in Figure 3. On the user-end game screen, the researcher designed a discussion screen similar to that of the server-end as shown in Figure 4. The main difference lies in the fact that the user-end interface has a common "vocabulary selection" button, which helps reduce typing difficulties and enhances students' confidence. Through the assistance of the number buttons, students are able to present the math expression in its entirety in the discussion zone for interaction with other learners and for completion of the question.

## 4. Research Outcomes and Discussions

### 4.1 Analysis of the two types of teamwork CAL on math teaching achievements of the classes

According to Table 2, we have learned that the pre-test scores of the experiment group and the control group have not reached the significant level, so we can say there is no discrepancy between the two groups. According to the experiment framework, independent sample ANOVA is employed for the post test. Post test data analysis reveals the differences between the two experiment groups and the control group reach the significant level as shown in Table 3. Yet post-event analysis shows the difference between the two experiment groups has not reached the significant level as shown in Table 4. Experiment outcomes indicate the two CAL teamwork models are significantly superior to the traditional teaching approach.

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	519.97	2	259.99	.67	.52
Within Group	33642.53	86	391.19		
Total	34162.50	88			

Table2. Pretest ANOVA

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3159.64	2	1579.82	3.22	.05
Within Group	42138.80	86	489.99		
Total	45298.44	88			

Table3. Posttest ANOVA

Dependent Variable: Posttest:

Based on estimated argental means

\*. The mean difference is significant at the .05 levels.

a. Adjustment for multiple comparisons: Least Significant Difference (equivalent to no adjustments).

#### 4.2 Covariance Analysis of Gender and Online Math Cooperation Models

The analysis indicates boys who participated in the collaborative model obviously outperform boys who went through the conventional teaching approach ( $p=0.05<0.05$ ). The mean score of the cooperative model is higher than that of the conventional teaching approach, but not by significant margin (Table 5). The result proves that through the collaborative model boys can make more significant progresses than their counterparts who go through the conventional teaching approach.

(I) 1.Cooperative 2.Conventional 3.Collaborative		Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval for Difference	
(J) 1.Cooperative 2.Conventional 3.Collaborative					Lower Bound	Upper bound
1	2	4.13	5.65	.47	-7.281	15.54
	3	-6.41	5.65	.25	-17.46	4.63
2	1	-4.13	5.65	.47	-15.54	7.28
	3	-10.54*	5.20	.05	-21.04	-3.97
3	1	6.41	5.45	.25	-4.63	17.46
	2	10.54*	5.20	.05	3.97	21.04

Table5. Posttest Analysis Paired Comparison of Boys of Different Teaching Models Pairwise Comparisons

Dependent Variable: Posttest

Based on estimated marginal means

\*. The mean difference is significant at the .05 level.

a. Adjustment for multiple Comparisons: Least Significant Difference (equivalent to no adjustments.)

Girls who participated in the cooperative model obviously outperform girls who went through the conventional teaching approach ( $p=0.004<0.05$ ); girls who participated in the collaborative model also obviously outperform girls who went through the conventional teaching approach ( $p=0.003<0.05$ ); yet the difference between the cooperative model and the collaborative model is not significant ( $p=0.333>0.05$ ) as shown in Table 6. It proves that the learning achievement of girls going through cooperative CAL or collaborative CAL is better than that of those going through the conventional teaching approach.

(I) 1.Cooperative 2.Conventional 3.Collaborative (J) 1.Cooperative 2.Conventional 3.Collaborative		Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval for Difference	
					Lower Bound	Upper bound
1	2	16.51*	5.48	.00	5.43	27.59
	3	-1.90	5.53	.73	-13.07	9.27
2	1	-16.51*	5.48	.00	-27.59	-5.43
	3	-18.41*	5.74	.00	-30.02	6.80
3	1	1.90	5.53	.73	-9.27	13.07
	2	18.41*	5.74	.00	6.80	30.02

Table6. Posttest Analysis Paired Comparison of Girls of Different Teaching Models Pairwise Comparisons

Dependent Variable: Posttest

Based on estimated marginal means

\*. The mean difference is significant at the .05 level.

a. Adjustment for multiple Comparisons: Least Significant Difference (equivalent to no adjustments.)

## 5. Conclusions

This study incorporates cooperative learning and collaborative CAL with elementary level math and allows two classes students participating in two types of cooperation. Following four weeks of game process, a data bank is employed to collect students' basic data in conjunction with analysis of students' pre-test, and post test scores and online survey questionnaires. In accordance with research objectives and the problems to be solved, this study analyzes "Learning Achievement of Different Classes", "Learning Achievement of Different Genders" as follows:

## 5.1 Learning Achievement of Different Classes

According to data analysis of this experiment we can prove that achievements of students who learn through cooperative CAL or collaborative CAL is significantly superior to that of the control group for which conventional teaching approach is employed. Yet the difference between the two has not reached the significant level. Thereby, we can say in the field of information-blended teaching, employment of cooperative CAL or collaborative CAL in math education is equally outstanding.

## 5.2 Correlation of Genders and Cooperative Patterns

Collaborative CAL is more suitable for boys. Data analysis indicates the collaborative CAL math games through online games; the boys outperform their counterparts that went through conventional teaching approaches. Their average score is also better than that of the cooperative learning pattern. Therefore, we can prove that boys are more suitable for collaborative CAL math games.

Both cooperative CAL and collaborative CAL are more suitable for girls: Data analysis indicates cooperative learning or collaborative learning through CAL online math games, the girls outperform their counterparts who went through conventional teaching approaches. Therefore, we can prove that girls are suitable for both cooperative learning and collaborative CAL math games.

Abstracts

This research aims to 1) survey current situation and knowledge review of Chachoengsao Local Learning, 2) conduct teacher network for instruct and develop the Local Curriculum, 3) propose the ways to support Chachoengsao Local Learning. The research procedure was divided into 3 phases. The research samples were 330 schools in Chachoengsao area and 28 network schools. The data were analyzed by descriptive statistic and content analysis. Research results found that the enhancing factor of learning process for hometown could be built by school mechanism, teacher and school network, Local Administration Organization mechanism, and academic mechanism respectively ( $\bar{x}$  = 1.92, 1.45, 1.13, 0.61; SD = 0.78, 0.76, 0.79, 0.69), but lacks of systematic network process. Moreover, results of Local Learning instruction effects toward student mainly ( $\bar{x}$  = 1.94, SD = 0.62). The result from content analysis found that Chachoengsao knowledge modules were used in Local Learning and schools in Chachoengsao to develop Local Curriculum in 4 ways including 1) integrating into core subject units 2) constructing extra subject, 3) creating school activity, and 4) building school project.

## **Introduction**

National Economic and Social Development Plan No. 10 (2550-2554 BC) is vision was to develop a community peace (Green and Happiness Society) by the philosophy of adequate economics- along with the development of an integrated, holistic approach that is based on people-centered development seriously. To adopt the balancing, Equitable, and sustainable, the family strength is the important start of developing children and young people reflecting on the people-centered development.

The Thailand Research Fund (TRF) was established in response to the 1992 Research Endowment Act and although it is part of the government system, it lies outside the government administrative bureaucracy. This allows great efficiency in research support. Since its creation, TRF has remained focused on its main duty: supporting at both local and national levels the creation of a knowledge to help those tackling societal problems. TRF believes in the creation of a wisdom-driven society through the application of research-based knowledge. We believe that knowledge should be applied to develop the country's potential, to shape its future, and to create new local and national opportunities. TRF develops the knowledge construction processes, trains researchers, creates research systems, and building research networks to find appropriate solutions to the challenges in our society. We always aim to enhance the knowledge and wisdom in Thai society and to strengthen local communities, helping Thai society stands ahead of a changing world.

Many of the eastern province Chacheongsao is research projects have been supported by the Research Fund (TRF), coordinating with Ramajitti Institute has which develop researches in child and education, such as Eastern Child Watch, Innovative Family Education. Which is currently in phase 2, Development of children and the coexistence of people in a peaceful and compassionate society is in order to- enhance the learning development of the students and community, strengthen the local sense, and strengthen the local management networks which to create the (model development) associating with a suggested policy, also, linking research networks in the local-area, technology, information- together. Finally, it will enhance the skills of the people, and local communities in the management.

Data from the study showed that there is a few and interesting learning processes that in local levels, As in Chacheongsao, Learning Process for Hometown Development Phase 1, 2554" project is to promote the hometown sense of love and developments, and participation—This will lead to the development of systems and policies for children both in local and national following.

## **Research Question**

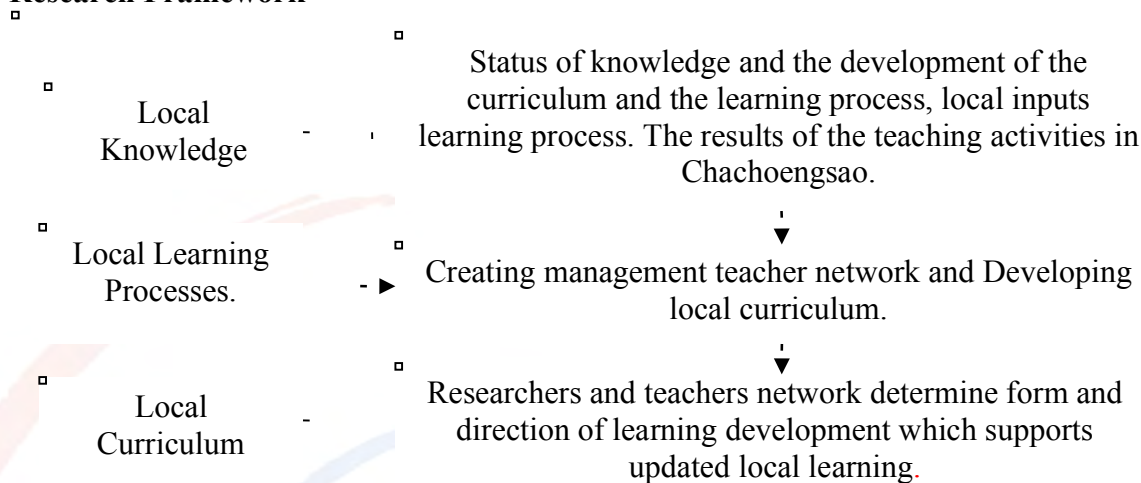

How to Development of Learning Process for Hometown of Chachoengsao Province.

## **Objectives**

This research aims to 1) Survey current situation and knowledge review of Chachoengsao Local Learning process , 2) Create teacher network for

instructing and developing the Local Curriculum, 3) Propose ways to support Chachoengsao Local Learning.

### Research Framework

### Methodology

#### Research Procedure

The research was divided into 3 phases: Phase 1: survey the area's data and Phase 2 : create research network and Phase 3 present the research framework. The sample used in this study were 330 primary and secondary schools in the province, 28 schools from teachers networks of management teacher of learning and development program. Using descriptive statistics and content analysis, the results showed that the supporting factors can occur mostly by the mechanism schools. The second is a network of schools and the teachers. Next is the mechanism of local organizations, and form department of mechanisms, respectively.

#### Data Collecting

Applied research and development (Research & Development) by merging the survey research and Needs Assessment. in the study population in the study areas : primary and secondary schools in the province, 330 schools which are 147 primary schools in first education area : 153 elementary school in second education area and 30 in secondary schools in the sixth education area province of the survey sample. The researchers selected a (purposive selected) sample-specific. The study population of 330 samples collected data by interviewing consisted of 1) the supervision and care of learning the local province 2) teachers, school administrators 3) government agencies and 4) student people in the province.

#### Research Instrument

Research instrument was a questionnaire "The Development of Learning Process for the Hometown of Chachoengsao Province" created by researchers and verified by experts. is divided into 3 parts including 1) the general context of the first two schools, exploring the situation and move on with the

development, Course curriculum of local schools with the three at the factors in the support process, 1) course curriculum of local schools 2) learning course of learning a local 3) the results of the learning program. Local learning and the Key Success Factors The Development of Learning Process for the Hometown of Chachoengsao Province.

### **Data collection Analysis**

The data were collected by at a questionnaire “The Development of Learning Process for the Hometown of Chachoengsao Province” The data was analyzed by the SPSS program. Then, researchers analyzed the general data by descriptive statistics, for instance, frequency, mean, standard deviation, and percentage.

### **Result**

#### **Levels of knowledge and learning about local movement.**

The results showed that the factors supporting the learning process to the native settlements can occur by the mechanism of most schools, the second is a network of schools and the teachers. Next is the mechanism of local organizations. Mechanisms of the Department, respectively ( $\bar{x} = 1.92, 1.45, 1.13, 0.61$ ;  $SD = 0.78, 0.76, 0.79, 0.69$ ) and found that the condition of the current lack of operating under the school network and teachers network in and out of school for learning local ( $\bar{x} = 1.06, SD = 0.78$ ) than that of performance on the learning of local results with participants mainly ( $\bar{x} = 1.94, SD = 0.62$ ) participated in the development of local learning. The local curriculum. The schools in the province. Local programs are developed into four frame : 1) integration of course, 2) units producing additional lessons 3) extra curricular activities, and 4) a school project, and also found the Chachoengsao produces lessons with its local knowledge. The survey found that, the course of the development of the province at least. The average performance was 1.28 ( $SD = 0.62$ ) and learning local implementation level increase slightly with the average performance was 1.43 ( $SD = 0.64$ ), the effects of the learning process. Local. Most operations. The average performance was 1.91 ( $SD = 0.61$ )

#### **The results of the network by the network of the second Test.**

Network meeting shows the four problems: 1) Policy: There is no definite frame work 2) Resource: there should be definite information 3) Preparation: tacks of cooperate schools and personals and there is no concrete knowledge set. 4) Collaboration: Lacks of collaboration from local admisitrators.

Under problems. Metioned, the research result in a moderate success in three areas: learners, learning processes, participation.

Local learning management currently enchanter both problems and successes. Therefore, in future plan, there are 2 levels of working process: policy level, and practical level.

### **Recommendations**

Research recommendations to 1) Executive Educational Administrator to develops education standards. 2) Administrators and teachers aware of the importance of local knowledge focusing on improvement of knowledge

management quality. 3) Schools provides supports for teachers to teach local knowledge.

### Acknowledgements

Abstracts

The aim of this research is to survey of relation between in-service training and crisis management. Hypothesis of this study is as follow: 1. There is relation between the short term in-service training and crisis management. 2. There is relation between long term in-service training and crisis management.

3. There is relation between kinds of in-service training and dimensions of crisis management cycle. Method of this research is Descriptive –Correlation. The instrument of this study is questionnaire and validity of the instrument was examined by 30 experts, and its reliability was calculated by Cronbach Alpha method proved 0.87. The population of this study includes 691 persons of managers and samples were chosen by the use of Morgan table and it comprised about 248 subjects. The gathered data were analyzed by using of descriptive statistics and inferential statistics including Pearson correlation test and Stepwise regression. Results showed that: 1. There is connection between short term in-service training and crisis management. 2. There is connection between long term in-service training and crisis management. 3. Short term in-service training has most correlation with first, second, fourth and fifth crisis management cycle.

**Key Words:** In-service training, crisis management, manager

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

### **Introduction:**

A traditional view at the crisis management indicated that crisis management means putting out the fire. In other words, the crisis managers wait for things to go wrong and then try to limit the losses as a result of the crisis. However, recently, the perception in this area has changed. Based on the recent definition, there should be a collection of plans and practical programs for facing the probable future developments within the organizations and managers should ponder about the probable future happenings and attain the unpredictable events face to face (Soleimani, 2007). The new definition of crisis management means the process or procedure of prediction and prevention of the crises coming into existence, intervention in the crisis and improvement after the crisis has struck (Nasiri, 2007). In the definition of organizational crisis, There has to be a difference between the crisis and an unfortunate event. Brent has made a distinction between These two and he says crisis describes conditions in which the foots of the crisis could be problems or difficulties such as The inappropriate management activities and structure or a failure in conformity with a change. However, an unfortunate event means that an organization has faced sudden or unpredictable catastrophic changes in which it has little control.

In fact, Systematic approach, crisis is an event in which the order of the main system or portions of it have been disturbed and its stability has been compromised (Tajik,2000). The management and taming these crises require the training of managers.

Training is referred to any kind of activities or solutions that have been designed in advance for the purpose of creating learning for the learners and in this article, the relation between the on-the-job training and the marine crisis management will be analyzed (Seyf, 2007). William Mark He and Paul Tader state that their intentions are to teach the activity or a collection of activities that provide the necessary skill, knowledge and perception for the task.

Therefore, taking into account the necessity for teaching the crisis management, the purpose of this research is to analyze the relation between the short and long term training with the management crisis. For this reason, the following hypothesis have been taken into consideration

The hypothesis of the research:

- 1) There is a correlation between the short term in-service trainings and the crisis management.
- 2) There is a correlation between the long term in-service trainings and the crisis management.
- 3) There is a correlation between different kind, of (short and long term) in-service trainings and the different dimensions of crisis management.

### **What is a crisis?**

Crisis is an event that happens suddenly or gradually either naturally or unnaturally and it imposes some hardship on mankind. Crisis means falling apart, chaos, descriptive change (s), more than usual fragility, the threatening of human values, socio-political instability, military hostility etc.,(Gottschalk, J, 2004).Crisis means a situation in which the main disciplinary system of portions of it has been disrupted and its stability has been disturbed (Soleimani, 2007).

### **Crisis Management:**

Crisis Management is a collection of current systematic procedures that are interrelated which are defined for the identification of the analysis for facing and training crises by using management strategies and methods (Dorn Busch, 2011). Crisis management requires the integration of skills, training, abilities and specifications which allows a manager to design, respond and learn from the critical crisis (Brockner and James, 2010). Meanwhile, as the business environment changes and gets complicated increasingly, it is important for the manager to find skills that helps them in responding effectively to crises (Mitroff, 2001). Crisis Management is the anticipation in the crisis and its rehabilitation after the crisis has taken place.

### **The necessity of Crisis Management:**

Peter Darakar (1980) has considered the crisis period as a dangerous one and believes that the highest danger is ignoring the new ones and primarily he does not agree with what everybody believes. Of course, the chaos is a period full of possibilities and opportunities for those who have recognized the new facts and have taken advantage of it. During a crisis, the most prominent necessity is the existence of managers who face the realities and challenge the temptation of following what they know (Nasiri, 2007).

Crisis management is a process for facing a difficult condition for which all the planning, organization and group control activities including actions and reactions have been mobilized and have been at the disposal of managers who should take actions fast and without hesitation (Safavi, 2005). It is natural that the most important issue in running the organizations goes back to the management issue. One of the most important subjects in one's life is the occurrence of catastrophes, problems or mishaps that are referred to as crisis. These can cause disturbances in all the dimensions of the society. However, with having comprehensive training and organizing effective resources and leadership and, ultimately, an all-out control which sum up to be the successful management, it is possible to face the most destructive crises (James, 2008).

Crisis management without knowledge, awareness, and deep thinking of the organization's financiers about the crisis is impossible. Therefore, the existence of a common view and mentality about the crisis and the negative consequences is very important for an effective management and the organization of activities related to the crisis management. On the other hand, the views of different organizations' managers in a country affect the processes of helping and rescuing in accidents and incidents. That means that the more managers in a society are sensitive to crisis and its consequences, the more it is likely to witness improvement in the management of and the processes of help and rescue.

Anticipation of the necessity for wise co-ordination, a collection of efforts accompanied with the optimum use of the capacity of technical specialists whether financial or nonfinancial along with the planning process and utilizing a collection of programs and different operational activities in the past, during and after the crisis to the point that the result will be having the maximum efficiency and effectiveness of help and rescue is called Crisis Management (Geary, 2006).

### **Crisis in the Organization:**

A manager in an organization can have two kinds of approaches in regards to a crisis: one is the strategy for the prevention of Crisis management and the other is the reaction

to the crisis. Either of these approaches requires a certain kind of organizational and managerial reactions.

Type of organizational Crisis		Key Dimensions
Concentrate	Sudden	
Gradual, step by step	Fast	The speed of Expansion
Too often	Too little	The predictability of the prediction
Unclear	Concentrated	Being special
Uncertain	Clear	The recognition of crisis
Normal	Special	The moving spot
Increasing as the time passes	Time limitation	The possibility of occurrence
Several Type		The lack of Co-ordination with environment

Table 1-Types of organizational Crises

Woteen peri and James Hines have divided Crisis Management into five stages:

First stage: 1) recognition of the sign (s) 2) significance and measurement

Second stage: 1) prevention and preparation. 2) The organization's selling ideas and creativity.

Third stage: 1) sustaining damages 2) decision making, Connection and Taking risks.

Fourth stage: 1) recovery 2) organizations promotion and flexibility.

Fifth stage: 1) training 2) reflection.

The first stage requires the managers to recognize the first symptoms that declares the probability of the existence of a crisis. In the second stage, the managers are expected to prevent crises stage includes damage control and prevention of the damage to spill over other departments of the organization. The fourth stage includes recovery which means managers should help the organization to re-start the operations. The fifth stage encourages the crisis managers in the training division to analyze the lessons learned from the crisis (James and Woteen, 2008).

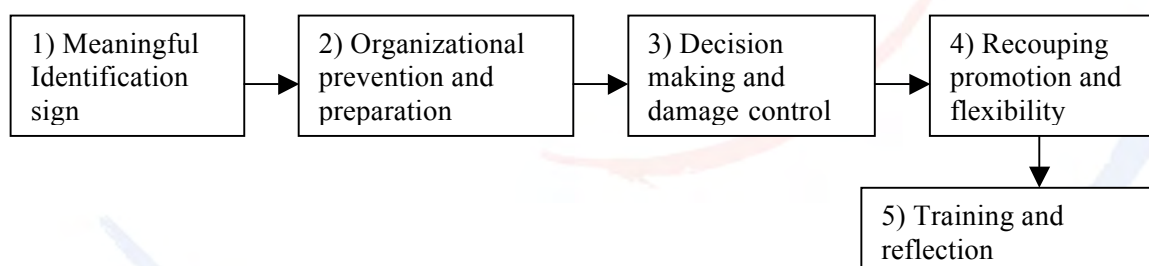

Table 2:The cycle of crisis management and managerial capabilities during the crisis (James and Woteen)

### In-service training:

On the job training is an experience based on learning and for the purpose of creating relatively permanent is an experience based on learning and for the purpose of creating relatively permanent changes in an individual so that he can improve himself in doing his duty (Toosi,2008).

Training the employees include a series of systematic operations with clear goals utilized for 3 purposes:

- 1) Increasing the employees awareness level
- 2) Increasing the employees' skills and their level of knowledge

3) Creation of desirable behavior compatible with the society's permanent values  
The employees' training includes increasing the employees' technical knowledge as such that they can do their duties fantastically and get ready for extra and more important responsibility (Fereydooni,2008).

#### **Short-term in-service Training:**

Short term in-service training is referred to trainings that last between a few weeks to a few months. The main philosophy of in-service Training is , in fact , based on planning these kinds of trainings because on the one hand these kinds of trainings are presented, precisely, in conformity with the job's duties and responsibilities and on the other hand, these types of trainings are essentially dependent on the employees' and the organization's definite needs(Adli,2008).

#### **Long-Term in-service Training:**

Long-Term in-service trainings are those types of trainings that time wise are expansive and secondly the result in receiving higher academic degrees. This type of organizational training are common in most Asian countries including Iran, Pakistan, Korea, Bangladesh, etc. For example, if there are some management courses at the, master's degree level and they employees receive an academic degree, we can, then call them long-term on the job training(Hejazi,2007).

The main goal of teaching or training the employees is education. Many organizations utilize many vast resources for the purpose of elevating the skills and abilities of their employees. The manager of one of the big companies believes deeply in education its employees. The employees of this company spend between two to four percent of their time at work in the classroom. Most of the trainings are done by the companies' managers and the goal is to teach the employees to find ways for finding resources for the company at the same time that they look for attaining rewards (Wang& Belardo,2005).

One of main goals in the training issues is to create the right attitude towards the organization's personnel and it is expected that after the end of the training course, the employees' attitude towards the organization will change in favor of a positive and effective co-operation with the organization and their mind will be shaped as such that they will support the organization's goals(Toosi,2008).

The following is Mr. Mir Kamali's version of the goals for training employees:

Item	Goal	Item	Goal
1	Improving performance	6	Achieving the right training and preparation for the creation of change in the organization
2	Revealing Information	7	Achieving technical and mental skills and learning about human relations
3	Job promotion	8	Orientation of the employees with the organization's goals
4	Solving problems	9	Effectiveness and Efficiency of the work force
5	Preparation for promotion	10	Co-ordination with scientific and Technological advances and changes

Table3-The Goals of Training Employees (Mir Kamali,2009)

### **Training and Crisis Management:**

Most managers are aware of the negative consequences in connection with an organizational crisis and insist on training as a method of appropriate reaction against crisis. Despite that many people ignore organizational crisis and this could be as a result of the lack of on-the-job formal training and experiences to enable managers how to manage crises. Managers who have succeeded to rescue their companies from certain crises such as marine crisis have demonstrated a group of complicated competencies that are as follows (Brockner and James, 2010).

1) crisis Identification 2) preparation and prevention 3) damage control 4)recoup 5) training.

In addition, crisis Management, finitely, requires managers to adopt a set of complicated competencies for an honest guidance of the company through the administration of different crisis Management strategies.

Training is a tool that helps crisis Management and identifies the strength or the ability of the Crisis Management, especially, in the operation of what has been done and the operational consequences, leadership and human resources when a crisis takes place (Wang and Belardo, 2005). Therefore, the argument is that the leaders and managers should be in charge of accepting responsibilities directly for the organization of an environment that conveys to the management an approach that is based on competency (James and Woteen, 2004). This includes the identification of vital tasks and activities that are needed during a critical situation, necessary skills and abilities for the successful completion of these activities and understanding the contents for conducting the Crisis Management strategies. The creation of such culture requires the multi-dimensional training that demonstrates both the competency of the management and the contents of the crisis. As a concentrated approach in the competency and the analysis of Crisis Management develops, it can lead to useful information for teaching the programs (Wang and Blardo, 2005).

Experiences attained as a result of crises coming into existence suggest that training and preparation are pre-request things for conducting successful operations and crisis control (Mitrof and Anagnos, 2001). Meanwhile, crisis can , by itself, be useful as an accelerator factor for a new thought for what is necessary for the organization and the crises, themselves, can be considered to be some kind of training programs (Brockner and James, 2010).

### **Method Of Research:**

Method of this research is Descriptive –Correlation. The population of the research included 691 managers who had, at least, 5 years management experiences (116 individuals from north and 575 from the southern parts of the country). In this research, sampling of a random method was utilized and the volume of the sample based on Morgan table was 248 individuals. 43 of them were from north (21 from Noshahr and 22 from Anzali). 205 people were from southern areas (130 from Bandar Abbas, 40 From Booshehr, 25 from Chahbahar and 10 from Khoramshahr). The tools of this research were questionnaires. Two questionnaires were prepared validity of the instrument was examined by 30 experts, and its reliability was calculated by Cronbach Alpha method proved 0.87. Ultimately, after assuring that the respondents had understood the questions and there was nothing wrong with the questionnaire, the final questionnaire was distributed.

Since the data in this research are at a distance level and the theories are based on parametric statistics, (Conformation of variances, the normality of the society and the distance among the variables) to attain the correlation among the variables, Pearson's correlative test was utilized. To determine the share of the variables in the related variables, Stepwise regression Was utilized. If Pearson's correlation is significant, to determine the share of the variables in the correlation variance, Regression can also be used.

### Findings:

First Theory: There is Correlation between the short-term in-service training and the crisis management.

	No	Mean	Correlation Rate	Significance
Short-term in-service training	248	26/16	0.47**	0.00
Crisis Management	248	156/31		

Table4- Correlation test between the two variables of Short-term in-service training and the crisis management

The correlation obtained from both variables of short-term in-service training and Crisis Management is equal to 47%. This correlation is significant and the first theory of the research with the accuracy of  $<0/01$  is confirmed.

Second theory: there is a correlation between the long-term in-service training and crisis management.

	Number	Mean	Correlation Rate	Significance Level
Long-Term in-service training	248	21.58	0.34**	0.00
Crisis Management	248	156.31		

Table 5- the correlation test between the two variables of long-Term in-service training and crisis management

The attained Correlation rate from both variables of long-term in-service training and crisis management is equal to 34% this correlation is significant and the second theory with the accuracy rate of  $<0.01$  is confirmed.

Third theory: there is a correlation between the two types of (short-Term and Long-Term) in-service training and the dimensions of the Crisis Management.

Crisis cycle Variables	First Cycle	Second Cycle	Third Cycle	Fourth Cycle	Fifth Cycle
Short-term in-service training	0.40**	0.36**	0.4/**	0.38**	0.39**
Long-Term in-service training	0.28**	0.28**	0.26**	0.25**	0.30**

Table 6-Correlation matrix of the types of in-service training and the dimensions of crisis management

As it is shown in chart 6, all the dimensions of the crisis management are in correlation with the levels of in-service training and the rate of attained correlation indicates that all of them at the significant level of  $\alpha = 0.01$  are acceptable. The strongest correlation is related to short-term in-service training and the third dimension of Crisis Management cycle ( $r=0.41$ ) and the least correlation is related to the long-term in-service training and the fourth cycle ( $r=0.25$ ).

### **Discussion and conclusion:**

The goal of this research, taking into account, the importance of the Crisis Management, is the recognition of organizational dangers and crises and the studying of (the short and long-term in-service trainings) and the Crisis Management. The results are as follows:

- 1) the analysis of the data indicates that at the accuracy level of 99%, there is a correlation between short-term in-service training and the Crisis Management.
- 2) The analysis of the data indicates that at the accuracy level of 99% , there is a correlation between the long- term in-service training and the Crisis Management.
- 3) The analysis of the data indicates that at the accuracy level of 99%, there is a correlation between the types of long and shortin-service training and the dimensions of Crisis Management.

Based on the first theory, taking into account the fact that short-term in-service training has the highest correlation with the Crisis Management and its cycles, it is recommended that short-term in-service training will be taken more seriously and the staff will be encouraged to participate in these trainings while the appropriate facilities are provided in this field.

In the new era, crisis has gone beyond its natural course and taken new social and organizational shapes such as strike, rebellion, sabotage, etc. In this direction, the important issue of the changing views is in correlation with the crisis. What is important in the changing views is not to be indifferent. In the new perception: the crisis can be tamed and controlled so that the least amount of damage will be inflicted to the social and organizational investments. Thus, crisis can be seen as a potential opportunity that is instrumental in experience-based learning: this is a process in which knowledge is created through the transfer of experience. In this process, paying attention to the experiences of others in the field of crisis and describing the results of the experiences in thoughts and actions can lead to the spread of knowledge in the field of crisis management.

One of main methods in dealing with crisis management is, having experienced and trained personnel in the organizations and considering the results of this research, we can say that training plays the main role in the management of natural and man-made crises in the organizations. The managers' dependence on-the control and crisis management having come into existence and the experiences of theirs and their personnel are the foundation of Crisis Management and when an organization's personnel enjoy different appropriate trainings, they will serve it with a lit more self-confidence. Since crisis puts in danger all kinds of investments such as people's physical and organizational investment and these damages inflicted on the organization

are irreversible, training is considered to be an investment and its accurate implementation results in the safeguard and the preservation of the organization. Thus, crisis are inevitable. Therefore, it is necessary for the wrong mentality in the field of crises to be stopped. For this purpose, prediction, recognition of factors, recognition of solutions and its training are interwoven and they should be presented at different levels of the organization in different training programs.

*Case Study: Students Perceptions of the Educational Environment of Basic Medical Science Program in Saudi Arabia*

Eman Aldigs, Hind Abdulmajed

0591

King Abdulaziz University, Saudi Arabia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

**Background:** The Basic Medical Science (BMS) program in the Faculty of Medicine at King Abdulaziz University, Saudi Arabia, has been recently established in 2009. It prepares the students for a "research assistant" profession. Students objected to the curriculum and timetable which are major determinants of our educational environment. In assessing perceptions of the environment, either qualitative (e.g. interviews, group discussions, observational techniques) or quantitative methods (e.g. The Dundee Ready Educational Environment Measure "DREEM") can be employed.

**Aim:** To identify the strengths, weaknesses and delivery methods of the current curriculum for urgent remediation and reestablishment of the curriculum.

**Methods:** Twelve female BMS students in total (from 2<sup>nd</sup> and 3<sup>rd</sup> year) participated in semi-structured interviews, focused-group discussions and DREEM during the academic year 2011- 2012.

**Results:** The total DREEM scores were 108/200 for the 2<sup>nd</sup> year and 96/200 for 3<sup>rd</sup> year BMS students. Academic self- perception was the lowest score (11/32) among the five domains for 3<sup>rd</sup> year compared to 17/32 for 2<sup>nd</sup> year. Perception of atmosphere deteriorated from 26/48 in 2<sup>nd</sup> year to 22/48 in 3<sup>rd</sup> year. Qualitative feedback was used for curriculum reconstruction not for statistical analysis of any findings. Short and long-term strategic plans were made to change the curriculum and timetable, by customizing the content to focus on its utility in their profession.

**Conclusion:** This is the first data on the perceptions of BMS students of the educational environment in our institution, which confirmed the existing limitations of our current curriculum and the importance of the outcome-based curriculum.

**Key words**

Educational environment, curriculum, Basic Medical Science, research assistant, Saudi Arabia, DREEM

## **Introduction:**

The Basic Medical Science (BMS) major is the most recently established program since its introduction in 2009 to the Faculty of Medicine at King Abdulaziz University (KAU)-Jeddah, Saudi Arabia. It is a four years Bachelor degree, preparing the students for a “research assistant” profession. The educational program is based on an integrated curriculum, organized in blocks of teaching; core courses, problem based learning and student directed learning. The first three years focus on basic sciences and medical studies whereas the last year is for a research project. This curriculum was constructed mainly for medical students program. As a result, the curriculum did not meet the objectives and skills needed for their profession. In fact, there was no defined statement of the intended aims and objectives, outcomes, training structure and assessment system.

The major approach in teaching and learning is teacher centered. Although students take a part in tutorials, practical and PBL sessions, they still assume their teachers to provide information constantly. This was one of the reasons to introduce innovative and hands on approaches in their program. However, the aims of these approaches remain hard to accomplish as they were a remedial action to the complaints and signs of third year students' dissatisfaction with the educational environment. They had indicated through interviews that they perceived themselves to be "laboratory animal mice", when asked about the reform of the timetable and curriculum. In their opinion, both were defective in many aspects. The students' messages from the interviews and focused group discussions were taken seriously. Our great concern was that negative perception of third year students through interviews was resonated by second year students. This was a clear indication as studies show that educational environment affects student behaviors, achievements and satisfaction (Genn, 2001; Demirören *et al.* 2008).

Said *et al.* (2009) described educational environment as an interactive forces in the teaching and learning activities that influence learning outcomes which is strongly linked to the curriculum. Dent and Harden (2009) supported that by defining the learning outcomes as one of the 20 elements of an educational environment listed in (Table 1). Not having clear curriculum outcomes led us to consider the outcome based model. Steps therefore had been taken urgently. This was achieved by defining the qualities of the successful graduate, then find out how students attained those outcomes, and finally create learning opportunities for them. Not only that, we also took into consideration the "Hidden Curriculum" and started to involve them in social and academic activities which allowed them to build up their character and improve their progress.

**Table 1.** Elements of an Educational Environment

Teachers skills	Assessment methods
Classroom	Accommodation
Size of class	Food
Learning materials	Personal safety
Teaching methods	Transport availability
Timetable	Library
Social Life	Leisure facilities
A sense of belonging	Clinical experience
Student support	Access to computers
Clear learning outcomes	Study skills

We decided to undertake this case study which is a part of large longitudinal project for identifying and improving the quality of educational environment in our institution. The highly reliable diagnostic tool (DREEM) was used to measure how students actually perceive the educational environment in relation to our teaching goals. The evaluation has been an essential element in building a feedback from students to administration to teachers and from teachers to administration to teachers. As a result of that, good practices can be implemented, and identified weaknesses with unintentional negative consequences can be corrected instantly or in the next possible opportunity.

Therefore, our aim is to verify the perceptions of BMS undergraduates' of their educational environment and to diagnose the problems and find solutions for the short and long term. Hence, the study findings will be used as a foundation for the curriculum committee to make urgent reconstruction to the current curriculum. This will enhance the students life quality on campus in areas such as social atmosphere. It will also provide guidelines for teachers to improve their teaching skills.

### **Methods:**

#### **The program and the students**

Four 2<sup>nd</sup> year and eight 3<sup>rd</sup> year students participated in the study after voluntarily providing their consent. Demographic profiles for age, route of entry to the program, language preference and academic record were analysed.

Students enrolled on this program were from two categories based on their route of entry. The first group were "transferees" to BMS program. They were originally 3<sup>rd</sup> year medical students who did not succeed and had obtained all the chances to pass to next year. The second group consisted of students who chose BMS as a major and enrolled in the normal route. In our study, all 2<sup>nd</sup> year students were from the normal route of entry while 3<sup>rd</sup> year students from both routes of entry.

### Qualitative evaluation

A mixed-method approach was used to collect data. The method of qualitative evaluation (semi- structured interviews and focused group discussions) was taken from Denz-Penhey and Murdoch (2009). Those were conducted weekly from the beginning of the academic year 2011-2012. The evaluation was exploring issues related to curriculum and its delivery, assessment, methods of learning and teaching and the timetable. The interviews were planned to be less formal to give students and teachers unofficial feedback for their problems to be solved. Qualitative records were analyzed before conducting DREEM. Feedback was used for curriculum reconstruction, not for statistical analysis of any findings.

### Quantitative evaluation

The 50-item DREEM questionnaire (Roff *et al.*, 1997) was administrated in English by the end of the academic year 2011- 2012 with modifications in some items (shown in italic) to avoid confusion and to fit with our students' profession. We chose to use DREEM questionnaire as it has universal validity and high consistency with cultural non-specificity in different settings. Each item of the questionnaire is scored on a five-point Likert scale. Strongly agree=4, agree=3, unsure=2, disagree=1 and strongly disagree=0. Seven items are negative with reverse scoring. The higher score gives more positive reading. DREEM measures the students' perceptions in five domains, as follows:

	Items	max. score
(1) Learning	12	48
(2) Teachers	11	44
(3) Academic self-perception	8	32
(4) Atmosphere	12	48
(5) Social self-perception	7	28

The user can then describe the scores of the total score environment and of the five domains separately (Shenaz and Sreedharan, 2011).

After an explanation of the study purpose and objectives, students voluntarily completed the questionnaire anonymously. Aims of the research and the confidentiality of the results were explained on the front page.

### Statistical analysis

The domains scores were interpreted by the guide proposed by Roff *et al.* (1997). Statistical analysis of the data were expressed as a Mean for scores of categorized domains and of each item separately.

## **Results:**

### **Demographics**

There were 12 female participants in total from 2<sup>nd</sup> and 3<sup>rd</sup> year. The range of their ages on admission was 18 to 21 years. The participants' educational background was defined as:

- High school graduates whose route of entry was the normal route (all six students of 2<sup>nd</sup> year and five students of the 3<sup>rd</sup> year)
- Transferees from college of medicine (three students of 3<sup>rd</sup> year).

### **Interviews and focused group discussions results**

Students used to complaint during interviews and group discussions and then directly to the vice dean about the curriculum, mainly the clinical part. Timetable was another issue that they exclaimed about, especially that they were attending lectures with the corresponding medical students (2<sup>nd</sup> year with 2<sup>nd</sup> year medical students and 3<sup>rd</sup> year with 3<sup>rd</sup> year medical students). This made them feel inferior and not significant. Both years students have even questioned whether all this large volume of basic science information allow them to be well prepared for their profession as a research assistant, which they were not clear enough about from the start. They were also more specific in requesting helpful change within the curriculum, content overload, use of active learning and assessment instruments which tested generally factual and short term recall.

### **Overall DREEM scores**

Response rates for DREEM scale were for 2<sup>nd</sup> year: 4/6 (66.6 %) and for 3<sup>rd</sup> year: 8/8 (100%). Despite small numbers of participants, the DREEM picked up specific concerns. Table 2 represents the overall mean scores of BMS respondents with a higher score of 108/ 200 for 2<sup>nd</sup> year than 96/200 for 3<sup>rd</sup> year. The mean scores of the three domains (learning, teaching and social self-perception) for both years are about the same. However, the total mean score of the academic self-perception was the lowest (11/32) among the five domains for 3<sup>rd</sup> year compared to (17/32) for 2<sup>nd</sup> year. There was also a difference in perception of atmosphere decreased from the 2<sup>nd</sup> year (26/48) to (22/48) for the 3<sup>rd</sup> year. Interestingly, 3<sup>rd</sup> year identified "perception of learning" as the domain with highest mean score, whereas 2<sup>nd</sup> year gave highest scores to their "perceptions of learning", and "academic self-perceptions".

**Table 2.** DREEM Overall Scores for 2<sup>nd</sup> and 3<sup>rd</sup> Year

<b>DREEM</b>	<b>Perception of Learning</b>	<b>Perception of Teaching</b>	<b>Academic Self Perception</b>	<b>Perception of Atmosphere</b>	<b>Social Self Perception</b>	<b>Total Score</b>
<b>2<sup>nd</sup> Year</b>	24	26	17	26	15	108
<b>3<sup>rd</sup> Year</b>	25	24	11	22	14	96
<b>Maximum Possible Score</b>	48	44	32	48	28	200

### Item level mean analysis

This describes a scores range that determines the development level essential for each scale. Using these scores allow us to discover specific strengths and weaknesses in their educational environment. It will also provide a clear idea of the actual status between 2<sup>nd</sup> and 3<sup>rd</sup> year.

The mean scores analysis of the individual items, were as follows: mean scores 3 and above were considered as areas of strengths, mean scores between 2 and 3 were areas considered to be improved and 2 and below mean scores were areas of weaknesses.

Table 3 shows that 5 out of the 12 items of students' perceptions of learning were less than 2. Item 44 scored the highest (4) among all five domains, for 2<sup>nd</sup> year students which deteriorated to 2.5 for 3<sup>rd</sup> year students. However, there was a high value of 2.1 for 3<sup>rd</sup> year for item 47 compared to 0.8 for 2<sup>nd</sup> year.

**Table 3.** The mean item scores of 2<sup>nd</sup> and 3<sup>rd</sup> Students Perceptions of Learning

Item	Perception of Learning	2 <sup>nd</sup> year Mean Score	3 <sup>rd</sup> year Mean Score
1	I am encouraged to participate in class	1.5	<b>2.9</b>
7	The teaching is often stimulating	2.3	2.1
13	The teaching is student- centered	1.5	1.9
16	The teaching is sufficiently concerned to develop my competence	2	2.4
20	The teaching is well focused	2.3	1.6
22	The teaching is sufficiently concerned to develop my confidence	1.8	2.1
24	The teaching time is put to good use	2	1.9
25	The teaching over emphasizes factual learning	1	<b>1.5</b>
38	I am clear about learning objectives of the course	2.8	1.9
44	The teaching encourages me to be an active learner	<b>4</b>	2.5
47	Long term learning is emphasized over short term	<b>0.8</b>	2.1
48	The teaching is too teacher centered	2.3	2.1

\*Bold numbers showing the lowest and highest scores

\*Items in *italic* are with modifications

Both years showed positive perception of teaching as only 2 items in 2<sup>nd</sup> year and 1 item in 3<sup>rd</sup> year had a mean score of less than 2. Also, 2 items in 2<sup>nd</sup> year and 1 item in 3<sup>rd</sup> year had a mean score of 3 and the rest were above 2 in the areas that could be improved (Table 4). There was a similar score in both years for items 2, 9 and 18.

**Table 4.** The mean scores of 2<sup>nd</sup> and 3<sup>rd</sup> year Students Perceptions of Teaching

Item	Perception of Teaching	2 <sup>nd</sup> year Mean Score	3 <sup>rd</sup> year Mean Score
2	The teachers are knowledgeable	<b>3</b>	<b>3</b>
6	<i>Teachers implement a student centered approach to teaching</i>	2	<b>1.8</b>
8	<i>The teachers insult the students</i>	<b>3</b>	2.5
9	<i>The teachers are strict</i>	2.5	2.5
18	The teachers have good communication skills with students	2.3	2.3
29	The teachers are good at providing feedback to students	2.5	2.7

32	The teachers provide constructive criticism	2.8	2
37	The teachers give clear examples	2.3	2.1
39	<i>The teacher get angry in teaching sessions</i>	1.8	2.6
40	The teachers are well prepared for their teaching sessions	2.3	2
50	The students irritate the teachers	<b>1.5</b>	2.4

\*Bold numbers showing the lowest and highest scores

\*Items in *italic* are with modifications

When we looked in detail at Students Academic Perception and related items to students work in the past, we found that item 5 and 26 showed high difference in 3<sup>rd</sup> year. Besides, item 45 was the main determinant of the deterioration in this scale as it was the lowest score in both years. However, finding a relevant difference between 2<sup>nd</sup> and 3<sup>rd</sup> year in item 21 and 26 attracted our attention the most (Table 5). There seems to be a similar response and scores for both years to item 27. Although the score of item 10 was the highest for both years, 2<sup>nd</sup> year response seem to be more confident. They also perceived themselves as more prepared for their profession than 3<sup>rd</sup> year.

**Table 5.** The mean item scores of 2<sup>nd</sup> and 3<sup>rd</sup> Students Academic Self Perceptions

Item	Academic Self Perception	2 <sup>nd</sup> year Mean Score	3 <sup>rd</sup> year Mean Score
5	Learning strategies which worked for me before continue to work for me now	1.5	2.3
10	I am confident about passing this year	<b>3.3</b>	<b>2.6</b>
21	<i>I believe I am being well prepared for my profession</i>	2.3	0.6
26	Last year work has been a good preparation for this year's work	2.5	<b>0.4</b>
27	I am able to memorise all I need	1	1.3
31	I have learned a lot about empathy in my profession	2.8	2.1
41	My problem solving skills are being well developed here	2.8	1.6
45	<i>Much of what I have to learn seems relevant to the profession as a research assistant</i>	<b>0.5</b>	<b>0.4</b>

\*Bold numbers showing the lowest and highest scores

\*Items in *italic* are with modifications

This domain was of our main concern as it signifies the actual educational environment (Table 6). 2<sup>nd</sup> year students were more positive than 3<sup>rd</sup> year students with only 4 items out of 12 scoring less than 2. They seem to be more motivated and enjoying the program (the highest score= 3.3) compared to 3<sup>rd</sup> year (1.8) which makes sense from their response to item 42 with a score of 1.1. However, 2<sup>nd</sup> year students found it challenging to ask the questions they need. Both years seem to be positive regarding the atmosphere during teaching sessions, seminars and tutorials but they have negative experience with the timetable, 3<sup>rd</sup> year students were more concerned about that (the lowest score= 0.4).

**Table 6.** The mean item scores of 2<sup>nd</sup> and 3<sup>rd</sup> year Students Perceptions of Atmosphere

Item	Perception of Atmosphere	2 <sup>nd</sup> year Mean Score	3 <sup>rd</sup> year Mean Score
11	The atmosphere is relaxed during teaching	<b>1.5</b>	2
12	<i>The program is well timetabled</i>	<b>1.5</b>	<b>0.4</b>
17	<i>Cheating is a problem in these courses</i>	1.8	1.8
23	<i>The environment is relaxed during lectures</i>	2	1.8
30	There are opportunities for me to develop interpersonal skills	2.8	2
33	<i>I feel comfortable in teaching sessions socially</i>	3	<b>2.8</b>
34	The atmosphere is relaxed during seminars/ tutorials	2.3	2.5
35	I find the experience disappointing	2.5	1.5
36	I am able to concentrate well	2	2.2
42	<i>The enjoyment outweighs the stress of studying the courses</i>	2.2	1.1
43	The enjoyment motivates me as a learner	<b>3.3</b>	1.8
49	I feel able to ask the questions I want	<b>1.5</b>	2.2

\*Bold numbers showing the lowest and highest scores

\*Items in *italic* are with modifications

Only two items in this domain scored more than 3, item 15 (3.3) in 2<sup>nd</sup> year students and item 19 (3.1) in 3<sup>rd</sup> year students. However, this was not much supported by item 28 for 3<sup>rd</sup> year students as the score was less than 2. The mean score of 0.7 for item 3 was the lowest in this domain for 3<sup>rd</sup> year students as an indication of the pressure they experienced in comparison to 2<sup>nd</sup> year students with a score of 2.5.

**Table 7.** The mean item scores of 2<sup>nd</sup> and 3<sup>rd</sup> year Students Social Self-Perception

Item	Social Self Perception	2 <sup>nd</sup> year Mean Score	3 <sup>rd</sup> year Mean Score
3	There is a good support system for students who get stressed	2.5	<b>0.7</b>
4	<i>I am too tired to enjoy the program</i>	1.8	1.3
14	<i>I am rarely bored in this program</i>	2.3	2
15	<i>I have good friends in this specialty</i>	<b>3.3</b>	2.9
19	My social life is good	2	<b>3.1</b>
28	I seldom feel lonely	2.3	1.5
46	<i>My learning experience is pleasant</i>	1.3	2.5

\*Items in *italic* are with modifications

### **Discussion:**

Our 2<sup>nd</sup> and 3<sup>rd</sup> year BMS students were enthusiastic to attend interviews, group discussions and to complete DREEM, as they exploited this as the best chance to deliver their point of view. This in turn allowed us to see them closely throughout the academic year 2011-2012 giving their comments full attention.

DREEM was used in 'diagnosing' the educational environment. The overall mean score for DREEM for both years was lower than those reported in Roff *et al.* (2001) and Bassaw *et al.* (2003). Al-Hazimi *et al.* (2004) reported similar overall mean score (102/200) to ours for medical students at King Abdulaziz University.

In our study, there was no such difference between 2<sup>nd</sup> and 3<sup>rd</sup> year perceptions, apart from the atmosphere and academic self-perception with the lowest overall scoring domain (17/32 for 2<sup>nd</sup> and 11/32 for 3<sup>rd</sup> year). The 3<sup>rd</sup> year mean score of 0.4 for item 26 and item 45 were the lowest in the academic self- perception domain (Table 5). This confirmed the shortcomings of the current curriculum and supported the interviews and focused group discussions feedback. It indicated that the information delivered to them was not relevant to their profession. Based on this, it was our duty to take urgent action and build short and long-term strategies to enhance the educational environment. For the short term plan, we called for urgent meetings with the head of departments and coordinators of modules to make some changes in the curriculum and timetable and to customize the content. A reduction of the curriculum concerning medicine has been made focusing on its utility in their profession rather than only the acquisition of knowledge. We detached them from medical students and allocated a separate classroom for them. We organized significant extra curriculum activities such as BMS awareness day and Vaccine Day at KAU to assist them know more about their profession, develop their

confidence and skills, prepare them for the next level, motivate them and create a more relaxed atmosphere for learning.

The long term plan priority was restructuring the curriculum. By 2013/2014, the new benchmark curriculum will be applied. An outcome based curriculum was a strategy that could develop student centered learning. As there was no integration between courses, students faced difficulty in utilizing offered learning resources efficiently. Timetable based guide was devised to emphasize the student's day to day timetable, relating the outcomes to learning prospect.

As 3<sup>rd</sup> year students have perceived the educational environment as teacher centered, supported self-directed learning was needed. We managed to achieve this by several useful strategies. One of the most successful ones was peer to peer learning, where every student chose a topic in the virology course, prepared the materials in less than a week and presented it to her classmates. The rest of the students were then given a space to interact and ask questions and to evaluate the lecture and presenter at the end. One of the BMS students was the first to successfully peer teach medical students a lecture. Besides, some students were disciplined and took the responsibility to do some training during the academic year in research centers at KAU. Other strategy was achieved by guiding them of how to use their time in summer. We introduced them to summer training to raise their knowledge about research and hands on labwork. To our surprise they all wanted to do it voluntarily. Applying these strategies resulted in team-building spirit, better social and communication skills, high self-esteem, greater achievement and productivity.

The low mean scores of 2<sup>nd</sup> year students also agreed with the messages from the group meetings indicating they started to confirm similar negative perceptions. However, they specified that some of the subjects were adequately presented and were student centered.

Zawawi and Elzubier (2012) reported that "regardless of curriculum experienced, educational environments that do not provide student social and psychological support mechanisms are unfavorably evaluated". These findings reinforced our students' complaint of not having the support needed especially that the majority of 3<sup>rd</sup> year students were stressed and exhausted to enjoy the program (Table 7). This is unfortunately common to medical and other healthcare students based on the quantity and quality of the required information during their study years (Till, 2004). Staff limited awareness with essentials of the students learning experience was a challenge. Our remedial action for that was counseling sessions related to health issues and life management skills. 2<sup>nd</sup> year students on the other hand were less stressful as they might not have been in many stressful experiences of educational environment such as linking theoretical knowledge into practice.

Turning students' results into a strategic plan was therefore a challenge as our study was the first on this specialty in our university and no previous data available to compare with. Roff *et al.* (2001) showed significant differences between both Nigerian and Nepalese students from both gender who were significantly dissatisfied with their educational

environments. This comparison was not available in our study as the only 3<sup>rd</sup> year male student was not attending the classes.

We believe that students have the influence and the rights to be members of deciding boards. This can help as a base for longitudinal evaluation of students' perceptions for the considered improvements. Thus, the results of this work were applied in guidance, planning and focusing on the available resources. It is essential to acquire regular assessment and feedback to manage change successfully. Small number of our students was the most important limitation of our study. Evaluating the learning environment perception by a questionnaire holds the possibility of excluding some components. This will drive us to study our educational environment in depth.

### **Conclusion:**

DREEM has been a functional diagnostic tool in recognizing the limitations of the curriculum. Students perceived the educational environment as teacher-centered. They were not satisfied with the timetable and showed more factual learning and ineffective social support. Consequently, the outcome based curriculum, time schedule, the social, academic and psychological support methods have been the main domains of curriculum development and learning environment. Further studies are considered necessary in BMS specialty at our university to analyse the educational environment and identify any gender differences. Comparative study over time would be useful and it should be conducted with other universities in the region.

### **Practice points**

- Quantitative evaluations support qualitative evaluation feedback.
- Remedial action should take place in areas of concern.
- DREEM is an effective diagnostic tool as it indicates clearly the weaknesses in each perception.
- DREEM can guide in strategic planning.

### **Acknowledgments**

The authors acknowledge students of Basic Medical Science for their courageous contribution in this study. We are also grateful for Dr. Fatin Alsayes, the vice dean of college of Medicine for her continuous support and effort throughout the last year and the year to come. Our thanks go to Dr. M. Hasanein and Dr. H. Noaman from the medical education department for their help and guidance.

### **Declaration of interest**

No conflicts of interests were reported by the authors who take full responsibility of the content and the writing of this article.

*The Effect of Academic vs. Non-Academic Extra-Curricular Activities on Creative Writing: The Study of Iranian EFL Learners*

Nasim Googol, Mahnaz Armat

0598

Macquarie University, Australia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Having focused on the role that extracurricular activities play in making foreign language learners more aware of the creative writing, the present study was designed to address the important issue of the effect of extracurricular activities on intermediate EFL learners' creative writing in Iran. A thorough review of the related literature revealed the effect of these activities on psychological aspects of students' learning in addition to their academic achievement (e.g. Marsh 1992; Darling, Caldwell & Smith 2005). Meanwhile the literature on the probable effect of such activities on the development of language skills, specifically writing, and the analysis of this issue in the EFL context as Iran have not been well recorded. To conduct the research, 80 intermediate female Iranian second language learners who enjoyed high degree of homogeneity took part in the study in four equal groups. The quasi-experimental method was chosen in order to investigate the effect of homework writing and strategy oriented training as the academic extracurricular activities, and non academic extracurricular activities of sport type on creative writing of EFL learners. The results revealed that dealing with homework writing as an academic extra-curricular activity in addition to application of writing strategies highly affected creative writing of EFL learners; whilst participation in sports as an academic extra-curricular activity did not have a plausible effect on creative writing. The pedagogical implications of the findings can be used by material developers as well as ESL/EFL teachers to familiarize EFL learners with creative writing strategies, critical thinking processes, and self-esteem development in order to think and write more creatively.

**Key words:** Extra-curricular activities, Academic Extra-curricular Activities, Non-academic Extra-curricular Activities, Creative Writing

## Introduction

ELT literature has recorded a number of known and unknown factors which may contribute to the success or failure of the learner in developing a second language. As far as the main concern of educationalists and parents is over learner's academic achievement, most of the teachers emphasize academic activities as a significant factor in learners' success (Broh 2002).

Within the domain of education, extra-curricular activities, which focus on academic areas, include the school newspapers, quiz team, science club, homework writing, and debate team or journalism club. These activities selectively can be helpful in improving students' knowledge in the second language (Navehebrahim & Ghani 2011). They help the learner to broaden his view towards learning a language other than his mother tongue. Responsibility taking, cooperation, and leadership skills developed in educational circumstances in which learners do the researches for debates and academic competitions could be somehow employed by the ELT practitioners in both ESL and EFL situations to help the learners develop a better linguistic command in the second/ foreign language they are dealing with.

On the other hand, non- academic extra-curricular activities can be categorized into various art or science clubs such as drama , photography, chess, and technology clubs. In addition, participation in sports, playing musical instruments, and parental involvement are among these activities.

In this regard, some scholars have divided extracurricular activities into formal and informal activities. Formal activities refer to structured programming like joining school sports groups or learning to play musical instruments. Informal activities include less structured activities such as watching TV. Literature on leisure studies has suggested that formal and informal activity settings have different influences on motivation and feelings of competence (Guest & Schneider 2003); While, Marsh & Kleitman (2002) believed that informal activities result in lower academic grades, poorer work habits, and poorer feelings of competence; while formal activities have inverse impact.

In a comprehensive study, Cooper, Valentine, Nye, and Lindsay (1999) also examined the relation between after-school activities and academic achievement as measured by standardized tests and teacher-assigned grades among students in grades 6 through 12. Using a questionnaire, adolescents reported approximately how much time they spent on homework, working at a job, extracurricular activities, structured groups outside of school, and watching television. Findings revealed that more time in extracurricular activities and less time in jobs and watching television were associated with higher test scores and grades. In addition, more time on homework was associated with better grades.

Focusing on sports participation, Jordan (2000) found that involvement in team and individual sports was positively related to GPA, general self-concept, and academic self-confidence. Eccles, Barber, Stone, and Hunt (2003) also found that participation in team sports, performing arts, and student government/school spirit clubs was positively related to grade point average and self-report of school enjoyment. In another recent study Fredricks and Eccles (2003) found that more time spent in school clubs was positively associated with school belonging and grade point average. While adolescents' after-school choices vary widely, current out-of-school time research often focuses narrowly on structured programs like Boys' and Girls' Clubs and organized sports. Structured sports programs receive attention because research has shown that participants benefit in a variety of ways, ranging from improved academic achievement to higher self-esteem (Feldman & Matjasko 2005).

Many researchers have investigated the effect of extracurricular activities on GPA of students; however, none of them have narrowed down this effect to one of linguistic skills like writing. Furthermore, there have been many researches examining the effect of many extracurricular activities (Brand 1987; Carrell 1984; Gerber 1996), but they did not make a comparison between the effect of two academic activities (homework writing and applying creative writing strategies) and non-academic one (participation in sports) on developing creative writing of the learners in an EFL context.

Having considered methods of conducting writing classes, we found that most of the teachers focus on mechanics and structure of writing while they do not develop learners' creativity in writing. Therefore, the present study aimed at determining whether the extra-curricular activities could promote EFL learners' creative writing and whether the type of the extracurricular activity (home work type or sports type) affects the concept referred to or not.

## **Methods**

### ***Participants***

The participants of the study were 80 fourth-grade female students of Iranmehr private primary school in Tehran, Iran. All these students studied general English as one of their main school subjects and they were in the forth level of English proficiency based on "Backpack Book series" published by Pearson Education which is equivalent to intermediate level for young English language learners. In this regard, they were familiar with sentence and paragraph structure and were capable of writing one paragraph composition. These participants were selected out of 120 ones who had taken part in the pre-test (which was a copy of YLE standard test) for the purpose of homogenizing the sample of the study. As a matter of fact these 80 participants had received the scores which were 1SD above and below the Mean. The subjects were divided into 4 groups of 20s as three experimental groups and one control group.

## ***Instrumentation***

The instrument used for the purpose of sample homogeneity was YLE(Young Learners English published by University of Cambridge, ESOL Examination) which is a reliable and consistent measure of how well children are doing in the skills of listening, speaking and reading and writing. The reading and writing test was used as a pre and post test to examine any changes in learners' performance after receiving the treatment.

The writings of the learners were scored employing the inter-rater method. This revealed how well they were familiar with the concept of creative writing before the treatment began. Reliability and validity of the test were taken into consideration as well.

To ensure that the participants went through sports and homework programs, and got familiar with what they actually did to improve their abilities; the learners all had been trained to present diaries and portfolios, while the parents had been briefed to write weekly reports to the teacher confirming, rejecting, or minimizing their daughter's reports. Actually the learners jot down their diaries and presented how well they had done the assigned exercises and homework. The parents also checked their daughters' writings and reports. Such activities are common in the primary schools especially in the famous and high-rank schools like Iranmehr School. Meanwhile the parents had been trained to deal with the activities more profoundly.

For the purpose of data analysis, both qualitative and quantitative data analyses instruments were employed and the main instrument employed was SPSS version 18 to calculate the ANOVA for comparing the mean scores of the four groups on the pretest and post-test of writing. Besides, the performance of the learners on both pre-test and post test of writing in each group was separately compared through running t-tests. Moreover, descriptive statistics of post-test of writing also was taken into consideration. At last, the learners' portfolios were also taken into consideration to see if they had been in line with the instructions given, the home work program, and the sport-activities they were supposed to take part in and read about.

## ***Procedure***

All 120 fourth grade students of Iranmehr language school took the pre-test (which was a copy of YLE standard test) in this study. 80 students whose scores had fallen 1SD above and below the mean were selected as the prime homogeneous participants of the study. The researchers conducted the treatment through the second semester of the educational year that took 4 months (each week 2 sessions and each session 90 minutes, altogether equal to 48 hours of instruction / treatment). All four groups of the learners were taking similar instruction for their ordinary writing courses; meanwhile each experimental group also took its own specific program:

- A. In the **Experimental Group 1**, the learners received extra-curricular activities of academic type in which they were supposed to work with watching films, reading story books, doing extra drills and exercises related to writing such as re-writing, summarizing, and writing daily diaries in English and the like.
- B. In the **Experimental Group 2**, the learners were supposed to deal with extra-curricular activities of non-academic type such as taking part in sport clubs, doing exercises, and reading and writing about sports they liked.
- C. The third group of the learners (**Experimental Group 3**), received instructions in terms of creative writing and were trained to be familiar with the most frequent strategies in developing creative writing. They were supposed to be familiar with critical thinking procedures, presenting novel ideas, focusing on the content organization, and the like.
- D. The fourth group received no extracurricular instruction and therefore was taken as the **control group**.

All the learners also were instructed to complete their portfolios in which they reported their diaries as well as their home work and their parents' reports. The parents also were briefed to cooperate with the teacher and since they all were educated ones had agreed to cooperate.

Following the instruction and treatment, all the participants took a test of writing. The learners' papers were scored by two raters considering the rubric for assessing creative writing including '*ideas & content, organization, voice, word choice, sentence fluency, and mechanics of writing*' (See the Appendix).

The learners' portfolios were also checked and analyzed throughout the experiment to ensure the validity and reliability of the research.

## ***Design***

The present study enjoyed a quasi-experimental design in which both qualitative and quantitative measures of data analysis were accounted for: There were four variables in this study: participation in athletics (non-academic extracurricular activity), homework writing (academic extracurricular activity), and strategy training (academic curricular-based activity) as **independent variables** and creative writing as the **dependant variable**. The researcher employed the quasi-experimental design in order to evaluate the effect of these extra-curricular activities on learners' creative writing. In sum the four groups went through the following procedures:

1. Group one received extracurricular activities in English writing in terms of home work as well as ordinary writing program of the course (Academic).
2. Group two received extracurricular activities in sports and physical education as well as ordinary writing program of the course (Non academic).

3. Group three received training in creative writing strategies as well as ordinary writing program of the course (Academic).
4. Group four received no extracurricular of any type (They only received ordinary course of writing).

## Results

### *Pre-test*

A one-way ANOVA was run to compare the mean scores of the four groups on the pretest of writing. As displayed in Table 1 the F-observed value of 2.12 ( $P = .103 > .05$ ) denotes that there were not any significant differences between the mean scores of the Homework Writing, Sports Taking, Strategy Learning and the Control groups on the pretest of writing. This represented that the four groups were homogeneous with regard to creative writing at the beginning of the study.

**Table 1: One-Way ANOVA Pretest of Creative Writing by Groups**

	Sum of Squares	D.F.	Mean Square	F	Sig.
<b>Between Groups</b>	<b>267.634</b>	<b>3</b>	<b>89.211</b>	<b>2.129</b>	<b>.103</b>
<b>Within Groups</b>	<b>3183.988</b>	<b>76</b>	<b>41.895</b>		
<b>Total</b>	<b>3451.622</b>	<b>79</b>			

Table 2 displays the descriptive statistics for the four groups on the pretest of creative writing test. The mean scores for the Homework Writing, Sports Taking, Strategy Learning and the Control groups on the creative writing test are 55.05, 53.87, 57.40 and 52.40 respectively.

**Table 2: Descriptive Statistics Pretest Creative Writing by Groups**

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Min	Max
--	---	------	----------------	------------	----------------------------------	-----	-----

					Lower Bound	Upper Bound		
<b>Homework</b>	20	55.05	6.90	1.54	51.81	58.28	45.00	72.00
<b>Sport</b>	20	53.87	5.49	1.22	51.30	56.44	45.00	65.00
<b>Strategy Takers</b>	20	57.40	6.63	1.48	54.29	60.50	44.00	69.00
<b>Control</b>	20	52.40	6.75	1.51	49.23	55.56	45.00	70.50
<b>Total</b>	80	54.68	6.60	.73	53.21	56.15	44.00	72.00

### *Post-test*

A one-way ANOVA was run to compare the mean scores of the four groups on the post-test of creative writing. As displayed in Table 3 the F-observed value of 10.98 ( $P = .000 < .05$ ) denotes significant differences between the mean scores of the Homework Writing, Sports Taking, Strategy Learning and the Control groups on the creative writing test.

**Table 3 : One-Way ANOVA Creative Writing by Groups (post-test)**

	Sum of Squares	D.F.	Mean Square	F	Sig.
<b>Between Groups</b>	3421.234	3	1140.411	10.989	.000
<b>Within Groups</b>	7886.738	76	103.773		
<b>Total</b>	11307.972	79			

Table 4 displays the descriptive statistics for the four groups on the creative writing test. The mean scores for the Homework Writing, Sports Taking, Strategy Learning and the Control groups on the creative writing post-test are 63.90, 60.35, 74.13 and 56.55 respectively. Graph 1 also displays the four groups' mean scores.

**Table 4: Descriptive Statistics Creative Writing by Groups (post-test)**

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Min	Max
					Lower Bound	Upper Bound		
Homework	20	63.90	12.92	2.89	57.85	69.95	51.00	97.50
Sport	20	60.35	6.55	1.46	57.29	63.41	51.00	77.50
Strategy Takers	20	74.13	12.12	2.71	68.45	79.80	59.00	92.50
Control	20	56.55	7.64	1.71	52.97	60.13	41.50	76.50
Total	80	63.73	11.96	1.34	61.07	66.39	41.50	97.50

Although the F-value of 10.98 indicates significant differences between the mean scores of the four groups, the planned (a-priori) contrasts should be run in order to probe each research question. Based on the results displayed in Table 5 it can be concluded that:

**A:** There was a significant difference between the Homework Taking and Control groups on the creative writing test ( $t = 2.28$ ,  $P = .025 < .05$ ). The Homework Takers with a mean score of 63.9 outperformed the Control group on the creative test. Thus **the first null-hypothesis** as “homework writing as an academic extra-curricular activity does not affect creative writing of EFL learners” **was rejected**.

**B:** There was not any significant difference between the Sports Taking and Control groups on the creative writing test ( $t = 1.18$ ,  $P = .242 > .05$ ). Thus **the second null-hypothesis** as

“participation in sports as an academic extra-curricular activity does not affect creative writing of EFL learners” **was supported**.

**Table 5: Planned Contrasts**

Contrast	Value of Contrast	Std. Error	t	D.F.	Sig. (2-tailed)
Homework vs. Control	7.35	3.22	2.28	76	.025
Sports vs. Control	3.80	3.22	1.18	76	.242
Strategy Takers vs. Control	17.57	3.22	5.45	76	.000

**C:** There was a significant difference between the Strategy Taking and Control groups on the creative writing test ( $t = 5.45$ ,  $P = .000 < .05$ ). The Strategy Takers with a mean score of 74.13 outperformed the Control group on the creative test. Thus **the third null-hypothesis** as strategy taking as an academic extra-curricular activity does not affect creative writing of EFL learners **was rejected**.

### **Inter-Rater Reliability**

The inter-rater reliability for the two raters who rated the students writing papers is .94 ( $P = .000 < .05$ ). Based on these results it can be concluded that there is a significant agreement between the two raters on rating students' writing papers.

**Table 6: Inter-rater Reliability**

		RATER 2
RATER 1	Pearson Correlation	.946**
	Sig. (2-tailed)	.000
	N	80
**. Correlation is significant at the 0.01 level (2-tailed).		

To investigate if the instruction given has had any effect on the learners' performances in the three experimental groups, paired- samples t-tests were run and the three hypotheses were checked against them.

*R.Q. 1 Does taking homework have any significant effect on the improvement of the creative writing ability of the Iranian EFL learners?*

A paired-samples t-test was run to compare the homework takers' mean scores on the pretest and posttest of creative writing to probe if taking homework had any significant effect on the improvement of their creative writing ability. The t-value of 5.03 ( $P = .000 < .05$ ) indicated that the taking homework had significant effect on the improvement of their creative writing ability. Thus the null-hypothesis **was rejected**.

**Table 7: Paired-Samples T-Test Pretest and Posttest of Homework Takers**

Paired Differences					T	df	Sig. (2-tailed)
Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
			Lower	Upper			
8.85000	7.86414	1.75848	5.16947	12.53053	5.033	19	.000

*R.Q 2 Does taking sports have any significant effect on the improvement of the creative writing ability of the Iranian EFL learners?*

A paired-samples t-test was run to compare the sports takers' mean scores on the pretest and posttest of creative writing to probe if taking sports had any significant effect on the improvement of their creative writing ability. The t-value of 13.63 ( $P = .000 < .05$ ) indicated that the taking sports has significant effect on the improvement of their creative writing ability. Thus the null-hypothesis **was rejected**.

**Table 8: Paired-Samples T-Test Pretest and Posttest of Sports Takers**

Paired Differences					t	df	Sig. (2-tailed)
Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
			Lower	Upper			
6.47500	2.12426	.47500	5.48081	7.46919	13.632	19	.000

*R.Q.3 Does taking strategies have any significant effect on the improvement of the creative writing ability of the Iranian EFL learners?*

A paired-sample t-test was run to compare the strategy takers' mean scores on the pretest and posttest of creative writing to probe if taking strategies had any significant effect on the improvement of their creative writing ability. The t-value of 5.20 ( $P = .000 < .05$ ) indicated that the taking strategies had significant effect on the improvement of their creative writing ability. Thus the null-hypothesis **was rejected**.

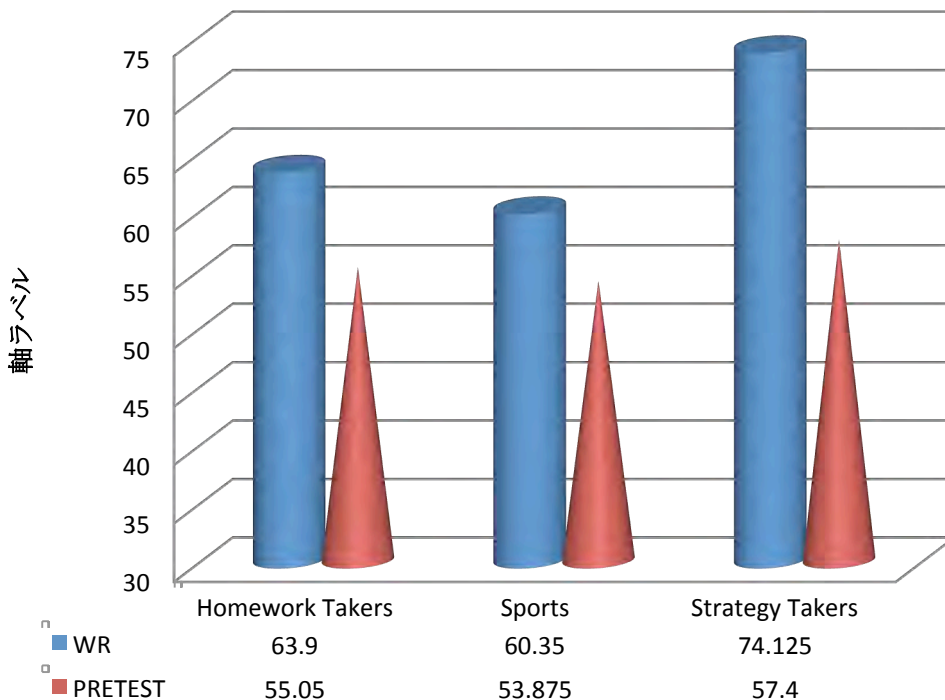

**Table 9: Paired-Samples T-Test Pretest and Posttest of Strategies Takers**

Paired Differences					T	df	Sig. (2-tailed)
Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
			Lower	Upper			
16.72500	14.36596	3.21233	10.00152	23.44848	5.207	19	.000

Graph 1 displays the mean scores of the Homework; Sports and Strategies takers' mean scores on the pretest and posttest of creative writing.

**Graph 1: Pretest and Posttest of Creative Writing by Groups**

□

It seems that all the variables under the study have proved significant as they all have helped the learners to develop their creative writing, though not in the advanced levels.

An interesting point revealed through statistics was that the comparison between the mean scores of the sport participants and that of the control group in the post-test of creative writing does not show that much significant difference while the comparison of means (t-test) of sport participants in both pre and post tests of writing presents a significant difference. Therefore we can conclude that sport based activities also have affected the development of creative writing among the learners; meanwhile this difference is not that high.

### ***Portfolios***

Regarding the portfolios of the learners, the researcher carried out a qualitative analysis of the data via employing both “**open coding**”, in which categorization of the information loaded on the data was accomplished each and every session of the classroom, and “**axial coding**”, in which the core concept of each group categorized in the “open coding” section was concentrated on. The last, third part of the analysis was seeking for continuous structuring, where the logical relationships between the core concepts (axial codes) were sought for through covering the portfolio of the learners.

Analyzing the participants' portfolios revealed that learners mostly were in line with the informed procedure of the research and parents also had taken enough care to help the students complete their homework almost orderly. Fortunately all of the parents of the students who had taken part in the study were educated individuals and therefore were highly helpful in that they took the research and their daughters' activities seriously and tried to be in close contact with the researcher. This energized the assurance towards the learners' process-based orientation of learning, especially about the sport-participants group.

## Discussion

The statistical analysis revealed that the **first null-hypothesis** as “dealing with homework writing as an academic extra-curricular activity does not affect creative writing of EFL learners.” **was rejected**. The results obtained via the ANOVA which was run to compare the means of the scores obtained by the learners in the control and the three experimental groups suggested that doing homework as an academic extra-curricular activity highly affected creative writing of EFL learners. Based on these results it can be concluded that there are significant differences between the mean scores of the homework group and the control group post-test of creative writing. The finding of the first research question is in line with the ideas asserted in the literature in the ESL situation (Beck 1999; Brown & Herrity 2001; Halpern1992) which provide support for using homework programs to build self-esteem of the learners and lead them towards creativity, while also finding that self-esteem can be a predictor of academic performance. The researchers cited above found that participation in an after-school academic oriented program such as watching a film, listening to a story, summarizing the talks and the like designed to build self-esteem in the learners had positive effects on the learners' standardized test scores in English writing and reading. The fact is that allotting extended school time to complete their homework did not have the same positive effects on self-esteem or achievement of the same learners.

The findings of the first research question of the present study, however, is not in line with the idea presented by some other scholars (Morrison, Storino, Robertson, Weissglass, Dondro 2000; Shin 2004) who are against the presentation of after-school academic activities such as homework extracurricular of writing. Such scholars believe that the non-academic after-school activities are more preferred in an attempt to increase the performance of the second language learners.

Concerning the second null hypothesis, the statistical analysis proved that there was not any significant difference between the Sports Taking and Control groups on the creative writing test ( $t= 1.18$ ,  $P = .242 > .05$ ). Thus **the second null-hypothesis** as “participation in sports as an academic extra-curricular activity does not affect creative writing of EFL learners” **was supported**.

This means that the after-school non-academic extracurricular activities of the learners who had taken sport club experiences and even had covered materials on sports in English were not revealed to be significantly meaningful in developing the learners creative writing. Meanwhile the t-test run to compare the mean differences between the pre-test and post-test of sport-group participants revealed that they have improved in their creative writing. This means that the sport takers also have developed some mechanisms of the creative writing; meanwhile these developments have not been that comparable to the achievements of the other two groups (homework takers & strategy-takers).

The findings of the second research question then partially reject the idea presented by some scholars (Eccles et al. 2003; Feldman & Matjasko 2005; Fredricks & Eccles 2006; Jordan 2000) in respect of extracurricular non-academic programs to develop the writing creativity in the second language learners. Morrison, et al (2000) have found that after-school academic tutoring or homework assistance may not result in an improvement in academic performance, but, rather, prevent a decline in performance that is evidenced by many at-risk youth. The extracurricular activities such as watching television programs were connected to cognitive development of students (Shin 2004). The amount and quality of television viewing and family involvement were not the only influences of helping at risk students. The effects of music and sports were highly influential in their relation to the prevention of this decline.

Though the ideas presented by these scholars cannot be neglected, it seems that within the scope of a Foreign Language context like that of Iran, the extracurricular of non-academic type is not that effective for the learners. It might partially have its origin in the local culture and the lack of enough exposure to the real world.

The result of the ANOVA and the descriptive statistics for the sport taker group and the control group on the creative writing also proved that the students in the sport taker group presented low performance as if they had not taken any valuable experience affecting their creativity in writing. This means that the learners have not been able to perform well, despite the fact that they have been trained how to deal with the task throughout the treatment. The reason probably lies in the learners' inattentiveness to learning while they are dealing with extracurricular activities even if these activities are in the second language they are developing. Another reason could be sought in the learners' ever experienced situation of learning and teaching which has not prepared them towards critical thinking, developing cognitive abilities, and writing creatively in their mother tongue, Persian.

Concerning **the third research question** the ANOVA run as well as the descriptive statistics revealed that there was a significant difference between the Strategy Taking and Control groups on the creative writing test. In fact the Strategy Takers outperformed the Control group on the

creative writing test. Thus **the third null-hypothesis** as “strategy taking as an academic extra-curricular activity does not affect creative writing of EFL learners” **was rejected**.

This means that helping the learners getting familiar with the creative writing strategies can be highly helpful. According to Hsiao and Oxford (2002), strategies can “pave the way toward greater proficiency, learner autonomy, and self-regulation” (p. 372). Therefore, it is necessary to employ creative writing strategies so that ESL/EFL learners can easily facilitate their writing. However, as Hsiao and Oxford (2002) noted, “exactly how many strategies are available to learners to assist them in L2 learning and how these strategies should be classified are open to debate” (p. 368). Victori (1995) also found that creative writing could be energized in case the learners’ awareness towards them is highlighted in advance. Of course these findings somehow support the concepts of noticing theory (Schmidt, 2001) and conscious raising theory (Ellis, 2003).

## Conclusion

Having aimed at contributing to world of ELT in Iran and focusing on the role extracurricular activities (whether academic or non academic) play in making foreign language learners more aware of the target language creative writing, the present study was designed to address the important issue of extracurricular academic versus non academic activities on intermediate EFL learners’ creative writing in Iran. A thorough review of the related literature revealed that introducing extracurricular activities of both academic and non academic types has proved well in the development of self-esteem, cognitive learning, and relief taking for the primary school students, and this in turn has affected their academic achievement in math, science, and technology. Meanwhile the literature on the effect of such activities on the development of language skills, specifically writing, and more specifically creative writing has recorded poor.

Having analyzed the data collected by examining all four groups, it was concluded:

1. Dealing with homework writing as an academic extra-curricular activity highly affects creative writing of EFL learners.
2. Participation in sports as an academic extra-curricular activity does not that much affect creative writing of EFL learners.
3. After-school non- academic extracurricular activities may not result in an improvement in academic performance, but, rather, prevent a decline in performance that is evidenced by many at-risk youth.
4. Strategy taking as an academic extra-curricular activity highly affects creative writing of EFL learners.

Considering the fact that Iranian students are dealing with English as a foreign language, the researcher might feel in ease to propose that extracurricular academic homework and applying creative writing strategies can be more effective than the conventional method of teaching writing to the learners. On the other hand, it seems that within the scope of a Foreign Language

context like that of Iran, the extracurricular of non-academic type is not that effective for the learners. It might partially have its origin in the local culture and the lack of enough exposure to the real world.

The logo for the International Association for the Advancement of Pedagogical Research (iafor) is centered in the background. It features the word "iafor" in a light blue, lowercase, serif font. The text is enclosed within a circular frame composed of two concentric, hand-drawn style arcs. The outer arc is a light red color, and the inner arc is a light blue color, matching the text.

*The Use of Unqualified Science Teachers in Developing Countries: A Barrier to  
Achieving Sustainable Global Education*

Vicent Naano Anney, Anne C. Hume, Richard Coll

0603

The University of Waikato, New Zealand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Developing countries are under huge pressure from the international community to implement conventions such as the United Nations Millennium Development Goals, with high priority given to achieving goals such as quality education for all students by 2015. Not surprisingly the response to this pressure has been an increase in student enrolment in schools, but in some developing countries, particularly in South Africa and Sub-Saharan Africa, this response has been accompanied by the employment of unqualified teachers to reduce the student-teacher ratio. This study investigated the professional knowledge of unqualified science teachers' working in Tanzanian secondary schools, especially their pedagogical content knowledge (PCK). Within a case study approach, this interpretive investigation used qualitative data gathering methods such as semi-structured interviews, classroom observations and analysis of teachers' artefacts and the generated data were analysed thematically. The results showed that licensed science teachers have underdeveloped PCK components and do not understand the learner-centred teaching methods. Unqualified science teachers in their classroom practices typically displayed passive teaching styles that promote rote learning and memorization of facts. These findings imply that students taught by unqualified science teachers tend to develop lower level cognitive skills and knowledge compared to students that are educated by qualified teachers. Arguably, the use of unqualified teachers is a barrier to achievement of sustainable global education that is not being acknowledged and addressed by the international community. The study recommends there is a need to enhance unqualified licensed science teachers PCK.

## Introduction

Education is recognized worldwide as a basic human right with the goal of education for every child among the top priorities for achievement on the agenda of the international community. For example, Article 28 of United Nations Convention on the Rights of the Child United Nations Educational Scientific and Cultural Organization (2007) states that “the right to education on the basis of equality of opportunity ... needs to be realized through provision of compulsory and free primary education, and available and accessible secondary education” (p. 118). Numerous developing countries like Tanzania have ratified such international conventions on education for all including the *Jomtien World Declaration on Education for All* in 1990, followed 10 years later by the *Dakar Framework of Action for Education for All* and the *United Nations Millennium Development Goals* (MDGs) in 2000. All these conventions require developing countries to achieve universal primary education by 2015 that includes at least 75% of their young population having access to quality secondary education (2007, United Nations Educational Scientific and Cultural Organization, 1990). However, for developing countries achieving the dream of quality education for their citizens is particularly difficult because of barriers such as inadequate budgets for financing education, large class sizes and most challenging of all is inadequate supplies of qualified teachers (Levin et al., 2004). Teachers are key players in achieving quality education particularly in bringing about reforms as Article 69 of the Dakar Framework of Action recognises:

Teachers are essential players in promoting quality education, whether in schools or in more flexible community based programmes; they are advocates for, and catalysts of, change. No education reform is likely to succeed without the active participation and ownership of teachers. (United Nations Educational Scientific and Cultural Organization, 2000)

The Education for All (EFA) and Millennium Development Goals (MDGs) campaigns have successfully improved pupils' enrolment in elementary education in developing countries, but they have also created demand for secondary education opportunities for students graduating from elementary schools. Increased students rolls in the secondary sector have presented an unexpected challenge for many developing countries because they have in turn created another unforeseen problem, that of teacher shortages. As a result, numerous developing countries are forced to recruit unqualified teachers to curb the teacher shortage in schools because their pre-service teacher education institutions do not have the capacity to train adequate teachers to staff all schools (Education International, 2009).

According to Millward (2006) and Saroj (2009), Sub-Saharan Africa needs almost four million new teachers by 2015 to fill the available positions in schools for the growing education sector with the six Sub-Saharan countries of Ghana, Kenya, Uganda, Malawi, Senegal and Zambia needing approximately 400,000 of those new teachers to meet the demands of their growing school rolls (Audrey-marie and DeStefano, 2008). Likewise, Asia Pacific countries also face the shortage of qualified teachers in rural areas particularly in science, mathematics, English and Information and Communication Technology subjects. For example, Thailand had shortage of 121,545 teachers for secondary schools; Lao PDR about 5,595 teachers they have basic

schooling than their students, Malaysia has 829 contract and uncertified teachers and India has more than 670,000 untrained teachers to mention a few (Gannicott, 2009, Global Campaign for Education, 2012). Tanzania like many other developing countries in Africa is not immune to the teacher shortage crisis in secondary schools. Lujara, Kissaka, Trojer, and Mvungi (2006) reported that urban Tanzanian secondary schools have a 60% shortage of qualified science and mathematics teachers, while rural secondary schools are 80% short of qualified science and mathematics teachers.

To address the shortfall in teachers, governments in different countries have responded by adopting both long-term and short-term strategies. The literature (Santiago, 2002, Education International, 2011, Even and Leslau, 2010) reports that commonly used strategies to address teachers shortages include:

- alternative routes of entry into the teaching profession or licensing of under-qualified/unqualified candidates;
- improving working conditions to attract qualified teachers who have retired from teaching;
- using a distance learning approach; and
- developing special loans and scholarships for those entering the teaching profession from other fields.

Of these options, the alternative route of entry or licensing unqualified/under-qualified candidates into the teaching profession appears to be the most popular short-term strategy in developing countries for increasing number of teachers. Alternative routes to teacher recruitment usually (but not always) refer to the recruitment of college/university graduates who are then licensed or certified to teach in schools without being trained in an accredited teacher education (long-term) programme (Heine, 2006, Legler, 2002). Tanzania has recently recruited secondary school teachers using this alternative route approach where such teachers are referred to as 'licensed teachers' (O-saki, 2008, Lynd, 2005). In some countries teachers recruited through these alternative routes receive a short induction course in teaching methods before they start teaching in the classroom. For instance, in Tanzania, licensed teachers are provided with four weeks of training to introduce them to the basics of classroom teaching without any actual classroom practice.

Shulman (1987) argued that the ability of teachers to effectively apply and use different teaching methods, learning theories and principles to transform students understanding and develop their skills, depends on their professional knowledge base which comprises their: content knowledge, general pedagogical knowledge, curriculum knowledge, pedagogical content knowledge (PCK), knowledge of learners and their characteristics, knowledge of educational context, knowledge of educational ends, purpose, values, their philosophical and historical grounds (Shulman, 1987). Of all these categories of professional knowledge Shulman (1987) considered PCK "of special interest because it identifies the distinctive bodies of knowledge of teaching" (p. 7), and "represents a blending of content and pedagogy into an understanding of how particular topics, problems, or issues are organised, represented and adapted to the diverse interests and abilities of learners, and presented for instruction" (p. 8). Since the Shulman publication, many other attributes of PCK have emerged and its components have been expanded upon (Loughran et al., 2006, Magnusson et al., 1999, Loewenberg et al., 2008). For example, Magnusson et al. (1999) extended Shulman ideas and proposed five components of PCK for science teaching. These are:

orientation towards science teaching; knowledge and beliefs about science curriculum; knowledge and beliefs about assessment in science; knowledge of students' understanding of science; knowledge and beliefs about instructional strategies for science teaching.

Since, pre-service teacher training, professional development, and teaching experience are considered key sources for building teachers' PCK (Etkina, 2010, Hume and Berry, 2010, Loughran et al., 2006, Hume, 2010, Grossman et al., 2005); it is likely that Tanzanian licensed science teachers recruited via non-traditional approaches that preclude pre-service teacher training, will have underdeveloped PCK. There is little interest and attention from the international community directed at this knowledge gap of unqualified teachers and the long-term impact of their classroom teaching on achievement of sustainable global education. This study sets out to investigate the professional learning needs of Tanzanian licensed teachers, with a focus on their PCK and their effectiveness in teaching students using learner-centred teaching methods. The study is guided by two main research questions.

- i. What are the professional learning needs, including those related to PCK, of licensed science teachers in Tanzania?
- ii. How effective are Tanzanian science licensed teachers in teaching science using learner-centred instruction?

### **The significance of the study**

As noted in the review of the relevant literature there has been very little research undertaken into the nature of the professional knowledge and practice of alternative route teachers' in Sub-Saharan Africa and South Asia. This study has the potential to make important contributions to the improvement of licenced teachers' performance by helping educational experts to understand the nature of their PCK and the impact their current teaching is having on student learning, current constraints on their PCK development and ways in which these constraints can be addressed to enhance their PCK.

### **Theoretical framework**

This study adopted social constructivism theory to explore licensed science teachers perceptions about their professional learning needs and their effectiveness in teaching students using learner-centred teaching methods. Social constructivists believe that human beings develop or construct meaning from their perceptions of different sources of information received through social interactions (Beattie and Dabbagh, 2003). This means that in social constructivism theory knowledge is socially constructed and is subject to individual interpretation. According to Karagiorgi and Symeou (2005) a core assumption of constructivism is "that individuals live in the world of their own personal and subjective experiences. It is the individual who imposes meaning on the world, rather than meaning being imposed on the individual" (p. 18). Adopting this constructivism position, this study has a view that the licensed science teachers are knowledgeable and able to provide their own views about their professional learning needs, in particular PCK, because their needs are felt personally and cannot be imposed from outside.

Constructivism as a school of thought “has its roots in the child-centred [student-centred], progressive ideologies of educationalists” (Duncombe and Armour, 2004). These constructivists held a view that in a learner-centred education knowledge is constructed by students and teacher(s) facilitate this construction of knowledge (Lea et al., 2003, O’Neill and McMahon, 2005). Student’s opportunities to learn during learner-centred instruction depends on the teacher engaging his/her learners actively by designing classroom activities that allows students’ construction of knowledge (Schunk, 2012). This paper uses social constructivism assumptions to explore licensed science teachers’ classroom practices in Tanzania to determine whether or not their classroom teaching practices engaged students in active construction of knowledge.

### Contexts of the case study schools

This study involved six teachers, two from Tlawi and Hewasi secondary schools, one from Nungu secondary school, and one from the Katani secondary school (all pseudonyms). These teachers brief background are shown in Table 1.

*Tlawi secondary school.* The school has 654 students of which 362 are girls and 291 boys. The school has 13 qualified teachers and five licensed Form Six teachers (four are science and mathematics teachers and one is an art subject teacher). The school has 15 classrooms and three unequipped science laboratory buildings.

*Katani secondary school.* This school has a total of 325 students, 11 classrooms and 12 teachers. The school had a deficit of six science and mathematics teachers and the school recruited two licensed science teachers to cover the shortage. This school does not have a working science laboratory.

*Nungu secondary school.* This school has 755 junior secondary schools students (ordinary level), 95 senior secondary school students (A-level), and 32 teachers. The school at the time of study had a deficit of two physics teachers and one chemistry teacher, and the school had recruited one licensed science teacher to fill the gap. The school has 18 classrooms but no science laboratory.

*Hewasi secondary school.* This school has total of 700 students of which 368 girls and 332 boys. The school has a total of 22 permanently employed teaching staff including five graduate teachers, 17 diploma teachers, and three licensed science and mathematics teachers.

## Methodology

This interpretive study used a multiple case study approach and qualitative data-gathering methods. The participants for this study were selected through non-probability sampling using a 'purposive sampling' technique. The participants of this study were six licensed teachers and five education officials. Data were collected from multiple sources such as classroom observations, individual semi-structured interviews, a focus group discussion and documentary reviews. The data were analysed thematically using the five components of PCK as identified by (Magnusson et al., 1999) as a deductive analytical framework. Qualitative trustworthiness criteria were used ensure the credibility of the study.

## Results

The following sections identify the key findings about the nature of the licensed science teachers' PCK and its impact on their teaching practice

### Licensed science teachers' beliefs about teaching of science

The licensed science teachers felt that access to a laboratory plays a key role in the teaching of science subjects as it enables students to understand and learn them more effectively. However, while they advocated teaching science through experiments and practicals enhances students' understanding, typically they reported their schools lacked the necessary resources for such teaching.

Yeah, as you know biology and chemistry are science subjects that require a teacher to teach them using practicals, but at this school I am teaching my subjects theoretically because there is no science laboratory for conducting science practicals.... in order for students to understand the topics, it requires the science teacher to do some experiments... (Qwary, interview 1)

Another teacher commented about inadequate laboratory supplies in the school:

... in the school biology laboratory we don't have important chemicals for doing practicals, and as you know biology teaching requires both the use of theory and practicals to aid students' understanding ... science teaching requires students to use their senses such as touching, smelling, tasting, observing and hearing. (Pombe, interview 2)

Tiita illustrates how large classes, the lack of resources and pedagogical skills to improvise and develop teaching materials led him to choose a lecture style delivery.

... I frequently use the lecture method in my classes because it is easier to use when teaching large classes. ...another challenge is how to prepare teaching and learning materials, because this was not taught in the induction course ... and teaching materials are not available in the school. (Tiita, interview 6)

Similarly Manimo describes the detrimental influence large classes had on his pedagogy.

The number of students in the class is bigger than the stipulated student-teacher ratio, particularly in my school. For example, we have four streams of Form 1 students, 1A, 1B, 1C and 1D, with each stream having over 50 students. Therefore, in terms of methodology, rather than using participatory [learner-centred] teaching methods I prefer to use the lecture method to teach students in the classroom because it is easier. (Manimo, interview 4)

### **Inadequate understanding of science content knowledge**

The licensed science teachers acknowledged that they had inadequate knowledge for understanding and teaching some science topics. For example, Qwary confirmed that "licensed teachers need training in how to teach their subjects, in particular the content. Here I mean that training should focus on the specific subjects we teach in school, such as biology, physics and chemistry" (interview 1). Similar views were also expressed by Tiita.

It is difficult for me to describe specific training needs, but I think that revising how to teach the subjects and conduct science practicals are more important training needs at the

moment.... we are not trained in how to prepare practical lessons in the induction course and there is no help here at the school...I do not have the skills for conducting science practicals. (Tiita, interview 6)

Tiita's views suggest that the licensed science teachers have inadequate science curriculum knowledge and PCK, in particular about how to prepare and teach science practicals. When the education officials were asked their impressions of licensed science teachers' professional knowledge around the teaching of practical work, they expressed similar views.

Licensed teachers do not have the skills for preparing practical lessons, which I think is one of their training needs... they lack practical teaching skills because most of them studied an 'alternative to practicals'<sup>2</sup> in ordinary secondary levels. Also, in Form 6 they did practicals as students simply to pass the final national examination. (Headmaster, Tlawi secondary interview 8)

The District Education Officers also identified the lack of content knowledge as an issue and recognized a need to enhance licensed science teachers' subject content knowledge.

Licensed science teachers should get a dose [of training] in mathematics or physics first, and extra training in teaching methodology ... Because if the teacher does not understand the content of physics or mathematics, even though he [she] knows how to teach mathematics or physics, he [she] will be teaching something that merely resembles mathematics or physics. (District Education Officer I, interview 9)

An added issue was the inclusion of some topics in the science syllabus that were new to the licensed science teachers and which they felt that they were not knowledgeable enough to teach. For example, Safari comments "of course, some of the topics recently introduced in the biology syllabus are difficult to teach. For example, I have a problem teaching the topic called 'balance of nature', because I didn't learn it in high school (Safari, interview 3). A similar concern was reported by Sungura.

Some topics are difficult to teach, for example, those you were not taught or didn't understand when you are in ordinary level secondary school or high school, and so, when you come across these topics, instead of teaching them you skip them, for example, the topic of the lymphatic system in biology. (Sungura, interview 5)

These teachers' views suggest that licensed teachers depend largely on their limited science knowledge gained from their own junior secondary and high school schooling to teach science in their schools. It appears the views expressed by a range of participants indicate that the licensed science teachers in the study have an inadequate understanding of the science education curriculum and how to teach the subject content matter effectively, that is, weak PCK.

---

<sup>2</sup> 'Alternative to practicals' is an alternative mode of teaching science practicals, whereby students memorize the science experiments theoretically and then do the examination on the basis of the experiments memorized in schools with an inadequate supply of laboratory equipment and consumables for carrying out real or wet practicals.

## **Perceived licensed science teachers' 'pedagogical knowledge' training needs**

During the interviews, the licensed science teachers raised a number of issues relating to their pedagogical knowledge learning needs, in particular, challenges concerning classroom management, understanding students with different learning needs and lesson preparation skills. Their comments focus on their need for training in teaching methodology [pedagogy] as Manimo explained:

Licensed teachers need training in teaching methodology [pedagogy] and how to help students to learn. Of course, when I was employed I was very young and so students have little trust in many of us because we are nearly the same age as them. You know at that time, I had few skills for managing students in the classroom. (Manimo, interview 4)

In a similar vein, Tiita reported that parents and the community at large see licensed teachers more in a caretaking role rather than teaching, describing the “licensed science teacher as a student employed to teach their fellow students, to keep students doing something rather than them remaining idle in the classroom” (Interview 6). While Pombe confessed that “I think licensed science teachers need to learn the different modern teaching techniques recommended in the new science syllabus, for example, the recently introduced participatory teaching methods”...(Pombe, interview 2). Another teacher claimed that:

To some extent the induction course covered some concepts such as methods of teaching but not all methodology concepts or techniques of teaching were covered due to the short time allocated to the induction course... professional development should focus on teaching and learning methodologies... how to recognizing talented and untalented students in the classroom and how to develop students' talents. (Manimo, interview 4)

In their classroom practice the licensed science teachers expressed uncertainty around the planning of instructional artefacts, particularly about filling in some sections of work schemes and lesson plans. Here Tiita described his difficulties with the terminology used in these documents during the focus group discussion.

Sorry sir, what is assessment? Because this is confused with evaluation, what is the difference between assessment and evaluation...in our new lesson plan template they have introduced sections for teacher evaluation and reflection, and in the scheme of work template there is also an assessment section. Can you explain each concept before we carry on to our discussion...I get confused over the use of these terms in the lesson plan. (Tiita, focus group discussion)

Another participant then commented that “in the new lesson plan template there are sections for remarks, reflection, consolidation, reinforcement, teacher evaluation and student evaluation as well as assessment, which is very confusing, because consolidation and reinforcement look similar to me” (Pombe, focus group discussion).

When samples of students' tests and examination prepared by the licensed science teachers from the case study schools were analysed using Blooms taxonomy of knowledge categories the findings showed that most of the test and examination items were testing the lower levels of Bloom's categories of knowledge (Table 2).

**Table 2**  
**Test items testing different levels of student knowledge by percentages**

Names of teachers	subjects	Number of test items	Categories of knowledge levels tested by items number and percentages					
			Knowledge	comprehension	application	Analysis	synthesis	Evaluation
Pombe	Biology <sup>3</sup>	33	84.85%	12.12%	3.03%	- <sup>4</sup>	-	-
	Biology <sup>5</sup>	40	80%	2.5%	7.5%	10%	-	-
Sungura	Biology <sup>6</sup>	30	76%	-	24%	-	-	-

Source: Tests and examination past papers prepared by licensed science teachers

These findings could infer that licensed science teachers avoid testing higher level categories of knowledge because they do not have the knowledge and skills necessary for assessing students' higher order learning. This interpretation appears to be supported by the headmaster from the Tlawi secondary school who commented:

If you evaluate the types of test or examination questions prepared by licensed [science] teachers, you will immediately recognize that these questions have not been prepared by a qualified teacher. They are not following the principles of test construction like the use of table of specification. Licensed teachers usually copy questions from textbooks and

<sup>3</sup> Biology Form 3 terminal examination

<sup>4</sup> Dash means the items were missing in the test

<sup>5</sup> Biology Form 3 annual examination

<sup>6</sup> Biology Form 1 test

<sup>7</sup> Physics Form 3 annual examination

<sup>8</sup> Chemistry Form 4 mock examination

<sup>9</sup> Physics Form 2 pre-mock examination

<sup>10</sup> Chemistry Form 2 Pre-mock examination

<sup>11</sup> Biology Form 3 mid-term test

<sup>12</sup> Biology Form 1 terminal examination

<sup>13</sup> Physics Form 1 physics annual examination

previous past papers without using the table of specification. (Headmaster, Tlawi secondary interview 8)

Arguably from these findings, it could be claimed that students taught by licensed science teachers will be unlikely to achieve their academic potential, as licensed science teachers are not knowledgeable enough to engage students in higher-order learning.

### **Effectiveness of licensed science teachers in using learner-centred teaching methods**

The findings from interviews indicated that licensed science teachers had only partial understanding of the purposes of learner-centred teaching and learner-centred assessment strategies and what they might involve. For example, when asked about learner-centred teaching methods they referred to ‘participatory teaching methods’, that is, methods used to keep students busy during the lesson and to allow students to conduct classroom discussions.

Of course I don’t remember the exact examples of learner-centred teaching strategies, but what I can say is that learner-centred teaching methods are those that use participatory approaches, such as students being allowed to conduct group discussion during the lesson in the classroom. (Sungura, interview 5)

Sungura did think that a learner-centred teaching method is where students participate in group discussion but he was not able to define or give explicit examples of learner-centred teaching methods. Manimo considered that learner-centered instruction was an opportunity for students to take responsibility for their own learning.

I think that learner-centred teaching methods mean that the teacher is not the source of knowledge but simply guides students’ learning. Students are the source of knowledge they can learn on their own... This means that during the teaching process you just pose an idea concerning the subject matter and give student time to discuss because they know something and are not tabula rasa<sup>14</sup>. (Manimo, interview 4)

Nonetheless, observation of Manimo and Pombe in the classroom revealed that their instructional practices contain less elements of learner-centred instruction than their views suggest. Their classroom lessons were dominated by teacher-centred approaches where typically they used the traditional ‘chalk-and-talk’ style of teaching with students silently copying what was written on the blackboard.

This study was interested to find out whether licensed science teachers classroom practices are entwined with formative assessment methods as suggested in the science curriculum. When asked the licensed science teachers responded by describing their use of assessment techniques

---

<sup>14</sup> the epistemological theory that individuals are born without built-in mental content and that their knowledge comes from experience and perception

such as quizzes, tests and oral questions and answers during classroom instruction. For example, Tiita made the comment “I ask my students oral questions during the teaching process to evaluate their understanding” (Tiita, interview 6) while Safari asserted that “in fact I usually use tests, quizzes, questions and answers... Therefore, after asking the questions I observe whether the students participate in answering them, and if they do then I know they have understood the lesson” (Safari, interview 3). However, despite the licensed science teachers’ claims that they used oral questioning to evaluate students’ understanding, classroom observations revealed that teachers rarely asked questions and in some lessons no questions were asked at all (Table 3).

**Table 3**

**Number of questions asked by teachers and students in each lesson observed**

		Teachers names and lessons observed												
		Manimo	Tiita		Sungur a		Pombe		safari		Qwary			
Subjects observed		Mathematics	physics	physics	Chemistry	physics	Biology	Biology	Biology	Chemistry	Biology	Biology	Biology	Chemistry
Number of questions asked by the teacher	of	2	4	6	2	0	3	4	0	4	1	1	0	3
Number of question asked by students	of	0	0	0	0	1	0	0	0	1	0	1	1	0

Source: Lesson observation notes

The findings here suggest that while licensed science teachers think they understand learner-centred assessment strategies they actually do not practice formative assessment in their teaching. In reality the teachers’ classroom practices are dominated by teacher-centred instruction and assessment, with little use of oral assessment techniques to evaluate student understanding of lessons. In all the lessons observed the teachers did not appear to evaluate students’ learning.

### Discussion and conclusions

This study sought to investigate unqualified licensed science teachers professional learning needs in particular PCK and how effective they were in using learner-centred teaching methods in their classroom teaching. The assessment of the licensed science teachers’ PCK needs was conducted with the intent to understand “how teachers take content and transform their understandings of it into instruction that their students can comprehend”(Nuangchalem, 2012). The findings of this study have shown that unqualified licensed science teachers have underdeveloped PCK components (orientation toward science teaching, knowledge of curriculum, knowledge of

science assessment, knowledge of students' understanding of science, and knowledge of instructional strategies) which need to be enhanced in order to improve the status of student learning in science and mathematics. Their PCK wants were broad but deeper understanding of subject content knowledge and training in pedagogical knowledge featured highly. When examining the licensed science teachers' understanding of science curriculum, this study found that nearly all the licensed teachers were lacking specific subject content knowledge understanding. This inadequate understanding has negative implication for students' learning as teachers' ability to transform subject content knowledge into student learning outcomes because it also impacts on their ability to design interactive instructional strategies. As a consequence of their resultant underdeveloped knowledge of science instructional strategies, the licensed science teachers' classroom teaching practises were dominated by 'chalk and talk' teaching styles and students were passive learners. The underdeveloped PCK of licensed science teachers was reflected in the nature of test and examinations items which were found to predominantly test lower level of Bloom's knowledge categories. In their classroom teaching they made little use of students' background experiences adopting a teacher supremacy approach to their teaching. Goodnough and Hung (2008) claimed that PCK components are interrelated and when one component is underdeveloped its effects are reflected across other components.

Classroom observations and interviews revealed that the unlicensed teachers do not understand and use learner-centred teaching methods. Their classroom practises were dominated by teacher directed learning while students' role in the classroom learning was to copy notes written on the blackboard. The most likely reason for this supremacy of teacher-centred teaching methods amongst licensed science teachers lies in the methods which were used to teach them when they are students in junior and high schools and they are imitating it as model of practice. Also, learner-centred methods are innovative to Tanzanian teachers and these practices are still not well understood and used in schools. These findings suggest that given the lack of pre-service teacher education and background experience about the use of learner-centred teaching methods, licensed teachers mimic the teaching styles of their 'masters teachers' – a term used by Stamatel (2003) to identify the previous teachers of novice or untrained teachers whose classroom practices they imitated because they considered them as masters teachers. However, Young et al. (2005) commented that novice teachers usually imitate teaching methods "without completely understanding the principles behind such teaching" (p.186).

In conclusion, this study finds that the PCK of teachers recruited through alternative route approaches, like Tanzanian licensed science and mathematics teachers needs to be enhanced. The impact of underdeveloped PCK components were reflected in all aspects of licensed science teaching and their classroom teaching is not helping their students to acquire higher cognitive skills. Also, their classroom teaching practises were limited by teacher-centred approaches which promote rote learning and memorization of facts. The implications for the wellbeing of Tanzanian society are serious because citizens with underdeveloped cognitive skills are not likely to compete on equal terms in global education and economic development because of the disparity of their skills. Arguably, the global community should consider and address the needs of unqualified teachers teaching in developing countries in order to bring equal opportunities for all global citizens.

Abstracts

This article examines the strategies of second generation Chinese new middle class that are unable to obtain admission in China's premier universities. It finds that their parents transfer their own *guanxi* (connection) by sending their children to private universities or study abroad to secure the intergenerational reproduction of their class status and mobility. The Chinese new middle class families look upon joint-partnership private universities as stepping stones for overseas study. It analyzes how the middle class parents can make use of their cultural and social capitals at hand to enhance the cultural capital of their children. In addition, this article examines how extant Western class theories cannot provide an adequate account for the generational stratification of Chinese new middle class families. The intergenerational mobility of the middle class families goes beyond the Western class theories, including Weberian, Neo-Weberian, and Bourdieuan theories. The article delves into this peculiar measure by exploring why the Maoist social institutions of *danwei* and *hukou* still matter in post-reform China in determining middle class parents-children's life chance. The emergence of the Chinese new middle class seem strongly tied to that of cadres; the actual beneficiaries of the economic reforms. Progenies of cadres i.e. co-founding families, are the greater beneficiaries of economic reform. [200 words]

Education has become a form of consumption. And like any other consumption item, educational consumption often is based on one's economic capability and intelligence. Excellent educational resources . . . are scarce and should be priced at a higher level. It is natural that not everyone can afford excellent educational resources. It is like shopping for clothing. A well-off man can go to a brand-name store to buy a 10,000-yuan suit, while a poor person can buy a 100-yuan suit from a vendor (Wang Xuming, 2006).

Affluent second generation descendants of the Chinese middle class comprise the majority of students in most of China's private universities. The increasingly globalized nature of the media, familiarity with the English language, and opportunities for higher education in Anglophone countries have lured many middle class children from Guangdong province to private universities in China. The quotation above fully depicts the perceived social role of education in today's China<sup>1</sup>. The expansion of transnational higher education in China, which evolves from "cooperation between foreign education institutions and Chinese education institutions in China cater for the needs of Chinese citizens" (State Council of China, 2003), is not only just one characteristic of the transitional Chinese community's mode of existence, but also a part of a community composed of ambitious, well-educated middle class families who are anxious to cement their social status in post-reform China (Fong, 2004; Fang 2012).

The primary research aim is to examine why the old Maoist social institutions of *danwei* do and *hukou* still play a pivotal role in determining one's life chance in today's China, even though the country has experienced substantial social change as a result of the pro-market economic reform. I then propose a theory of social stratification in socialist countries to account for how social stratification emerges and is sustained in the Chinese socialist system. Also, I examine how an application of the existing Western class theories, especially the Marxist, Weberian, Neo-Weberian, and Bourdieuan ones account for the rise and consolidation of the Chinese new middle class in post reform China as prelude to ascertaining why in the area of higher education, the old Maoist social institutions of *danwei*<sup>2</sup> and *hukou*<sup>3</sup>

---

<sup>1</sup> For example, in the UK, an overseas pupil needs to pay an average of £16,000 (\$25,000) a year for boarding-school education – about ten times the average annual income of an urban Chinese household in 2003. Meanwhile, about 7,000 students from China study in Australia at secondary level each year, accounting for half of the students studied study abroad on student visas in 2003. The number of the student to study abroad is growing by 10% a year (The Economist, 2003).

<sup>2</sup> The *danwei* (单位 'work unit') system refers to the place of employment, especially in the context of state enterprises during the pre-reform period. The *danwei* was the first step and principal channel for implementing party policy in the Chinese socialist infrastructure. The work unit once held considerable sway on the life of an individual: workers were bound to their work units for life. The work unit was almost wholly self-contained and provided an individual with a full complement of goods and services for living, such as housing, healthcare and education. The same system monitored the behaviour of each individual for compliance with implemented party policy.

<sup>3</sup> The *hukou* (户口; household registration) system separates the entire Chinese population into two (and only two) categories: agricultural registrants domiciled in rural areas and non-agricultural (i.e. urban) registrants in cities. Introduced in the 1950s, it became quickly entrenched by the early 1960s. The *hukou* is a nationwide system of household registration set up under the 1958 Regulations on *Hukou* Registration were issued by the National People's Congress (NPC) in a bid to safeguard progress towards collectivisation in rural areas and control food shortages in urban areas. It was designed chiefly to control internal population movement. It created a legal domicile for every person and bound each person permanently to that domicile.

still matter in determining middle class children's life chance to study in private university in today's China. The continuing dominance of state-owned entities in Chinese post-reform society allows middle-class parents to utilise the social and political capital at their disposal to enhance the cultural capital of their children in order to preserve their hard-earned social status. I argue that many children of affluent, new middle class children in China, cannot win places in China's prestigious, tier one universities because of the highly competitive national university entrance examination (*gaokao*). Their families prefer them to study in private universities. On the surface, it is natural. Many parents of Hong Kong students pursue the similar options when their children cannot be admitted to government-funded institutions.

As discussed in detail below, what differs, however, is that there are no "memo students" in Hong Kong. Most of the middle class parents I interviewed have connections with their previous *danwei* and they belong to "co-founding families". The memos and connections students mostly come from the influential departments in the district, such as the Industrial and Commercial Department, the Tax Bureau, Planning Department and the Discipline Inspection Department in Guangdong. These middle class parents-children are comparably easy to get the co-founding fees when compared with working class families. Co-founding fees (Wu Xiaoxin 2008:600) are the money provided to preferred schools by work units to ensure the middle class parents-children from the work units can attend their co-founding schools, which are, in most cases, the best local primary, secondary, and even private universities if they failed to get a place in tier one universities. At least, most of the cadre's children belong to co-founding family/student. This coincides with the emergence of private universities since the 1990s which has been encouraged and supported by the central government in its attempt to shift the financial burden of expanding higher education from the state. The emerging Chinese new middle class also facilitates the rise of private universities in China. Particular focus will be on how middle-class parents make use of the advantages provided by the long-standing social institutions of *danwei*, *hukou*, and *guanxi* to find places for their children in private universities or to send their children abroad for pursuing higher degrees. Born when China was under economic reforms, the second generation of the Chinese new middle class has a "post-communist personality" that is individualistic, materialistic, and moneymaking in attitude (Faure 2008: 476), defying traditional cultural values such as frugality, modesty, and self-restraint (Wang 2002; Faure 2008: 475-76).

### **The rise of the private universities and the definition of the Chinese new middle class**

Until the early 21<sup>st</sup> century, most Chinese students studied at state-run universities or colleges and relied on government scholarships for studying abroad. According to the Chinese Ministry of Education, in 2007, there were approximately 4,300,000 students in private post-secondary institutions, 1,600,000 in private universities, 1,800,000 in second-tier colleges of public universities, and 870,000 students in other kinds of institutions (Chinese Ministry of Education 2007). Foreign educational institutions then began to show great interest in investing in higher education in China. Around 200 British institutions offer various study programs in China, with some 11,000 students pursuing British academic degrees under such programs. American academic institutions, including Duke University, New York University, Columbia University, and many others colleges, are also active in collaborating with Chinese educational institutions. It is estimated that well over 1,000 foreign academic institutions have expressed keen interests in establishing private universities in China (Fazackerley 2007).

This development have been in sync with the emergence of a new middle-class, one of the drastic social changes in China over the past 30 years or so, especially in Guangdong which enjoys an average annual economic growth rate of approximately ten per cent.

The Chinese new middle class<sup>4</sup> is defined by a number of criteria: the first standard is a minimum per-capita income of RMB9, 000 per month; second, post-secondary education (technical or non-technical) or above; third, managerial-level or managerial-type job position; fourth, urban belonging (urban *hukou*), fifth, possession of a house or a car either by mortgage or outright purchase; and sixth, disposable income of RMB300, 000 or above (Author 2013). Most middle-class families today can afford educating their children in private international universities in China, the USA, or the UK. In fact, private universities have become a tool for achieving intergenerational upward mobility, and this paper examines how the new middle class fully utilize their economic privileges and the growth of private universities in China to preserve upward social mobility. To secure their middle-class status in post-reform China, both the older and younger generations of the middle class feel compelled to upgrade themselves in the face of increasing competition fuelled by both economic reform and globalization. The national higher education entrance examination (*gaokao*) is very competitive in China. According to a report published by Commonwealth of Australia (2009), there were 10.5 million candidates in 2008, of which only 57% (5.99 million) were eligible for admission to China's universities. Only the top 10% of the candidates were admitted to tier one universities. This explains why middle-class parents whose children are not in the top percentile of grades will try various means to get their children into transnational higher education institutions. However, one has to understand in the first place from a sociological perspective why parents attach much value to education.

### **The growing role of education in class distinction: a theoretical overview**

Sociologists have discussed the role of education in analysing the emergence of new social class. A theoretical framework incorporating a spatial-temporal dimension to the extant debates on class analysis, consumption patterns and institutional changes in post-socialist China will be presented. Up to now, most research on class structure and formation is based on Western European concepts originated about 100 years ago. This is because Europeans were the first to write about class, in a way coherently and sensibly enough to allow further research. For this reason, the classical Marxist point of view is traditionally a good starting point for analyzing class in the academic world. Whenever class is discussed in China, naturally Marxist theories on class are referred to in the first place. This paper, however, argues that Marxist theories cannot be applied for the purposes of understanding the emergence of the Chinese new middle class because Marxists ignore the intermediate middle class and Marx's theory is a theory of polarisation. The Chinese case also introduces problems—it is a “wrong” transition from state socialism to market socialism (capitalism). The Chinese transition complicates the Marxist analysis by including a trajectory not recognised by Marx. If market capitalism tends to be a class society, it is not a class society in the Marxist sense. Neo-Marxist (e.g. Erik Wright's) class analysis is not applicable to the Chinese context in the sense that in the western debate, there is an attempt to understand modern capitalism in class terms. This begins with Marx and moves in a Weberian direction. This move entails first locating intermediate classes within Marx's polarized classes as fractions (Poulantzas 1973 &1976; Wright 1985a &b).

---

<sup>4</sup> This is based on my doctorate study of the emergence of the Chinese new middle class. See Author (2013).

According to Max Weber, skills and educational credentials are two of the basic elements of class formation. The Weberian approach argues that education is important because it indicates membership of a status group that controls access to higher-paying jobs. Education is a key factor in upward social mobility. Weber developed a typology of class, status, and party as the three bases of social stratification. He considered them exerting important influences in people's lives, as opposed to the Marxist emphasis on property classes alone. That means the Weberian approach looks at educational credentials as differential sets of life chances for members. Weberian and Neo-Weberian approaches, in contrast, are more relevant to the study of the emergence of the Chinese new middle class in post reform China. China is now moving towards a form of market capitalism, the Weberian notion of party is more relevant to understanding transitional issues than status (Weber 1951).

On the one hand, social status has to do with individual or group lifestyle, education, training and socialization as well as inherited or occupational prestige. On the other hand, class distinctions are linked in various ways with status distinctions. Property is not necessarily recognized as a status qualification, although in the long run it is and with extraordinary regularity (Weber 1946: 186-187; Liechty 2003: 14). The Weberian analysis provides useful insight into how consumption and status could be related to the dynamics of middle-class cultural practices. (Liechty 2003: 11) The rationale is that socio-cultural processes in Weber's intermediate strata (i.e. middle class) revolve around a wide range of cultural formations, lifestyles, party, and status claims. Furthermore, social status and hierarchy are based more on marketable skills, lifestyle, party (cadres) and consumption. (Storey 1999; Pinches 1999)

In addition, the concepts of work and market situation proposed by Neo-Weberian, John Goldthorpe (1980; 1982) is particularly relevant in this study for highlighting the importance of the cultural capital or education credential. His class framework is primarily divided into those who exercise "delegated authority or specialised knowledge and expertise" and those who do not. The authority factor is the most likely one that gives rise to differences in working conditions and market capacity, even if status and party tend to be residual terms. According to Goldthorpe, market situation refers to an occupation and its income source and level, associated conditions of employment, the degree of economic security, and the chances of economic advancement. Market situation also refers to categories of occupations whose members are well connected in the field, and have connections in the job market. Work situation refers to where an occupation is located in the systems of authority and control within the production process. (Goldthorpe 1980: 40) Occupations typically have common market and work situations within the boundary of the same class. This means the middle class are the members of the same jobs and they have a very good information flow at the same field.

Bourdieu's theory is another way to serve as a cultural task like consumption patterns, lifestyles, and identity of class formation, which is a different way of picking up the status theme from Weber and Neo-Weberian discussion in China. A paradox is whether "class analysis" can be applied to China when it is in negating Marxist principles. Pierre Bourdieu (1977; 1989) provided another conceptual framework for class analysis whereby classes can be distinguished from one another in terms of different educational levels, family inheritance, and internally coherent sets of tastes. His concept of class *habitus* indicates that cultural capital is the pivotal determinant of values, instincts and lifestyles. Cultural capital comes in various institutionalized forms. But it is most readily evidenced by education and skills.

Bourdieu & Wacquant (1992) emphasises the leading function of education as one that predisposes an individual or group to engage in certain cultural practices. The inference is that education brings out differential cultural patterns. A dominant economic class able to gain access to superior culture (e.g. good taste) legitimizes its position of superordination relative to other classes. Education enables the class to progressively capture the means of cultural reproduction as a way of increasing its chance for social reproduction (Bourdieu 1977; 1989). The class *habitus* theory suggests that as an example, one can predict a low likelihood of friendships between professionals and manual workers because they differ sharply from each other in cultural capital. The more culturally similar the people are, the more likely they will become close associates. (Silver 1990; Zang 2006) Real life bears this out: professionals are mostly university graduates trained in critical thinking and they develop a tendency to exchange views only with their equivalents.

Cultural capital can take three forms. They are embodied, objectified, and institutionalized. (Bourdieu 1986) The embodied and institutionalized forms of cultural capital can be applied to depict the middle class's goal to maintain their status over generations. The embodied form of cultural capital refers to the individuals who possess basic intellectual skills that allow them to learn other advanced skills. This kind of cultural capital is directly associated with time, effort, and parental involvement and nurture. Middle class parents invest in their children so that they can learn other talents, skills, and partake in extra-curricular activities. Institutionalized cultural capital refers to educational qualifications or credentials, creating a "certificate of cultural competence which confers on its holder a conventional, constant, legally guaranteed value with respect to power". (Bourdieu 1986: 248)

Middle class families tend to have comparable cultural capital, tastes, *habitus*, distinction, and class (Bourdieu 1986). The taste that a person shows in goods is an indicator of his or her social class in a commodity-oriented (i.e. consumption) culture (Featherstone 1991: 88). That makes consumption culture a 'field' to create, preserve, and replicate social differentiation and social disparities (Bourdieu 1977; 1989; Bourdieu & Wacquant 1992). If, as already mentioned, a dominant class uses education to preserve its culture as well as class position, then one can say that education shapes taste as well as consumption behaviour with respect to social differentiation and class boundaries. That in turn shapes the characteristics of the consumption culture. This is the way Bourdieu interprets class in cultural terms (lifestyle and consumption patterns), which is similar to Featherstone's (1991) understanding except that the latter focuses on consumption rather than production of work.

### **Education, class formation and social stratification in today's China**

There is a growing body of literature that lends support to the claim that Chinese middle class are in a privileged position by virtue of their access to education. Both Stephen Ball (2003) and Diane Reay (2001) point out that there is an increasing importance of parental involvement in neo-liberal, marketized education systems through their role in nurturing their children's studies and careers. Ball (2003) and Reay (1998, 2001) have theorised how middle-class "choice" configures the school environment in the United Kingdom. Beverley Skegg's (1997) study of young, white, working class women in British Midlands, and Simon Charlesworth's (2000) study of young people in Rotherham show that these groups feel disempowered by the workings of the educational system. Education is a commodity that is commercialized. There is stratification and polarization between the middle class and the

lower class. Education is a major contributing factor to upward generational mobility for the middle class. (Crabb 2010)

In post-reform China, class is generally referred to structures of material inequality or groups ranked in a hierarchical order (Guo, 2012: 725). Rhetorically, class in post-reform China is an increasingly redundant issue (Holton & Turner, 1989) largely because the Chinese government and the official media show great reluctance to mention the notion of class for fear of provoking ideological debates about the nature of the Chinese socialist system and correspondingly political instability. The Chinese Communist Party (CCP) has already abandoned class struggle and “continuous revolution” politically and ideologically in order to embrace economic development through marketization since 1978. (Guo 2012) Rather, China prefers the discussions of social stratification or hierarchy. This is why whenever a class analysis of the Chinese new middle class is conducted, class was primarily a signifier of the CCP’s desirable and undesirable beliefs, values, and behaviour. That means class does exist in post-reform China, but the CCP tried to deny the existence of class. Before the economic reform, the CCP only recognized cadres and working class which included peasants. There was no such concept of middle class. However, after economic reform, entrepreneurs and cadre-entrepreneurs have been emerging to form the core members of the changing Chinese society. The emergence of the Chinese new middle class is more political-ideological than sociological. Politically and ideologically speaking, China wants to facilitate middle class as a “politically and economically stabilizing force”, “a social stabilizer”, “promoters of advanced culture”, “a natural opponent to violence and dictatorship” and “represent moderation and rationality”. (Lu Xueyi, 2006: 54) But sociologically speaking, China never thinks the Chinese new middle class could be a good source to narrow down the economic inequality between the rich and the poor. While the CCP refuses to refer to Marxism and class struggles in favour of economic development and social harmony, the concept of class is still enshrined in the constitution, national flag, and national emblems. Cadres and state-owned enterprises and institutions, including the old Maoist social institutions of *danwei* and *hukou*, still play a pivotal role in allocating sought-after resources in the country and accordingly determine the life chances of the second generations studying at private universities if they fail to gain admission into tier one universities.

In China, most of the old generation enjoy all the institutional changes in reform China since the 1980s, especially for the cadre-entrepreneurship in the mid-1990s. They have accumulated lots of social capital or resources like good *danwei* (work units), urban *hukou*, and connections in helping their children to get a better education or even life chance. *Hukou* creates spatially distributed inequality. *Danwei* continues to be significant on class and class distinction in urban China. Both *hukou* and *danwei* create differences in work situations by forming *guanxi* (connections and networks) inside the boundary of the new middle class. The *guanxi* circles that ex-state workers have developed during their time with the *danwei/hukou* remain useable and important even after their switch to the business world.

Institutional changes in China since 1978 have allowed and promoted collaborations amongst the Chinese new middle class. Cadres are still important in forging collaboration with professionals and entrepreneurs. The rise of a new group of hybrid elites, known as “cadre-entrepreneurs” (Nee, 1989, 1991, 1996) is particularly peculiar in post-reform China. The new middle class and others often exploit policy loopholes to collaborate with cadres for pecuniary or other gains, thereby reinforcing any grey areas that exist in the system. The mad rush to economic performance causes due diligence in governance to fall by the wayside. The

resulting chaotic, badly developed systems of policymaking, legislation, and general administration result in institutional fuzziness and illegality. There comes a proliferation of swindling, counterfeiting, influence-peddling, and other malfeasances. It comes with a large grey area of interconnecting relationships built up by gift-giving, wining and dining, collective memories, traditional Chinese values, and the need for self-improvement. The loophole in the machinery of government and the relationship-oriented nature of Chinese society results in administrative grey areas and encourage *guanxi* networks to arise as a means for “getting things done.” This explains why the middle class parents can afford to send their children to the private universities since they accumulate enough economic capital (money) if they are in possession of a reputable *danwei* in urban China.

Most of the older Chinese new middle class have *hukou* and each of them is politically affiliated to one particular *danwei*. An urban *hukou* is very important for the middle class parents to help their children to study in private universities. Urban *hukou* holders get easier access to key (*zhongdian*) primary schools and secondary schools where there is always keen competition for places. With enrolment quotas, the key primary schools and secondary schools only accept urban *hukou* children, and more likely include English into their formal curriculum. Even though most of my samples, as discussed below, do not select private universities as their first choice they appropriate their urban *hukou* and the previous educational qualifications to study at private universities in South China that use English as the medium of instruction. The highly-competitive, State-run prestigious universities they did not qualify for use Putonghua.

Another mechanism of social stratification in post-reform China is derived from the fact that the same occupation (in class terms) is rewarded differently in different regions because of the continued operation of *hukou* and *danwei*. As noted above, *hukou* creates spatially distributed inequality. Initially conceived as an instrument of social control in the Mao era, *danwei* continues to be significant in class and class distinctions in urban China. Both *hukou* and *danwei* create differences in work situations and facilitate the forming of *guanxi* networks among those within the boundary of the new class. I focus on the children of the older generation of the middle class – the second generation – who fail to go through the intense competition of *gaokao* to win places at the prestigious tier one universities like Peking, Tsinghua or Fudan Universities in China. Discontented with second tier universities, their parents prefer to utilise their social and political capital at hand, derived from their connections with their old *danwei* and *hukou*, to send them first to domestic private universities and then universities abroad in order to preserve their middle class status. This cannot be properly explained by Western theories because there are no counterparts of *danwei*, and *hukou*, in the West. To fill in this literature vacuum, I attempt to argue that *hukou*, *danwei*, and *guanxi* play a very crucial role in the upward generational mobility for the Chinese middle class to secure one admission to private universities in post-reform China. Focusing on cultural “forms” (cultural resources and practices), my operationalizing approach is appropriate for the Chinese context. In traditional China, due to the absence of public education, educational opportunities were limited to children of high-status scholar-gentry families that had educational or cultural resources. As a cultural legacy, in today’s China, parents always go to great lengths to help their children make progress in key schools and, particularly, to ensure that they are well prepared for the state-run competitive entrance examinations. My approach of operationalizing cultural capital from Bourdieu reflects the reality that middle class parents provide more cultural resources to help their children succeed than their working class counterparts. (Wu Yuxiao 2008:204-205)

## **Watching, participating, observing, and interviewing: a study of South China**

While I was teaching in an English speaking joint-partnership private university in China, I obtained funding to investigate the perception of parents and children toward private education in China. My fieldwork for this study comprised of 15 in-depth interviews with parents and their children. Table 1 shows the details of the interviewees. Most of the in-depth interviews were conducted in this private university before summer 2011. They signed the consent form to grant my permission to collect all data for this paper. I had many formal and non-formal opportunities to talk with the Chinese new middle class parents and children. The old generation of Chinese new middle class in this study were born between 1949 and 1969. They are professionals, entrepreneurs or cadres. The young generation of the Chinese new middle class are the children of the older generation. In this research sample, most of them were born in the 1990s. The reason for this grouping is because most of the old generation experienced the tumultuous Cultural Revolution, rendering them ample life differences from the younger generation who did not experience the same revolutionary movement. The students could not secure places in upper crust universities and were currently studying in private universities in China or universities in Macau, and some even were studying in the USA when the interviews were done in 2011. The major research targets are the middle class parents who are upper-middle class professionals, cadres or entrepreneurs, and have economic capital to arrange their kids for studying at private universities. The study also comprised informal chats with informants, and home visits of 15 middle class families in Guangdong. Combining formal and informal methods helped interviewees feel more at ease and encouraged them to reveal more openly and deeply about their self-identities, life philosophies, insecurities, imaginations, and outlooks on various issues. The qualitative interview, as a method that yields “rich sources of data on people’s experiences, opinions, aspirations, and feelings” through its flexible and sensitive dynamic. May (1993: 91) has proven to be a solid feature to study the nuances of the education and middle class parent and children in today’s China. The identity of the respondents is protected by the use of pseudonyms. As a fluent Cantonese and Putonghua (Mandarin) speaker, there were no language barriers.

It is obvious that the middle class parent and children respondents in my samples are very conscious about the need to select only prestigious educational institutions. They possess what Bowen calls “the appropriate economic, social, and cultural capital to ‘decode’ school systems and organization.” (Bowen 1995: 25) However, the working class is comparable to the middle class in its desire to escape the “iron cage of zoning.” (Lauder & Hughes 1999: 18) This explains why the middle class families spend huge investment in their children’s education. Yang (2010) concludes that the opportunity to attend higher educational institutions depends highly on parental education. In rural China, 85% of rural students are admitted to colleges whereas in urban China only 83% of students are admitted to colleges after the national higher education entrance examination in 2003 (Yang 2004). However, most of the grassroots children cannot afford to study in private universities and drop out. It also found that top colleges cater to elite students and favour children of home cities, often requiring rural students to outperform urban counterparts on a national test. (Yang 2010)

### **How did middle class parents transfer their networks to their children?**

Most of my middle class parents have connections with their previous *danwei* and belong to “co-founding” families. ” As soon as their students did not enter one of the top national universities, they wanted their children to study in private universities. There are English-speaking native professors at private universities, which create a very good language and learning environment in China. Indeed, students do not need to glorify the CCP or receive political indoctrination in private universities. When I was a teacher at my previous university, I was asked many questions about future graduate study, either by my students or their parents. “Can you give me more hints as to how I can help my daughter to study in the USA or the UK? It is not a matter of money, but it is a matter of chance!” (Fong, 48, entrepreneur, Annie’s mother) ‘I don’t care how much I spend on my son’s education, I just want him to

study at a well-known university and get a relatively stable job either in the USA or China. I analyze how the middle class parents and children utilize their economic, social and political capital (cadre according to Weber) to gain more cultural capital (education) to maintain their middle class status in post-reform China. The Chinese middle class parents have economic capital to invest in their children for them to learn talents like playing the piano, drawing, English, football, swimming, skiing, and many other talents.

*Danwei*, *hukou*, and *guanxi* are closely intertwined with each other. The Chinese new middle class uses *danwei* resources to help their children maintain intergenerational mobility. Since the 1990s, many cadres have “jumped into the sea [of commerce]” have close connections with their previous affiliated workplace (*danwei*), which was officially dismantled in rural China but it continues to operate in urban areas. Because historically welfare benefits and resources were distributed through *danwei*, it now affects work situation and influences welfare, and accordingly impacts on class relations. *Danwei* is significant in class distinction because of its role in forming *guanxi* networks inside the boundary of the Chinese new middle class. Therefore, *danwei* is a major institutional factor that directly contributes to the emergence of the Chinese new middle class, who possess urban *hukou* status and have connections with urban *danwei*. Both in turn opened up vistas to accumulate economic assets following the market reforms, which in turn allows for the development of certain lifestyles that could be shared with others who have gone through roughly the same pathways. They are generally seen as the lucky ones when compared with the “lost generation” of *xiagang gongren* (laid-off/redundant workers) when many Chinese state enterprises were closed down around the mid-1990s because of economic streamlining. They did not suffer from the so-called destratification of social status. (Parish 1984; Davis 1992:1062-1085; Bian 2002: 105) The family status is also crucial for their children to study in key primary and secondary schools.

In addition, most entrepreneurs and professionals in the older generation were previously cadres. Thus, cadres are frequently also entrepreneurs, at least part-time, and professionals also engage in entrepreneurial activity. Equally, given continued state ownership, some positions – for example, in health – that in Western contexts would be identified as professional also overlap with cadre roles and provide opportunities for various kinds of private activities. In this way, it is not simply an issue that entrepreneurs need to make contact with cadres, but that in some contexts, the entrepreneurs in question are also cadres. In this way, the different groups have no difficulty in understanding the world of the others and their expectations, because they occupy that world not just in terms of common background, but also in their everyday activities.

I found that most of the middle class families are well networked and they have ties with ex-colleagues (cadres) or acquaintances (social capital) in the private university. It will be easy for them to bring their children to it. Although most of private universities accept students on the grades attained in the national entrance examination in China, they still have quotas for self discretion, giving rise to “memo students” and “connections students. They are the students whose parents were cadres-turned-entrepreneurs or professionals in the 1990s. Their parents have *danwei* and urban *hukou*, and have close connections with their acquaintances who have the same background (*guanxi*) and political capital in Guangdong. Urban *hukou* is still important for the older generation to help their children to study in a key primary and secondary schools, and private universities. Fong (Annie’s mother) told me that her urban *hukou* has allowed Annie to study in key schools and a private university. The key schools

teach English in their formal curriculum. The private university has a mission of advancing the internationalization of Chinese quality education while at the same time taking the lead in implementing liberal arts education in China. (Woronov 2008) This private university offers a number of unique features. First, it is an internationalized school with unique educational approaches blending elements of Chinese and Western educational models. Second, it provides small-class teaching and numerous extracurricular activities. Third, English is the primary medium of instruction. Four, it emphasizes the importance of education, critical/creative thinking and the balance between study and extra-curriculum activities. Most Chinese new middle class parents who do not want their children to be exposed to political propaganda are also impressed by the flexibility offered by private universities.

Fong was taught by her colleagues to invest wisely so she has started to invest properties as well as shares. At the same time, her middle class acquaintances who are professionals, cadres or even entrepreneurs in China can help Fong if she needs some sorts of helps to educate or nurture Annie. She is aware that a degree from the publicly-run universities will not help Annie find a good career. Annie got a high GPA at my previous private university. Fong decided to let Annie study abroad. She did a lot of data collection, sought help from her ex-colleagues in the government, and consultancy agencies in Guangdong while Annie was studying in year one. Finally, Fong gave RMB100,000 to the agencies which guaranteed that Annie could be able to get a place in one of top 50 universities in the USA. If she failed to get an offer, the agent would refund the money. Finally, in September 2010, Annie was able to attend a prestigious university in the USA.

Similar with Annie, Raymond got an offer from New York University in the USA in 2010. His mother, Yan, had a back-up plan. Yan has very broad connections with professionals, cadres, and entrepreneurs. If Raymond cannot find a job in the USA, it is better for him to work in China earlier. Otherwise, once Yan retires, her *guanxi* will fail to provide any inroads. She revealed that some graduates from Fudan University (the best university in Shanghai) could not even find a job. She is anxious about her son's future. "*Guanxi* is considered significant in future job-seeking. Thus, even if they earned a PhD from a very good university in the USA or even China, it is hard for people to get a good job" without *guanxi*. Raymond echoes his mother's concerns and follows her plan. With her mother's back up plan, he is at ease. At least, he does not need to worry too much. The middle class children prefer working in the USA. But if they fail to get work in the USA, they still have connections to get a job in China.

The above conversation illustrates that the older generation of the Chinese middle class cultivate their social networks derived from *danwei* and *hukou* to help their children maintain their middle class status. The younger generation of the Chinese new middle classes show characteristics of a "post-communist personality". (Wang Xiaoying 2002; Faure 2008: 476) To prevent any possible demotion along the social strata, the Chinese new middle class resorts to extensive investment in social connections and ways of life, especially to their only child. Most of the middle class children are well-planned, flexible to change, individualistic, ambitious and aspiring in their career planning. Losing "face" is a concern deeply ingrained in Chinese culture. They try to find a good career in order not to ruin both their family and individualistic trait.

The parents of the young generation invest heavily in their children: a considerable amount of money is often reserved exclusively for their children's future. Meanwhile, some of the Chinese students already abroad may try to get some international work experience (as well as to cope with living expenses). With that kind of overseas work experience, the returnees become much better positioned to get hired back home and more likely to be in the pipeline for promotions, more so than local graduates. From my case study, some middle-class parents even invest money on their daughters to marry rich husbands in the future. As a typical example, they bought first class air tickets so that their daughters have greater chance to meet rich and highly educated men. All this supports the view that the younger generation, who have been educated overseas, are bound to have better life chances than the same younger generation who are locally educated. That, in turn, fuels the need for people to receive an overseas education, heightening the need to succeed in the education system at home and abroad.

## Conclusion

This article examines how the older generation of China's middle class makes use of their cultural and social capital to help their children secure places at transnational higher education institutions to maintain their upward generational mobility and secure the reproduction of their class status. With the expansion of an emerging Chinese new middle class, there is a huge demand for university places in South China. The transnational higher education provides an English-learning environment, critical thinking, and quality education. That attracts many middle class parents to have their children study there. By operationalizing Weberian, Neo-Weberian and Bourdieuan concept of socioeconomic status, sociocultural, and cultural capital respectively, this paper argues that China's middle class parents and their children have absolute positional advantages to receive better education. To counterbalance a credential inflation, they nurture their children to study at transnational universities, and then use these universities as a stepping stone to send their children abroad if they fail to well secure a place in some tier one universities. The private universities, however, are regarded as conspicuous consumption choices rather than an environment for fostering creativity and critical thinking. According to my ethnographic data, education becomes a kind of materialism, consumption, commercialization, class segregation, and distinction. Quality education, at least, should be quantitatively measured in the market, but not by marks and scores. With the expansion of the Chinese new middle class, private education becomes the ascription of class. Thus, to maintain the middle class privileges and status, it is still a process intertwined with cultural capital (education), social capital (*guanxi*), and political capital (cadre).

Further research about the inter-generational mobility could focus on the national level, instead of Guangdong province only. In this research, I provided the local particularities in Guangdong since it is one of the coastal provinces and enjoy more than ten per cent economic growth annually. It has many affluent middle class families. Most of the middle class could afford to pursue transnational higher education if they fail to find a place in tier one universities. It turns out both middle class parents and their children tend to be more materialistic, pragmatic, and utilitarian to get positional advantages to maintain their middle class status over generation. In reality, the aim of quality education (Rosen 2004) to foster creativity and critical thinking is somewhat neglected. Furthermore, research can fill in the

gap to examine what are the meaning of quality education in today's China. Undeniably, the educational development in the 21st century is moving toward a high degree of privatisation, consumption, and commoditization. It is high time for local and central governments to think more about the essence of quality education. Its goal should be to foster moral, and to be allowed to be critical of the CCP as a responsible citizens.

## Introduction

This paper is based on an action research project completed in 2011 and the follow-up actions taken in 2012.

The action research explores the feasibility of setting up an independent learning resource facility for English Language learners.

What prompted us (a team of teachers teaching 12 – 13 year old students) to embark on this was the realisation that students need more practice in language use beyond the classroom. There is not enough time in the classroom to help certain students develop the required language competencies. Something must be done to help them outside the curriculum time. We believe that we could offer our students drill and practice as a way to help more students develop their language proficiency. However, there was a lack of drill and practice resources in the school library and the public libraries. We came to realise that if we can promote independent learning and provide the learning resources needed, we can help more students to develop their language competencies without having to worry about the availability of teachers outside the classroom. There is no limit to what students can learn, as long as they are committed to learn.

Hence, we decided to use action research to determine the answers to two essential questions:

1. How can teachers promote independent learning?
2. What kind of resources can support students in independent language learning?

It is not expedient to examine the English Language results of these students after just seven weeks on the programme, so our research seeks to examine the perceptions of the Year 1 IP (Integrated Programme) students towards the provision of resources for language learning and the implementation of an independent learning programme.

In early 2012, as a result of the favourable findings of the action research project, the independent learning resource corner was set up in the library for EL learners, in our school (River Valley High School) in Singapore. Furthermore, we refined our independent learning programme to help our PAR students to use this resource facility to improve in their language proficiency. PAR stands for Pupils at Risk and it refers to those students who are at risk of not doing well enough to be promoted to the next level. In my school, if students score less than 60%, they are considered at risk.

## What is independent learning?

Independent learning is also known by a number of other terms: learner autonomy and learner independence (Sinclair, 2001). All these terms refer to a concept where learners are involved in their own learning process.

One accepted understanding of learner independence is that it ranges across a continuum (Figure 1). At one end there are dependent learners who have had little opportunity to

develop independent learning skills, and at the other end of the continuum there are learners who are self-directed, self-motivated and capable of learning without a teacher. Good learners will move gradually along the continuum with the help of peers, parents, teachers and appropriate learning experiences.

Figure 1 – The Learner Independence Continuum

Dependent Learners \_\_\_\_\_ Independent Learners

Figure 2 below has been compiled from a number of sources (Holec, 1981; Little, 1991; Dickinson, 1987; Broady & Kenning, 1996; Oxford, 1990; Barnett, 1993) and shows some of the characteristics of dependent learners and independent learners. Most learners would be somewhere in between the two extremes.

<b>Dependent Learners</b>	<b>Independent Learners</b>
rely heavily on the teacher	are self-reliant
cannot make decisions about their learning	can make informed decisions about their learning
do not know their own strengths and weaknesses	are aware of their strengths and weaknesses
think that the teacher is wholly responsible for their learning	take responsibility for their own learning, know about different strategies for learning
do not set learning goals	plan their learning and set goals
will only work when extrinsic motivators such as grades or rewards are offered	are intrinsically motivated by making progress in learning
do not reflect on how well they are learning and the reason	often reflect on the learning process and their own progress

By looking at the characteristics of independent learners from the table above, we can say that independent learning is also synonymous with self-directed learning which is a very popular term in education circles today. The salient aspects of self-directed learning are: ownership of learning, management and monitoring of own learning and extension of own learning.

Self-directed learning is defined as a very broad class of learner-initiated and regulated activities that includes activities other investigators refer to as autonomous learning activities (Thomas and Rohwer, 1986), studying (Anderson & Armbruster, 1984), metacognitive activities (Brown, 1978), self-regulated learning (Corno, 1986), and intentional learning (Bereiter & Scardamalia, 1985)

In other words, self-directed learning activities are activities that are wholly or partly under the control of the learner.

Students are viewed as ultimately responsible for their own learning.

The proper role of the teacher, in this view, is to make it possible and easy for students to carry out this responsibility while refraining from providing students with compensations that make self-directed learning unnecessary (Thomas, Strage and Curley, 1988).

### **What is drill and practice for language learning?**

It is our belief that drill and practice is one of the ways that we can offer our students in learning independently and improve in their language proficiency. However it does not mean the only way. In fact, as we progress in our research, we realise that there are other types of resources that have to be provided for independent student learning.

Drill and practice refers to the structured, repetitive review of previously learnt concepts to a predetermined level of mastery.

“It is evident that the swing, the rhythm, the momentum of sentences built up according to a definite pattern can bring about automatic reactions and produce a habit. It is only to the extent in which control over the mechanics of form is sufficiently automatic to enable the mind to concentrate primarily on function that anything approaching mastery is achieved.” (Shears, 1944)

As an instructional strategy, drill & practice is familiar to all educators. It promotes the acquisition of knowledge or skill through repetitive practice. It refers to tasks such as the memorisation of spelling or vocabulary words. There is a place for drill and practice to develop competencies (Zimmerman and Martinez, 1990). The skills built through drill-and-practice can become the building blocks for more meaningful learning.

In the context of the English Language, it means knowing our language multiplication tables, our linguistic axioms so that the reasoning powers may be freed for the proper goals of self-expression and reflective thinking.

When we provide drill and practice exercises for students in the context of self-directed learning, the students can master competencies at their own pace and in their own time. Furthermore, students are given greater responsibility for their own learning. Ownership of their own learning induces self-motivation and self-discipline which are critical to improvement and achievement.

### **Research Methodology**

First, we have to select a group of students whom we think will benefit greatly from this resource facility. We decided to focus on those who are the average and the weak language students based on the Term 1 continual assessment results (first quarter of the year).

Two students who achieved a B grade in EL (60 – 69%) were selected from each of the twelve Year 1 classes (12 – 13 year old students) to form the B group. Two students who achieved a C grade in EL (50 – 59%) were selected from each of the twelve Year 1 classes to

form the C group. We also included those students who scored less than 50% in the C group. Altogether, forty-eight Year 1 students participated in this programme. The sample size is about 12% of the population.

Resources prepared by the Year 1 EL teachers were organised into three categories. Package B (for B graders) was colour-coded green. Package C (for C graders) was coded red. The orange coded books were reference books for both B and C graders to use, when necessary. These resources were placed in the Action Research Corner in the library for easy accessibility.

The librarian was to help to issue worksheets and answer keys for them to mark and correct their own work. This would help ensure that they did their work first before checking with the answer keys. The students would know almost immediately where they had gone wrong. Encouraging self-assessment was one way used by the teachers to promote independent learning.

A briefing session was organised separately for the B group and the C group. At the session, the teachers shared the purpose, the process and the responsibilities. They had to fulfil at least two hours of independent learning in the library for seven weeks. We wanted to make sure that fourteen hours of work would give them enough time to decide whether they could benefit from a resource facility.

They could choose the kind of worksheets to work on, the areas of language to focus on, and the kind of reference resources to use. They could also decide when to do it, whether to do it alone or in groups, and how much time to spend on learning each session. They could also choose whether to write an essay or a reflection of their progress every fortnight. As for the essay, they could write on any topic. Giving them choices was another way we, teachers used to promote independent learning. Making choices would encourage our students to reflect on their own interests and preferences, and start taking responsibility for their own learning.

At the end of the briefing session, the students had to sign their contracts willingly, confirming their commitment. Since the students were embarking on an independent learning journey, we felt that they needed to be self-motivated and self-disciplined right at the beginning. They had to be personally committed to do it to ensure success. The contract asked for students to set personal goals, to seek consultation with the teacher when necessary, to be self-disciplined and conscientious in completing, marking and correcting their work, as well as to reflect on their progress and make improvements.

As teachers, we understand that leaving them to do everything on their own without monitoring their progress will spell disaster for those who are not totally independent learners. Hence, both Groups B and C had to submit their progress charts and their completed work filed in their colour-coded folders, at the end of every week, including a short reflection /essay once every fortnight. On the progress charts, they had to indicate the kind of resources used and the time taken. Teachers would check their work and sign accordingly.

Based on the progress chart and their essay or reflection submissions, the teachers could then discuss with the students about their progress and offer feedback, encouragement and suggestions to help the students make improvements in language acquisition. In this way, we got the students to set intermediate learning goals with guidance from the teachers. This is a worthwhile exercise to encourage the students to reflect and self-evaluate, thus helping them to become independent learners. An example of this is as follows:

What do I need to improve?	How will I do this?	How and when will I follow this up?
Vocabulary	<p>I will work on worksheet entitled “Easily Confused Words”.</p> <p>I will use the Sadlier-Oxford Vocabulary workshop Level A for the next two weeks.</p>	Next fortnight, I will talk to my teacher about my progress.

At the end of the seven weeks, the students completed a questionnaire. All the Year 1 teachers and the librarian gave their feedback and observations. We also talked to the students informally concerning their progress and their thoughts throughout the whole duration of seven weeks.

### Findings

The results of the questionnaire were collated separately for Groups B and C according to the following areas: benefits gained, range of helpful resources, recommendations of resources for future use, accessibility of resources, procedural convenience, language needs and obstacles faced. Below is a table of data capturing the perceptions of students concerning certain issues.

	Group B	Group C
Accessibility of resources	92%	87%
Value of resources	83%	83%
Recommendation to others	95.8%	91.6%
Obstacles faced	50%	45.8%
Suggestion for 1 hour a week	63%	54%

92% of Group B students and 87% of Group C students found it convenient to use the resources since they were located in a designated shelf in the library with clearly marked labels.

The students were also comfortable with the procedure of completing the worksheets, marking and correcting their own work. However, they needed more explanation for the mistakes made.

83% of both Group B and C students found the resources beneficial, especially in vocabulary learning of a wider range of words and phrases. They were able to distinguish easily confused words and were using them in their fortnightly reflection /essay submissions. They found the in-house worksheets useful because they included the mistakes from their daily assignments and were structured in such a way as to guide them to arrive at the right answers. However, they wanted more resources in grammar, vocabulary, writing and comprehension. When asked about the language skills that they needed more practice in, the majority of the students indicated writing and vocabulary skills.

95.8% of Group B students and 91.6% of Group C students would recommend this resource facility to their friends. They saw the resources as being helpful in improving the needed language skills.

The comments are as below:

“It has improved my English so much and the worksheets are easy to understand and manageable.”

“My English results improved quite a lot.”

“From a D7 I managed to achieve a B3.”

“My English improved by 1 grade.”

Some of them appreciated the cultivation of self-discipline and an independent learning attitude.

“It is quite useful and trains us in self-discipline.”

“It allows us to be more independent in our studies.”

“It is very useful as we can revise and improve our English without the stress of teachers around.”

The librarian made some observations and had this to say: “I had seen the seriousness of the Year 1 students in actively participating in the project. They had shown great initiative and pro-activeness by coming to the library after school (on days without CCA or other activities) and diligently completing the papers prepared for them. It is very encouraging to see these students displaying such a positive attitude in their quest to improve their English and of course the efforts by the EL teachers to set up such a programme for them. On a side-note, I even had students (Year 2/3) asking if they could take the papers for their own practice as well.”

50% of Group B students and 45.8% of students found it difficult to keep to the schedule because of co-curricular activities, homework and tests that competed with the use of their

time each week. However, they managed to make up for it and completed the fourteen hours required for this study.

As such, 63% of Group B students and 54% of Group C students suggested that it would be more manageable to devote just one hour a week to independent learning in the library.

### **Strengths of this Study**

1. The participants were briefed clearly and so they understood their responsibilities. The signed contracts sealed their commitment.
2. All twelve Year 1 classes participated and thus offered a good representative sample.
3. The teachers built certain elements in the programme to promote independent learning such as giving them choices, getting them to reflect on their progress and set intermediate learning goals, as well as involving them in self-assessment. Creating a resource facility without helping them to be independent learners will not bring about positive results in their language learning.

### **Weaknesses of this Study**

1. The resources for the students during this action research were limited because they came from our own collections. The school could not possibly buy them within a short time because of purchase requirements.
2. The students were busy and they could not put in two hours every week. Nevertheless, they did put in the required total of fourteen hours for this programme.

### **Conclusion**

In this action research project, the student participants benefited from using the drill & practice as well as the reference books on their own. They were happy to recommend to their friends at both Year 1 and year 2 levels because they have seen the value of independent learning using these resources.

### **Recommendations**

1. We will set up an Independent Learning Resource Facility for English Language learners in the library in 2012.
2. More resources will be bought, especially those regarding Vocabulary usage and Writing skills. They include both reference books and drill & practice books.
3. EL teachers will draw up an independent learning programme in consultation with the weaker students to address their language needs.

4. EL teachers will provide more learning support for those who may not understand the basis / rationale for the answers. Students can arrange for individual or group consultation with their respective EL teachers.

### **Follow-up Actions in 2012**

All the recommendations were implemented early this year.

To date, our independent learning resource facility for EL learners has 115 titles, covering grammar, vocabulary, writing, comprehension, reference books, graded readers, SRA Reading Laboratory kits and in-house worksheets.

Besides providing more learning resources, we have also refined our programme for weaker language students to help them use these resources. First, we conducted a survey of their language needs. Then we discussed with individual students their learning goals and got them started on independent learning. We still monitored their progress and helped them maximise the use of these resources. We provided consultation for those who needed further explanation for the mistakes made.

We recognise that an independent resource facility should not just be confined to a physical space with physical resources. A lot of online resources have sprung up over the years.

To provide students with more choices and more convenience to meet their language needs, we have enrolled students in a Criterion Programme which is powered by e-rater's<sup>®</sup> automated scoring technology to provide students with immediate scoring and diagnostic feedback on essays they submit. The Holistic Scores are based on nationally recognized standards. The Trait Feedback Analysis focuses on grammar, usage and mechanics; style; and organization and development. This analysis provides both a summary and in-depth analysis of errors in an effort to pinpoint areas that require attention.

We have also introduced to students [www.vocabulary.com](http://www.vocabulary.com) which enables students to create their own vocabulary lists and then to review their lists regularly so that they can eventually use the words daily. We have also helped students to use the interactive resources in the Edmodo app on iPad.

Let me end by sharing with you some of the other online independent learning resource facilities that I have not mentioned earlier and that may be suitable for your students.

The West is currently facing a profound crisis in its educational system whose causes are multiple and complex. A closer look at the phenomenon, however, reveals that the foundations of a particular “ideological” approach merit examination. This paper proposes such an analysis by focusing on a quasi-organic loss of values associated with education, including elevation, emulation, and discipline, that have become so diluted that they are no longer present because they are no longer internalized.

Further, placing students at the center of the system has provoked an inversion in which everything related to work and effort has lost its value. This has been fueled by a consumer society in which marketing, advertising, and new technologies lead to the belief that one need only hold out one’s hand to instantly demand—and receive--the slightest object of one’s desire. This raises the possibility that certain alternative philosophies and paths to wisdom, like the martial arts, might be able to reintroduce common sense and harmony that could contribute to the rebirth of something that deserves to be called education by re-introducing teaching that focuses on cross-cultural communication.

### **I) In Search of Lost Education**

Early in the 2012 school year in France, a number of news items shocked French public opinion. It was reported that students and even parents had committed acts of exceptional violence—both verbal and physical--towards teachers.

The increasing frequency of such incidents in contemporary societies are evidence of the degradation of school environments by constant chatter, rudeness, and incivility.

A variety of public figures and organizations have spoken out in recent years concerning the bankruptcy of our educational systems and a “rising tide of ignorance.” While some international organizations continue to work in favor of “Education First” (the title of a recent United Nations campaign) and governments have created positions such as “Ministerial Delegate For the Prevention of School Violence,” the deep causes of this widespread dysfunction have thus far defied explanation, and the solutions have proven equally elusive. Clearly, Western societies currently face a problem of civilization whose symptoms are profoundly worrisome: As the Ancient Greeks pointed out, when children no longer respect their elders, barbarianism will take over.

Indeed, the transmission of knowledge and of the values linked to it no longer appears to function in our societies. Two statistics suffice to support this assertion: A reported 50% dropout rate in American public schools, and the inability of fully 25% of students entering the first year of *collège* or middle school in France (what we call the 6<sup>th</sup> form or *sixième*) to either read or count.

In fact, we appear to be witnessing a process of de-culturation, in which any trace of formalism is rejected and, paradoxically, education under the present conditions causes a child to be mal-adapted for living in society!

According to the sociologist Edgar Morin, “the new obscurantism (...) has now descended from the summits of culture; it is growing within the very heart of knowledge while remaining invisible to most of the producers of knowledge” particularly in European cultures that have institutionalized this knowledge. Some studies also question the role of mass culture and the exploitation of psychological weaknesses in a consumer society that only obeys the economic laws of the market-place.

From this perspective, in an environment of near-universal entertainment, knowledge has become the object of a “process of destruction” in which teachers are denigrated and compelled to become entertainers, leading to profound impoverishment of their standards amidst complaints that they lack the material means to perform their jobs. Factors cited as contributing to this erosion include competition from television, the Internet, and video games (35% of young people spend five hours per day in front of a screen), as we become increasingly connected to communicational activity thanks to rapidly developing technologies that are widely assumed to encourage violence.

Parents have even been known to raise their babies in front of the television. A study by the French psychiatrist Serge Tisseron has shown that this has the counter-intuitive effect of damaging children’s cognitive development: “without moving and with their eyes glued to the screen, the child learns instability.”

Objections will be raised that, because globalization is complicated, diverse, and coproduced differently, not every culture has been affected in the same way and today’s students develop new virtual abilities and learn to participate in a new collective intelligence through their encounters with intersecting electronic screens.

Are there not deeper causes associated with the loss of meaning in the contemporary world that “offer themselves for reflection,” to quote the philosopher Paul Ricoeur, “under the double sign of growing rationality and growing absurdity”? Is it possible that a particular ideology that banishes taboos and preaches egalitarianism has made possible the slackness that is a major obstacle to the educational process, even if we can also observe a return to discipline? From this perspective, current changes in education include suppressing grading because they are judged to be a means of sanctioning students and no longer as a method for evaluating their progress. Diagnoses and proposals for reform from every political source appear hopeless when education seems simply to have gone missing, even within the family.

What perspectives might be able to help us to rediscover the meaning of the values of education? The section that follows suggests possible inspiration in other cultural traditions.

## **II) Alternative Paths to Knowledge**

Alternative solutions to the problems of education have suggested. One study conducted recently in France has found that young people of Asian origin tend to show higher levels of school

achievement than children of other origins. Among the study's findings are that French-Asian children reportedly do not question the teacher's role as an authority figure. Another interesting viewpoint arises from the controversy surrounding the recent book, *The Battle Hymn of the Tiger Mother*, by the Chinese-American academic Amy Chua. Chua's book explains how the major principles of Chinese education, grounded in the quest for excellence, forbid such distractions as television and video games. The book has been sharply criticized and, it seems to me, misunderstood, by a number of readers who believe that children should in fact have more time for themselves because "as soon as they begin to study that are already tired"!

This is a cultural conflict between West and East, in which two value systems confront each other without mutual understanding: What is perceived as emulation by one side is considered to represent humiliation by the other; authority is denigrated for some, while permissiveness is criticized by others.

This leads to the following question: What paths to better understanding might enable "foreign" experiences to be seen as meaningful and become integrated into Western models of learning? Further, how can the original principles of Western education, which have become dulled or forgotten, become revived by the resources of other cultures that have preserved the means of providing access to knowledge through education?

For students, developing a consciousness that allows them to accept limits and to be naturally attentive goes well beyond an exclusively intellectual approach. These approaches pose particular problems in deeply Cartesian countries such as France. Progress and modernity do, however, go hand-in-glove with certain recent findings in the "sciences of the mind" that are in fact thousands of years old. One example among others worth citing is the creation of The Mind and Life Institute by Francisco Varela in 1987.

One such method that has been proposed focuses on the development of total awareness. Professor Kabat-Zinn's MBSR program (Mindfulness-based Stress Reduction) is based on Buddhist-inspired meditation and has been applied in American schools. The program will be implemented in Japanese hospitals in the near future and has been scientifically shown to improve attention span and concentration. Sports and artistic activities also offer promising potential pathways when approached from such a perspective.

Within these rediscoveries, the martial arts, having accompanied mankind's evolution for so long, hold particular potential, because they are motivated by a philosophy that prizes wisdom and that offers a path towards changing young peoples' awareness or "mindfulness."

*Budô*—introspective exploration—is not easily reconciled with Western tradition. It allows the entire being's resources to become mobilized, transcending the purely intellectual level. A heightened awareness that encompasses the intelligence of the heart engenders a new alliance between the individual and the universe and nature, as well as other interpersonal relationships that go beyond alterity. Describing *aikido*, which I have personally practiced, Georges Brunon has asserted that "we perceive, when we enter into the creative gesture, that a certain approach to the body allows us to transform that which was previously only physical into the corporeal. This

new corporeal self reveals itself to be a dynamic that introduces us to act of creation, an act that applies not only to people whom we call artists but to every one of us.”

The question, then, is whether the gradual progression towards discovery and self-fulfillment offered by the martial arts, as well as contributing to the fulfillment of others (which is somewhat far-removed from the original combat techniques from which it evolved) can offer a path towards love in a society of violence. Conceivably, students and teachers could thereby discover new ways of thinking and a new educational communication by adopting this way of living, transforming the anarchy of information into knowledge and wisdom, and reintroducing temporality that is not a mere artifact of technological “real time.”

For this to take place, however, the teaching of cross-cultural communication needs to be more fully-developed, which would enable students to learn to be open to new potentialities.

Indeed, pursuing the thinking of the anthropologist Edward Hall, we need to bring to light “cultural interfaces” that are indispensable to every authentic exchange, in other words, we must become capable of establishing systems that enable us to be in phase with other cultures. Only in this way can we establish fertile exchanges between East and West, especially in the critical field of education.

Abstracts

This paper shows how to address technological, cultural and social transformations with empirically grounded innovation. Areas in transition such as higher education and learning techniques today bring about new needs and opportunities for innovative tools and services. But how do we find these tools? The paper argues for using a strategy of (user) value innovation that creatively combines ethnographic methods with strategic industry analysis. By focusing on unmet and emerging needs ethnographic research identifies learner values, needs and challenges but does not determine solutions. Blue-ocean strategy tools can identify new opportunities that alter existing offerings but give weak guidance on what will be most relevant to users. The triangulation of both is illustrated through an innovation project in higher education in Germany.

**Keywords:** User needs and values, innovation, learner-centered design, ethnography, blue ocean strategy, triangulation

## 1. Introduction

The reality of university students is in transition. New rules and regulations govern their education. Expectations from industry and society and their own self-image change while emerging digital tools uproot time-tested methods of studying. In Europe the Bologna process fostering comparability in educational standards and ensuring quality of qualifications is only one visible cornerstone of substantial changes driven by trends such as globalization, mobile digitalization, and the knowledge economy. All stakeholders are being affected: Far from their old image of ivory towers, universities struggle to cope with the mass inrush of students. Still holding on to the Humboldtian model of unity between research and teaching, teachers are torn between their own scientific curiosity within an overwhelming body of knowledge and the demand to deliver innovative approaches to teaching and learning. Students are often overstrained by requirements resembling those of corporate managers but without having the resources and tools that professionals use. The scope and multitude of these transformations explain why educational technologies have struggled to keep up with providing the best potential support to students and professors. All this demonstrates the need for innovative tools and services outlining a new field for innovation in the higher education domain. But how can we support learners in dealing with the transformation in the educational systems and media landscapes? How can we grasp and specify opportunities for innovation in such a transitory field?

While numerous ways have been proposed to generate ideas at the fuzzy front end of innovation management and to position new products in a market, what is lacking is a consistent perspective on the theoretical and operational links between them. We suggest that the notion of value may provide such a theoretical perspective and a consistent anchor for the different activities involved in innovation. Our argument is based on the assumption that it is the purpose of business to create value for people and society. What is of value to individuals and to cultures, however, changes in eras and areas of transformation, like those currently taking place in domains like the financial systems or higher education. A profound understanding of what is of value at a given historical moment is required to create relevant value propositions and enable sustainable new business. In order to comprehend what is valuable to people we need to understand their needs and their values.

On a theoretical level, we contrast different notions of value and propose an integrated concept of “value innovation” in order to create solutions that are both, valuable and relevant as well as novel, innovative and different. Value innovation combines user-centered with market-strategic approaches in order to create substantial new value for users by serving new or insufficiently fulfilled needs or by supporting inadequately supported values. Ethnographic research is good at identifying learner needs, desires, values and challenges but cannot define which solutions are viable. Blue-ocean strategy techniques are able to identify new opportunities from existing offerings but can only provide weak guidance on what will be truly relevant to users. We illustrate our suggested approach of creatively combining both approaches through a recent innovation project in learner centered design in Germany. The project on learning management tools and services demonstrates how the triangulation of both approaches can help to generate qualified product ideas and maintain focus throughout innovation projects.

## 2. Value innovation in learner-centered design: Related works and theory

For laying out our thoughts on value innovation we build on scholarly work on learner-centered design (e.g. Breuer & Matsumoto 2011), ethnographic explorations of customer needs, and grounded innovation theorizing (Breuer & Steinhoff 2010).

A key role is played here by the **notion of value**. Often in discussions in economic or business contexts the notion of value refers to monetary value or price, what Marx had called exchange value, and is closely linked to profit considerations. Yet in our discussion on value innovation we understand the term “value” to refer to the value that products have or create for the user outside of its exchange value – how valuable it is for them in their use or in their life. There are several ways, however, in which a product can have value for users (Boztepe 2003). Of interest here at least three: products can be valuable because they have utility, because they fulfill people’s (emotional) needs, or because they support their values (note the distinction here between “values” and “value”). We argue that in order to be successful, value innovation needs to take seriously the latter two meanings of value.

The most common view of value when referring to use, points to a product’s utility, its practical purpose and functionality. Accordingly a wide-spread strategy for developing new products is making them useful in new ways or enabling new uses. Along these lines, in the Marxist tradition use value refers to utility and the physical properties of a product in use (Marx 1962). Marx pointed out that in order to create use value the producer had to imagine what is useful to people and build that into the product. This imagining of usefulness is not a trivial task, however, and Marx did not specify how to determine what is useful, nor did he move beyond a quite practical but somewhat limited understanding of use and usefulness. Baudrillard (1991) later criticized Marx’ “naturalistic phantasm” of utility value and complemented the functional dimension with a symbolic dimension of products, which are not only appreciated for what they do but for what they signify, resulting in their sign value. This way Baudrillard emphasized the importance of an understanding of value that includes emotional, social and identity-related aspects beyond purely functional ones.

We believe that a forward-looking understanding of user value needs to move beyond utility and pay attention to people’s needs (especially their emotional needs), and values. Although the attention in the business world to customer need fulfillment has been growing in recent years, this perspective is far from a given and there are still a lot of innovation attempts that fail by failing to serve people’s needs. Yet while needs are on the radar of companies at least to some degree, the value of supporting customer values and goals has received less attention. A notable exception is Schrage (2012) who demands that product innovation should not only address customers’ needs but also their desired futures – answering the question who customers want or need to become. Therefore it is important to analyze their personal, communal and cultural values. The distinction between needs and values may be worth pointing out. Needs always refer to a lack; they are experienced individually and often emotionally as part of a mental state of being. Values in contrast are directions for human action by pointing to ideals. They do not just belong to one individual, rather they are shared by cultures or communities or social groups, and like needs are not always conscious. Values can motivate and guide needs, preferences, wants and goals of people, and influence the interpretation of needs as well as decision making.

A focus on both needs and values is especially crucial when innovation is planned for domains in transformation, as it is the case in our example of digital learning tools or techniques in higher education. Change, whether it is technological, social or cultural, often changes existing or generates new needs and values. The task and opportunity for value innovation lies in uncovering and addressing these shifting and newly emerging needs and values. In short, a comprehensive notion of value innovations should recognize and include the value created by fulfilling people’s emotional needs and by supporting or promoting their values, in particular if applied to shifting everyday practices, social domains or technological fields. In order to involve customers to help create value

and to inform the innovation processes companies (or administrations) have employed a range of structured approaches, from traditional market research to advanced user studies.

In recent decades especially **ethnographic research** has become a preferred approach to see the world from a customer point of view, by studying them in their natural habitat and by using observation and participation as research techniques in addition to conversation and interviews (Atkinson & Hammersley 1994). The key reason for the growing attention to ethnography in commercial contexts lies in its promise to enable the creation of value for customers and thus ensure the relevancy of new products, services and marketing activities.

The characteristics and specific qualities responsible for the claimed success of ethnographic insights have been widely discussed in the last decade (Sutherland & Denny 2007, Cefkin 2009, Jordan 2002, Mariampolski 2005, Bockhahn & Schwarz 2010): Ethnographic insights are seen as more real and more true to the actual way people behave, think and make decisions than other methods. They are seen as going further and deeper than traditional market research in that they capture not just the rational but also the emotional side of people's experience and their interactions with the world. They are seen as less reductionist since they see people as part of social and cultural systems rather than simply as individuals with independent behavior. Finally, ethnographic insights are seen to capture not just behavior and opinions but moreover uncover intangibles such as e.g. needs and problems, fears and hopes, ambitions and values of people. In short, ethnographic research has been established as a source of deep insight into why people behave the way they do and what they intimately wish and need.

Yet such a rich and deep understanding of customers' needs does not per se lead to novel and innovative solutions. But we argue that ethnographic inquiry can encourage new ideas, for one due to its exploratory nature. In contrast to hypothesis-based research or testing methods, the open mind approach of ethnographic practice leaves the door open to findings and observations that are not pre-defined, anticipated or expected and therefore carry the potential to be surprising and new (Lindlof & Taylor 2002). Yet more importantly ethnographic research can **facilitate the development of new solutions in at least four ways**: by focusing on unmet needs; by concentrating on latent or hidden needs, values and motives; by aiming at newly emerging needs and desires; and by paying attention to workarounds.

First, focusing on unpacking people's needs that are currently not or not sufficiently met, the product opportunities defined by these needs are by definition not already filled by existing products. If the right offerings were already available to customers these needs would not remain unfulfilled. For reasons ranging from a lack of knowledge, accessibility, availability, to a poor overall configuration of products, the unmet need indicates openings for an innovative product offering, communication or distribution system.

Second, by uncovering latent or hidden needs, problems and values, ethnography increases the likelihood to discover new or untapped opportunities. If needs or values are hidden they are not easily discovered by traditional research approaches and thus are probably not yet part of the public discourse and general awareness. Invisible cultural patterns and taken for granted cultural beliefs and preferences are unknown to most people. People also do not always have access to the emotional drivers underlying their own decisions; rather motives tend to get rationalized after the event. Finally, people's ideals and impression management often obscure the reality of their lives and selves, not only to outsiders but also to themselves. By not solely relying on what people consciously

articulate but rather by utilizing nonverbal cues, material artifacts, situational contexts and actual behavior and taking seriously seeming contradiction, ethnography may both circumvent the impression management of people and unpack hidden drivers and motives.

Third, investigating newly emerging needs and desires is likely to point towards new opportunities that can lead to novel solutions. Needs change in accordance with societal structures, cultural practices, and new means of satisfying needs. New needs surfacing in a situation of cultural or social transformation and technological change are different from existing and established needs, and so must be the solutions designed to address them. For instance, the unfolding needs and desires of students, who find themselves in an environment with heightened expectations on their performance and defined by a challenging mix of analog and digital learning tools and techniques, tend to resonate with this unique situation and cannot be served with old solutions, products and services.

Fourth, by paying attention to everyday practices and routines, ethnography frequently finds workarounds that people use. These are ad-hoc, improvised and often personal strategies that people employ to reach their goals in the face of challenges or in situations lacking established solutions and existing products. Sometimes workarounds carry the seed for the type of solution that is required. When a mother tapes her phone to the baby stroller so that she can write text messages while pushing her child, there is a cue to a potential design solution. Like the inventions of lead users, workarounds found by ethnographic research can provide interesting pointers towards innovative solutions.

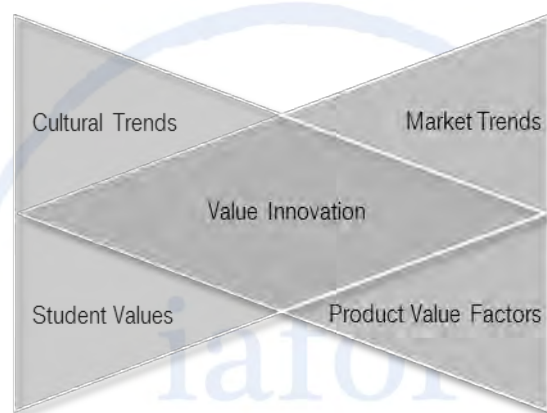

In sum, a focus in ethnographic research on unmet, hidden and newly emerging needs, motives and values and on everyday workarounds may guide the search for new solutions into new and uncharted territory. Yet, despite directing a guiding light into untapped directions and offering some inspirations for solutions or user requirements, an ethnographic approach cannot pre-determine these solutions, guarantee their novelty, and ensure their potential for business. Other techniques must complement the ethnographic approach.

Particularly, in order to turn ideas on potentially valuable solutions into an innovation on a marketplace knowledge of this marketplace is required. Strategic approaches like **blue ocean analysis** (Kim & Mauborgne 2005) aim at such an understanding of the strategic market value that new products and services can capture. Referring to the renewal of corporate strategy rather than to incremental innovation in established business Kim & Mauborgne (2005, 218) remark that “value innovation is about redefining the problem an industry focuses on rather than finding solutions to existing problems”. Putting a notion of (buyer) value and a focus on non-incremental innovation into the center of attention blue ocean analytical tools and frameworks suit to the attempt to drive innovation based on empirical customer values.

It is important to point out the differences between our concept of ‘value innovation’ based on real customer insights and the notion of value innovation on a corporate strategy level used in the literature on blue ocean strategy. Kim & Mauborgne (2005) discuss value innovation as strategic renewal impacting the corporate activity system rather than innovation in the sense of new product development. Their concept focuses on the notion of exchange value as discussed above, and defines value through the alignment of innovation with utility, price and cost positions (2005, 13) and distinguishes between buyer value and company value. As buyer value is comprised of utility and price of a product, and company value is comprised of price and cost structure both may be remodeled in order to create or enter into an “uncontested market space”. Trying to transcend established market boundaries and industry structure blue ocean strategy remains related to both as

defined by the competition on the rather macroscopic level that is closely related to business model innovation. While such market analysis can identify potential new markets, the relevancy of the assumed, the potential real values for users, cannot be determined by it.

Combining market analysis and ethnographic approaches through the notion of value, in this paper we follow a user-centered and learner-centered paradigm, in which value is defined by the user or learner. The **value proposition** links business to the existential needs and motivations of different groups of people, and thereby the existential reason for the whole endeavor, the job to be done. A value proposition not only describes the functional utility, or what something can do, but also implies personal needs and values. Value innovation then refers to the empirically grounded development of new and relevant value propositions. Value innovation in our understanding is based on functional, emotional and symbolic user needs and values, backed up by cultural trends, intersecting with novel product value factors (functional, emotional and symbolic ones) backed up by market trends.

**Figure 1.** Value Innovation is based on an understanding of user / student values (backed up by cultural trends) intersecting with new product utility factors (backed up by market trends).

### 3. Methodology for identifying a potential value innovation

Based on this understanding of value innovation we suggest the following methodological approach within fields of cultural transformation such as today's higher education domain.

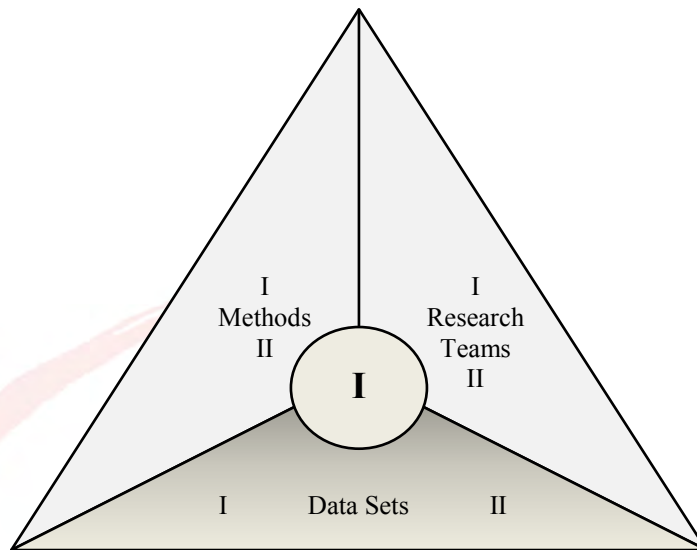

- A deep immersion into the world of the customer through ethnographic methods.
- Competitive analysis and contrasting market boundaries based on desk research and expert driven business modeling.
- Triangulation of both perspectives supports the creative generation of qualified product ideas and value propositions that also allow to maintain focus throughout innovation projects.

Immersion into students' lives is meant to yield insights into the nature of learning activities and challenges, reoccurring routines, obstacles, workarounds and problems as well as unfulfilled needs and values. **Participant observers** of students focus on unmet, hidden and newly emerging needs, values and motives and pay attention to workarounds in order to lay the direction for potentially novel perspectives and solutions. In order to do so it may be important to observe students in key learning situations, individual and social ones, in their homes and at other learning locations; to explore both digital and analog ways of studying, organizing material and note-taking etc.; and to

investigate what it means to be a student today more broadly. In order to analyze the current market **desk research** may proceed top down starting from global trends (such as the trend towards lifelong learning or the increasing importance of peer learning), or bottom up looking up relevant keywords in order to retrieve inspiring cases in terms of new products, new business (e.g. startups and corporate ventures) and emerging platforms and ecosystems. Most interesting cases may be shortlisted based on criteria such as e.g. market reach, novelty, time to mainstream adoption and attractiveness of the business model being pursued.

Looking into a specific market or product category (such as learning-management systems or digital textbooks) competitive factors of existing offerings represent the dimensions on which products within this category compete, e.g. the price or feature range or editing capabilities of a digital textbook. In **blue ocean strategy** a “value curve” is used to depict corporate or product scores on the main competing factors. The value curves of competitors are used to identify potentials for variation and extension. The so-called “four actions framework” promotes four kinds of variation to the main competing factors within an industry in order to generate a new buyer value curve. Variation eliminates, reduces or raises factors below or above the industry’s standard or (in line with our approach to identify empirically grounded value innovation) creates new factors. It aims at increasing buyer value by optimizing utility and price, and to increase company value by optimizing price and cost structures (Kim & Mauborgne 2005, 17). The identification of new competitive factors plays the decisive role in the attempt to create substantially new value for users. Several methods may be applied to identify new and unique product factors (such as a learner-centered modularity of content organized around learning goals in the case of digital textbooks). The ethnographically grounded approach to value innovation bears the greatest potential to introduce new product factors to blue ocean analysis based on a profound understanding of changing values of individuals and society. Such understanding is a sound basis for knowing which factors to eliminate-reduce-raise-create, and for knowing why to do so.

**Triangulation** makes it possible to scrutinize a problem from various sides in order to validate results and enable a broad understanding from multiple angles. The methodological and data sets triangulation suggested here can be also complemented by a triangulation with respect to researcher. According to Denzin (1970) researcher triangulation involves different researchers during observation or data analysis. It is based on the assumption that participation of more than one researcher can mitigate the problem of conflicts of interest that may appear if it is the same researcher who both formulates a theory and empirically examines its research results. Also, different skills and backgrounds on behalf of different researchers may enrich the elaboration of results.

**Figure 2.** Triangulation of methods (I ethnography and II blue ocean), research teams (I anthropologists and II market researcher) and data sets (I on student life and values and II market state and benchmarks); results are synthesized in workshops aiming to find ideas for value innovation through interference of diverse knowledge types.

In this case, triangulating an empirically grounded understanding of learner values with knowledge about alternative market positions creates a productive foundation for identifying qualified ideas for new value propositions and offerings. Doing so still requires a vivid confrontation of different perspectives and (implicit and explicit) knowledge. The typical format for this is a workshop where carefully selected representatives bringing to the table different kinds of knowledge interact in a live environment. A moderator and group exercises push participants to take their thinking off the beaten tracks of convention. Shifts in perspective are further encouraged through external participants, a thorough preparation and utilization of instructions and media, and specific communication techniques like ad-hoc visual documentation of discussions. Such an interactive environment of changing conditions aims at helping the actors generate new knowledge and ideas.

#### 4. A Case on Learner-Centered Design

As an illustration for describing the approach and methodology for identifying a potential value innovation we use a recent innovation project in higher education in Germany. The project had the goal to identify potential new learner-centered tools and services for university students with high business potential. As suggested above, three different research methods were applied and combined to achieve a broader and deeper understanding of the topic at hand: Ethnography, desk research and blue ocean market analysis. The ethnographic part and the analytical part were each performed by two different research teams from different service providers, one specialized in market analysis, the other in ethnographic research.

##### 4.1. Ethnographic research setup and results

One of the main challenges was to capture the broad variety of today's students' learning activities interests and values – and to find corresponding participants. Our sample contained 11 students between 19 and 27 who studied in or around Berlin, Germany. We strove for a balance between

female and male, freshmen and advanced students, and students from different disciplines (law, business, and social sciences & humanities). The context and content of learning, learning techniques applied, as well as learning problems and needs differ widely depending on the discipline or desired degree. We wanted to understand not just learning activities in a narrow sense but also the organization of university life including issues like time management and collaborative learning.

The ethnographic research had two parts: participatory observation with ethnographic in-depth interviews followed by self-observation with online diaries. The observation aimed at understanding students' daily routines and different learning situations in order to identify latent, unmet or newly emerging needs and problems. Researchers participated in lectures and seminars, accompanied the students to study groups or library visits. The observations usually took two to three hours and were followed by a three-hour semi-structured interview in the student's familiar environment, usually their home. The interviews were designed to explore students' motivation, their social interactions, their learning behavior and strategies, the digital and analogue tools they used and student life in general. The second research part consisted of a five-day online diary. Students were asked to describe their learning activities, the use of digital and analogue tools, and potential problems and challenges. They were also encouraged to describe their motivation, dreams and ambitions by using pictures and short texts. The self-descriptive data helped to enrich and put into perspective the insights gained during field research.

The results were analyzed in a ten-day process of identifying patterns in the data collected and subsequent insight development. One result, for example, revealed that most of the students were struggling with time problems. Due to increasing study and difficulties to efficiently manage the time, nearly every student complained about running out of time and time pressure. Literature research, for example, appeared to be an especially time-consuming and costly activity. One of the students complained about finding and getting literature: "I usually dedicate my Saturdays for searching for books, getting them, going through them and copying the chapters we need." Other students reported on their struggles with limited access to online books and journals, especially from home, difficulty in assessing which article or book is worth reading, lack of overview and centralized control over different lending sources and costs caused by purchasing articles and lending fees. The observations also revealed some workarounds such as for instance checking reviews in Amazon before lending a book in order to save time.

More specifically, ethnographic research and analysis led to four different need or value clusters:

1. "Quality of learning" was reflected by students' complaints about poor quality of educational materials and a lack of support when needed. The cluster also refers to students' concerns about the quality of their education and their needs for effective learning techniques, from note taking and marking up digital content to understanding and memorizing content.
2. "Motivation" illustrates students' needs for motivational support during the semester and the whole period of studies, their wish to sweeten study activities through little rewards and pleasures, their strong desire for feedback on learning outcomes, and their need to assess labor and time investments and progress in knowledge and skills.
3. The "efficiency" cluster describes students' need to manage time and organize learning activities efficiently in an environment free from distractions. This includes the need to coordinate group activities and exchange insights and materials, also easy literature searching and quick access.

4. “Productivity / organizing” deals with students’ need for easy-to-use resources, well organized and managed study material, a flexible move between analogue and digital material, as well as ubiquitous but one-place access.

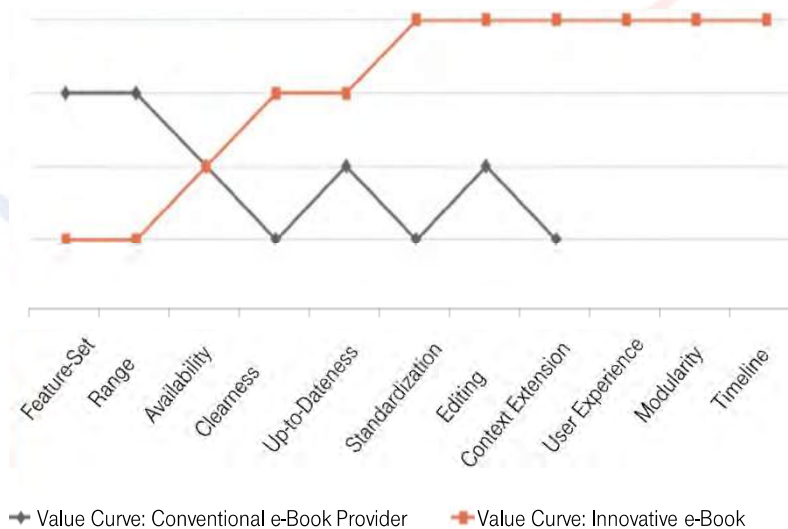

These results were then explored in a concept workshop with the goal to develop product ideas based on the obtained student needs.

#### 4.2. Desk Research and Blue Ocean

In order to understand the educational market and educational trends a comprehensive desk research was conducted based on a wide screening of relevant publications and start-ups in the field of education. It identified a number of socio-economic and technological drivers, such as a growing demand for education and reorganization of knowledge, to name just a few. Based on these drivers six key educational trends were derived. Examples include:

- Open education: the growing amount of teaching content online and learner-generated content available (Breuer & Matsumoto 2011),
- Edutainment – implementation of game mechanics in processes of learning, and
- Enriched content – integration of audiovisual interactive and social media elements into traditional content formats.

Some of the trend fields that resulted from desk research (e.g. enriched digital content) were selected for close examination. A blue ocean workshop was designed to identify various value curves of brands and products in order to distinguish the potential new business from its competitors. Creative sessions involving “learning from other brands” and “brainstorming with megatrends” revealed competitive factors for developing an innovative learning management system e.g. based on an increase or creation of flexibility, openness, personality development, emotions, fun and world of experience. Informed by the trend of *enriched digital content* and the empirical student need to quickly assess and find suitable literature, the attendees created new ideas for modular digital textbooks such as the concept of “Digital ConText Book”.

**Figure 3.** The value curve depicts corporate scores on the main competing factors of digital content providers.

Its modular structure allows to focus on educational content and learning goals. Students can purchase and work with relevant parts of a publication and do not have to buy an article or a book as a whole. They can also subscribe to topics they are interested in to get content from different journals, papers, single chapters of a book. In addition, learning materials, learner-generated content and documents can be matched to one's personal learning progress. Students can view and edit content that is created or organized and validated by a lecturer. The idea of a "Digital ConText Book" satisfies different needs identified through ethnographic research, e.g. the need for easy literature searching and access from different work locations. It offers efficiency that do not exist on the market yet and an added value by guaranteeing high quality of materials, providing flexibility in note taking and text marking, and allowing feedback on the progress in knowledge and skills, thus providing for a sense of overview and success.

#### **4.3. Synthesis**

Due to integrating the two perspectives of ethnographic research and blue ocean analysis the obtained results enriched and encouraged each other. On the one hand student needs and values, desires and problems described above could not be identified through desk research or blue ocean strategies but rather only through a deep immersion into the students' worlds by using ethnographic methods. On the other hand ethnographic research cannot yield an overview over the educational market, its competitors and market niches. Only in combination can the derived ideas create a new market and meet customers' needs at the same time. Results of each methodological approach have not only enriched each other but also encouraged the project teams' assumption that the search field of higher education bares substantial and qualified business opportunities. These are based on uncovered customer values and needs and may be served by an industry that currently does not provide them.

#### **5. Conclusions**

We described a green-field approach on how to drive innovation in user- and learner-centered solutions based on an empirical understanding of student values, needs, and requirements (e.g. in terms of efficiency and time-management). Ethnographic results and a clear understanding of the strategic market position based on extended value curves informed strategic decisions and specification of propositions. Novel solutions were generated e.g. providing enhanced contexts to learning materials. Encouraged through their participation in the discovery of real user needs, values and strategic options the business owners gained sufficient confidence in the concepts to invest in their development within a newly found business unit. First patent applications are underway. Their specification, implementation, marketing and validation in the marketplace are work in progress. Future review must show if a potential success of propositions may be traced back to these value-based concepts. So far, understanding user values, needs and desires, and strategic market analysis already created the indispensable basis for the attempt to develop new and relevant products and to establish sustainable business.

#### **Acknowledgements**

Many thanks to Gregor Erkel and Friedrich Kurz for enabling the project and for contributing essential ideas. They are working hard to turn these ideas into reality. We also thank our colleagues from User-Driven Innovation at Telekom Innovation Laboratories, Trommsdorff & Drüner, and Point Blank International for their support.

Abstracts

It seems that humour plays a vital role in our everyday social encounters which is rooted in a cultural context of a specific community. Humour is estimated to comprise almost one-half of the total nature of human life (Koller, 1988). In other words, our total life experience is inextricably bound up with humour. Living in the age of mass communication and media development, it is even becoming of more outstanding significance in recent translation studies. However, choosing the most natural and applicable strategies for a better transfer of humour from one language into another is indeed a challenging task for translators. Humour translation differs from other types of translation since it requires more intricate strategies (Vandaele, 2002). This can be a reason that humour translation has been rarely done from English cartoons into Persian and has even been more neglected in the field of subtitling. Accordingly, this paper attempts to investigate the strategies employed by Persian translators while translating humour in English cartoons and to identify which strategy is mostly applicable. To this end, twelve broad translation strategies were borrowed from Newmark (1988) and their implications were discussed in detail. Furthermore, the materials were selected from three American cartoons, namely 'Barnyard' (2006), 'Ice Age 1' (2002), and 'Shrek 1' (2001). After analyzing the data, it was concluded that the most frequent strategy employed by Persian translators was 'synonymy'. The findings of this research could be beneficial for translators, translation students, and companies providing subtitles.

**Key words:** humour, cartoon , subtitling , translation strategies , synonymy

## Introduction

“Humor is not a feeling but a philosophy of life” (Wittgenstein, 1980, p.78) . It is an inseparable component of any language which seems to be one of the most defining aspects of humanity (Palmer, 2005) . Humour is also considered as a vehicle for mass entertainment since it is served for the purpose of pure enjoyment, sheer exhilaration and a moment of laughter which are among the primary effects of any humorous discourse. Thus, it plays an important social function. Until the last quarter of the twentieth century, the media was mostly restricted to newspapers but with the ascendancy of television as well as the Internet, they could establish themselves in a position of cultural dominance throughout the world. Nowadays, television provides numerous entertaining programmes replete with humour as the most prominent element.

Humour can be vividly touched in most cartoons. In fact, cartoons are considered to be the prototype of a humorous discourse since they are often associated with humour. Although cartoons are relatively young in terms of their history of the mass media, they are comprised of many intricate aspects. When it comes to the area of translation, they manifest such intricacies even better. In other words, they resist translation or at least make it rather difficult to tackle with . The difficulty of humour translation is not exclusively reliant on words for when a cartoon is watched by an audience who is not acquainted with the cultural properties depicted in the scene , even if the words are meaningful , incomprehension may appear . This highlights the fact that any translation including humour is in direct interaction with culture. Indeed, “cultural formation mediates every stage of translation process” (Faull, 2004, p.34) . Translation is more like a negotiation between two cultures, a transaction between two languages (Pierre and Kar, 2007). One perceives the world from the window of the culture of his or her own community.

Humour translation in cartoons can be even more challenging in the area of subtitling. In fact, subtitling is a unique form of translation which is quite different from other types. While watching a subtitled cartoon, most viewers are unaware of the complicated process the translator has carried out. Subtitling imposes a variety of translation constraints and limitations on translators, out of which one can mention the constraints of time, space, and shortening or reduction. Moreover, there are a number of qualitative and quantitative changes which should be taken into consideration in subtitling (Gottlieb, 1992). All these constraints challenge the translators’ potentiality to render an appropriate translation. Translators may be easily lost in the process of translation when coping with the SL limitations and TL demands.

Considering the aforementioned points, one could probably mention that the big problem here is how translators fill the gap in translating the humorous elements from the source language into the target language and what is the most frequent strategy in order to do so.

Although humour translation seems to be a complex and multifaceted domain, there is a great volume of literature on humour and the translation of it. Indeed, different scholars have demonstrated different translation strategies for a better rendition of humour from the source

language (SL) into the target language (TL), for instance , Freud (1991) has provided a summary of the existing strategies , including ‘condensation’ , ‘multiple use of the same material’ , and ‘double meaning’ . Gottlieb (1992) has also presented a set of other strategies, namely ‘expansion’, ‘paraphrase’, ‘transfer’, ‘imitation’, ‘transcription’, ‘dislocation’, ‘condensation’, ‘decimation’, and ‘deletion’. Moreover, according to Vinay and Darbelnet (1995), there are two broad methods of translating, namely ‘direct/literal’ and ‘oblique’. These two categories include seven strategies which are ‘borrowing’, ‘calque’, ‘literal translation’, ‘transposition’, ‘modulation’, ‘equivalence’ and ‘adaptation’. Furthermore, Jaskanen (2001) has divided the translation strategies into three classifications of ‘exoticization’ or what Toury (1995) called ‘adherence to source norms’, ‘naturalization’ and ‘neutralization’. And finally, Chiaro (2004) has proposed five different strategies for the translation of humour on screen which are as follows:

- “1. Leave the VEH (verbally expressed humour) unchanged .
2. Substitute the source VEH with a different instance of VEH in the TL .
3. Replace the SL VEH with an idiomatic expression in the TL .
4. Replace the SL VEH with an example of compensating VEH elsewhere in the TL text .
5. Ignore the VEH altogether” (p. 45) .

However, it should be noted that their suggested strategies are not exclusive of humour translation but rather of any type of translation including humour as well.

Furthermore, the study of humour translation by Persian translators seems to have been highly neglected .To date, no studies have explored the existing translation strategies adopted by Persian translators in order to render humour elements.

Moreover, research involving humour translation has traditionally focused on the translation of books. To the best of the author’s knowledge, only one study has explored the translation of humorous elements on screen (Chiaro, 2004).

Therefore, this study will fill this gap by conducting a qualitative method on the very issue to find out what are the existing strategies in order to translate humour elements from the SL into the TL and to identify the most frequent strategy adopted by Persian translators. The researchers deliberately chose such a topic in the hope of providing some guidelines for students of translation as well as the educators as the stakeholders of the field.

## **Methodology**

The material required for the purpose of the present paper was collected by analyzing the Persian subtitles of the three American cartoons namely ‘Shrek 1’ directed in the year 2001 by Andrew Adamson , ‘Barnyard’ directed in the year 2006 by Steve Oedekerk and ‘Ice Age 1’ directed in

the year 2001 by Chris Wedge and Carlos Saldanha. The reason for choosing these three cartoons from among other numerous ones was twofold. Firstly, the existence of a large number of humorous instances that can fit into the framework of this research. Secondly, the use of animals instead of humans as their main characters which also brought about a kind of laughter for the viewers.

In order to reach the purpose of the study, a step-by-step procedure was followed. First of all, each English sentence containing humour both at the cultural and linguistic level was extracted from the original cartoons and was then compared with their subtitles in Persian. Second of all, the translation strategies employed by translators were studied. Finally, the most appropriate and frequent strategy used by Persian translators was identified.

### **Theoretical framework**

The theoretical framework of this research is the one proposed by Newmark (1988) since he has provided a detailed analysis of the areas of translation and culture which leads to a better understanding of this domain. More importantly, Newmark (1988) has discussed the possible strategies in the area of culture in a very narrow sense and this is also a great help to study

humour translation which is rooted in a specific cultural context. Indeed, he has proposed twelve different strategies according to the following definitions:

**Transference** : The term refers to a process in which an SL item is brought into a TL, but with an SL meaning which commonly happens when TL has no proper equivalence for an SL item and thus 'borrows' the item due to cultural, geographical, or linguistic reasons.

**Cultural Equivalent**: In this strategy, an SL cultural item is translated by TL cultural item. The translator attempts to provide a substitution in the TL culture which can get near to the concept as much as possible.

**Literal Translation**: An SL word, phrase or sentence, as a translation unit, is translated into a TL word, phrase or sentence without breaking the TL syntactic rules.

**Neutralisation (Functional / Descriptive Equivalent)** : This strategy requires the use of a culture free word and therefore neutralizes or generalizes the SL item.

**Naturalisation** : The SL pronunciation is converted into normal TL spelling. In other words, the SL word is brought into the TL text and the writing is adjusted to its writing system.

**Synonymy**: When the translator is unable to find the exact equivalent, he selects the synonym which is a near TL equivalent to an SL word.

**Couplet:** This is a strategy when the translator adopts using two procedures at the same time.

**Translation Label:** It is an approximate equivalence, usually for new institutional terms.

**Through Translation:** It is known as ‘calque’ or ‘loan translation’ and is used for the name of institutes, organizations and common collocations.

**Paraphrase, Gloss, Notes, etc.:** In this strategy, the meaning of the SL item is explained. Also, gloss is a kind of translation strategy in which the translator attempts “to reproduce as literally and meaningfully as possible the form and content of the original” ( Nida , 1964 , p.159 ) .

**Deletion:** It happens when an SL item, as a translation unit, is dropped in the TL text. To many scholars, it should be regarded as a last resort. However, Baker (1992) stated that “If the meaning conveyed by a particular word or expression is not valid enough to the development of the text, the translator can omit translating the word in question” (p.1).

**Componential Analysis:** The meaning of words is broken down on the basis of shared and contrastive features. The SL word is replaced with a more general TL word plus one or two components to complete the meaning which is not embodied within the first TL word.

## Discussion

Some of the humorous instances gathered from the three cartoons under study, along with their translation in subtitled Persian are analyzed below based on the aforementioned framework.

1. Oh, come on Shrek . Wake up and smell the pheromones ! (Shrek 1 )

اوه بس کن شرک ، بیدار شو و بو رو حس کن !

Pheromone is a chemical substance produced by an animal to influence the behaviour of others of the same species, often functioning as an attractiveness to the opposite sex. The sentence is humorous since Donkey believes that Shrek is hiding his animal instincts and encouraging him to express his feelings for Fiona. In Persian translation, the nearest equivalent is selected for the SL item since there is no exact equivalent for it in the TL. The strategy applied here is ‘synonymy’.

2. You definitely need some Tic Tacs or something , cause your breath stinks ! ( Shrek 1 )

تو واقعا به یه خوشبو کننده ی دهان یا چیزی نیاز داری چون که نفست بوی گندی میده !

Tic Tac (officially styled as 'tic tact') is a brand of small sweets produced by the Italian confectioner Ferrero. The individual candy pieces are commonly called tic tacs themselves. The sentence is uttered by Donkey and the humour in the original sentence is due to his direct and straightforward opinion about Shrek's smelly mouth. The name of the candy in the SL is reduced to a more general or neutral term in the TL since it may not be familiar to the target culture. The strategy applied here is 'neutralisation'.

3. You know, it's times like this when I really like to say, 'oh ,caca!' (Barnyard)

میدونید ، توی یه همچین مواقعی ... دلم میخواد با خونسردی بگم ... بدبخت شدیم !

Caca is a nursery but a rather old-fashioned cultural term which is synonymous with the word 'excrement'. In the SL culture, it is mostly used when something unpleasant is on the verge of happening. The SL cultural item is translated by another cultural item in the TL and, thus, 'cultural equivalent' is used as the translation strategy .

4. You are the embarrassment of nature , you know that? (Ice Age 1 )

تو مایه ی خجالت طبیعتی ، میدونستی ؟

The SL sentence is translated into the TL sentence without breaking the TL syntactic rules. The strategy used here is 'literal translation'.

5. You didn't do that ! ( Barnyard )

ای زیونتو مار بزنه !

The Persian translation is not the exact equivalent for the English sentence but rather a near TL equivalent. It is believed that 'synonymy' is used as the translation strategy.

6. Back off Daisy, there's an 'L' in that boy's forehead. (Barnyard)

بکش عقب دیزی ، روی پیشونی این پسر نوشته دال که میشه دروغگو .

The sentence is uttered by Daisy's friend, Bessy who believes that whatever Otis says is only a bluff. Accordingly, the letter 'L' used in the SL stands for the word 'liar'. In Persian translation, the nearest equivalent is chosen. Here, the strategy used is 'synonymy'.

7. This time tomorrow, you could be a free mammoth or a nanny . Personally, I never get tired of peekaboo. (Ice Age 1)

فردا تو یه ماموت آزاد خواهی شد یا یه پرستار بچه .

Peekaboo is a simple game played to entertain children, in which the face is hidden behind the hands and is then shown unexpectedly. Since the term is cultural and there's no same equivalent for it in the TL, it is dropped in the Persian translation. The strategy applied is 'deletion'.

8. Oh, you were expecting your Prince Charming! (Shrek 1)

چی ، انتظار شاهزاده چارمینگ و داشتی ؟

The sentence is told by Shrek in response to Fiona who is surprised to find her rescuer an ogre. There is a hint of irony in his voice. In fact , the word 'Prince Charming' itself is mostly used to add more humorous effect. In Persian , 'Prince' is literally translated while 'Charming' is borrowed from the SL. The two strategies applied here are 'literal translation' and 'transference'. Moreover, 'couplet' is applied since the translator adopts using two procedures at the same time.

9. You have a lot to learn . (Barnyard)

تا گوساله گاو شود .

Here, the translator has used the nearest equivalent for the SL utterance which is indeed palpably clear to the target culture. It is worth mentioning that the Persian translation matches the visual context of the scene very well since the barnyard's veteran cow, Ben, is talking to his carefree son, Otis. This increases the effect of humour in the TL. The strategy used here is 'synonymy'

10. Come on Sid, let's play tag . (Ice Age 1)

یالا سید ، بیا گرگم به هوا بازی کنیم .

Tag is a children's game in which one child chases the others and tries to catch them . The sentence is ironic and the humour lies behind this irony . Diego is indirectly or jokingly suggesting Sid to play tag so that he can chase and eat him. The SL cultural item is translated by a TL cultural item. Thus, the strategy applied is 'cultural equivalent'.

11. Oh, manabunga ! (Barnyard )

هی ، بکش کنار گاوی نشی !

Manabunga is a play on words of 'cowabunga' which is an exclamation of rejoice from the early 1990s. When jumping into water, Otis expresses his fun and joy by shouting 'manabunga'. Due to the reason that there is no exact equivalent for it in Persian, the meaning is changed and the Persian translation is mostly selected from the visual context of the cartoon. 'synonymy' is used as the translation strategy .

12. I have to save my ass . ( Shrek 1 )

باید خرم و نجات بدم .

The sentence is uttered by Shrek when he is escaping with Fiona from the castle. However, the dragon is taken Donkey and Shrek must logically rescue him as well. This is an instance of homonymy (wordplay) since the meaning of the word 'ass' is twofold. One means 'donkey' and the other one refers to the slang 'to save one's ass' which means 'to get someone out of trouble'. In Persian, however, this wordplay can't be created and only the first meaning, 'donkey', is taken in translation. The strategy applied here is 'literal translation'.

13. Hey, why am I the poop checker ?! (Ice Age 1 )

هی ، مگه من پوشک عوض کنم ؟!

Sid is the one chosen to change the baby's nappy and he is angry about it. Due to the reason that the exact equivalent of the word 'poop' is impolite in the target culture, the closest TL equivalent is selected. The used strategy here is 'synonymy'.

14. That's the animal sin of sins, huh? (Barnyard)

این خفن ترین عملیات حیوانیه ، درسته ؟

The sentence is uttered by Eddy, a friend of Otis while driving wildly in the car with the rest of friends and totally enjoying themselves. The Persian translation can be considered in two aspects. Firstly, the term 'sin of sins' can be seen as an allusion to the 'seven deadly sins' which are part of the Christian ethics, including lust, gluttony, wrath, greed, sloth, pride, and envy. In this regard, the SL cultural item is translated into a more general or neutral term in the TL and the applied strategy is 'neutralisation'. Secondly, the SL sentence can be viewed without the cultural load behind it. Considering this aspect, the Persian translator has attempted to provide the nearest TL equivalent for the SL item. Here, the used strategy is 'synonymy'. In fact, both strategies are applicable in Persian subtitling since as mentioned earlier, one strategy may have the features of other ones in some degrees.

15. All right, all right. Don't get started. No one likes a kiss ass. (Shrek 1)

باشه ، باشه . زیادی جو گیر نشو . هیچکس دوست نداره که یه خر و بیوسه .

The sentence is uttered by Donkey when Shrek tries to kiss and hug him for bringing the dragon so that all can fly to save Fiona. The idiom 'to kiss sb's ass' is used to praise someone more than reasonable to make him or her do the things we like. Due to the fact that the idiom is potentially offensive, the Persian translator has attempted to neglect the idiomatic meaning and translate the sentence literally as 'to kiss an ass (donkey)'. The applied strategy here is 'literal translation'.

## Conclusion

Humour seems to play an important role in our everyday communication. Accordingly, a proper transference of the humorous effect from one language into another is probably of a remarkable significance. This is particularly the case when most TV programmes, including cartoons are loaded with humour as their primary element. Keeping this point in mind, the present paper made an effort to examine how humour travels between languages and cultures through subtitling, the focus of this study.

The research tried to demonstrate a range of strategies open to Persian translators while translating humour from English into Persian. Twelve different strategies suggested by Newmark (1988) were studied and eventually the analysis of the data indicated that 'synonymy' is the most frequently used strategy for English cartoons subtitled into Persian. This can be because of the brevity of this strategy since it provides the TT viewers/readers with the closest TL equivalents.

In other words, it involves the replacement of an SL item with a close TL equivalent, preventing long wordings and unnecessary explanations. As the second position, 'literal translation' was mostly selected by Persian translators, although Newmark (1988) considered it as the basic translation procedure. 'Neutralisation', 'cultural equivalent', 'couplet' and 'deletion' were not used very often and the remaining strategies were mostly put in bracket by Persian subtitlers.

In conclusion, humour translation seems to be a daunting task which inevitably challenges almost all translators. It necessitates a lot of time, endeavour, and energy particularly in the area of subtitling. Humour is a complex cultural phenomenon that demands a broad inclusive outlook for its translation ( Esar , 1954 ) .

The logo for the International Association of Foreign Language Researchers (iafor) is centered on the page. It features the word "iafor" in a light blue, lowercase, serif font. The text is enclosed within a circular frame composed of two concentric, hand-drawn style arcs. The upper arc is light blue, and the lower arc is a slightly darker shade of blue. The overall design is minimalist and academic.

### Abstracts

The use of ICT in education has developed rapidly in the past two decades. ICT usage is not only using computer, but also using the internet and social media as an important tool in teaching and learning process. It provides opportunities for both teachers and students to engage beyond classroom setting enabling them to flexibly interact. Social media, like Facebook, Twitter, Flickr etc, gains popularity in our today's world, and educators see this as an opportunity to develop innovative ways to create more interesting learning experience for their students, especially in order to improve students' critical thinking skills. However, there are ongoing debates on whether the use of social media can bring beneficial impact for students' critical thinking skills.

In this proposed paper, we would like to investigate the following questions: 1) How do the students perceive social media as a tool for learning, especially in improving their critical thinking skills?; 2) How do the students' questions and responses in their discussion in social media reflect their critical thinking skills?

## 1.Introduction

Personal computer has developed as an important tool for teaching and learning and the widespread usage of software, local area networks (LANs) and especially the Internet has created big opportunities for learners to enhance their communicative ability (Smith, 2010). It is believed that the usage of computer and internet can excel students' ability in acquiring knowledge since internet enables students to go to global community to interact with broader network to access education.

Education perspective has changed from classroom environment to broader access and interaction through the internet. Smith (2010, p.107) believes that students can tap "into a global community of other learners", or in other words the usage of internet had made interaction between learners around the world possible and this condition can make student exchange their knowledge with others.

The internet is a very broad medium of education and the emergence of social media brings dramatic impact on educators and schools (Williamson & Howard, 2012). Some might wonder the meaning of Social media that can be described as "a method or category of methods, to facilitate communication among social groups or individuals" (Williamson & Howard, 2012, p.4). The usage of social media in education should also be considered as one of the important tools that will enable both educators and learners to interact with each other in teaching and learning process.

Moreover, social media roles in education can also affect students' critical thinking skills which is one prominent skill in education. Fisher (2001) conclude that critical thinking is a skill that grasp educators attention, and more teachers want to teach critical thinking to students directly. This fact will lead us to examine the role of social media in the process of teaching critical thinking skills.

In this paper, we would like to investigate the following questions: 1) How do the students perceive social media as a tool for learning, especially in improving their critical thinking skills?; 2) How do the students' questions and responses in their discussion in social media reflect their critical thinking skills?

## 2.Social Media Development And Its Use in Education

To integrate the usage of social media into educational process, prior knowledge of social media types is needed. The first social media that is well known to be used is blog which enable students to access interactive features that will enhance the way they interact with others like a bio, events, archive of past blogs and comments (Bunzel, 2012). Richardson (2009) highlighted the difference between blog from website on the types of activity that students can find when they use blog. Blog is not created to be static but active, it stimulates students to make reflections and conversations by using the comments function, and blog is used primarily to "share details of everyday happenings in their [students] life" (Subrahmanyam and Greenfield, 2008, p.122). This means that blog can be observed as a tool that can be used to engage students' life and interact with them personally.

Richardson (2009) pointed out that by using blog students can engage with ideas and questions, because it can stimulate students to think and give response. This can bring benefit to student since if this applied in education they can practice their critical thinking and their writing skill since by writing comments students will have the chance to formulate appropriate answers. Richardson also suggested that students can also be involved in the process of Scaffolding Blogging, where students can be asked to make basic deconstruction of the blog design and they can add more function for the blog. This type of process will empower students' critical thinking skills since they will experience and involve actively in the learning process.

Wikis is another type of social media that is well-known as a “completely collaborative Web site run, edited, and managed by its users” (Bunzel, 2010, p.68). All of its users, including students, will have the chance to add and edit information and it means that students can actively participate in building the web and support it with their research on any topics found in Wikipedia category. Ward Cunningham designed Wikipedia because he wanted to create an easy authoring tool that might encourage people to publish and share their knowledge and information on particular topic (Richardson, 2009), or in other words by using Wiki in education it will trigger a research habit of Wiki users, especially for students. If Wiki activities are stimulated in education, students will have the motivation to look for sources and publish it on Wiki and this will surely enhance not only their writing skills but also their research and critical thinking skills.

The third social media, which can be considered as a breakthrough in education, is Bookmark. Most students and most internet users will probably use bookmark application in order to store their favorite website that will help them to seek understanding about certain issue. From the education point of view, bookmark can help students and also teachers to support their research and Bunzel (2012) pointed out that there is a development happened in the usage of bookmark where users can not only record their web address but also share it with others in a network.

The prominent application that enables this function is *Diigo.com* and *Delicious.com* in which students can open an account to store their own bookmarks and share them with others. By using these social media teachers and students can build subject specific resource list that they can easily share when using Real Simple Syndication (RSS) – a technology that allows educators to subscribe to “feeds” of the content that is created on the Internet (Richardson, 2009). These tools allow students to see other people who are accessing the same information and they can contact them. By doing so, students can interact with other people who have the same interest with them. This will surely help students to gain more resources that relates and are relevant to their research topic. They can transmit and share their knowledge or perspective to others.

A new presentation –based social media is Prezi which is a ‘web-based storytelling tool that uses a single, unlimited canvas that hold images, audio clips, video, and other objects and the information exist can be zoomed in and out depending on the the depth of exploration desired (McHanney and Daniel, 2011, p.179). Why it can be categorized as social because the presentation can be shared to all users of Prezi, both students and teachers can save Prezis made by other user and they can use it as their reference or edit it if they want to. This can empower education process since Prezi can be an interesting way to write and present ideas.

The fifth social media that can bring great benefit in education field is Twitter. This micro blogging system was created to gain short attention and generate quick-change mentality of today's world and can be considered as the most significant real-time social media communication tool (Bunzel, 2010). By using Twitter, users can notice the immediacy of

Twitter's status updates and the responses of followers, and this interaction can be seen as a fast development since in Twitter users can have instant feedback from followers in a very fast time span. This function will allow students and teachers to interact in a very fast way and they will get a wide response. From education perspective this can be seen as an opportunity to make a wide range interaction between students and teachers, for example, teachers can make a short review about their lesson by tweeting them and later students can give response to it. This will surely make a review session much more interesting than ever and this will last longer than a conventional method.

The most noticeable social media that bring great impact to the world is Facebook, in this website users can share resources in form of text, pictures, videos, and links in a more public display and users can also participate in live chats and internal e-mail (Ewbank, Foulger & Carter, 2010). Through these functions, students and teachers can interact and share knowledge in any way possible and they can personalize it, meaning they can both share anything and limit the way they share it. Facebook and its functions can be used to support education. Many colleges around the globe are using it to give more value to their education process. Many education oriented organization have used Facebook for education purposes, for example VOA English program in its Facebook group page regularly post English lesson program discussing specific English lesson where its group members can interact with a VOA language instructor. Through this program VOA helps students around the world with better understanding of English language learning aspects.

Ewbank, Foulger & Carter (2010) explained that Facebook has several advantages which are its interface, collective pages and page settings. The interface of Facebook is continually upgraded to support innovative communication techniques in which allow members to participate in any communication process. Another advantage is the possibility of Facebook users to create group page that can be used by individuals with common interest to share their knowledge by interacting with other individuals in the group. The last benefit can be gained through Facebook page settings function, where administrator can control the content of their pages and even add various mediums of discussion, such as: video, reviews, picture, time table, etc.

There are abundant of other Social media in the internet beside those six discussed above, and both students and teachers can gain benefit by using it in education. Again, a well thought plan is necessary to integrate social media in education so educators can bring its positive effect rather than its negative effect.

### **3.Pros and Cons of Social Media and How It Affects Education**

There are numerous social media exist in the internet used by millions of users around the globe namely Facebook, twitter, blogs, wikis, podcast, and many more. The growing number of social media can be seen through positive or negative point of view.

From the positive point of view Williamson and Johnston (2012, p.4) highlighted that "the jury is still out on whether that impact will be positive or negative", and they argued that education receives great positive impact since social media contribute to good development of learning, community support, and effective leadership. Those who support social media in education believe that social media can increase the quality of teaching and learning, since it provides wide range of materials available online that can be used to enhance their knowledge.

Moreover, social media change how people communicate with each other since people from any background can access it (Bunzel, 2010), this might be a positive point since by using

social media it is possible that students can discuss with not only other students but also other teachers or professionals across disciplines. Students will have the opportunity to ask questions or seek for solutions of their learning difficulties to competent people or even do peer-review on their task with their friends online, and this surely will positively affect their learning process. Also, students can add more information upon their particular study, and contribute to the knowledge of their friends through online discussion facilitated by social media.

Despite the positive side of social media, McEwan (2012, p.23-24) points out that “social networking sites also create new challenges and potential pitfalls for student... [Social media] may also contribute to a diminished skill, information overload, problems associated with disconnecting from the pre-university network, and decreased academic performance”. Students might decrease their learning skill because the primary intention of many social media is to entertain them by having larger social connection rather than to enhance their knowledge. Students can be easily distracted from learning process by spending more time to build their social network, rather than genuinely study.

People who oppose social media integration to education believe that social media will also make students suffer from information overload; this may be true because social media is the place where everyone can interact with each other and share lots of information. A research explains that students in some colleges, which are using a social media called Facebook, do over posting where they post lots of unnecessary, irrelevant and uninteresting post (Ewbank, Foulger and Carter, 2010). From this fact, it is visible that Students can be overloaded with unnecessary updates. This situation will make student suffer and drive them away from their primary goal that is to study since their time will be consumed by reading unnecessary information.

The worst negative impact of social media is its effect to students' academic performance due to the big amount of time used by students online. The time spent to maintain their social network may have big discrepancy with the time used to do learning related activity. When students want to use the social media to do learning activities their focus can be distracted by their friends' activity, and their eagerness to give comments on it. Students are also reluctant to give comments or to browse the social media to get information about their network. Moreover students, like other users of social media, will be exposed to a 'space' for uncontrolled narcissism in which students are motivated to express themselves largely for their personal motivation (Bianco, 2009), rather than for educational purposes. This will affect students intention when they want to use social media for education because their narcissism will alter their focus when they want to study. If the condition continues, it will surely bring negative impact to their academic achievement since they neglect their study to do other activities in social media.

The negative might outweighs the positive but the impact of social media towards education cannot be ignored, since it is suggested that “those who take risks will open new opportunities and help society work through some hard issues” (Carter, Foulger & Ewbank, 2008, p.685). Therefore, both educators and learners need to find the remedy of the negative side of social media and maximize it for learning process. This can happen by making proper teaching and learning plan that can be designed to integrate classroom activities with learning activities related to social media.

#### 4. Critical Thinking Indicators

Fisher (2001) explained that critical thinking emphasize on the importance of reasoning in which individuals are expected to give and to evaluate reasons as good as possible by using their ability to evaluate other ideas. Fisher (2001) also emphasize that critical thinking skill is shown when someone consciously aiming to improve his/her ideas and create new ideas which are more reasonable. Geertsen (2003) suggested that critical thinking is not merely giving criticism upon certain issue, but more to value imagination, feeling, and the social construction of issues that are being discussed.

To analyze students' critical thinking skills appropriate critical thinking indicators are needed. According to Fisher (2001, p.8) there are nine fundamental critical thinking skills where students know how to:

- a. identify the elements in a reasoned case, especially reasons and conclusions
- b. identify and evaluate assumptions
- c. clarify and interpret expressions and ideas
- d. judge the acceptability, especially the credibility of claims
- e. evaluate arguments of different kinds
- f. analyze, evaluate and produce explanations
- g. analyze, evaluate and make decisions
- h. draw inferences
- i. produce arguments

There are various ways to analyze critical thinking skills above, and a performance assessment can be used to explain the skills shown by students when they use social media. Ennis (1993) suggested that performance assessment can be applied to situations which can be considered as real life situations in which observer is going to make note on the events and focuses on the activities done by one person or group. In this type of assessment observer, who in this case is the lecturers, will analyze students critical thinking skills and then give description on how students express their idea and link it with the critical thinking skills described above.

#### 5. Data Description

The most important data source for this research is taken from the assignment of *American Culture and Society Studies* course which is offered as an elective course at English Department, Sampoerna School of Education. This course explore various institutions within the American society from the standpoint of history, education, government, politics, social & culture, and its global roles. The course uses the American educational issues as the main starting point and invites the students to look deeper on other topics. Forteen students enrolled for thiss class in the Spring 2012.

One of the assignments in this class was Discussion Questions in which the students, at least once during the semester, were required to prepare a list of questions that relates to the topic being discussed in respective meeting, and post it on E-learning platform, i.e. Moodle. Other class members should respond to the questions. The topics for the discussion questions were:

1. *American History* (Meeting 2);
2. *The Civil Rights Movement* (Meeting 4);
3. *The*

*American Dream* (Meeting 7); 4. *Education and Societal Issue* (Meeting 9); 5. *Issues in American Youth* (Meeting 10); 6. *The US Government and Politics* (Meeting 13).

Through whole class consensus, the students preferred to create their own Facebook group to do this activity after the discussion topic number 5, rather than using Moodle as planned, due to several reasons and one of those was accessibility. According to the students, it was easier to access Facebook, and the fact that they do not feel as if they are studying when using it makes it more interesting to most of them. The lecturer, then, accommodated this initiative. In its journey, the group was not only used for assignment related discussions, but also information sharing, announcement, asking clarification for other assignments, etc. The group was created on May 25, 2012 and actually ended on July 2012. There are three topics that were discussed in the group with five threads and it received fifty three comments

## 6. Findings and Discussion

The research was started by quantifying the number of threads both on Moodle and Facebook which are explained on the table below:

### Moodle Overall Review

Topic	Students Name	Number of replies	Participating Students
American History	M. Iqbal	13	13
	Zainatul N.	13	8
Civil Rights Movement	Merry	4	4
	Natasha K	3	3
	Ika Siti	2	2
The American Dream	Gratika	1	1
	Mutmainah	3	3
Education & Societal Issues	Andik	4	2
	Ira	2	2

### Facebook Overall Review

Topic	Students Name	Number of replies	Participating Students
Issues in American Youth	Nur Afilin	6	4
	Rahma C.	15	8
	Desri	17	8
US Government & Politics	Ema J	12	7
American Dream	Risma	3	2

Based on the analysis it can be seen that there were 4 topics covered by 9 students in Moodle platform. There are 9 threads and they received 45 replies in total, with 38 participating students. From all 9 threads posted by students the average number of replies are 5 replies. In the first two threads the number of replies and participating students was quite high. The topic on American History received 13 replies for each of the questions and those replies were posted by 13 different students for the first thread and 8 different students for the second thread. This data shows that student participation rate was significantly high at the beginning of the online discussion. However, starting from the second topic on 'The Civil Rights Movement' the number of replies and participating students was falling steeply. Even in the topic of 'American Dream' one thread only received only 1 reply.

As stated above, Facebook was used starting from topic number 5. The students posted 5 threads containing the discussion questions on two topics which are Issues in American Youth, US Government & Politics, and a late discussion on The American Dream. The 5 threads received 53 comments from 29 participating students with an average of 10 comments for each threads. The first topic discussed on Facebook only got 6 comments from 4 students. However, starting from the second thread of the same topic the number of comments rose considerably. The second thread received 15 comments from 8 students and in the third thread 8 students responded by giving 17 comments. The second topic on Facebook received 12 comments from 7 participating students. In regard to the last post on The American Dream, 2 students only gave 3 comments on the thread and this happened since the topic was supposed to be covered on Moodle discussion forum, not on Facebook.

From the quantitative description above it can be concluded that Facebook usage attracted participating students to give more comments compared with how students' participate on Moodle. The average of students' participation was doubled when they use Facebook in their discussion. Moreover, the usage of Facebook encouraged students to leave more comments rather than on Moodle. Regarding the logic behind the students' participation rate cannot be explained only by looking at the above quantitative description. Therefore, further analysis on the qualitative aspect of student comments and replies is required, which will in turn reflect the students' critical thinking development.

On Moodle, it is clear that the students exhibit at least 8 critical thinking indicators in their responses to their peers' questions. The questions on "the American History" generate 13 replies which represent four indicators of critical thinking development, i.e. identify and evaluate assumption (b), analyze, evaluate and produce explanations (f), clarify and interpret expressions and ideas (c), and produce arguments (i). The responses on the questions on "The Civil Rights Movement" reflect almost similar results in regards to critical thinking indicators. What is absent on the responses on the first questions is the occurrence of the first indicator, where one student tries to identify the reasons and draw conclusion at the end of his explanation (a). The responses for the topic of "American Dream" implicitly generate critical thinking indicators. Those are identify and evaluate assumption (b), and judge the credibility of claims (d), evaluate different argument (e). On the topic "Education and Societal Issues", the participating students employ the following indicators, namely b, c, f, and i.

In terms of the qualitative analysis on the students critical thinking skills when they used Facebook, based on the findings there are 8 indicators that can be identified from students response which are: a, b, c, d, e, f, h, and i. In the first topic about 'Issues in American youth', in the first post, students able to create answers which fulfill indicators a, e, f and i. From this post one student tried to support her reasoning by giving reliable source from other internet page which discussed similar idea. Moreover, the second post of the same topic manages to gain responses which fulfill indicators b, c, d, e, and i. One interesting fact in this post is that 4 students in the discussion tried to evaluate other students' argument by using the tag function so other students directly knew the evaluation. Meanwhile, in the third post the indicators that can be identified are e, f, and i. In this post 3 students also evaluate other students' argument by using the tag function. In the post with the topic 'U.S. Government & Politics', the indicators that can be identified are: c, e, h and i. In this post, besides producing arguments and ask for clarification, 2 students attempt to evaluate other students argument. The last post about 'American Dream', indicators e and i can be identified and 1 student tried to evaluate other student's opinion.

Regarding on how they perceive social media, particularly Facebook as a tool of learning the students come up with positive responses. One student expressed the idea that by using Facebook or other social media, like twitter, it eases them in giving response since students always go online and check their social media. Another response highlighted the idea that using social media will make students comfortable in sharing their knowledge since Facebook and other social media is more casual than other education platform like Moodle. Other student also emphasized that Facebook bring efficiency in doing their assignments, since social media can give them easy and fast access in sharing arguments and backing it up with useful and trusted information. One suggestion that they made to improve the usage of social media is by enabling students and teachers to make teleconference to enable direct communication.

## **7. Conclusion**

Based on the analysis above it can be seen that the usage of social media can motivate students to participate in online discussion, rather than when they use Moodle as the online learning platform. From the qualitative analysis, we can see that students can perform relatively the same critical thinking skills when they use Moodle and Facebook. But as educators we might want to note that by tapping into social media students' motivation can be increased due to the fact that social media can give them comfort and confidence. Moreover, the tools provided by social media gave students with the opportunity to be more expressive in sharing their ideas.

*Developing a Location-based Mobile App to Save Heart Patients in Emergency*

Durairaj Ponraj, Luo Zhiqiang, Ang Candy

0649

Nanyang Polytechnic, Singapore

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

One out of three deaths in Singapore is due to heart disease and stroke. Statistics indicate that 70%-80% of heart attacks occur either at home or in public places. The prompt emergency measures, for example performing a cardio-pulmonary resuscitation (CPR) and employing automated external defibrillator (AED), are critical life-saving procedures when attending to a heart attack victim. Hence, we developed a mobile app, called *SOSHeart*, to assist heart patients to receive prompt assistance when they are suffering from heart attack and possibly a cardiac arrest in public places. This application integrates the mobile and cloud technology to provide the comprehensive location-based services in threefold. First, the one-click SOS assistance allows a heart attack patient to call for help from all relevant parties in the fastest manner in emergency. After initiating such assistance, the patient's location tracked by the global positioning system (GPS) data on mobile phone will be flashed in a city map provided by *SOSHeart*. All CPR-certified citizens within a 1-km range of the site of the heart attack will be alerted by *SOSHeart* on their mobile phones where they can also find the patient's location on the map. Second, the on-site guidance instructions can refresh and guide CPR-certified citizens to perform CRP and use AED correctly. Lastly, *SOSHeart* can share patient's medical data to facilitate the correct treatment in emergency. The system architecture and each component of *SOSHeart* are introduced too. A pilot test found that the one-click SOS assistance is a reliable means to quickly get attention and help from nearby CPR-certified citizens. Our future work is to simulate several field studies to test the effectiveness and efficacy of *SOSHeart* to save heart patient in public places.

## 1. Introduction

One out of three deaths in Singapore is due to heart disease and stroke. Statistics indicate that 70%-80% of heart attacks occur either in the home or in public places (such as shopping malls). Currently, the Singapore's survival rate in cardiac arrest cases away from hospital is between 2 and 3 per cent. It can take up to 20 minutes from the call for help before paramedics arrive. Factors associated with survival from heart attack include patient's age, witnessed collapse, prompt initiation of cardio-pulmonary resuscitation (CPR), type of initial arrhythmia recorded at the scene, early defibrillation if warranted, time elapse from cardiac arrest and the arrival of the first rescue team, and the patient's comorbidities [1-3].

Early CPR has been shown to be a vital link in the "Chain of Survival" [4] for out-of-hospital cardiac arrest and is an important key to improving survival rates. Therefore, the National Resuscitation Council of Singapore and the Singapore Heart Foundation initiate to train one million citizens in CPR by 2020 [5] as these citizens could provide CPR immediately. One gap, however, is the absence of means for a heart attack victim to get the prompt treatment from a CPR-certified citizen. Despite one million CPR-certified citizens, they may not be aware that someone nearby needs CPR. To bridge this gap, the location-based services accompanied with a mobile phone app could possibly be an effective tool.

The location-based services (LBS) represent a general class of computer program-level services that can identify and update the location data. Now the high-speed cellular networks combined with location enable to give the target service based on the current user position [13]. LBS mobile applications have been used in various contexts [14], such as local search, tour guides, mobile games, advertising, and mobile commerce. The location-based service considered in the present project is to track the locations of heart patient and CPR-certified citizens. Thus the heart attack patients can call for help from the nearby CPR-certified citizens and the nearby CPR-certified citizens can also find the location of heart patient in a quickest possible manner.

Besides the prompt initiation of CPR, caregivers (including CPR-certified citizens or medical staff providing emergency services) at site of heart attack victims also need to know the patient's recent medical data and drug allergy. Such medical data are usually not available at the scene because sudden heart attack usually happens away from hospital or home. In recent years, hundreds of heart-related applications are available for our smart phones. Many are little more than glorified diaries and a growing number are tapping into the sophisticated technology packed into these phones [6]. For example, Instant Heart Rate [7] measures our heart rate using the built-in camera. Pocket First Aid & CPR [8] from the American Heart Association can guide us through the steps of performing CPR and using the AED. It also includes in-depth information for other health emergencies. Heart4Life [9] from Singapore Heart Foundation can also increase awareness and knowledge of CPR skills amongst the general public. The general app for emergency, such as an ICE (in case of

emergency [10]) app, let user record name, medical conditions, blood type, allergies, and medical contact information into mobile phone. Thus such information can be used in emergency.

The present study aims to develop a mobile app, called SOSHeart, to provide location-based services to heart patients to call for help from caregivers as well as providing the personal medical data and other useful information in heart attack emergency. We propose that the integration of location-based service and medical data on a mobile app at heart patient's hand can assist in prompt assistance and treatment to heart attack victims in public places in emergency. The following sections will introduce the architecture of mobile app first and then present the main features of the app. The result of pilot test on the location-based service will be presented, and followed by the design of field study to comprehensively test SOSHeart. Finally we conclude the present study.

## 2. Methodology

### 2.1 System architecture

The SOSHeart is an Android-based mobile app with Microsoft Azure cloud support, which comprises two major applications, the application on smart phone and the network service in Azure cloud, as shown in Figure 1.

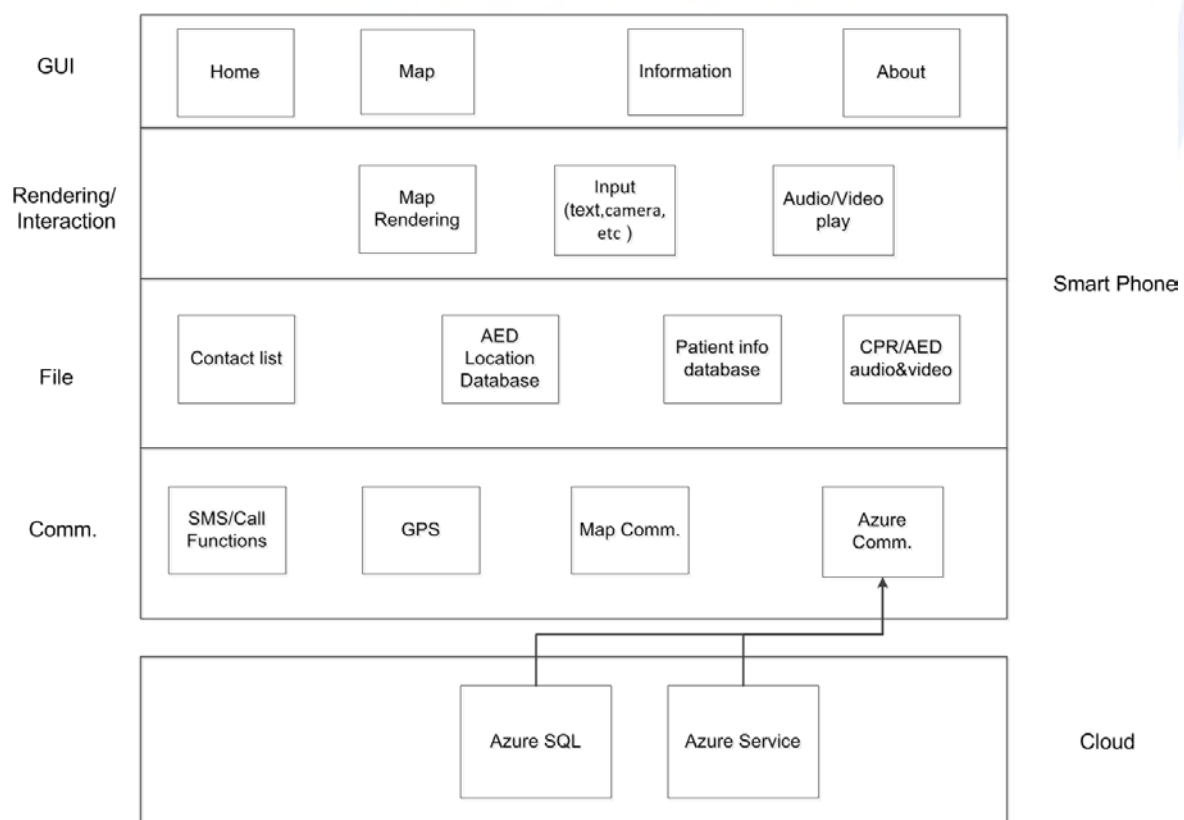

Figure 1. System architecture of SOSHeart

There are four layers with the application on smart phone. The first layer is the graphic user interface (GUI) where the user can see and interact with the mobile app. The GUI layer comprises four tabs, Home, Map, Information, and About, to categorize the available functions in fourfold.

The second layer is rendering the data and map, accepting the user input, and playing the audio and video files. This layer focuses on the functions responding to user's interaction.

The third layer is to store all relevant files. The files include the list of emergency contact, the AED location database, the database to store patient's medical information, and the audio and video files to instruct CPR and AED.

The last layer is to implement the communication function of SOSHeart. The communication function is the key component since it helps heart patient to contact the possible caregivers, for example the emergency contact or the CPR-certified citizens. There are four communication functionalities. First, SOSHeart allows user (e.g. heart patient) to send messages or make a phone call to caregivers. Second, SOSHeart records the GPS data of smart phone to track user's location in city and displays his/her location on the integrated city map. Third, a map communication function is available to retrieve OneMap (the local GIS map system in Singapore) data to the mobile phone. Lastly, the Azure communication function is to communicate with the services run in Microsoft Azure cloud.

The network services in Azure cloud are the backend services to support all smart phone's location-based services in field. The network services comprise two components, the SQL database hosted in the cloud and the Azure services to communicate with the mobile app. The SQL database will store all user's medical information and the location data in real time. The data are sent from the Azure communication function of mobile app. The Azure services are responding to maintain the SQL database and the communication with the mobile app in real time. Thus the user's current location sent from the mobile app will be received and stored in database in real time.

## 2.2 Three features for heart attack emergency

### 2.2.1 One-click assistance

The one-click assistance with SOSHeart allows a heart patient to call for help in the fastest manner, which provides three options in emergency (see Figure 2). First, the patient can call the ambulance service just by clicking one button without inputting the ambulance phone number (which is 995 in Singapore). SOSHeart can assist the

heart patient to give the current location data which can be communicated to the ambulance team for easy location of the patient in a quickest possible time.

Second, the heart patient can call and send messages to emergency contacts (i.e. the family member) by one click too. The emergency contact list can include maximum four phone numbers, where the first contact can be alerted by the phone call and message whilst the other three contacts will be alerted by the message only. Since SOSHeart can detect the patient's location, the message content will automatically include both patient's name and current location. Furthermore, if the SOSHeart is also installed with emergency contact's smart phone, they can find the patient's location in the integrated map with SOSHeart.

Lastly, the heart patient can choose the one-click SOS assistance, a holistic assistance in emergency, to (1) call for help from the CPR-certified citizens who are within 1-km range of distance to the patient's site and to (2) send messages (the same message content as described above) to all emergency contacts. Specifically, after the heart patient initiates the one-click SOS, SOSHeart will search all CPR-certified citizens within a 1-km range of the site of the heart patient and send an alert message to the found citizens. At the CPR-certified citizen's side, the SOSHeart with their mobile phone will receive the message and then the citizen can respond to the message by confirming his/her willingness to offer the help. Once the citizen confirms to help, the citizen's location will be flashed on the map and he/she can also check out the heart patient's location on the map and to find the direction to the patient's location. Figure 3, shows the display of both heart patient and two CPR-certified citizens on map.

Meanwhile, one-click SOS alerts the emergency contacts by sending message to call for help. The emergency contacts can call ambulance to go to the patient's site as well as check out the map to find that any CPR-certified citizens are going to offer help. At the site of the heart attack victim, the patient's medical data will be displayed on mobile phone screen to assist all possible caregivers and the accompanied alarm can catch attention from bystanders to offer necessary help.

When the first CPR-certified citizen arrives, he/she can proceed to deactivate the one-click SOS on the patient's mobile phone. This will inform his/her appearance at the site of heart attack victim to other CPR-certified citizens on the way.

Figure 2. The three options of one-click assistance offered in SOSHeart

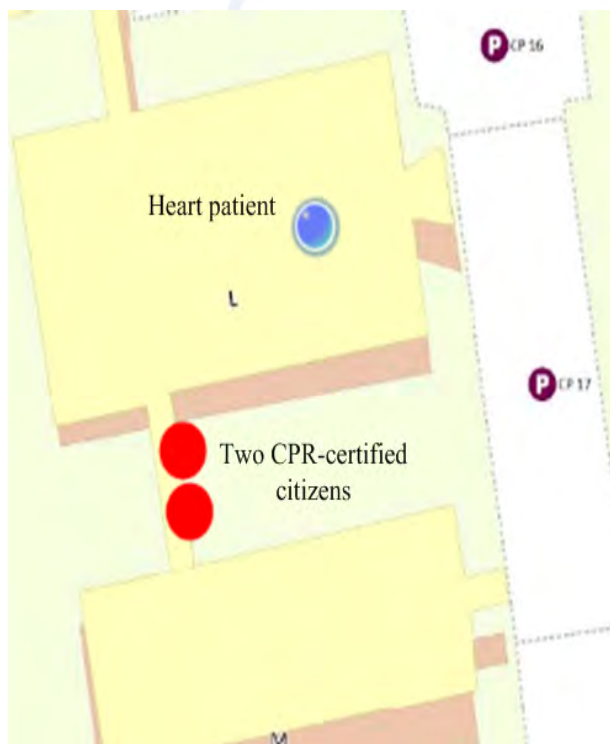

Figure 3. Displaying the positions of both heart patient and the CPR-certified citizens on the integrated map

### *2.2.2 On-site emergency guidance*

The on-site emergency guidance with SOSHeart stores the step-by-step audio instructions to prompt CPR-certified citizens to correctly perform CRP. Such instructions are very helpful in performing CPR correctly, especially for the new CPR trainee or even bystanders [12]. The audio instruction will be recorded in an mp3 file and be played by a CPR-certified citizen when performing CPR.

The emergency guidance also includes the pictures with step-by-step instructions to guide in the correct use of AED. When using AED, the audio guidance will prompt the user to do each step. But AED can't determine whether the user correctly implement the task of each step, for example, attaching the two pads to the correct positions on patient's body. The AED only has a simplified indication figure which may not give the user a clear guidance. Thus a picture showing the two pads on a real human body will be much helpful to correctly do this task. SOSHeart also includes a database storing AED locations in Singapore, which can help the CPR-certified citizens to locate and get a nearest AED as soon as possible.

### *2.2.3 Medical data for better decision support.*

The medical data included in SOSHeart is for the ambulance team and medical staff at hospital to quickly determine the heart patient's recent medical conditions and then render the right treatments. The medical data are classified into four categories: the patient's medical conditions, medication taken recently, drug allergy, and medical records. The medical data will be stored on both heart patient's mobile phone and the remote Azure database. The patient can input medical conditions related to cardiac illness, like IHD, heart attack, hypertension, Diabetes and hyperlipidaemia. The onsets of these medical conditions are required to be keyed in. The current medications used are also useful to the treatment, where the patient needs to input the name of medication. The common allergic drugs list will be included in SOSHeart for the heart patients to just choose. The patients can also input the names of other drugs he/she may be allergic to.

The recent medical records are crucial for medical teams to make decision to render correct treatment to the heart attack victim in emergency. The medical records consist of the blood pressure, electrocardiogram (ECG) report, echocardiogram report, blood test report, and other relevant past surgery. Heart patients can input these medical records simply by taking a photo of these reports obtained in clinic checkup and saving the photo in SOSHeart.

Figure 4. Four categories of medication data with SOSHeart: medical conditions, medications, drug allergy, and medical records.

### 2.3 Pilot test

A pilot test on SOSHeart was conducted with four subjects who are students from the Nanyang Polytechnic, Singapore. The objective of this pilot test is to test the reliability of one-click SOS assistance with SOSHeart to call for help from the CPR-certified citizens around the patient site. In this test, one student played the role as heart patient to initiate the one-click SOS assistance with his smart phone; two students played the role as the CPR-certified citizens; and the fourth student played the role as the patient's emergency contact. The test was conducted in the urban area of city where the speed of mobile network is good.

The pilot test found that both two "CPR-certified citizens" and one "emergency contact" could receive the SOS message from heart patient within five seconds after initiating the one-click SOS assistance. Furthermore, all subjects could see his/her own and others' positions on the map in real time. The integrated map can guide the "CPR-certified citizens" and the "emergency contact" to correctly and easily arrive at the location of the "heart patient".

## 2.4 Future field study

Several field studies will be conducted in various public places in future to comprehensively test SOSHeart in the simulated emergency situations. The public places will be shopping malls or markets since these are the major places where heart attack happens away from home or hospital. The participants of field study will be students who have received the formal training on CPR and AED. They will be randomly assigned into two groups, using or not using SOSHeart. In each group, participants will play roles either as heart patients or CPR-certified citizens. In the first group not using SOSHeart, the “heart patient” will call the “CPR-certified citizen” by dialing phone number; whilst in the second group using SOSHeart, the “heart patient” will call for help from the “CPR-certified citizen” through one-click SOS assistance. The experimenters will follow the “CPR-certified citizen” and record their performance in the study.

The performance data of interest is the time spent on each stage of treatment rendered to “heart patient”. For example, to the first group without using SOSHeart, the time from initiating the phone call to the “CPR-certified citizen” to the arrival of the called CPR individual will be recorded; whilst, to the second group using SOSHeart, the time from clicking SOSHeart app to the arrival of the first “CPR-certified citizen” at the site will be recorded too. The distances (less than 1-km) between the “heart patient” and the “CPR-certified citizen” are the same in these two groups, and they don’t know each other’s location before calling for help. We will compare the time spent by the two group participants. Meanwhile, the time taken to get the nearest AED will also be recorded and compared. The overall time taken to reach the location of the “heart patient”, the time to perform CPR and the use of AED will also be recorded. The accuracy when performing CPR and using AED will be another important data. All collected data will be analyzed statistically by t-test and MANOVA to compare the differences between these two groups. We expected that the group using SOSHeart will perform better than their counterparts without SOSHeart.

## 3. Conclusion

A cloud-based mobile application, SOSHeart, is developed to help heart patients to call for help from caregivers, ambulance team, emergency contacts, and the nearby CPR-certified citizens, in a quick and easy manner. SOSHeart provides the location-based services to facilitate caregivers to find the location of heart patient from the integrated map. The system architecture and the three main features of SOSHeart are introduced in detail. Our future work is to conduct field studies to test the efficacy and efficiency of SOSHeart to save the heart patient in emergency in public places.

## Acknowledgement

The present project is funded by the Singapore Heart Foundation with the grant application number RG2011 /002. The authors wish to thank Dr Jack Tan from the National Heart Centre, Singapore, for his expert advice and valuable input.

Abstracts

More attention in developing countries often pays to availability of the communication infrastructure. Hence the applied solution supporting by a Universal Service Obligation (USO) is procurement of the communication access, either for some voice channels or limited data service of hundred kbps. Nowadays, such a limited services only end to one or two points in a community. This effort finally is not a sustainable project, due to only limited equipment or point or type of services.

This integrated service platform architecture consists of service extension of such a point in remote area, providing communication service intra community and global access based on VoIP service, providing the IPTV platform which proposes education programs and a local Learning Management System synchronized to a Master LMS.

The architecture of those platforms consists of three different local access points containing each service (VoIP, IPTV or LMS server), which is connected each other using a wireless LAN IEEE 802.11 and supported by a single sign on system. One access point is connected to gateway server to global access via a USO connection point.

Prototype performance shows that a limited bandwidth should be assigned to guarantee voice communication performance in the backbone of transmission, i.e. 64-256 kbps. Whilst the other services may use the rest of bandwidth capacity. However, for optimum use, reserving at minimum 128 kbps for LMS transaction is recommended. Such a green architecture is constructed by considering choice of low power devices and equipments, in addition using a solar cell power generation.

## **1. Introduction**

In order to achieve global development program as stated in World Symposium on Information Society, i.e. Information Society in 2015, Indonesia has been working hard to provide communication infrastructure, especially in rural area through Universal Service Obligation (USO) program, in order to support information traffic among people, as well as to gather information and use the information for improving their knowledge, skill, capacity and other related to their job; and finally will improve their welfare and competitiveness.

Progress of research and development in e-learning platform especially LMS synchronization, voice communication over IP networks, and internet television has been achieved to be integrated as a multiplatform services to support human resource development and communication infrastructure when they are implemented with the USO program.

## **2. Rural Infrastructure in Indonesia**

The teledensity index in Indonesia has been increased significantly thank to the cellular phone technology; according Wismadi (2010) has contributed almost 63% in 2009. This number far above the contribution of those of fixed line and fixed wireless; where the implementation and penetration is not widely spreading in all area. This magic number of 60 % does not reflect the number of one phone for one person. Growing of cellular phone business has been opened by globalization policy in telecommunication. Nowadays there are 10 operators running their competitive business at the same market in Indonesia; hence in such a situation, they offer competitive services that attract certain active customers to equip with more than 2 cellular services. However, with such a significant teledensity is not distributed related with the coverage area of services. Most infrastructure penetrates in urban area (cities, capital of province), this situation relates to distribution of the people (demography factor), developed infrastructure in rural area is so limited due to accessibility problems (due to logistics, development program, human resource capability etc.). This situation gives impact investment of telecommunication operators are limited for this area, because it is not profitable from business point of view.

Discrepancy of coverage services may affect the problems in rural area in accessibility of information. Hence the Government launched the Universal Service Obligation (USO) to collect fund from the related operators to be invested in such a rural area in order to improve the penetration rate. Universal Service Obligation is collected fund from telecommunication operators to promote communication infrastructure in rural area. The USO program launched by Ministry Communication (2010) covered 31.824 villages by remote cellular phone services via satellite. The existing communication infrastructure only covers 54% by cellular networks of TELKOMSEL and 16 % by PSTN (Public Switch Telephone Networks) of TELKOM. The table 1 shows the related USO region grouped by the biggest islands. Hence target of the USO program is to cover communication services in the uncovered one.

Table 1 Coverage of USO Infrastructure and Public Networks

Region	USO Region		Existing Telkomsel network coverage <sup>1)</sup>		Existing Telkom network coverage <sup>2)</sup>

<b>NASIONAL</b>	<b>4217</b>	<b>31824</b>	<b>69%</b>	<b>54%</b>	<b>46%</b>	<b>16%</b>

### 3. Higher Education Resources

The distribution of higher education institution in Indonesia, as described in figure 1 prepared by the Directorate General of Higher Education (n.d.) shows that most developed region are Jawa island and north Sumatera province (green one). Other regions have large difference number of higher institution compare to those in both regions. This significance difference implies less available qualified human resources in these regions. The condition in remote/rural also lack of developed communication infrastructure as mention before. In such a situation, the activity of either formal education or long life learning is limited.

However, if we would like to develop this region, a collaboration activity with qualified resources in developed institution is recommended. Such an activity will be well run when it is supported by learning technology environment. Nevertheless, in remote area, electricity to support learning technology equipment is not always reliable or even available. Hence energy solution is using sustainable and renewable energy suitable with local resources, i.e. solar energy. In addition, to such a system design, low power energy consumption should be considered.

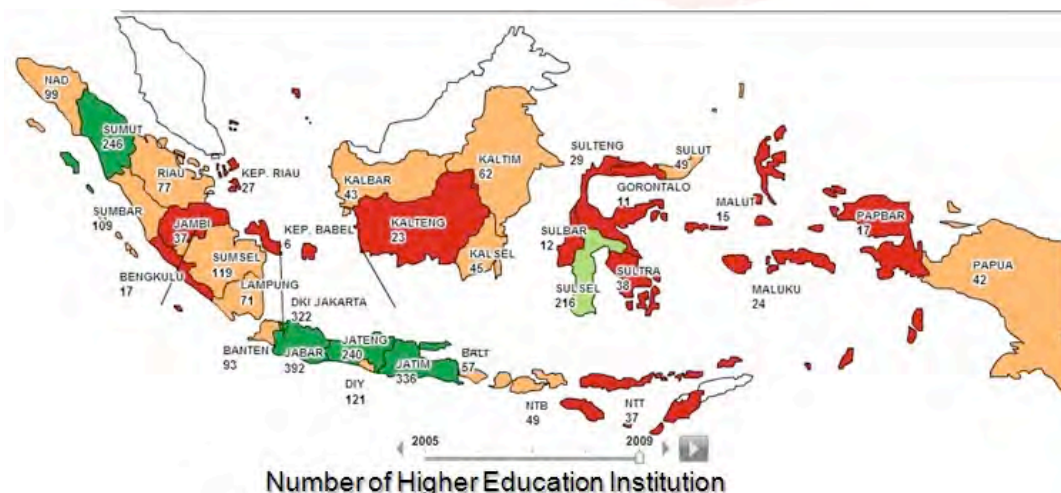

Figure 1. Distribution of Higher Education Institution

#### 4. Learning Management System (LMS) Synchronization

Learning technology solution is implemented by providing e-learning platform which suitable for the important issue: content sharing from a qualified resource institution. One consideration to implement e-learning is preparing suitable Learning Management System (LMS).

Once an LMS is decided, the learning and collaboration activity may be well prepared and organized together by local institution and the qualified one. So that content sharing through LMS synchronization method can be a sustainable solution to this situation. Such a content sharing will have some advantages as follows according Usagawa (2009):

- E-learning in each institution has various contents and different materials which have potential to be complemented among them.
- Reducing burden works for developing and maintaining digital course contents/materials
- Reducing digital gap among educational institutions.

Based on the experience, preparing good content/material in the system is not easy work. Whilst, there are many available learning material in the network. So far organizing learning activity in rural area with limited qualified resources and infrastructure will be an exhausted work when there is no support from an advanced institution.

An algorithm or method of LMS synchronization has been provided by Usagawa (2009), Affandi (2009), Ijtihadie (2011, 2012). We can share the same content or course material in any LMS in remote and in the Center one. Moodle based LMS has been chosen, and the algorithm allows us to synchronize material database from a Master server to its member.

Here is the example of snap shot material synchronization in the Master LMS in Kumamoto University and its member: an LMS at ITS Surabaya. Some course material is already synchronized. When there is modification of one course material or any addition of new course material, synchronization is applied for the difference data base system; hence the synchronization will not be repeated for the same data.

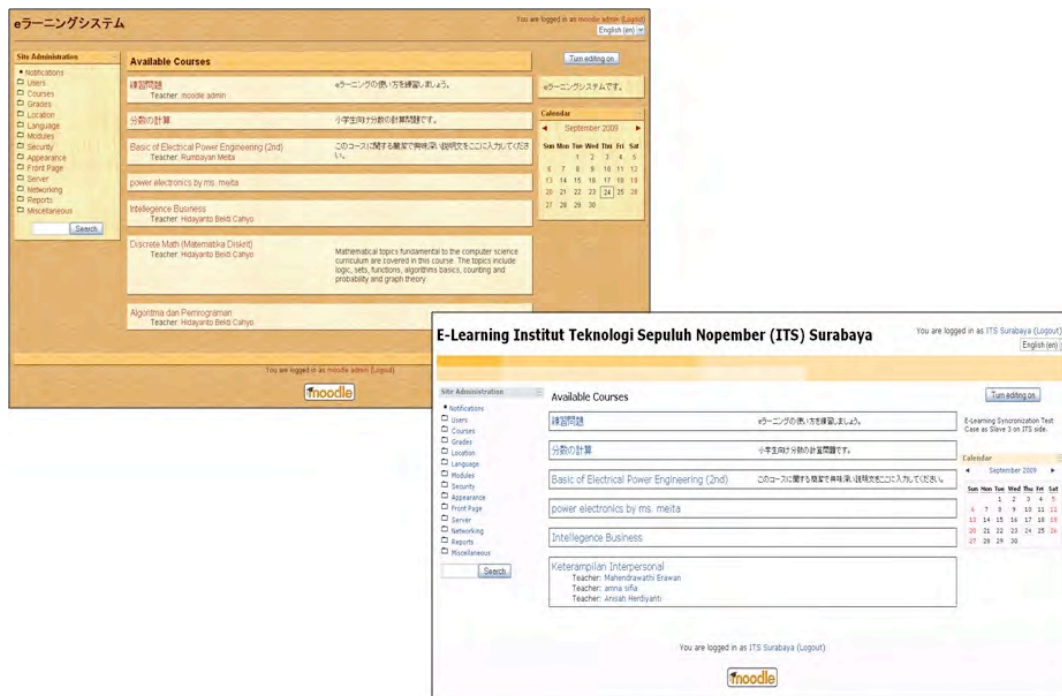

Figure 2. Snap shot of content synchronization in an LMS

Such a course synchronization time will be vary, it depends on the size of the synchronized file, the environment of networks including available bandwidth, specification of the equipment and off course the traffic condition in the network. In a such experimented network condition, figure 3 by Affandi (2009), there is no important disturbance and limitation of environment. Hence the throughput collected from the synchronization is almost the same as the available bandwidth, in addition, synchronization time almost close to ideal situation.

However, such a performance may vary, when the available bandwidth is vary, furthermore when network is not reliable; such a situation in cellular networks (i.e. using GPRS), the time performance may time varying related with the traffic condition. In a certain time it may be not available, see the graphic of GPRS, this graph shows the throughput of synchronization applied. It may stop the synchronization, and it should be restarted to continue until all file is synchronized.

Hence this method is useful, effective and efficient when we would like to share content and knowledge for rural or remote area. Based on our experience, we will use this approach to be integrated with other requirement or demand of communication and entertainment in rural/ remote area.

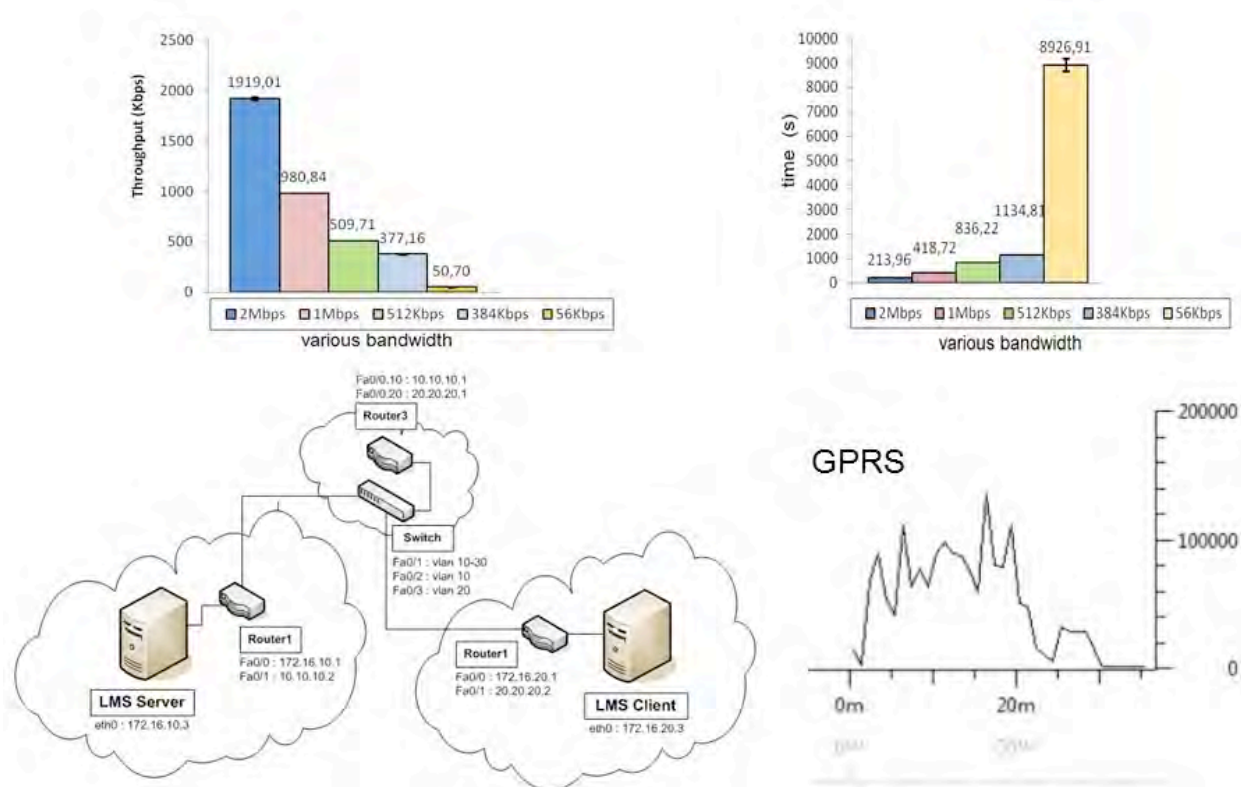

Figure 3. Performance of synchronization in the experiment

## 5. VoIP is applied as back bone of communication infrastructure

Standard protocol (IP based): SIP or H323, IETF (n.d.) is suitable protocol to organize voice communication over internet, with the following reasons:

- simple architecture and open technology : Asterisk
- minimum equipment for switch and terminals
- capacity can be improved by choosing optimal CODEC and application of parallel processing technique

VoIP server may be directly connected to users through local area network in the service point or through community access point via wireless networks; If local users only, it is used as a phone cabinet services connected to cellular gateway, but for community access; VoIP server may be functioned either as PABX for local community or a gateway to Public Cellular Networks. They may communicate each other through VoIP terminals in the community as well as to communicate with national or international society

Based on the experiments organized in our laboratory we recommend using GSM codec rather than G711 for optimal bandwidth consumption among communicators. When using such a GSM CODEC, ETSI (1998) states its rate is of 13 kbps, for duplex communication, hence required bandwidth is about 26 kbps; in simple calculation we rate 30 kbps per channel. In addition, to improve the number of concurrent, develop a cluster or parallel processing algorithm rather than using a single big capacity of server. Such a consideration is related to electric power consumption, as well as to reliability of the system.

Figure 4 show the VoIP performance with clustering server configuration. This shown that in a configuration of cluster of N servers environment of Pentium IV with 512 Mbps memory may gain a number of concurrent call (green one), i.e. about 26 users comparing 25 when using the independent configuration. As consequence, impact of call setup delay will also increase in cluster topology. However such a delay will not disturb the conversation, because this delay concerns time to connection setup, the user should wait a bit longer than in an independent configuration.

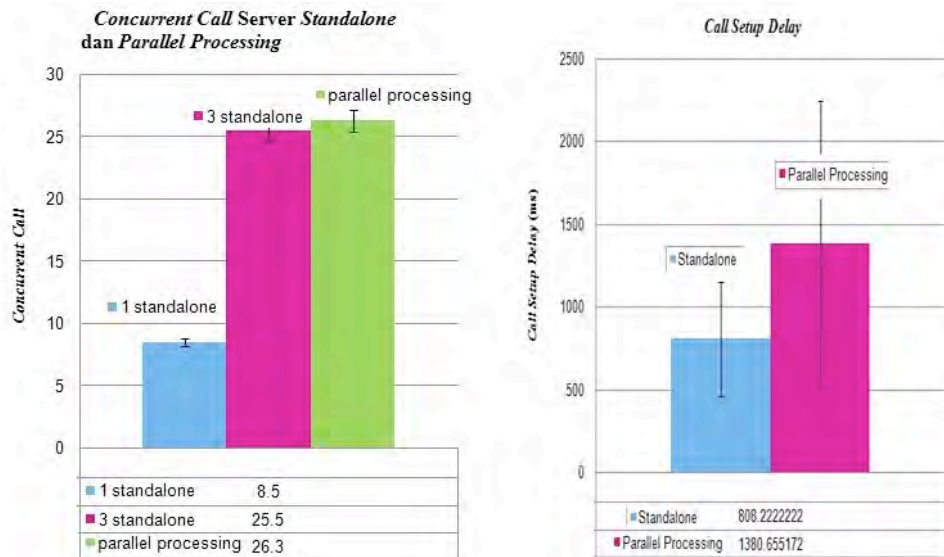

Figure 4. Performance of parallel processing VoIP server

Hence with the VoIP solution and its possibility to upgrade using clustering the VoIP server, problem of communication in rural will be significantly reduced. Use of wireless network (802.11, with 6 Mbps available bandwidth in worst situation) to support the backbone and access network will be enough, assumed 30 kbps x 50 concurrent users will consume bandwidth reservation of 1.5 Mbps.

## 6. Edutainment – IPTV

Introducing entertainment facility will attract users to access learning activity, instead of addition voice communication facility. Hence the IPTV platform is introduced. The proposed features including TV broadcasting, Video on Demand (VoD), Private Video Recording (PVR) and video conferencing.

To support the platform running in the network, it should be assured that multicast protocol may be available in the network equipment. Multicast protocol is an important support for broadcasting or video streaming. This protocol set up may be concerned in router equipment.

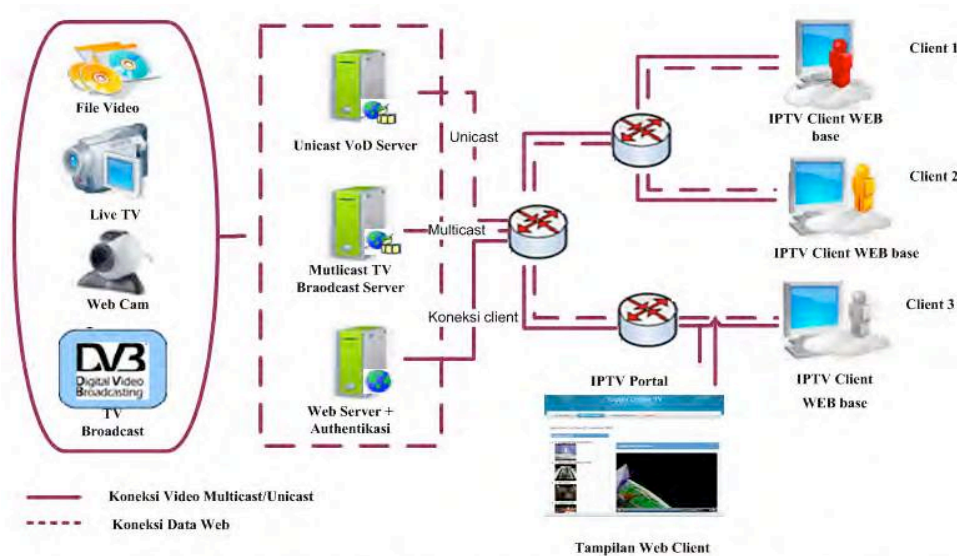

Figure 5. IPTV service features and environment

Here are the features of the IPTV:

- *Home services*, is an introduction and user login facility
- *TV Broadcast*, that equipped by a performance feedback from user, concerning video quality through a Mean Opinion Score approach. User will click the received video quality.
- *Video on Demand*, user may play a from a listed program. For this service, there is also feedback from user concerning buffering time for streamed video file.
- *Private Video Recorder* service allows user to record chosen program.
- *Video conference* service may be used to support synchronous learning in the community, or for daily usage.

The performance test for IPTV services can be evaluated from broadcast program for example. In the broadcast or multicast protocol used, when the bandwidth is not enough there will be a disturbance in vision because the video frame data is not completed due to less data rate achieved in the receiver. In addition the IPTV service is equipped feedback message from user by answering survey message on received video quality as provided reference.

## 7. Multiplatform Service scenario

There are two types of delivered USO services to end point via Very Small Aperture Terminal (VSAT) satellite transceiver, i.e.:

- *Desa Berdering (ringing village)*, means providing phone services via VSAT and pico-cell BTS in a village; usually this service provides certain amount of concurrence phone calls in the area.
- *Desa Pintar (intelligence village)*, instead of providing phone services only, the IP VSAT support Internet Protocol services. A small bandwidth, such as 256 kbps is provided as backbone to the master control via satellite. This internet gateway delivers data service to public internet service in the village. However, usually this service includes only internet access and information service provided by centralized system.

Figure 6. Configuration of Multiplatform Services

The idea is promoting two available infrastructure connections: A and B, to be backbones of multi platform services. Multiplatform services (MPS) concern for providing a local Private Branch eXchange (PABX) that may connected among people in the local community or to cellular gateway for public phone services. Then, learning activities of local people are organized via an LMS server where the contents will be synchronized to the master LMS suitable with local needs. In addition, we can provide multimedia services through MPS servers, they propose edutainment program which are broadcasted through IPTV server.

In order to extend the service, the development stage may be implemented by integrating with the existing internet public service in the main site. If there is new investment, it may be expanded the coverage by installing wireless access point network.

## 8. Green Architecture Concept

Green architecture, or green design, is an approach to a building that minimizes harmful effects on human health and the environment. The "green" architect or designer attempts to safeguard air, water, and earth by choosing eco-friendly building materials and construction practices.

Green architecture characteristics concern on energy usage efficiency, including:

- Efficient design & construction
- Energy-efficient lighting and appliances
- Alternate power sources such as solar power or wind power
- Implementation of newly innovation or invention

In order to achieve green architecture for Multi Platform Services we concern on three factors, i.e.:

- Use minimal required power consumption of equipment and systems
- Distributed each server to each service area, considering bandwidth requirements
- Sustainable power generation, using a hybrid power generation from solar cell and wind turbine

However, we also consider the system requirements of:

- Bandwidth:
  - VoIP : GSM Codec about 30 kbps per service channel
  - IPTV & conference : 512 kbps per service

- LMS : best effort, it is not necessary to prepare bandwidth management; just share the rest of available resource
- Backbone means from the available USO program, one village may have :
  - VSAT + BTS cellular for VoIP service; and or
  - VSAT IP for data transfer application using MPS

Multi Platform Service, MPS, may be designed as:

- independent architecture, for this scenario it will serve local content service only; i.e. local PABX inter community, local content of LMS and as well as IPTV
- supported by the USO backbone will provide integrated services that connected the local community to global world, and local LMS can be synchronized with the Master LMS in resource institution

Implementation of equipment and material to support technical specification for minimum requirement, we search on market some low power PC products in order to stay on minimizing energy consumption.

The following example of infrastructure and equipment are as follows:

- Low power PC: < 10 watt, 1 GHz, 1GB memory; additional memory for higher requirements
- Clustering, parallel processing, load balancing for more capacity
- Solar panel power generation : 2 x 100 Watt

To implement the system, we consider first about energy consumption, for 3 low power servers we need 24 watt, and also other equipment. Total energy consumption of about 52 is required; hence providing a solar panel system of 2 x 100 Watt will be enough to supply the energy consumption.

## 9. Model of MPS

Three models are introduced for Multi Platform Service implementation, including Centralized MPS, Distributed MPS with minimal architecture and Distributed MPS with cluster architecture. Whilst to support real-time protocol which related to voice and video application, a recommendation may vary about 0.75 Mbps for about 25 users. If such a technical specification of servers is high enough we may increase its capacity. For IPTV services required 4 x 512 kbps, or about 2 Mbps to obtained good video broadcast quality.

### *Centralized MPS architecture*

Centralized approach of MPS is a simple configuration of using three servers in one location with the input feeding from the USO infrastructure. This centralized approach may cover the surrounding area of base station. The coverage area may be extended by putting repeaters or access points pointed to the base station, as described in the figure 7.

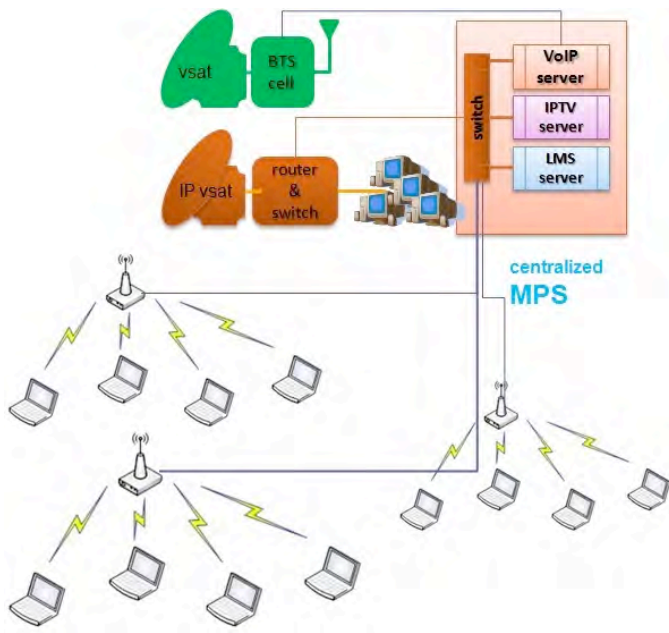

Figure 7. Centralized MPS architecture

#### *Distributed MPS with minimalist architecture*

In the distributed minimalist architecture of MPS, principally the related users are regrouped into related three community access point. Each group will be served by one server, either LMS, VoIP or IPTV server. Three servers are connected by wireless backbone (bridge) that has independent bandwidth out of the access bandwidth to users.

The requirements of distributed MPS with minimalist architecture are as follows:

- wireless bridge/router backbone is required to interconnect the servers
- each server is placed in a certain service area and has an independent access point to its users
- any user has connection to any servers through a wireless access point or cable via switch then continued to related server via wireless backbone.

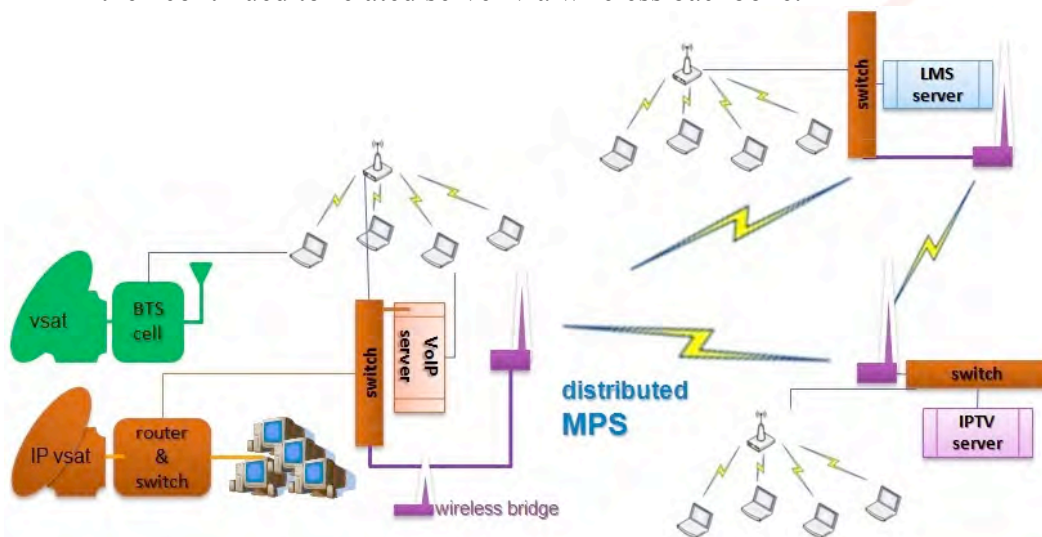

Figure 8. Distributed MPS with minimalist architecture

### *Clustered Distributed MPS Architecture*

Clustered Distributed MPS architecture is proposed when we concern on capacity of each services. We apply cluster computing or parallel processing and bandwidth management solution for integrating 3 or more servers into one system but separately located in related community access points.

Distributed MPS with cluster architecture are indicated by following characteristics:

- each service is served by a cluster of servers for different community access point
- each CAP (Community Access Point) has each MPS servers and one service cluster controller
- any users have connection to any servers through a wireless access point
- capacity of system  $>N$  times of related server,
- bandwidth per user may be expanded by additional access point

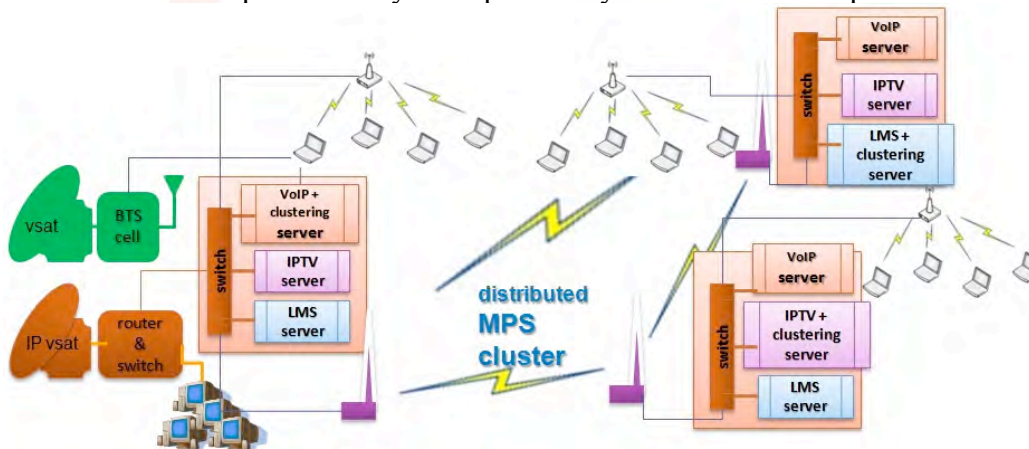

Figure 9. Clustered Distributed MPS Architecture

## **10. Conclusion**

Integrated e-learning, communication and edutainment that has been realized by a Multi Platform Services (MPS) can be considered an independent service or an extended USO service in rural area. e-learning platform using an LMS can be improved by providing an LMS synchronization method which allows content sharing among institutions or LMS Master and Client.

Communication service is supported by a VoIP server. Capacity of the server may be expanded by applying lower rate CODEC, such as GSM and by clustering method of servers.

Entertainment content may be put in to the IPTV server through TV broadcast, Video on Demand presentation. In addition, learners may perform video recording and video conference as well.

In order to implement suit with Green Technology Architecture, then the MPS may be implemented by providing less power server and using sustainable power generator, i.e. solar energy.

Three architecture or MPS has been introduced i.e. Centralized MPS, Distributed MPS with minimalist architecture and Clustered Distributed MPS architecture; to facilitate service capacity. Centralized

## Recommendation

Independent MPS architecture may be implemented without USO head end system (either cellular or IP VSAT) for local community infrastructure. In such a case, content sharing is carried out by digital media transfer (CD, USB disk, HDD etc)

MPS architecture is the simplest architecture where the capacity is limited by server specifications and reserved bandwidth for related real-time protocol (i.e. VoIP & IPTV).

Distributed MPS with minimalist architecture is an alternative solution when similar users are grouped in some Community Access Points. Servers are distributed close to the related user group.

Clustered Distributed MPS architecture is designed for expanded capacity of the system by server clustering, parallel processing or load balancing techniques. In both distributed MPS architecture may use either wireless, cable or fiber backbone media for connecting among related servers.

Official Conference Proceedings 2012

Abstracts

China English is the English based on standard linguistic rules while bearing Chinese cultural and social characteristics. It is a kind of English that takes on Chinese features in both form and function. While courses of English cultures are being offered to assist the English language teaching in most Chinese universities, China English, with unique Chinese cultural traditions, is of similar significance in English teaching. With proper introduction strategies, China English would encourage students' voluntary comparison of the dissimilar cultural and language systems, avoid misunderstanding derived from cultural stereotypes, promote positive language transfer and finally improve the effectiveness of English teaching.

Key words: China English, College English teaching, Intercultural Communication

## 1 INTRODUCTION

While the aim of Chinese College English teaching is shifting the focus to the cultivation of intercultural communication skills, English teaching should aim at increasing learners' cultural awareness on their own behaviors as well as those of English-speaking cultures, and raising their ability to reexamine and explain their own cultural standpoint. Introduction of China English with Chinese culture into English language class would provide students cultural perspectives, lead to voluntary comparison between native language and English, in which students' interest and motivation in language study would be promoted, which in turn, improve their study and help the development of competence in intercultural communication.

## 2 LITERATURE REVIEW

Fresh ideas on the effects of native language on the second language acquisition were developed since 1970s, in which friendly, positive influence of native language in second language acquisition has been attached importance. As psychological linguistics has been developing rapidly, native culture, as a positive input in second language study, attracts much attention. More people come to see native culture as a kind of input which facilitates subconsciously the second language learning process.

### 2.1 Related Linguistic Theories

Krashen's Input Hypothesis says "Humans acquire language only by understanding messages or by receiving comprehensible input" (Krashen, 1985). Hence second language input must be comprehensible to promote second-language acquisition (Krashen, 1996). In addition, Krashen distinguishes acquisition from learning in Acquisition-Learning Hypothesis. Krashen believes acquisition is supposed to be a subconscious process which leads to fluency. Learning, on the other hand, is a conscious process which shows itself in terms of learning rules and structures.

Within the above two process, Krashen points out the subconscious 'filter' as well as the conscious 'monitor' as internal processors in second language acquisition and learning. 'Filter' is responsible for the extent to which the learner's acquisition is influenced by social interest, motivation and other affective factors. When learners are with optimal attitude, they are more likely to acquire a language effortlessly. The monitor has nothing to do with acquisition but with learning. The learned system acts as an editor or 'monitor', making minor changes and polishing what the acquired system has produced. The 'monitor' is responsible for conscious learning. The learners correct mistakes in their speech according to their self-consciousness.

Sapir and Whorf believe that human being with different languages live in distinct worlds respectively. Language is not simply the labels attached to the society, but a linguistic system in our mind as the medium of expression for the impressions. According to Sapir-Whorf Hypothesis, language teaching and culture introduction cannot be separated since language and culture cannot be separated. Language is by no means neutral but directly influences people's entire life. One's native languages

strongly influence the ways one thinks and shape one's view towards the world. Thus, communication between different languages could not be well promoted by solving language problem solely. Ineffective communication between people might be attributed to their different cultures, not the languages.

## 2.2 Native Culture Influence

During 1980s, Dr. Robert Lado proposed that comparison between target language culture and learners' native cultures could raise students' cultural awareness in second language teaching. According to Dr. Lado, comparing target and native cultures with the Implementation of the certain guidelines could help students deepen their take-for-granted native cultural concepts while learning to appreciate other cultures as well.

Such comparison guidelines are: Form, Meaning, Distribution, Misinformation and Linguistic Evidence. Form is the physical setting and objects of an event; meaning refers to the meaning of an event to the members of a certain culture; distribution is the frequency which the event occurs; misinformation is the misinterpretation of people of another culture towards the event; and Linguistic Evidence is the differences in languages the two cultures in describing the same event.

One decade later, Tomalin and Stempleski (1994) proposed that English language teaching should not only concentrate on English culture input for English learners, but aims at increasing learners' cultural awareness on their own behaviors. They also list out the guidelines for intercultural communication activities and provide language teachers with practical teaching principles, among which awareness of both native and target cultures is for all levels of learners. In addition, among the four dimensions of communicative competence proposed by Canale and Swain, which includes language competence, sociolinguistic competence, strategic competence and discourse competence, the latter three are closely related to culture.

Though second language acquisition theories have long been disputed, they provide different perspective in the study of foreign language education. And, as an indispensable counterpart of English culture, Chinese native culture input would facilitate English teaching and help the development of the intercultural communication competence as the ultimate purpose of English teaching.

## 3 POSITIVE INFLUENCES OF CHINA ENGLISH

Familiar native culture in the process of foreign language study would help create a comfortable study atmosphere in class. Introduction of China English would connect Chinese identity perception and cognitive patterns for students in English study, arouse motivation and interest, and facilitate the understanding of English language and culture.

### 3.1 China English

As English becomes the international language, increasing cultural exchanges between English and non-English cultures will inevitably bring diverse fresh ingredients into English language and culture. During the process of cultural exchange and integration, localization of English appears widely in the non-English area, which brings different variations of English, among which China English is the English based on standard linguistic rules and bearing Chinese characteristics (Wang, 2000).

Different languages make their own contribution to all human civilization. There are great assets in different languages, which derived from the even more sophisticated human cultural heritage. China English, different from Chinglish, the misused English, is one of the important variation of English language. It is correct, standard English, reflects unique Chinese culture and mentality, and is of great significance to the world civilization.

China English has unique features in itself: it is sinicized English with localized characteristics. *A land of rice and fish* (China English “鱼米之乡”) has the similar meaning as in English *a land flowing honey and milk*. There is also Chinese-style in China English. For example, *One Country, Two systems* indicates clearly Chinese characteristic in the administrative manner in Hong Kong and Macao. There are also Chinese words that have been assimilated into English, like *Kongfu* (martial arts), *Guanxi* (connections), *Mianzi* (face), *Lundu* (ferry), etc..

### 3.2 Positive Influence of China English and Chinese Culture

#### 3.2.1 Current situation

Currently, universities in China have realized the significance in introduction of English culture in English language teaching. Background knowledge, like introduction of western civilization, and courses of English cultures are being offered to assist the English language courses. However, the positive influence of one's native culture and China English has not yet been attached importance.

A hundred and twenty students majored in scientific studies have been surveyed on the Chinese cultural knowledge in April, 2010. The survey questions focused on Chinese language and basic cultural backgrounds in the form of multiple choices and short-answer questions. The result of the survey shows the positive correlation between the students' English level and their Chinese cultural knowledge. Comparatively speaking, students with better English scored higher in the survey than those who are struggling in English study. Such result proved that Chinese culture has the positive influence on students' English language and culture study.

An affiliated question to the survey collected students' attitudes towards the introduction of Chinese traditional culture in their English study. There are 58.6% of the students surveyed believe that Chinese culture is very important in their language study. Students who believe it is important or comparatively important accounts for

26.3%. Thus, 89.9% of the surveyed students regards Chinese culture as a crucial influence in their English study and believe that it would benefit their cognitive understanding of a foreign language and culture.

There are 10.1% students who would not support the idea of course in Chinese culture. But most of them provide the reason for such decision as that they have already high pressure from various courses and would not like to have more. Lateral correlation shows that the average English grades of such students are much lower than those who uphold the Chinese culture introduction. Obviously, cultural awareness promotes language study, and vice versa. Native culture enriches and promotes students understanding of English language, ensures better performance in English courses. On the contrary, ignorance in cultural knowledge, take-for-granted attitude in culture study could only result in more difficulties in the language study.

### 3.2.2 Positive influence

First of all, China English in English language class would combine a familiar Chinese cultural atmosphere with foreign language input. As a result, students' eagerness in expressing their own understanding of their native culture are well-motivated, hence it is easier for them to become more willing to experiment the English language they have acquired. Effective English teaching would be again facilitated by the introduction of China English with Chinese Culture. The voluntary comparison aroused among students between Chinese and English cultures and language systems would help them clarify the roots of their recurrent mistakes derived from their cultural stereotypes and language form.

Secondly, native culture shapes one's values, hence influences one's cognitive patterns, interest and motivation in study. Values play a core role in intercultural English language teaching. Introduction of native cultural values would be able to arouse the cultural awareness from students, help them to view language study from a higher level as the way of enhancing their intercultural communication skills.

In addition, cognitive patterns and mode of thinking would influence one's English study. Most Chinese college students start English language study after they have had a fairly good command of native language. No matter the native language transfer is positive or not, it could not be ignored or eliminated. In the study of vocabulary, students would voluntarily associate similar Chinese words to memorize the newly accepted English words; while doing reading comprehension, they would translate the passage in their mind to understand the meaning it conveys. While in more expressive ability like writing, Chinese grammar structures are frequently seen.

Finally, with the development of humanistic psychology, and according to Krashen's theories about the internal processor "filter", students' emotional aspect in second language study should have been paid much attention to as well. Emotion and mood are both human experience and feelings which reflects people's need, thus both have

the positive and negative sides. Positive emotion and mood would help promote the interest and motivation in study, and dig out students' potential in language learning. Introduction of Chinese culture in English language class would help reduce the psychological distance between Chinese students and foreign language learning. It shows the language culture in the take-for-granted behaviours and most common daily life, which would help students accept the exotic knowledge in language.

#### 4 STRATEGY OF CHINA ENGLISH INTRODUCTION

In order to make the most of positive language transfer among Chinese students, to promote deep awareness and understanding of English, China English should be adopted together with the introduction of dissimilar cultural heritages and different ways of language expressions.

##### 4.1 Classroom adoption of China English

In vocabulary study, the adoption of China English could help students to realize the limitation of translation. Due to cultural differences, some Chinese and English words would not be easily translated into a read-made counterpart words. While explaining word in China English, students would have to think about the word meaning in different cultural backgrounds and thus improve their ability in comprehensive analysis and use of the language. Students would also find such activity more related to their life than mere memorizing the new vocabularies.

Efforts in connecting China English and English teaching could also be put in grammar review. For example, "He who has never been to the Great Wall is not a true man." is the Chinese expression to indicate the magnificent scenery of the Great Wall in China. Literally, it means one who has not climbed the Great Wall and appreciated the grand landscape of China from it would be having a lifelong regret. With such explanation, students would once again appreciate the Chinese expression they are familiar with. On the other hand, the sentence can be used in reviewing the grammar of attributive clause, subjunctive mood and different English tenses.

##### 4.2 Resources of China English

Selection of proper resources would be crucial to the effectiveness of China English introduction, which require English teachers to attentively observe the Chinese cultural expressions in standard English. There are excellent China English resources which basically falls into three catalogues: Chinese literature written in English by Chinese writers; fine English translation of Chinese works; works on China and Chinese cultures written by English native writers.

Three-time Nobel Prize Nominee Lin Yutang and his *Moment in Peking* would be one of such works. As one of the most influential writers in his time, Mr. Lin has more works written in English, for example, *My Country and My People*, *Between Tears and Laughter*, etc.. His works bears a casual but deep emotion, and his humor shows the wisdom of Chinese. Besides, his English translations of Chinese classical texts

have been best sellers in the western world, which would also be great resources as China English. Besides, there are numerous native English writers who are fascinated by China and Chinese cultures. If Pearl S. Buck is considered as the first generation of American writers who wrote about China, Peter Hessler, the author of *River Town: Two years on the Yangtze*, *Oracle Bones: A Journey between China's Past and Present*, and *Country Driving: A Journey through China from Farm to Factory*, would definitely be the modern counterpart. Such fine writings could serve as China English reading materials for students both in and after class.

What's more, as the development in digital audio-visual technology, various media information from the internet provides more and more language learning materials, among which is Chinese cultural introduction created by Chinese and foreigners. College English teachers could provide students with such information to assist their language study and employ the material in their classroom teaching.

Besides the efforts made by English teachers, text book compilation plays an important role in China English and Chinese cultural introduction. While most text books in China involve topics about almost everything but Chinese traditional culture, publishing houses of English text book should not only focus on the introduction of English cultural but take into consideration the national cultural characteristics. Combining the foreign culture with comparison with classic national traditions would be perfect for Chinese English learners, especially adult learners.

While employing assets of Chinese culture in the form of China English, there are limitations which should not be ignored. The students' native culture should be actively and properly incorporated in the language educational process, and should remain the assistant role in their English language study.

## 5 CONCLUSION

The appearance of China English indicates that Chinese cultural identity has been taking up more influential and positive role in the modern cultural exchange among all the nations. Universities could take China English as convenient and effective mode of language teaching resources.

The aim of language teaching is to enable a communicative tool for students, thus a balance has to be achieved in language teaching and the introduction of cultural background. After all, introduction of Chinese culture is not the dominant purpose of the English language course. While maintaining the core of English language teaching, promoting students' interests in Chinese characteristic traditional culture, enhancing the awareness of national identity would be crucial to effectively improve their command of languages and extensive bilingual cultural knowledge. Thus, students would be able to communicate better internationally in the global exchange in the future.

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

Literature and film is a cornucopia of vibrant essays, novels, stories that chart the history and confluence of literature and films. It explores in detail a wide and international spectrum of novels and adaptations for most people, film adaptation of literature can be summed up in one sentence, "The movie wasn't as good as the book" This volume undertakes to show the reader that not only is this evaluation always true but sometimes it is intrinsically unfair. Movies based on literary film are not the same thing as literature. I found many similarities between literature and films. You see films as a show; I see it almost as an attitude towards life film is a conductor of motion, film is an innovator in literature, and film is a propagator of ideas. My paper will focus on comparing between literatures based films in Indian Bollywood context of 70s and 80s movies with the current stage. In compare to 70s and 80s Hindi films today have become much braver. Film making is much more transparent. The makers are adventurous and the audiences are ready to accept something new and different .infected this is a fantastic phase where the experimental cinema is flourishing and the good old Hindi cinema is also rock solid. Audiences have a greater number of films to choose, compared to the olden days, where the scenario was "This is what has released and this is what you have to watch".

To believe that adaptations are acceptable substitutes for the works adapted is to believe that the experience of watching a film or television show, even the most intelligent and well-wrought shows, and reading a novel are essentially the same, A good television dramas or film adaptation can certainly provide pleasures of its own, but they are the pleasures available in that medium. A good film requires careful attention, just as does a good novel. Which we have to look and listen.

Film requires a kind of looking, but even our visual registering of word, phrase and sentence, and the way these elements arrange themselves in a "style" distinctive to the author we're reading, is more an internally-oriented mental process than an externally-oriented process of sorting sights and sounds although a kind of "listening" is also certainly involved, as language manifests itself to our mental "ear". Our imaginations then have to finish the job the writer has started. We have to mentally transform the words, phrases, and sentences into the "actions" or "thoughts" or "emotions" of the "characters" we agree are being brought to a kind of life. Films, of course, do this work for us. And we have to keep straight the way in which the characters and their actions are being presented to us in a particular sort of formal arrangement, an arrangement that is again mostly a phenomenon of our mental engagement with the text.

Literature and film are both written, when watching a movie you can see and hear the details, whereas when reading a book you are able to imagine them, and create the pictures in your head. While writing a book the author only has to imagine it and write it down, but when making a movie the director, producer, and screenplay writer have to work together to create the scenes, make the special effects, and of course find the perfect actors/ actresses for each major and minor role. There is also a considerably more amount of money involved in making a film. You have to make the scenes, hire the actor, and pay the workers, directors, producers, buy the advertisements pay for the reels that the movies are made on. The book has more information about the story while movies are shortened and with less information.

Also, for what the producer and director believe will enhance the entertainment aspect of the film, they may add information that was not at all seen in the book.

So people should read the books before they watch the movie. The other aspect of the book vs. the film is the instant ability to re-read passages that at first the reader did not totally grasp. Besides the obvious, movies condense books for time and economic reasons. The movie may also contain scenes that are not in the book. This is done for several reasons which include the idea that an addition to the movie may enhance the story.

In the process of filmmaking, there has been an integrative, connective tendency, which neither is nor present in the product. People of all religions, faiths, castes, languages and physiognomies have worked happily together in Bollywood for decades in a model of harmony. The language of the films also bears testimony to this unifying principle in evolving a widely comprehensible Hindustani, made up of Hindi dialectal words, Urdu and smaller borrowing from other languages, reflecting the diversity of India, and bypassing the oppressive Sanskritization of the official language whose failure has been evident for decades. Hindi cinema is acceptable through the length and breadth of the country but the opposition to the imposition of shudh Hindi remains unabated.

The relationship between literature and film has been the subject of numerous reflections and analyses; we turn to literature and film because they engage us. Cinema is an expression of reality, is a widely-held theory.

Over the few years, a growing numbers of universities in India have begun to offer, or are thinking of offering, film studies as part of their curriculum. A central part of these new courses, as distinct from programmes of literature and cultural studies, is a history of cinema in India and elsewhere. This offers great opportunities: the purpose of a history of cinema is to arrive at an understanding of where cinema must have come from, of how it functions within a global process of industrialization as encountered by diverse societies, and of the nexus between that and the reshaping of peoples habits and lives through the narrative strategies of individual films.

Diversity is the hallmark of Indian cinema.” If asked, what human activity is most widely appreciated and easily understood as cultural expression in India today, I would not have a moment’s hesitation in replying, it is cinema.” Films transform lives too.

What the Indian cinema needs today is not more gloss but more imaginations, more integrity and a more intelligent appreciation of the limitations of the medium. What our cinema needs above everything else is a style, an idiom, a sort of iconography of cinema, which would be uniquely and recognisably Indian. it is only in a drastic simplification of style and content that hope for the Indian cinema resides. The raw material of cinema is life itself. It is incredible that a country, which has inspired so much painting and music and poetry, should fail to move filmmaker. He has only to keep his eye open, and his ears. Let him do so.

Film and literature as manifested in the adaptations of literary text into films from its earliest beginnings, film has owed a great deal to literature. Film as some of the earlier essays have

shown, engages deeply, as does the literature, with issues of representation, telling and showing visuality and textuality, narrativity and language, image production, point of view, identification, form, genre and authorship, as do literary text. It is film in fact that provides and interdisciplinary site par excellence, requiring a multiplicity of disciplinary and theoretical grids for an adequate understanding.

Although the relationship of literature and film is not merely one of the adaptations of literary texts, adaptation nevertheless is a key issue in a discussion of the relationship of the two media, raising several hermeneutical questions pertaining to both.

Cinema has to live not in competition with literature but in reconciliation; this way it can retain its character and find its place among the arts. This would, of course, apply only to literature-based films. This reconciliation should not be confined to the format of cinema only; it has to be with time also and in consonance with three loyalties of the film-maker, to the theme, to the medium (of cinema) and to the time he lives in.

Some of the important films where literature and cinematic imagination is “Shatranj ke khiladi” starring Sanjeev Kumar this was the scene of the declining court of the Lucknow during the last days of the avadh before the rise of the British. Here one notices the collision of two world-and unhurried past and uncertain future. In this catastrophic collision the collapse of an old regime was excellerated by its failures to not read the reality.

The cinematic style is itself a mixture of the changing times. The rapid transactions are dismissed by the feudal classes. The palaces, splendour are all activities of intense fight. But for some, they choose to remain close to it. this film again led to an easy portrayal of Lucknow past. it was because such a lucknowi past was created by the early Hindi film, the use of their language settings and props this is what Mukul keshavan calls as the rise of an Islamic said culture in Indian cinema. Similar exercise is repeated in 1981 in Muzaffar Ali’s “Umrao Jan”. like “Shatranj ke khiladi”, Umrao Jan also went well with the audiences. The selective use of the Urdu language the idea of the courtesan and the use of some symbols like Hookah and Pan brought about the settings that would be a new templet. while this films where part of a north Indian Mughal cultural, the literature could easily pick up subjects and give life to these subjects. Thus some new genre in film making evolved a common language that emerged as cultural resources to be taped. This shift from Hindi to Lucknowi Hindi was accomplished very easily and certain standardised features like songs and gazals helps to illustrated this process. The audiences were familiar with the idea of a Mughal courtly style in Hindi cinematic language by this 1970s.

If the language of the court was main familiar in this genre by the association of Urdu, similar experiments were taking place with regard to the cultural hunger in many parts of the country. It is here one notices the language of protest emerging in India by the 1970s the naxasalite by K.A. abbas and bandit queen both this films situated at different chronological end of the decade shows the emergence of dis satisfaction that is becoming a problem of the country. Mithun chakravorty’s the naxasalite portraits the culmination of Amitabh bachchan angry young man’s image as an idealistic escape for the youth. Based on a literature both this films

brought out the idea of the rebel as a new phenomenon was present in both literature and film. Thus the gap between literatures of film was closing very steadily.

Conclusion-It has been observed that while language influences cinema technology mediates this influence and gives a new form to this visual language. The number of films can be grouped into genre, the face to face with literature and film and subsequent productions laid to a dialogue encounter. This audience based participation in the dialogue and their contribution as thus let to the evaluation of a new cinematic visual culture. While many margins let the lost world of Urdu and social protest were brought the main stream, it also has done the danger of homogenization. (Draft paper, a revised edition will be sending as soon as possible.).

## Introduction

Science education and communication has been promoted hardly as cross-disciplinary study in Taiwan in recent years and our research attention has been focusing on science communication for preschool children of foreign-marriage families. The culture was however still very traditional and conservative those multicultural perspectives are hardly decayed. We found that there were tensions and conflicts within the families that may take their preschool children into different routs in terms of learning and development.

## Science Communication and Educational Activities

In recent years, “Science Education” and its related studies such as “Science Communication (SciComm)” and “Public Understanding of Science and Technology (PUST)” have being pushed and encouraged by the National Science Council of the Republic of China (Taiwan). While science education for the general public is meaningful, we turned our research attention to preschool children of foreign families. As Asmolov argues that “a necessary condition for the development of different kinds of systems is the contradiction (conflict or harmonic interaction) between adaptive forms of activity ... and the manifestations of activity of elements bearing individual variability.” (1998, p. 35) Thus, the adaptive activity of social norms and individual “self expression” of activity from own experience, feeling, and thought can create a tension to one’s own situation. In our study, this is the motivation that we argued to be the driven power for concept formation.

Science education in early childhood education has been always a challenge to educators, especially when science becomes a social means of production to one child’s socialization. In other words, the term “science” becomes a mediation tool for the children to think internally as well as behave externally. Thus, the science education for those young children is less a academic issue, but a practice of learning to the world. In our study, we investigated science education in foreign marriage families of those preschool children and their scientific concept formation within that domain by the assistance of a predesigned parental read-together program. Through all activities within that program, we have learned great detail about how those children form their scientific concept and their higher psychological function in the process of problem solving. Among all activities, image making and storytelling becomes very meaningful tools for our study.

## Cultural-historical Theories

Our research is based on Vygotsky's Cultural-historical psychology to investigate those preschool children's learning psychological path to their scientific knowledge construction. We used “Zone of Proximal Development” theory to understand the ins and outs of those preschool children’s learning psychological functions. Vygotsky thinks that learning is a mediated process that goes upward and downward. (Vygotsky, 1930/1978) While the zone of proximal development (ZPD) is an implication of Vygotsky’s theories in education (Vygotsky, 1930/1978), The idea and the term scaffolding was introduced

by Wood, Bruner, and Ross (Wood, Bruner, & Ross, 1976) and is often thought as an extended implication from Vygotsky's discovery of the Zone of Proximal Development. (Wertsch & Rogoff, 1984) Although the scaffolding that introduced by Wood, Bruner, and Ross in 1976 does not directly refer to ZPD, but the subsequent researches of scaffolding echoes ZPD. (Newman & Holzman, 1993) However, some scholars reject Vygotsky's ideas in the 30s Russian skin and favor the contemporary western capitalists' style. (Lambert & Clyde, 2003)

The Zone of Proximal Development is an approach and concept that Vygotsky discovers to the study of the interaction between learning and development in school learning. (Vygotsky, 1930/1978, p.84-85) According to experiments, Vygotsky believes that children with similar levels of mental development can have a result of very different degree of "subsequent course of their learning" from the guidance of a teacher. (Vygotsky, 1930/1978, p.86) The development of the children's mental capabilities can go further with the adult's assistance. Thus, Vygotsky calls the difference of development between without and with adult assistance as the zone of proximal development and describes:

It [the zone of proximal development] is the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers. (Vygotsky, 1930/1978, p.86)

Because of the help from the more knowledgeable other, Vygotsky distinguished what a child can learn by them own and what can be learned through the assistance from the more knowledgeable others. (Snowman & Robert, 2003)

### Social Justice

In our view, social justice is explained as a dialectical process of human learning and development. Within the process, all revolutionary conflicts from the social-cultural condition transform themselves as well as social. Social justice has to though mediated and dialectical process within the social-historical activities.

Social justice is ideal. It is what a human being is working hard to be himself as stand firm in the situation that is different from "usual". The usual state of mind can create peace as well as all things are in place. It is the feeling of justice while nothing is compared to be conflicted. In other words, everything is exactly the same without contracting. In fact, contraction is eliminated from the awareness of mind while the societal conflict is eliminated. The social norm replaces human cognition to the rest of the world and becomes stable. The ideal of justice becomes the norm that is given from institution authoritative voices, thus our minds are finally self-contained. No abstraction is produced from any activity within and in between minds. Science Communication as social means for this mediated and dialectical process. In addition, Hegel thinks that justice as institutionalized freedom. (Hegel, 1975)

Therefore, social justice is socially mediated and historically situated. It is not a fixed stage of social relationship between foreign-marriage families and the rest of the society, but a dynamic process of learning and development in itself. Learning and development

by using scientific knowledge is meditational tools for communication and negotiation. While the society provides a socially conditioned rule to follow, they are able to deconstruct the rule and reconstruct to a new one that fits their needs. Although all the reconstruct knowledge have the same components as the socially conditioned one, the new one has a new meaning for those foreign marriage families. While concepts of living is different from others in the family, as well as the others outside the family, foreign marriage mothers are having conflicts.

### Learning Process

A total of 12 preschool children participate in our research project. We use language as the key to detect the children's higher psychological functions in the activity, and the content is purposely designed to promote scientific knowledge while embedded foreign mother's cultural artifacts along with the program such as children's music and graphics from the foreign mother's native tone.

### Means of Production

This dialectical process is children's scientific concept process and activity for their scientific concept development. We came up with a idea of pseudo-multicultural concept for that children of foreign marriage families do not benefit from their mother in their scientific concept development and that may become a guide for a social change this existing pseudo-multicultural environment into more multicultural respects.

## Introduction

I am a lecturer in The Hong Kong Institute of Education. In recent years I am involved in the teaching of a module ‘Mathematics Explorations with Technology’.

The major focuses of this module are algebraic and dynamic geometry softwares with their applications for enhancing explorations in primary mathematics. With the rapid advancement of technology in our information era, the module content is shifting from the introduction and usage of classical mathematics softwares such as Mathematica and Maple to freewares like Cabri Geometry and GeoGebra.

In this paper I would like to share a teaching case with illustrations selected from project works designed by my students.

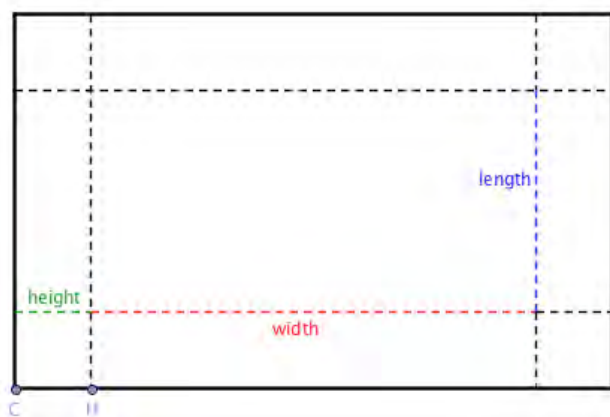

## The Maximum Volume Problem

A4 and A3 sheets of paper are commonly found in schools for photocopying machines. What is the width( $w$ ) to length( $l$ ) ratio of the A series of paper? By proportionality of similar figures we have

$$\frac{w}{l} = \frac{l}{2w}, \text{ yielding } 2w^2 = l^2. \text{ So the ratio } w : l = 1 : \sqrt{2}.$$

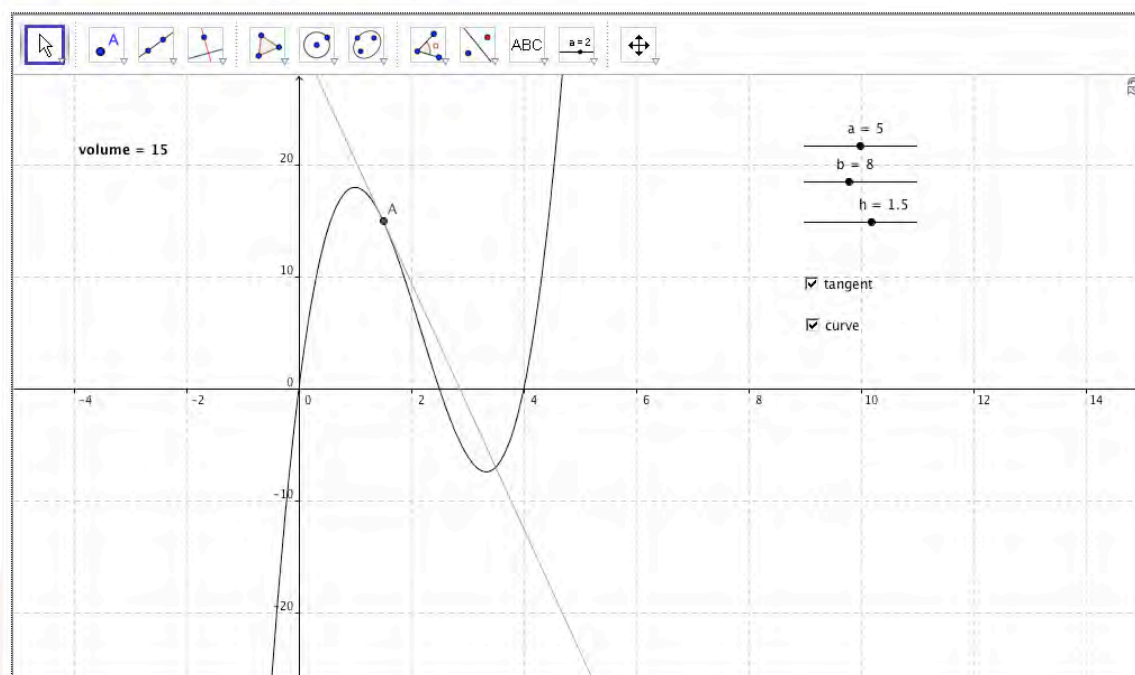

What is the maximum volume of an open box created by a sheet of A4 paper? This is a well known calculus problem in mathematics for students to carry out exploration.

Take the width of a paper to be 1 and the length to be  $\sqrt{2}$ . The volume of the box,  $V$  is a function of the height of the box,  $h$ . Obviously in this case  $0 \leq h \leq 0.5$ .

$$V = f(h) = (1 - 2h)(\sqrt{2} - 2h)h = 4h^3 - 2(1 + \sqrt{2})h^2 + \sqrt{2}h$$

The function  $f(h)$  is continuous and differentiable in  $0 \leq h \leq 0.5$ .

For maximum volume  $\frac{dV}{dh} = f'(h) = 12h^2 - 4(1 + \sqrt{2})h + \sqrt{2} = 0$

$$\text{Therefore } h = \frac{4(1 + \sqrt{2}) \pm \sqrt{[4(1 + \sqrt{2})]^2 - 48\sqrt{2}}}{24}$$

$$= 0.612 \text{ (rejected) or } 0.193 \text{ (to 3 decimal places)}$$

With width = 210 mm and length = 297 mm,

the required height for maximum volume =  $210 \times 0.193 \text{ mm} \approx 40 \text{ mm}$ .

### Exploration with Microsoft Excel

The above analysis requires the prerequisites of differential calculus which can hardly be understood by primary students. However with the advancement of technology teachers can write simple subroutines in Microsoft Excel. By applying the elementary volume formula students are guided to search for the solution.

Here is the basic subroutine with a ‘for-loop’:

```

Dim i, k As Integer
Dim length, width, start, interval, h As Double

Sub volume()
    Call GetData
    i = 5
    For k = 1 To 10
        If k = 1 Then h = start Else h = h + interval
        Cells(k + i - 1, 4) = h
        Cells(k + i - 1, 2) = length - 2 * h
        Cells(k + i - 1, 3) = width - 2 * h
        Cells(k + i - 1, 6) = h * (length - 2 * h) * (width - 2 * h)
    Next k
End Sub

```

Entering the length and width of the given paper, and the initial value of  $h$ , with the decided increment, we can execute the subroutine. Below is an example.

1. Starting with  $h = 1$  and increment of 1, volume attains a maximum when  $h = 4$ .

	length	width	starting pt	interval
A4	29.7	21	1	1
length	width	height	volume	
1	27.7	19	1	526.3
2	25.7	17	2	873.8
3	23.7	15	3	1066.5
4	21.7	13	4	1128.4
5	19.7	11	5	1083.5
6	17.7	9	6	955.8
7	15.7	7	7	769.3
8	13.7	5	8	548
9	11.7	3	9	315.9
10	9.7	1	10	97

2. Starting with  $h = 4$  and increment of 0.1, volume attains a maximum when  $h = 4$ .

	length	width	starting pt	interval
A4	29.7	21	4	0.1
length	width	height	volume	
1	21.7	13	4	1128.4
2	21.5	12.8	4.1	1128.32
3	21.3	12.6	4.2	1127.196
4	21.1	12.4	4.3	1125.052
5	20.9	12.2	4.4	1121.912
6	20.7	12	4.5	1117.8
7	20.5	11.8	4.6	1112.74
8	20.3	11.6	4.7	1106.756
9	20.1	11.4	4.8	1099.872
10	19.9	11.2	4.9	1092.112

3. Starting with  $h = 4$  and increment of 0.01, volume attains a maximum when  $h = 4.04$

4. Starting with  $h = 4.04$  and increment of 0.001, volume attains a maximum when  $h = 4.043$

	length	width	starting pt	interval	
1	29.7	21	4	0.01	
2					
3					
4					
5	1	21.7	13	4	1128.4
6	2	21.68	12.98	4.01	1128.439664
7	3	21.66	12.96	4.02	1128.468672
8	4	21.64	12.94	4.03	1128.487048
9	5	21.62	12.92	4.04	1128.494816
10	6	21.6	12.9	4.05	1128.492
11	7	21.58	12.88	4.06	1128.478624
12	8	21.56	12.86	4.07	1128.454712
13	9	21.54	12.84	4.08	1128.420288
14	10	21.52	12.82	4.09	1128.375376

	length	width	height	volume	
1	29.7	21	4.04	0.001	
2					
3					
4					
5	1	21.62	12.92	4.04	1128.494816
6	2	21.618	12.918	4.041	1128.49501
7	3	21.616	12.916	4.042	1128.495099
8	4	21.614	12.914	4.043	1128.495081
9	5	21.612	12.912	4.044	1128.494958
10	6	21.61	12.91	4.045	1128.49473
11	7	21.608	12.908	4.046	1128.494395
12	8	21.606	12.906	4.047	1128.493955
13	9	21.604	12.904	4.048	1128.493409
14	10	21.602	12.902	4.049	1128.492757

The precision of  $h$  is getting higher and higher in this iterative process. This is in fact the idea of numerical method in obtaining the solution correct to the decided decimal places.

### Exploration with Origami

For primary students concrete objects are better than pure number operations in interpreting results. The exploratory process can be visualized concretely with the help of origami models. The figures below illustrate Lucas Garron's way of locking the corners of a box.

Step 1: form the crease as indicated	Step 2: fold the 45° angle bisectors out	Step 3: now in 3D, continue collapsing
Step 4: fold the top part down as far as possible	Step 5: finished lock	An open box by origami

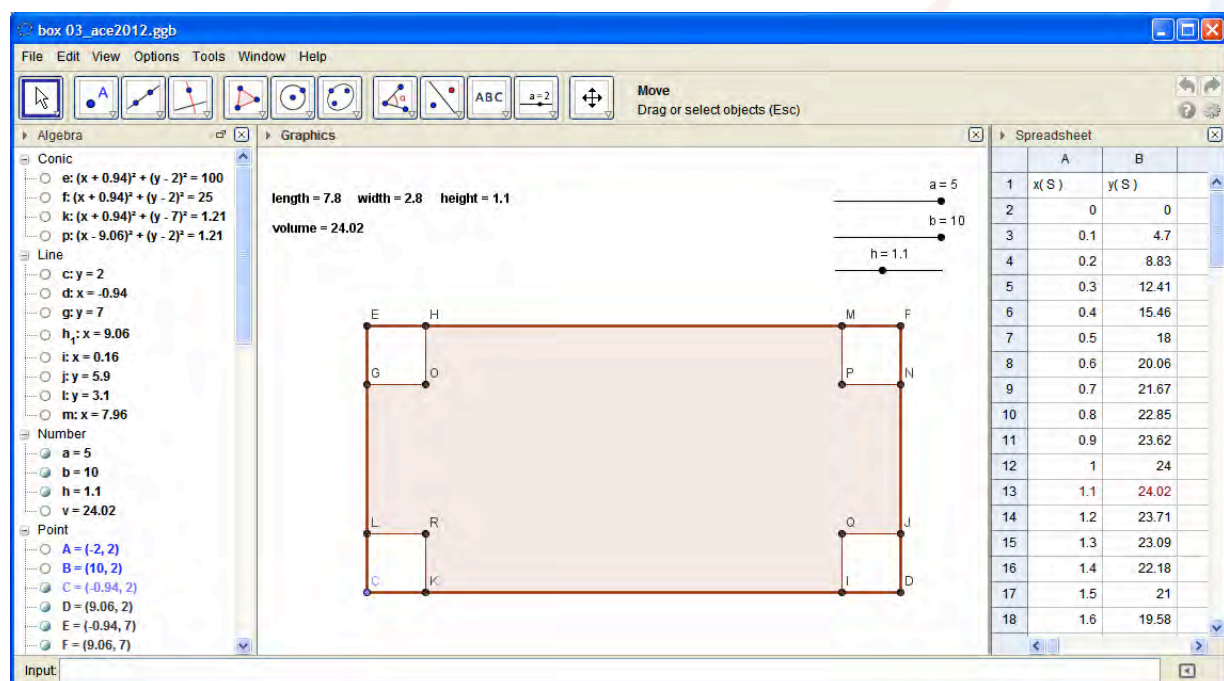

Below is a suggested classroom procedure for teachers.

1. Teacher demonstrates to students the folding procedure of an open box with a particular height. Then the exploratory problem of finding the box of maximum capacity is raised.
2. The class is divided into groups. Each group makes several open boxes (4-6) of different heights.
3. Students are then asked to measure the capacity of these boxes by rice and obtain their dimensions by ruler.
4. Remind students to enter their measurement results in a worksheet table.
5. Teacher, with the help of Microsoft Excel worksheet, checks the accuracy of students' data obtained and feedbacks on students' team work.
6. Teaching explains to students how the subroutine works with demonstrations.
7. A discussion is held on finding the value of  $h$  for the box with maximum capacity.

### Exploration with GeoGebra

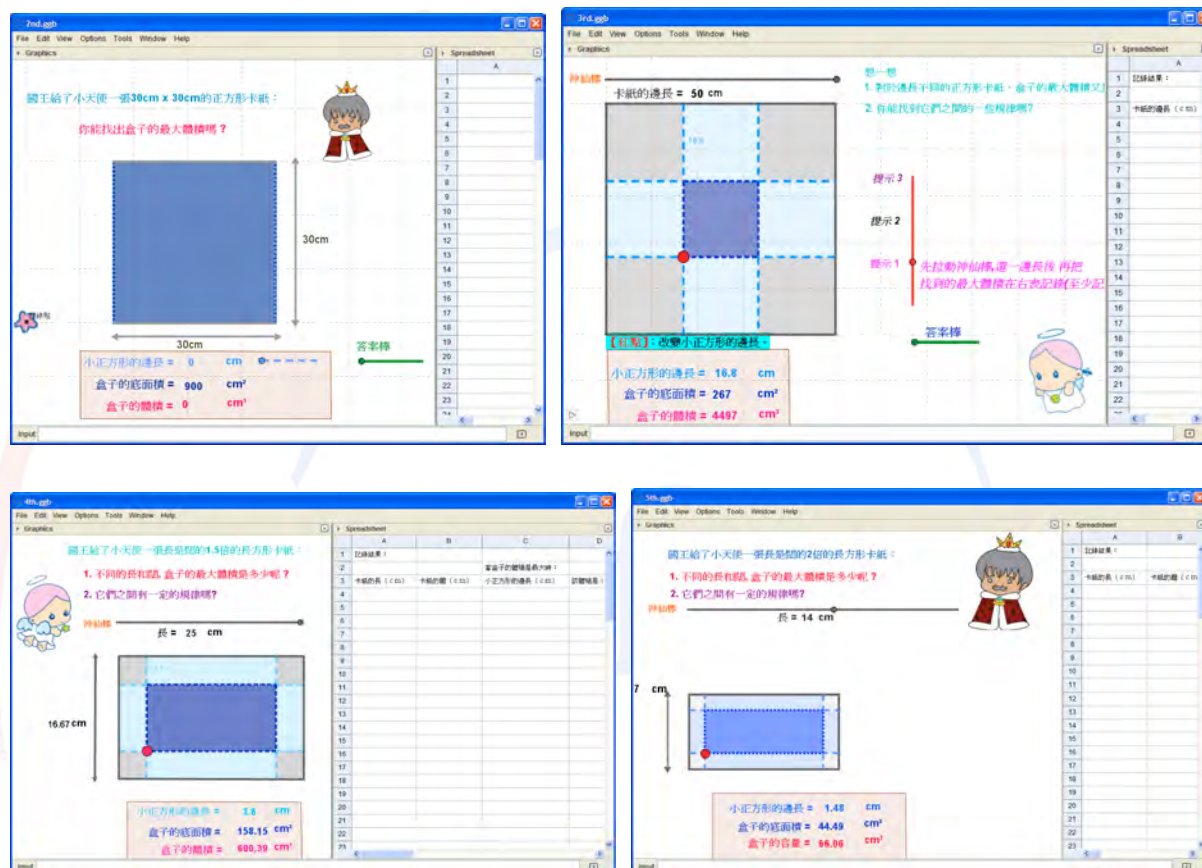

It is natural that classroom measurements are accompanied by errors. And the building up of origami models is time consuming. The application of dynamics geometry software can overcome these shortcomings. GeoGebra is a prominent example developing rapidly in recent years. It provides us various platforms (algebraic view, graphic view and spreadsheet view) in illustrating the model visually and analyzing the situation systematically.

With a basic mastery of this software the net of this model can be constructed with slider controls for width, length and height of the box. And their corresponding volumes are computed and recorded conveniently in the spreadsheet embedded.

## Exploratory Design of my Students

Teaching is an art. To carry the investigations interestingly and meaningfully in primary classrooms, Carol Choi-Kuen Chan, one of my students, integrates the story-telling (The King and the Angel) techniques with a series of GeoGebra files constructed and compiles them into a learning package. The figures followed are the interface designs of her GeoGebra interactive worksheets.

Below is her sequence of exploration questions:

1. The king has given the angel a 30 cm x 30 cm square paper. What is the volume of the largest box created?
2. What if the length of the square paper is altered? Do you observe any pattern?
3. Now the king gives the angel a rectangular sheet instead. Its length is 1.5 times the width. What is the volume of the largest box?
4. How about the case if this ratio is changed, say the length doubles its width? Is there any pattern?

These files have been uploaded to GeoGebraTube . They are assessable in the world-wide-web:

<http://www.geogebraTube.org/student/m971>

Choi-Kuen is a pre-service student teacher. Would you like to provide her your comments and suggestions based on your teaching experience?

### Challenges and Transformations

Enormous changes are brought about by the advancement of technology. The above is just an illustration of how mathematical concepts and generalizations are visualized. The data generation ability of these freewares provides students with a lot of data which facilitate them to make conjectures and guesses. Hence shortens the time elapsed in constructing and manipulating concrete models. This is quite impossible in the past - young students without strong mathematical background can explore complicated mathematical problems with the assistance of technology.

Nearly twenty years have passed since the advocate of pedagogical content knowledge (PCK) by Lee S. Shulman. Living in the information era today teachers are inevitably to pick up technological knowledge for designing and implementing their lessons. In compare with the old days mathematical modeling is far much easier and simpler with the help of technology. And that is why the idea of technological pedagogical content knowledge (TPCK) emerges. Can you tell how pedagogical, content (mathematical) and technological knowledge come into action in the example above? Does it inspire you with more similar teaching ideas? May be the essays 'Math in the Box' by Mary DeYoung and 'Algebraic Thinking through Origami' by William Higginson and Lynda Colgan will give you more insight! Would other origami methods in folding an open box provide you more mathematical explorations?

In our IT world new development takes place every day. Only by continually learning teachers can keep up with the swift advancement of mathematical softwares. Each time I pick up my teaching module GeoGebra is revised and updated (While I am writing this paper, the new version 4.2 is coming!). It does more and more in a user-friendly manner. So I have to learn with my students! And it appears to me that the GeogebraSpreadsheet will sooner or later take the place of Microsoft Excel!

The virtual reality brought about by technology is fascinating. But concrete teaching aids and traditional mathematical proofs do have their own importance. Their roles are not replaceable. With proper management both concrete and virtual manipulatives are powerful learning/teaching tools for students and teachers.

## **1. Introduction**

Globalization induces the importance of English as a common tool of communication, i.e., an important lingua franca in Asia. However, our classroom practices have not provide enough opportunities for our students to engage in using English as a lingua franca (ELF), in spite of the fact that Information communication Technology (ICT) enables us to give our students the abundant practices of ELF. We argue that ELF practices are solutions to enhance English Language Education in Asian countries and we present the method of teaching as a lingua franca, the survey data to prove the motivational merits, social skills, intercultural competence and the method of automatic assessment of oral performance.

English should be taught as a lingua franca. The learners and users of English should be given more ELF-centered practice and opportunities to use English. Kirkpatrick (2012) mentions in his keynote speech at Conference on English in Asia's Languages Habitats and Europe's Asia Competence that the goal of English education among the outer circle and expanding circle countries should be set at the level of successful ELF users rather than that of Native Speakers. This suggests the paradigm shift of the traditional model dependent on native speaker norms to a bilingual or multilingual model and at the same time that Learners' proficiency levels should be assessed in terms of international standards such as Common European Framework of References (CEFR). In this symposium, we demonstrated not only educational merits of ICT-based Asian interactions but also the method of measurement and assessment.

## **2. Cyber ELF Practices: Cross-Cultural Distance Learning (CCDL) at Waseda**

Since English began to be used as a common tool of communication in accordance with globalization, the most common local problem in Japan is a student's lack of English oral proficiency required to discuss the current problems in the world, such as climate change which inherently contains such irrevocable dilemmas about national interests as opposed to lengthy process of idealistic consensus-building towards global solutions. In addressing other current problems in the world without resorting to the military powers, we need to realize that global solutions can be reached at with our firm recognition that this is the age of dialog. In this sense, English Education has been highlighted as a means of promoting dialog more urgently now than before. In order to overcome the local problem mentioned above, Waseda University adopted the three stages of English Education, as shown in Figure 1: tutorial English to promote communicative competence, cross-cultural distance learning to promote inter-cultural

competence and cyber seminars among Asian students to promote discussion ability on complex issues.

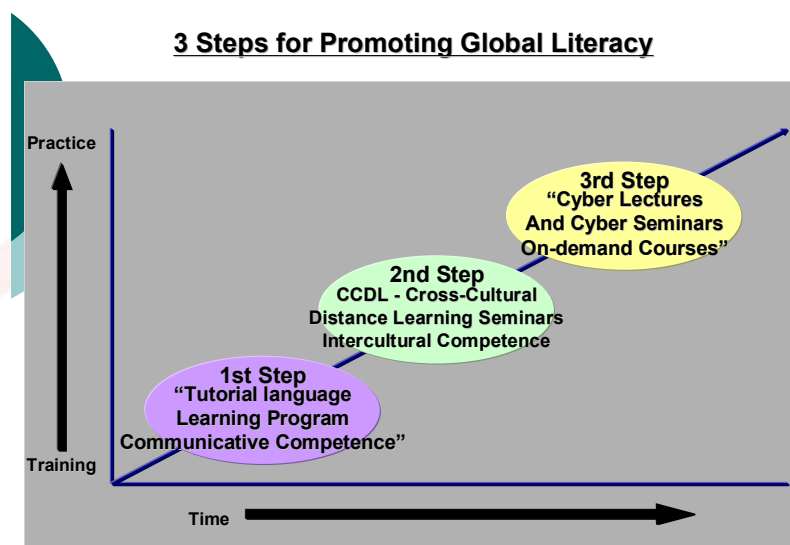

Figure 1: Three Steps of English Language Education at Waseda

Communicative Competence is summarized by Kramsch (2005) as Melting Pot View; i.e., you are accepted once you conform to the main stream of American or British Culture and Societal norms embedded in Native Speaker (NS) English. Without being melted into the mainstream NS norms nor blindly following their norms, communicative competence can be introduced in Asia; we need to know NS values and how NS speakers behave, but we do not need to mimic them. Once Asians are accustomed to detach ourselves from the authority and social norms, and to test ourselves as individuals, we would begin to trust our instincts and feelings and could think outside the box. For this reason, our programs at the first stage of Educational goal are based on communicative competence. In the second stage, we conduct one-to-one cyber seminars in which Intercultural Competence is introduced (Figure 2 and 3). Intercultural competence is metaphorically summarized by Kramsch as Salad Bowl View in which differences are respected as diversity, but the sense of unity may be difficult to achieve. English Language Education at this stage is called CCDL (Cross-Cultural Distance Learning) programs at Waseda University. We use videoconferencing system (Polycom) and/or the PC chat system (LiveOn) and conducts exchanges with students from partner overseas universities in English. Exchange tools between Waseda students and oversea partner students are either TV conferencing system and/or oral chatting system.

*Figure 2: Cyber Exchange Course*

*Figure 3: International Student Forum*

CCDL promotes understanding of different cultures and provides opportunities to gain practical communication abilities in English, which leads to links with Asia and steps to the world. This is the age of Dialog. Conflict resolutions had better be reached at by dialog rather than military powers. At the tertiary level of Education it is better for us to give Dialog training to our students. The role of English in Global Literacy should transform itself and the nature of English Language Education should be shifted from NS-oriented to Asian Englishes-oriented. At the final stage, cross-cultural competence is focused in our education; Cross-Cultural Competence represents a set of social and emotional intelligence to cope with incommensurable world views. Multi-point Distance Learning System is utilized and the students need to cope with multiple points of views such as historical perspective, socio-economic perspective, political perspective involving not only the point of view of a global citizen but also that of an expert in a given area. In the second section of this paper, our educational outcomes are briefly described in terms of motivation, and social skills. Tables 1 and 2 summarize our educational efforts in Asia.

Table 1: The Number of Cyber Exchange courses at Waseda University

	2005	2006	2007	2008	2009	2010
Classes	34	45	67	83	102	85
Students at Waseda	2235	3211	3379	3477	3543	3574
Overseas students	1181	2094	3058	3882	4422	4254

Table 2: The number of participating overseas universities for cyber exchanges

	2005	2006	2007	2008	2009	2010
Countries	21	21	21	24	24	24
Universities	52	55	78	86	89	91

These Cyber courses accords with Kirkpatrick (2010) in several ways.

1. Learners of English need to be able to use English successfully in ELF interactions and in the ELF contexts; although they are communicating via Internet, the ELF cyber practices are authentic social contexts within our region.
2. The educational targets are not set at the Native-like fluency; rather we aim at the proficiency levels of successful bilinguals or multi-linguals.
3. We wish to measure “success and fluency against the ability to engage in lingua franca communication”: Kirkpatrick (2010, p.176).
4. The teachers in these cyber courses are not monolingual native speakers of English, but they are bilinguals or trilinguals in China, Korea, Taiwan, Singapore, Hong Kong, Macau, the Phillipines, Malaysia and Japan. In the ELF contexts, these bilingual or multilingual teachers can become “not only the role models for their learners, but, crucially, they also become their linguistic models”: Kirkpatrick (2010, p.177).
5. Cyber exchanges can establish partnerships with other universities in different countries; in particular, they have face-to-face meeting either in Singapore, Seoul, or Tokyo and they work together on projects in which they need to use English as a lingua franca.
6. The CCDL courses offer opportunities to enhance inter-cultural and cross-cultural communication skills, as recommended by Kirkpatrick (2010). Our courses at the tertiary level need to include educational opportunities to discuss current issues in our contemporary world.

### **3. Cross-Cultural Distance Learning (CCDL)**

#### **3.1 Introduction**

Waseda University has been conducting Cross-Cultural Distance Learning (CCDL) Program since 1999 in order to enhance students' cross-cultural understanding and to improve their English communication skills. The four objectives of CCDL are (1) to deepen students' cross-cultural understandings between Japan and Asian countries through the means of English, (2) to foster understandings for different cultures based on the sound comparisons of cultures, (3) to acquire the willingness to participate in discussions, and (4) to acquire such skills as discussion skills, facilitation skills and presentation skills.

As the second objective above indicates, in this global age, one cannot emphasize enough the importance of English between non-native speakers of English at the tertiary level. To accommodate this trend, in the field of Applied Linguistics the concept of 'English as a Lingua Franca (ELF)' has emerged as an alternative to such concepts as 'English as an International Language (EIL)' and 'World Englishes (WE).' One feature of ELF is that it focuses on the actual interactions between non-native speakers of English rather than the empirical study of nativized varieties of English which WE seems concerned with (see Cogo and Dewey, 2012 for further discussion on this issue). In this vein, we can state that what CCDL aims to accomplish is in line with the concept of ELF.

CCDL has the potential for offering substantial benefits relative to the amount of student interactions in the context of ELF. One benefit of CCDL can be summarized as follows:

Students who have been exposed in person to the styles of English communication by Chinese or Koreans, which are influenced by their cultures, would be in an advantageous position to better understand their English, compared with those who have not had such chances. This activity should also be meaningful as an effort to help Chinese and Korean people become familiar with the styles of communication in Japanese English (Translated by Hino, 2009).

In other words, CCDL encourages students to engage not only in ELF interactions but also in cross-cultural understanding.

The CCDL Program divides into two types: theme-based CCDL and non-theme based CCDL

(see Nakano et al., 2008). The former refers to CCDL courses with predetermined content and accompanying textbooks. The latter, on the other hand, consists of CCDL courses where instructors can decide what to teach in cooperation with overseas partner university instructors.

The CCDL courses we focus on here are the theme-based CCDL, which includes ‘Social and Global Issues Course,’ ‘CCDL Media Course,’ and ‘International Career Path Course.’

### **3.2 The content of CCDL Courses**

In this section we will focus on the theme-based CCDL, that is, Cross-Cultural Distance Learning (CCDL) Courses, which include three one-semester (15 weeks) sub-courses: Social and Global Issues, Media, and International Career Path.

For the signup for these CCDL Courses, students are required either to have taken ‘Intermediate-level Tutorial English’ or to have English proficiency equivalent to TOEFL 500 scores (PBT), 200 scores (CBT), or 63 scores (iBT). Some of the characteristics of CCDL Courses are (1) relatively small classes (less than 25 students), (2) joint classes with Asian partner universities using LiveOn video chatting and TV conferencing systems, (3) highly-structured class schedules, and (4) original textbooks.

Participating partner universities as of 2012 are Korea University, Yonsei University (the Republic of Korea), Tamkang University, Southern Taiwan University of Technology (Taiwan), Dalian University of Technology, Dalian Jiaotong University, Dalian University of Foreign Languages (the People’s Republic of China).

As for the textbooks, each course (i.e., Social and Global Issues, Media, and International Career Path) has their original textbooks. These textbooks contain nine skills and concepts to make communication between interlocutors more smooth and effective in cross-cultural settings. These skills and concepts are (1) Facilitation Skills, (2) High- and low-context Communication, (3) Intercultural Translation, (4) Cooperativeness, (5) Reaching Agreement, (6) Risk Orientation, (7) Emotional Intelligence, (8) Social Intelligence and (9) Research Skills.

For instance, among the nine skills and concepts, facilitation skills are presented in the textbooks as follows:

1. Keeping the conversation going.
2. Ensuring everyone is participating and can understand what is being discussed.
3. Writing discussion questions and keywords in the TextBox to ensure everyone is focused on the main discussion topics.
4. Inviting a student to speak up or ask questions if they have been quiet for some time.
5. Preventing one person from dominating the discussion.
6. Deciding who should go first if two or more people want to speak at the same time.
7. Directing the discussion by calling on individual people by name.
8. Preparing extra questions and/or topic-related material beforehand to deepen and/or extend the discussion.
9. Asking “Why?” questions during the discussion to expand understanding of reasons and motivations behind ideas presented and to avoid making assumptions and overgeneralizations.
10. Enabling group members to make personal and topic-related connections at a deeper level.

### **3.3 Questionnaire survey**

For success in educational curriculum, the three notions are significant; feasibility, replicability and sustainability of the course. Especially, in the CCDL courses, these three notions are more vital because the courses are conducted in different universities. In the CCDL courses, these three notions are achieved by its common platform; that is, methodology and the course textbooks. It is significant to check what to teach and how to teach in the courses, to examine whether the course is effective, and to make some revisions if necessary.

The aim of the questionnaire survey was to check (1) effectiveness of the CCDL courses, and (2) the validity of the textbook used in the CCDL. Through the questionnaire survey, we also examined whether the participants in this course acquired these concepts and skills. Originally, nine concepts and skills, some of which are relevant to intercultural competence proposed by Byram (2008), were dealt with in the CCDL course, but four out of nine concepts are difficult to check by the small size questionnaire, so they were omitted (Table 3). Based on these concepts, the questionnaire items were created. The questionnaire contains fifty seven items, key questions of which, besides the concepts in Table 3, were (1) intercultural understanding, (2) communication skills, (3) willingness to communicate, (4) acceptance of Asian Englishes

(English as Lingua Franca), (5) facilitation skills and (6) The main questions.

Table 3: Skills to be acquired in the CCDL textbook

- Facilitation Skills
- High- and low- context Communication
- Intercultural Translation
- Reaching Agreement
- Research Skills

The questionnaire survey was conducted only to Japanese participants in the CCDL, and we got results from 92 participants.

### 3.4 Results of the questionnaire survey

The results are reported according to the key questions below.

#### <Intercultural misunderstanding>

The results of Q. 46 show that that 40 % participants experienced cross-cultural misunderstanding through the CCDL courses. More than 70% participants reported that they came to know kinds of misunderstanding caused by cultural differences (in Q.21). As for the question whether they acquire problem solution knowledge about cross cultural misunderstandings, about 60% participants reported to get some skills/strategies to avoid misunderstanding and to solve problems caused from cross-cultural misunderstanding (in Q.7). They successfully learned skills and strategies to avoid misunderstanding caused from cross-cultural settings.

#### <Communication Skills>

As for how many participants came to acquire this skill (Q. 4 & 5), 80% participants reported that they acquired this skill to change their perspectives in communicating with participants from other countries.

Another strategy to avoid cross-cultural misunderstanding in the textbook is “critical thinking”. 70% participants replied positively to the questionnaire item on acquiring the strategy of “critical thinking” (Q. 19 & 29).

From these results, we can say the CCDL textbooks are effective in providing the participants with intercultural communication knowledge and skills.

<Willingness to communicate>

Q. 33 and 34 examined whether the participants tried to join the CCDL LiveOn session willingly. 80% of them answered they tried to do so. Hence, participants in the CCDL can get the attitude to try to continue communicating in cross-cultural settings.

< Acceptance of Asian Englishes (English as Lingua Franca)>

In the CCDL course, the participants were made to recognize the notion of ELF and use ELF implicitly. In Q.26, the participants were asked how they think about English as a lingua franca. The result was that only 50 % participants answered that they recognized the notion. Half of them still think their model of English should be that of native speaker's English, such as British English and American English.

<Confidence in communicating in English>

The questionnaire items, Q31, 32 and 41, examined the participants confidence in communicating in English. 80% participants reported that they got confidence in communicating in English. The results confirms that the CCDL course can give the participants confidence in communication in English.

<High-/Low-context culture>

The communicating styles are required to change according to the people we are talking with in cross cultural settings. Knowing notion of high/low contexts culture is useful for the participants in the CCDL course. Q 42 examined the consciousness about cultural differences. The results showed that 80% students pay attention to cultural differences and tried to change communication styles.

<Reaching agreement>

In Q. 44, we checked that the participants could acquire these discussion management skills through the course. 80% participants reported they tried to cooperate with each other to reach agreeable conclusion in CCDL exchanges.

### <Facilitation skills>

Q. 49, 50 and 51 examined whether the participants came to be good facilitators. The results showed that 50 % participants think they can get better facilitation skills and more than 70 % participants paid attention to a role of facilitator, and tried to be a good facilitator.

### <Research skills>

The results of Q30 showed the participants got familiar with research skill in the CCDL course.

## 3.5 Summary of the questionnaire survey

From the results of the questionnaire survey, it is found that almost all of the objectives and skills dealt with in the course and textbooks can be achieved by the participants. Besides, the textbooks work well to support the CCDL course. However, we found that some part should be changed (i.e., Acceptance of Asian Englishes).

## 3.6 Future Plan

To revise the CCDL courses more effective way, PDCA cycle is useful. PDCA cycle, each alphabet of which represents “Plan”, “Do”, “Check” and “Act”, is an iterative four-step management method used in business for the control and continuous improvement of processes and products to make business projects advance (Figure 4).

Figure 4. PDCA Cycle in the CCDL Courses

The questionnaire survey reported above is the “Check” stage, namely the phase to check what to teach and how to teach in the CCDL course. Based on the results, we will proceed to the next “Act” phase: we will have to adjust the contents in the textbooks and teaching method to make

the CCDL more pedagogically effective.

#### **4. CCDL Program Assessment (Motivation Surveys)**

##### **4.1 Introduction**

This section provides a brief overview of our longitudinal study that aimed to evaluate the effectiveness of CCDL program in terms of the students' motivation towards CCDL computer-mediated communication (CMC) activities. As we reviewed so far, one of the main aims of CCDL program is to enable the participating Asian students to be successful bilinguals, who, as one of ELF learners, achieve the English proficiency essential to communicate with various people with different mother tongues. In order to embody this aim, CCDL has utilized information communication technology (ICT) and provided authentic communicative situations for the students in the form of CMC (Nakano, Owada & Yoshida, 2008). Thus, with the aid of the currently challenging teaching method, CCDL has provided one of the most appropriate and effective learning contexts for ELF practice. With the above point in mind, our longitudinal study is intended to investigate how the students think of the value of CCDL program, specifically focusing on their motivation towards the CMC activities, and whereby evaluate the effectiveness of CCDL program. By means of questionnaire-based survey guided by Self-Determination Theory (SDT; Deci & Ryan, 1985), we discussed not only the above issues, but also ideal learning environment for the students.

##### **4.2 CCDL and Students' Motivation**

Nakano (2006) emphasized the importance of students' motivation towards CCDL CMC activities. She argued that lack of motivation towards the activities hinders students' development in the program, and often induces their failure to be a successful ELF learner. Nakano also pointed out that, as one of the potential problems, the difference of class types, elective and compulsory, could cause the motivational differences among the students. Furthermore, referring to Self-Determination Theory (SDT; Deci & Ryan, 1985), she made an assumption that students' motivation will be expected to be more satisfactory if the class is elective, whereas the students' motivation will be less if the class is compulsory. As a first step to evaluate the value of CCDL, therefore, we examined this assumption by means of questionnaire based surveys guided by SDT.

##### **4.3 Purposes and Hypotheses**

The primary purpose of this study is to examine whether the difference of class type, elective vs.

compulsory would cause motivational differences among the participating students as argued in Nakano (2006). In so doing, we adopted Nakano's assumption as our research hypotheses; that is, if a student participate in elective class, his/her motivation will be desirable, whereas, if the student in compulsory class, her/his motivation will be less as compared with those in elective class. To address this issue, we employed theoretical framework of SDT (Deci & Ryan, 1985), and discussed the relevant motivational issues in terms of the concepts of three types of motivation: intrinsic motivation, extrinsic motivation and amotivation. Figure 5 shows the self-determination continuum (e.g., Deci & Ryan, 2000), that summarizes the theoretical relationships among the above three types of motivation.

Behavior	Non self-determined					Self-determined
Type of Motivation	<b>Amotivation</b>	<b>Extrinsic Motivation</b>				<b>Intrinsic Motivation</b>
Type of Regulation	Non-Regulation	External Regulation	Introjected Regulation	Identified Regulation	Integrated Regulation	Intrinsic Regulation
Locus of Causality	impersonal	External	Somewhat External	Somewhat Internal	Internal	Internal

Figure 5: The self-determination continuum (as cited in Deci & Ryan, 2000, p.237)

## 4.4 Method

### 4.4.1 Participants

The participants in this study were Japanese university students who were all enrolled in CCDL English classes. Table 5 summarized the details of the participants in the surveys 2008 (Nakano & Yoshida, 2008), 2010 (Yoshida & Nakano, 2010) and 2011 (Yoshida & Nakano, 2012).

Table 5: The participants in the surveys in 2008, 2010 and 2011

	2008		2010		2011	
	(N = 204)		(N = 176)		(N = 365)	
	elective	compulsory	elective	compulsory	elective	compulsory
<i>n</i>	67	137	94	82	68	297

Note: The survey in 2010 included Asian participants from Korea and Taiwan.

### 4.4.2 Questionnaire

The questionnaire contained 24 items based on those in the Language Learning Orientation Scale

(LLOS; Noels, Pelletier, Clement & Vallerand, 2000; Park, 2006) and Academic Motivation Scale (AMS; Vallerand, Pelletier, Blais, Briere, Senecal, & Vallieres, 1992). In line with the LLOS and AMS, the 24 items were designed to be one of the reasons for doing the target activity (i.e., CCDL CMC activities, in this case) and can be categorized into the following 7 subscales: Intrinsic Motivation for Knowledge (IMK: 3 items), Intrinsic Motivation for Accomplishment (IMA: 3 items), Intrinsic Motivation for Stimulation (IMS: 3 items), Extrinsic Motivation-Identified Regulation (EMID: 4 items), Extrinsic Motivation-Introjected Regulation (EMINTRO: 4 items), Extrinsic Motivation-External Regulation (EMEX: 4 items), and Amotivation (AMOT: 3 items). Using 5-point Likert scale, we asked the students to indicate to what extent each of the reasons corresponded to their reasons for participating in the CMC activities.

## **4.5 Results and Discussion**

### **4.5.1 Results of EFA**

As a result of EFA, we found 6-factor solution was suitable in all the three surveys in 2008, 2010 and 2011. It is important to note that each of the resulting factor structures was found to be almost congruent with each other; 2 out of the 6 Factors were regarded as AMOT (with some EMEX item[s]) and EMINTRO & EMEX Describing External Pressures (e.g., effect of teacher); 4 out of the 6 were interpreted as EMID, IMA (with some items in relation to students' future direction), IMS (sometimes combined with EMID) and IMK. The former 2 Factors were said to be *controlled types of motivation*, whereas the latter 4 Factors were *autonomous types*.

### **4.5.2 Results of comparison between *elective* and *compulsory***

Figures 2-4 show the results of motivational comparisons between elective classes and compulsory classes in the surveys in 2008, 2010 and 2011 respectively. All the 6 Factors are ordered along with the self-determination continuum so that the degree of self-determination (i.e., autonomy) as well as motivation is expected to be enhanced from the left to the right side.

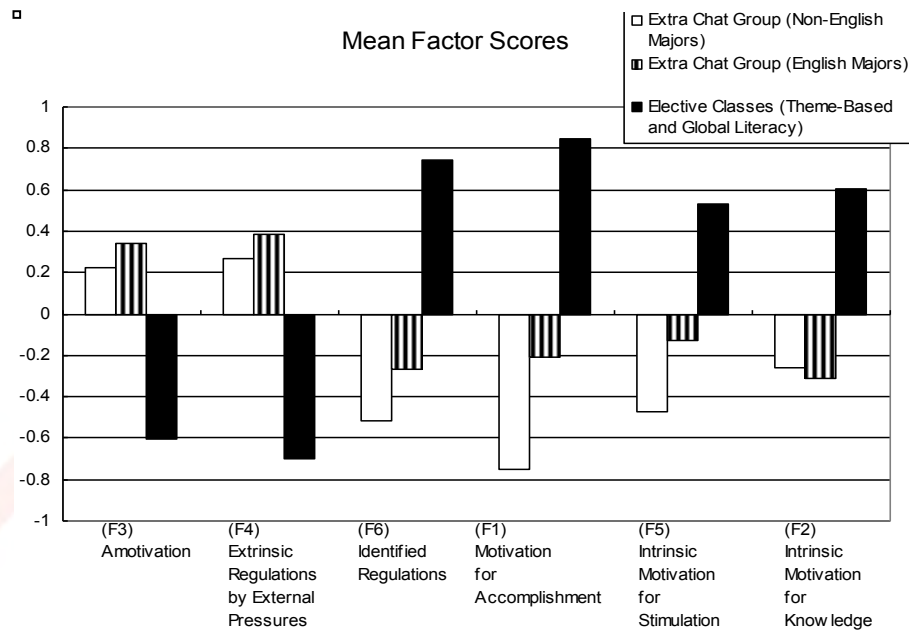

Figure 6: Results of the survey in 2008

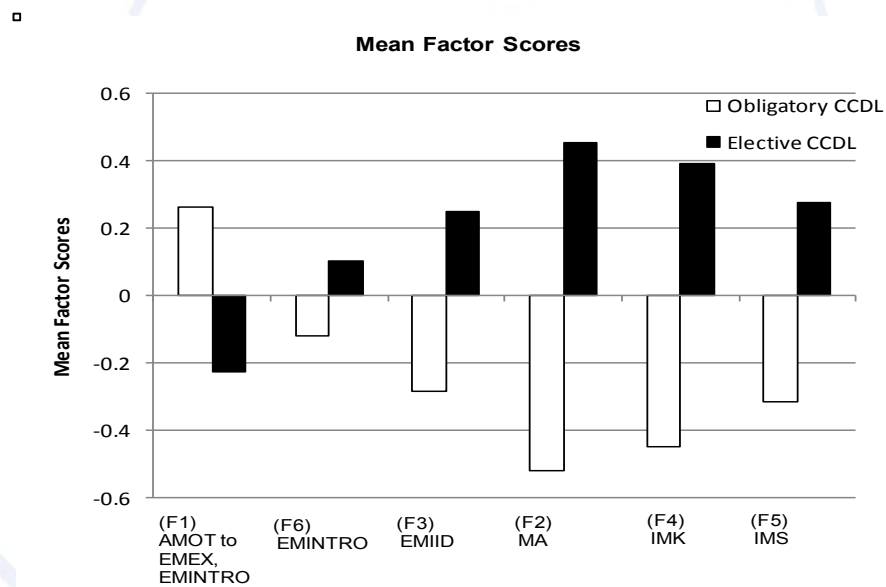

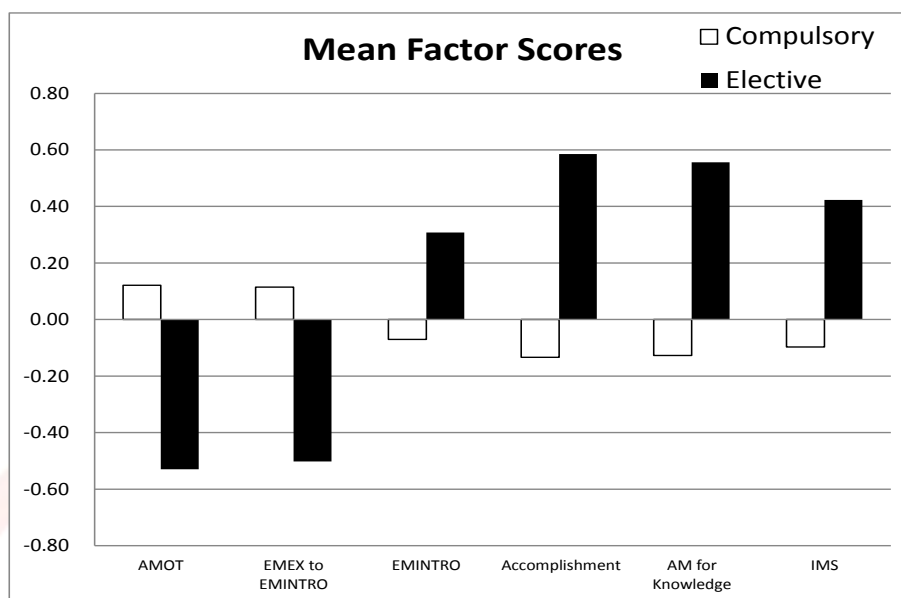

Figure 7: Results of the survey in 2010

*Figure 8: Results of the survey in 2011*

The results in Figures 6-8 show the similar scoring patterns in the three surveys; the students in the elective classes scored highly on the autonomous types of motivation, whereas they scored less than grand mean (i.e., 0 in each of comparisons) on the controlled types of motivation; on the other hand, those who in the compulsory scored less than grand mean on the autonomous motivation, whereas they scored highly on the controlled types of motivation.

#### 4.6 Summary

The results in the surveys supported Nakano's (2006) assumption, indicating that the students in the elective classes had motivational predisposition toward autonomous learners, whereas those in the compulsory classes had the predisposition toward externally regulated learners. The results also implied that the students in the compulsory courses were demotivated by such external pressures (or forces) from their instructors, and that some were to be amotivated in the long run (Nakano & Yoshida, 2008).

In order to prevent the students from being demotivated, therefore, it was necessary to look for some effective motivating strategies. To address this issue, Yoshida and Nakano (2011) investigated the relationship between learning environment and students' motivation, drawing on the concepts of autonomy and competence discussed in SDT. The findings in the survey indicated that the hypothesized causal relationships between autonomy supportive environment, where students could perceive optimal level of autonomy and competence, and the student's

motivational enhancement could hold true within the context of CCDL English classes.

These findings implied the possibility that creating the autonomy supportive climate could be one of the effective motivating strategies to encourage the students who were found to be externally motivated, to be more autonomous learners. As a first step to enhance the students' motivation, therefore, we believe that it will be necessary to conduct needs analysis among the students so as to make the learning environment as autonomy supportive as possible. It will be also important to reconsider the tasks assigned in the classes and make them optimally challenging to the students so as to promote their sense of accomplishment and competence.

## **5. Designing automated scoring system for L2 speech**

### **5.1 Backgrounds**

As mentioned in the previous section, there are four purposes in CCDL. To achieve these goals, speaking ability and skills are one of the foundations, and it is an important issue to grasp the change of students speaking ability through CCDL. However, a speaking test has not been adopted for a couple of reasons. Performance assessment requires expert rating, which is a major limitation for the large scale implementation. The use of rater will introduce another problem to the assessment: Inconsistency of assessment and investment of time. The oral performance is assessed manually by trained raters based on the respective criteria of proficiency standards. Before conducting speaking tests, test designers discuss and determine a set of evaluation criteria and the procedure of rating, and raters receive some training to arrive at good inter-rater agreement. After the test, the raters sometimes watch the video or listen to the recorded speech of the examinees', and the evaluation scores given by the raters are analyzed based on some statistical model. It is often hoped that as a solution, automated scoring of second language (L2) speech be built to predict the evaluations by human raters.

In the assessment of L2 speaking skills in general, examinees are asked to introduce themselves, to describe some pictures, or to discuss general issues, and raters evaluate the examinees' speech. The speech elicitation tasks can be selected based on the purpose and the practicality of the assessment. However, the selection of tasks is limited in automated L2 speech scoring because of speech recognition technology. Figure 9 shows the degree of freedom and predictability of speaking.

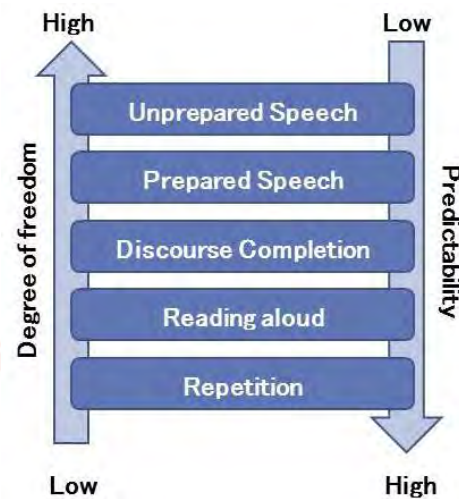

Figure 9: The degree of freedom and predictability of speaking

The degree of freedom of speaking goes up from the bottom to the top, while the difficulty in predicting the utterances increases from the top to the bottom. In the repetition task, for example, examinees just repeat a sentence or a word as they hear. The words to be recognized are already presented. In unprepared speech, on the other hand, examinees will talk about a certain theme or topic. It is difficult, in this case, to predict the words. Practically speaking, perfect recognition is totally impossible in unprepared speech. We have to choose a task to use according to the limitation of speech recognition technology in order to construct an automated speech scoring system.

## 5.2 Procedure

### 5.2.1 Elicitation task

In the present study, Discourse Completion Test (DCT) was chosen as elicitation task. In DCT, examinees are given a certain situation and are supposed to say something appropriate to the situation. Examinees' utterances are not fixed, but the words they use are limited. Speech recognition is more difficult than in read-aloud speech for speech recognition, but easier than in unprepared speech

For the present study, an item writing committee was comprised and composed the DCTs according to the textbooks used in Tutorial English provided by Waseda University. Tutorial English is highly structured course and designed referring to the levels of Common European Frameworks of Reference (CEFR: Council of Europe, 2001). The textbook is divided into seventeen units according to topics. Our DCT requires examinees to use the expressions in each

unit. We composed eight to ten DCTs for each unit (132 items in total).

### 5.2.2 Data

A website was created for the data collection. The speakers access the website, enter their names, are given the instruction, and then start their recording. In the data collection in 2011, students at Waseda University provide their speech for DCTs at A2 level of CEFR. About a hundred speakers furnished their speech data. A hidden Markov model based speech recognizer was constructed by using Hidden Markov Model Toolkit (HTK: Young, Evermann, Gales, Hain, Kershaw, Liu, Moore, Odell, Ollason, Povey, Valtchev, and Woodland, 2006). The native speakers' speeches from TIMIT Acoustic-Phonetic Continuous Speech Corpus (Garofolo, Lamel, Fisher, Fiscus, Pallett, Dahlgren, and Zue, 1993) were used for training the acoustic model in addition to the L2 speeches from English Speech Database Read by Japanese Students (Minematsu, Tomiyama, Yoshimoto, Shimizu, Nakagawa, Dantsuji, and Makino, 2002). Using HTK, bigram language models were constructed for each task.

### 5.3 Results and Discussion

The result of word recognition of the first item in Unit 3 is shown in Figure 10. The recognition at phone level is not good, but this is the perfect word recognition. The speaker actually said "I always walk around the park".

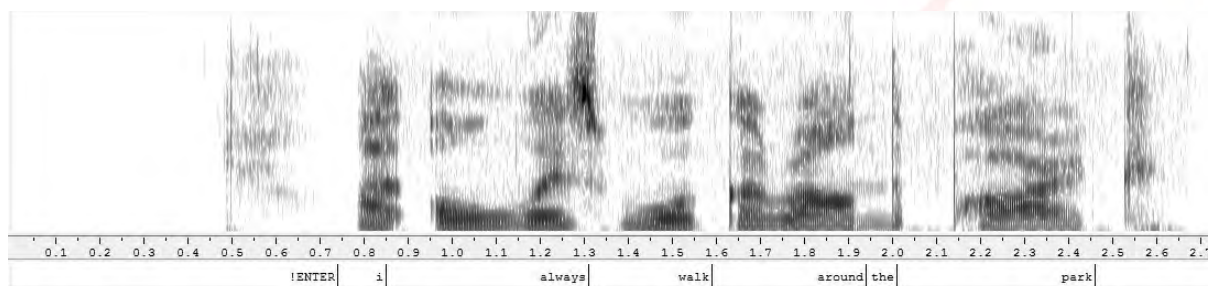

Figure 10: The Result of Word Recognition of the First Item in Unit 3

The result of word recognition of the first item in Unit 17 is shown in Figure 11. Again, the word recognition is perfect, but it's not so good at the phone level. The utterance, probably started with the aspiration of the k sound of can, but the recognizer does not do well with the plosives.

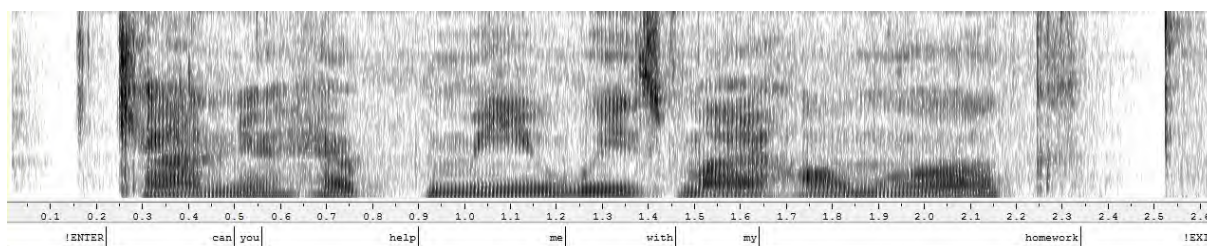

Figure 11: The Result of Word Recognition of the First Item in Unit 17

Table 1 shows a part of the results in the word recognition. It shows the results of the word recognition of the first 6 items in Unit 3. Around 80% of correct word recognition rates we can find in every item.

Table 6: The results in the word recognition of the first 6 items in Unit 3

Item	N	H	D	S	I	C	A
3-1	688	602	44	42	20	.87	.84
3-2	656	656	28	40	43	.89	.83
3-3	740	603	45	92	36	.81	.76
3-4	604	468	61	75	48	.77	.70
3-5	600	514	46	40	37	.86	.80
3-6	511	426	39	46	14	.83	.81

Notes. N: the total number of labels H: the number of correct labels D: the number of deletions S: the number of substitutions I: the number of insertions C: H/N A: (H-I)/N

Accurate recognition at phone level is difficult, but word accuracy rate of around 80% is acceptable in DCT. Based on the DCTs with 80%, the correct word recognition rate, we will be able to assess grammatical accuracy, appropriateness, and politeness of utterances. If we use the two tasks, reading aloud and DCT, we can assess several aspects of learners' speaking ability.

Official Conference Proceedings 2012

Abstracts

This study takes up the 2009 Inaugural Speech by President Barack Obama (or Obama Speech) as the target of stylistic analysis. The main concern of the study is to find out the content of his speech as well as how it was carried out. In order to identify the WHAT and HOW questions, I employ a stylistic analysis, in which both content and linguistic analyses are combined. More specifically, research questions included: (1) What promises and requests are made and how they are made?, (2) How does intertextuality (quotations from other sources) strengthen Obama speech?, (3) What are the lexical features of Obama speech? (4) Are there structural resemblances between Obama speech and other presidents' speeches?, (5) What are the referents of politically loaded pronouns (we, they, you) in the speech? Questions (1)-(2) are the target of content analysis, and questions (3)-(5) were the target of linguistic analysis. Among other things, the study reveals the following: (1) Obama's promises were made in the form of "we will do such and such to do" in the same paragraph; (2) Obama quoted passages from the Bible, Musical *Swing Time*, and Thomas Pain's *the Crisis* in the right places; (3) Obama used structural patterns derived from FDR speech. Most interestingly, Obama strategically used ambiguous pronouns like "they" and "we" in order to let the concept of "E pluribus unum" govern the flow of his whole speech.

**Key Words**

1. Obama Inaugural Address 2. stylistic analysis 3. intertextuality 4. structural resemblance

## 1. Introduction and Background of the Study

This study takes up the Inaugural Address of Barack Hussein Obama II, the 44th President of the United States (Jan.20th 2009) as the target of stylistic analysis, in order to identify WHAT is talked about and HOW it is delivered.

US Presidential Inaugural Addresses have been researched in various fields. Leadership has been the main issue in Political Studies and Business studies, whereas American Studies have observed historic moves chronically (Erickson 1997). In addition, Inaugural addresses have been researched in the field of rhetoric. However, the research focus in that direction has been again mostly on how presidents' leadership and charisma were shown (Matsuo 2002). Due to their high recognition of leadership and charisma, the following are among the most researched presidents' speeches: inaugural addresses of President Franklin Delano Roosevelt a.k.a. FDR and President John Fitzgerald Kennedy a.k.a. JFK, and the Gettysburg Address of President Abraham Lincoln (Houk 2002).

Matsuo (2002) points out the 'paradoxical presence' of U.S. presidents. On the one hand, they are 'common man' (unlike European kings); on the other, they are the commanders-in-chief and they are the achievers of the American dream, which makes them special. Matsuo also points out that the 'target' of presidential inaugural speech is inevitably 'US citizens'; thereby every inaugural speech has two missions: 1) to ask requests; 2) to give promises on his administration.

This study imbibes Matsuo's suggestions while utilizing linguistic stylistic analysis. Though I draw on *Investigating English Style* (Crystal and Davy. 1969) as stylistics classic, 'stylistic analysis' in this paper means the combination of lexical (structural) analysis and content analysis.

All texts can be resolved into lexicons. Expressions are weaved by construction/syntax, and messages are delivered. Thus, all texts share two dimensions: WHAT and HOW, meaning WHAT is talked about and HOW it is delivered. WHAT and HOW cannot be divided, but rather co-related; therefore, I will focus on HOW —language use— to

clarify WHAT.

## 2. Objectives of the Study

Obama has been emphasizing the concept of 'One America'; THE United States of America, during his first presidential election campaign 2008. Or, even before.

In 2004, at the Democratic National Convention (DNC), he directly quoted the U.S. fundamental philosophy: 'E pluribus unum (One out of many)'. This Latin expression is incused on U.S. coins as well.

E pluribus unum was the solution, the creation of a brand-new national identity. US ideal is not functioning anymore; Schlesinger (1992) raised an alarm, pointing out:

"The Europeans who had torn up their roots to brave the wild Atlantic wanted to forget a horrid past and to embrace a hopeful future. Their goals were escape, deliverance, assimilation." And he went on, "The escape from origins yields to the search for roots. It belittles *unum* and glorifies *pluribus*."

With this social background in mind, Obama left the following words at DNC: "There is not a white America, there is not a black America, there is not a Latino America, there is not an Asian America; There is the United States of America."

This was the speech glorifying the spirit of E pluribus unum, with an emphasis on *unum* = ONE.

Did Obama carry on this message / spirit in his inaugural address as well? If so, HOW did he deliver it?

## 3. Research Questions

This study aims to identify and analyze the stylistic characteristics of Obama speech by

addressing the following research questions:

- (1) What promises and requests are made and how they are made?
- (2) How does intertextuality (quotations from other sources) strengthen the Obama speech?
- (3) What are the lexical features of the Obama speech?
- (4) Are there structural resemblances between the Obama speech and other presidents' speeches?
- (5) What are the referents of politically loaded pronouns (i.e. we, they, you) in the speech?

#### **4. Research Methodology**

The target of this study is Obama's inaugural speech full text (2400 words). For comparison, I refer to 60-year-length of all presidential inaugural speeches, from JFK (1962) to Obama including reelected president's speeches: Nixon, Reagan, Clinton, and G.W. Bush. Though Ford's speech has not been researched much due to his irregular inauguration—he is the only president who was not elected by the citizens, this study includes his speech as well.

First, I employ content analysis, which enable us to clarify the flow or the picture of the speech. Secondly, I focus on intertextuality as reference to U.S. history ——'speaking to ages'—— is one of the requirements of U.S. inaugural addresses. They are usually unsourced. Third, from token meaning raw data, I analyze type and frequency counts: so-called, quantitative analysis. Forth, I employ structural analysis where I analyze both intra / inter syntax. Related with intertextuality, I focus on structural relevance between other presidents' speeches. Lastly, I observe distinct usages of pronouns, and then clarify ways Obama adopts to address people.

#### **5. Analysis**

##### **5-1: Promises and Requests**

In the Obama speech, promises are made in a certain fixed pattern. As underlined and numbered, he uses the same construction pattern, ‘will do such and such to do something’ repeatedly and presents five promises in a row. By using the modal auxiliary ‘will’, he expresses the determination of Obama ministration, while describing the purposes of those actions with the infinitive ‘to do’.

- (1) We will act not only to create new jobs, but to lay a new foundation for growth.
- (2) We will build the roads and bridges, the electric grids and digital lines that feed our commerce and bind us together.
- (3) We will restore science to its rightful place, and wield technology's wonders to raise health care's quality and lower its cost.
- (4) We will harness the sun and the winds and the soil to fuel our cars and run our factories.
- (5) And we will transform our schools and colleges and universities to meet the demands of a new age.

Obama’s requests are made as follows:

“What is required of us now is a new era of responsibility - a recognition, on the part of every American, that we have duties to ourselves, our nation, and the world, duties that we do not grudgingly accept but rather seize gladly, firm in the knowledge that there is nothing so satisfying to the spirit, so defining of our character, than giving our all to a difficult task. This is the price and the promise of citizenship. This is the source of our confidence - the knowledge that God calls on us to shape an uncertain destiny.”

The core message is to ask the citizens to be aware of their duties and responsibilities and get over the difficult time.

## **5-2: Intertextuality**

Quotations from U.S. history—‘speaking to ages’ —is one of the requirements of U.S. presidential inaugural addresses. Let us observe what and how Obama quotes in his own speech.

### 5-2-1: Quotations from Scripture

Obama: “We remain a young nation, but in the words of Scripture, the time has come to set aside childish things.”

This is an indirect quote from Corinthians, The Testament.

“When I was a child, I talked like a child, I reasoned like a child. When I became a man, I put childish ways behind me. Now I know in part; then I shall know fully, even as I am fully known.”

(c.f. : New International Version.13.11)

Obama’s ‘childish things’ refers to “the petty grievances and false promises, the recriminations and worn out dogmas, that for far too long have strangled our politics” in his inaugural address.

### 5-2-2: Quotations from Swing Time

One of the sound bites of Obama speech is “We must pick ourselves up and dust ourselves off and begin again the task of remaking America”. But why ‘dust ourselves off’?

There was a musical named *Swing Time* (lyrics by Dorothy Fields, music by Jerome Kern) in 1936. It was played to lift up the U.S. citizens’ spirit during the Great Depression era.

*Swing Time:*

Nothing’s impossible, I have found.

For when my chin is on the ground,

I pick myself up, dust myself off,

Start all over again.

Don’t lose your confidence if you slip.

Be grateful for a pleasant trip,  
And pick yourself up; dust yourself off;  
Start all over again.

Through its lyrics, especially from the first phrase “For when my chin is on the ground”, we can tell now that the original character’s situation and the reason of Obama’s expression.

### **5-2-3: Quotations from Thomas Pain**

Obama directly quoted from Thomas Pain’s booklet, *The Crisis* (distributed on Dec.23, 1776). Underlined in the extract below are Pain’s words.

Obama:

“At a moment when the outcome of our revolution was most in doubt, the father of our nation ordered these words be read to the people:

"Let it be told to the future world...that in the depth of winter, when nothing but hope and virtue could survive...that the city and the country, alarmed at one common danger, came forth to meet [it]."

Pain’s work is known as the first president George Washington’s favorite. Obama’s “the father of our nation” refers to President Washington, who read these words to the soldiers in Valley Forge to lift up their spirit during the Independence War.

From those three quotes, we can see how Obama follows predecessors’ (former presidents’) inaugural style, but also stands out or attains his originality by letting the nuance of ‘lifting up spirit’ link two historically significant moments.

### **5-3:Lexial features**

In this section, I will explain Obama’s main characteristic terms or lexical items. Below are the top 12 most frequently used terms in Obama inaugural speech.

Nation 15  
America 14  
people 8  
generation 8  
now 7  
today 7  
time 6  
spirit 5  
crisis 4  
peace 4  
Americans 3  
journey 3

On the basis of the frequency counts, it turned out that 880 different words were used in the speech with 2400 token words. Out of these 880 words, basic words (verbs) such as 'carry', 'remain' and 'meet' were repeatedly used to make his speech lucid. 'America' and 'Americans' are among the 'buzz words' frequently used in U.S. presidential inaugural speeches. 'Buzz words' mean "the terms which arouse U.S. citizens' patriotism" (Matsuo 2002). Other examples of such expressions are 'peace', 'hero', 'unity', 'believe' and so on.

Obama uses a larger number of buzz words usually in his speeches (notably, the 2008 election campaign slogan was 'change we can believe in'). But in this inaugural address, he used few buzz words. Instead, he managed to arouse patriotic feelings in context and with the strategic usage of pronouns. In the sections 5-5-1 to 5-5-3, let us see how Obama replaced the terms 'American/ Americans'.

#### **5-4:Structual Resemblance**

Here, let us consider whether we can see any structural resemblance between the

Obama speech and FDR's first inaugural address. Franklin Delano Roosevelt made his first presidential oath during the Great Depression era (1933). In the beginning of his inaugural speech, Roosevelt noted "the only thing we have to fear is fear itself" and recited the critical economic crisis those days in parataxis without using discourse markers.

Roosevelt (1933) :

In such a spirit on my part and on yours we face our common difficulties.

- 1) Values have shrunk to fantastic levels;
- 2) taxes have risen;
- 3) our ability to pay has fallen;
- 4) government of all kinds is faced by serious curtailment of income;
- 5) the means of exchange are frozen in the currents of trade;
- 6) the withered leaves of industrial enterprise lie on every side;
- 7) farmers find no markets for their produce;
- 8) the savings of many years in thousands of families are gone.

(numbers added by the author)

This style is also found in the Obama speech.

Obama:

That we are in the midst of crisis is now well understood. Our nation is at war against a far-reaching network of violence and hatred. Our economy is badly weakened, a consequence of greed and irresponsibility on the part of some, but also our collective failure to make hard choices and prepare the nation for a new age.

- 1) Homes have been lost,
- 2) jobs shed,
- 3) businesses shuttered.
- 4) Our health care is too costly,
- 5) our schools fail too many—
- 6) and each day brings further evidence that the ways we use energy strengthen our adversaries and threaten our planet.

(numbers added by the author)

This commonality can be described as 'structural resemblance'. This structural resemblance contributes to a heightened persuasion of the Obama speech since the Obama administration faced the severest economic crisis since the Great Depression in the days of the FDR administration.

### **5-5:Pronoun Usage**

The way pronouns are used in a given text is well worth examining for the sake of stylistic analysis; namely, who or what is referred to by which pronouns in what kind of context. According to Brown and Gilman (1960), pronouns suggest power and solidarity. Pronouns in this study include 'I' 'you' 'we' and 'they'. You and I share a correspondence relationship dialogically while they and we share another type of correspondence relationship. In addition, pronouns reflect the speaker's (in this study, president's) stance. 'I' means the speaker him/herself, yet which does not count much in this study, as the speaker in U.S. inaugural addresses is evidently, the president himself.

Postulating Obama's pronoun usage is related to "E pluribus unum" spirit with the emphasis on 'unum (One)'. This is one of the points to be verified in the following section.

#### **5-5-1: THEY**

'They' is classified mainly into two groups: suggesting human e.g. men and people in general or NOT human e.g. trees and organizations. It makes distinct difference between other pronouns 'I' 'you' 'we' as the rest can only suggest human. Furthermore, 'they' has a function to 'group up individuals and bind as a whole' (Ito 2010) like 'we', still we need to observe its referents by context.

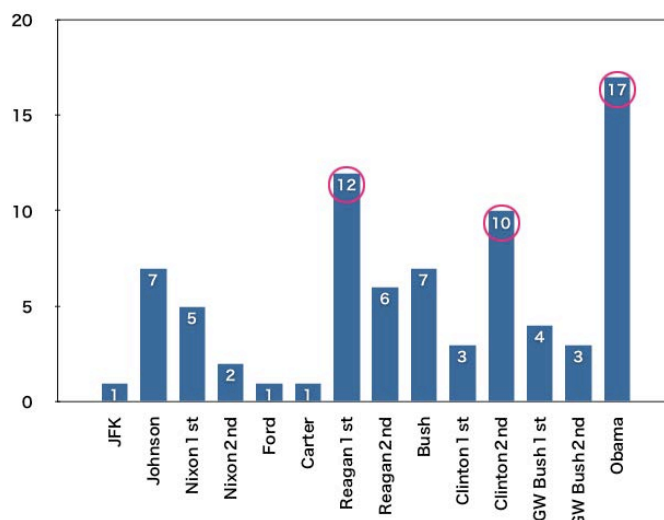

Fig.1 Frequency of 'they' in inaugural addresses from JFK to Obama

Obama used 'they' 17 times in his inaugural speech. Compared with all the other presidents from JFK, Obama's 'they' use was by far the top. Second most they-user is Reagan the 1st (12 times) and Clinton the 2nd follows (10 times). However, frequency won't tell enough, so qualitative analysis must be pursued. To focus on the connection of pronoun usage and "E pluribus unum" spirit, consider the following.

Obama:

For us, they packed up their few worldly possessions and traveled across oceans in search of a new life.

For us, they toiled in sweatshops and settled the West; endured the lash of the whip and plowed the hard earth.

For us, they fought and died, in places like Concord and Gettysburg; Normandy and Khe Sahn.

As underlined above, there are three times of appearance of 'they'. The first use of 'they' reminds us of Puritans (Whites) who immigrated to America by the Mayflower. However, the second 'they' evokes slaves (Blacks) from Africa. The third 'they' superficially hints at all Americans, yet if we take a closer look, there can be a deeper interpretation. Concord suggests the War of Independence, Normandy suggests World War II and Khe Sahn suggests the Vietnam War. Thus 'they' refers to Americans. But

Gettysburg is the Civil War, meaning this was the battle among Americans. Gettysburg is the symbolic place for President Lincoln's Emancipation Proclamation (1862) and the Gettysburg Address (1863), which lead us to the idea that 'they' implicates more of Blacks. Historical facts show there were more black war victims at that time.

In this paragraph, Obama repeatedly used the expression, "For us, they...". The next section is dedicated to an analysis of the use of this 'us'.

### 5-5-2: WE & I

'I' means the president himself in the inaugural address. Impression changes by frequency, placing, and usage. Obama was the second least 'I' user (3 times) in 60 years next to Clinton the 2nd (2 times), whereas Obama was the third most 'we' user (62 times).

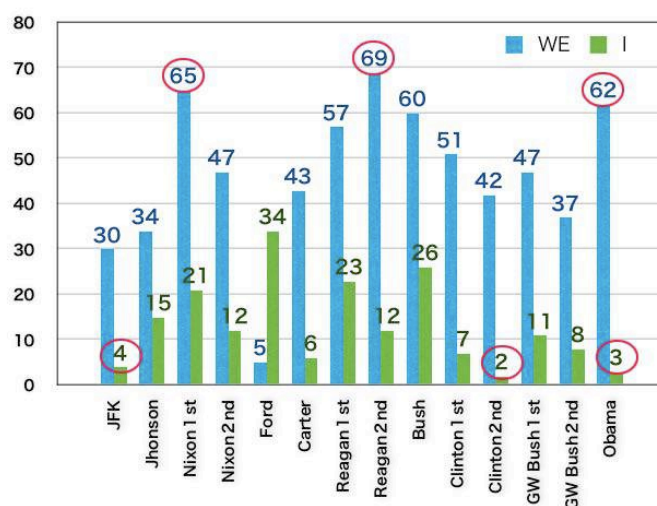

Fig.2 Frequency of 'we' and 'I' in inaugural addresses from JFK to Obama

'We' has a function to 'arouse sense of unity by grouping up individuals and bind as a whole' (Ito 2010). When observing the pronoun 'we', there are two essential points: First, is 'we' inclusive or exclusive? Second, is there 'a basis of sense sharing' or not (Tanaka and Fukaya 1998)?

Before analyzing the Obama speech with these two points, considering everyday utterance examples would be meaningful.

(1) “Sorry we are already closed”

Situation: A CVS manager says to customers after he closed the store with his colleagues.

This ‘we’ usage is exclusive, as it is not including customers (=‘you’).

(2) “I trust you just as much as you trust me. We are one and the same.”

This ‘we’ includes the listener therefore it is an inclusive ‘we’ usage.

(3) “We are Americans”

Situation: A speaker, born and raised in U.S., utters to someone that has the same background as the speaker.

This is inclusive ‘we’. Also ‘a basis of sense sharing’ is assured. For it is a fact that they share the same background and U.S. citizenship.

(4) “As we both know, men can't take that kind of things.”

Situation: A girl (a listener) had a fight with her boyfriend and got heart-broken. Her female friend speaker talked to the listener above to comfort her.

This ‘we’ includes the listener and excludes men in general. However, here, something interesting happens. Since ‘men can't take that kind of things’ is not at all a universal fact (this is a statement which relies on the speaker's subjective opinion), whether ‘a basis of sense-sharing’ is secured in this usage of ‘we’ seems to be up in the air. There is not yet that sort of sense-sharing established, but rather, the speaker herself is now attempting to make a new basis of sense-sharing. So if the listener agrees to the idea ‘men can't take that kind of things’, a feeling of sense-sharing occurs such that ‘we’ can function as the speaker's strategic intention. However, if the listener rejects the speaker's idea, feeling e.g. “You've got some problem. Not every man is like that”, the speaker's intention fails and there won't be ‘a basis of sense sharing’.

So why does this phenomenon happen? This is because ‘we’ does NOT exist in the first place. The component of ‘we’ is ‘you’ & ‘I’. Hence, even the example (1) excluding

customers has 'a basis of sense sharing' of 'we'; in other words, CVS clerks themselves have the premise as a collective or community within a store. This is the rationale for setting the function of 'we' as to 'arouse sense of unity by grouping up individuals and bind as a whole.'

With the analysis above in mind, let us go on to the analysis of Obama's usage of 'we'.

Obama:

We are shaped by every language and culture, drawn from every end of this Earth; and because we have tasted the bitter swill of civil war and segregation, and emerged from that dark chapter stronger and more united, we cannot help but believe that the old hatreds shall someday pass; that the lines of tribe shall soon dissolve; that as the world grows smaller, our common humanity shall reveal itself; and that America must play its role in ushering in a new era of peace.

First 'we' evidently refers to Americans. However, the question is the second 'we'. People suffered from Segregation are Blacks, not Whites that this 'we' implicates Blacks. Therefore, this is superficially an exclusive 'we' usage (against White people). Yet the third 'we' suggests 'we the Americans' or 'one people', meaning an inclusive 'we'. Was the second 'we' originally intended to be an exclusive usage and interpretation, addressing only from Blacks' viewpoints? My answer is no.

Compared to all the inaugural addresses from JFK, Obama is the first president that used both 'they' and 'we' to mention racial issues. Former white presidents avoided the use of 'we' for the topics of segregation and slavery—they quoted or hinted at Lincoln and Martin Luther King Jr. instead, whereas half-Black Obama had the right to use 'we'. Yet, Obama has been appealing himself as 'American' (not Black) since his first election campaign and had the ideal of 'One America'. This usage of 'they' and 'we' was his way of meeting high expectations from U.S. citizens and the world on his epoch-making inauguration—to complete a historic turn.

Rather, by fusing exclusive 'we' and inclusive 'we' together and by making the best of the functions of 'we' and 'they', Obama stylistically accomplished to encode the

concept of 'One America', the fundamental philosophy of U.S., 'E pluribus unum' in his first symbolic inaugural address.

## Conclusion

This study was motivated by the question 'WHAT was talked about and HOW it was delivered' in President Barack H. Obama's Inaugural Address 2009. In order to clarify the stylistic characteristics of this speech, I employed a method of stylistic analysis that combined content analysis and linguistic (lexical, structural and pronoun) analysis. With the notions of WHAT and HOW being inseparable, I placed a high priority on HOW; linguistic analysis. The focus of this study was on how the concept of intertextuality and the idea of "E pluribus unum" were represented.

As of intertextuality, I clarified Obama's both direct and indirect quotations from the Bible, a musical *Swing Time*, and Thomas Paine's work. Content analysis made in this study revealed that Obama's promises were made in the form of "we will do such and such to do something". Linguistic analysis showed that Obama speech and that of FDR (the Great Depression era) share a structural resemblance. Pronoun analysis revealed Obama's stylistic realization of "E pluribus unum" spirit by adjusting referents of pronouns.

Analyzing 200-year-long U.S. presidential addresses was beyond the scope of this study. I would like to go for that starting with another stylistic analysis of the up-coming Obama's second term inaugural address.

Official Conference Proceedings 2012

### Abstracts

The objective of this paper is to estimate the factors of intergeneration educational mobility in Russia and Soviet Union, that is to test the equality in accessing the continuation of education at the next level for children from different social groups (families with various levels of the family capital), estimated for different cohorts. The data source is Russian Longitudinal Monitoring Survey (RLMS-HSE) in 2006-11. There are panel data collected in 1994-2011. The sample is representative for Russia population as a whole. In 2006 there were some questions about respondent parents, that allow us to test if there is the dependence between educational level of respondent and some parameters of his/her parents, including their educational level, Communist Party membership and several other.

We estimated the model of probability to get the education of the given level depending on gender, age, nationality, characteristics of parents and birthplace for Russian people born in 1946-1990. Data about respondents' education are collected in 2006-11, about their parents - in 2006. The method of this model estimation is multinomial regression. The model was estimated for the pooled sample, as well as for three cohorts separately: born in 1946-60, 1961-75, 1976-90. It was found out that the family capital (first of all, the educational level of parents and urbanization level) represent an essential obstacle for educational opportunities of Russian high schools graduates. Regression estimation for the pooled sample demonstrates the significant level of dependence of respondents' education on that of their parents.

The main conclusion is that the inequity in access to professional education was strong for all three cohorts. The following factors have positive impact on the child's chances of having educational level lower than university diploma: parents' human capital is low; respondent was born in a village; father wasn't a member of the Communist Party of the USSR; respondent's gender is male (excluding secondary professional education). The inequity in accessing professional education was strong for cohorts born in 1946-60 as well as in 1976-90. Parents' human capital always had the greatest effect on educational chances compared to all other factors.

The negative impact of parents' low human capital was stronger for younger cohort (born in 1976-90) than for the older one (born in 1946-60). That is why although the absolute accessibility of professional education in modern Russia increased, the relative accessibility of professional education (i.e. their dependence on parents' education) decreased. The intergenerational educational mobility (percentage of children who are more educated than their parents) decreased.

**Keywords:** education, intergenerational mobility, educational chances

## 1. Introduction

During the last 10 years the problem of the accessibility of education in Russia has attracted an increasing attention of researchers and policymakers. It is believed that high educational level of the population, on the one hand, increases the economic potential of the society, and on the other hand it raises the well-being of people, their social status, helps to overcome inequality. However, education could be a factor of social mobility only if children of poorer and low educated parents have the opportunity to get education and income higher than those of their parents. Some problems in education have become more transparent in post communist Russia thanks to the social structures demolition and the intensive mobility of people in the social hierarchy. Besides, in the middle of the 1990s the dependence of incomes on educational level decreased, some social strata with high level of education but low incomes have appeared, rate of returns on the "old" (soviet) and "new" (post-soviet) education are different.

Besides, during the last 15 years the number of students and their proportion in Russian population has grown, which promotes the absolute accessibility to education. This happened mostly due to the investments into education made by the population but not by the government. Thus, the number of students who pay for their education has grown and in 2003 their percentage reached 50% of those who have entered Universities that year. It seems natural that fees for education raise the educational accessibility for rich and reduce it for poor families. Certainly, besides incomes, many other factors can influence the probability to obtain a particular level of education for a boy or a girl – their success in school, quality of training in school, parents' education, social networks of family, urbanization level, etc.

Since the end of the 1990s Russia has seen the boom in demand for higher education. Between 1995/96 and 2009/10 academic years the number of students in Universities has grown from 2,7 to 7 millions, in professional colleges (secondary professional education) from 1,9 to 2,1 millions, and in vocational schools (primary professional education) has fallen from 1,7 to 1 millions.<sup>1</sup> We should note that the decrease in birth rate in Russia started only after 1991 and it has not affected the cohorts who entered schools of professional education in 1995-2005. Thus, the percentage of students (at all levels of professional education) in Russian population was 4,3% in 1995/96 and 7,1% in 2010/11 (figure 1).

**Figure 1.** Percentage of students (higher, secondary and primary professional education) in the Russian population (% , by years)

Sources: Russian Federal State Statistic Service - RFSSS.

So, we can conclude that the absolute accessibility of professional education has grown in comparison to 1991, first of all thanks to the increase in the overall number of students in

<sup>1</sup> Russian Federal State Statistic Service - RFSSS

<http://www.gks.ru/wps/wcm/connect/rosstat/rosstatsite.eng/figures/education/>

Universities. At the same time, since this growth is mostly explained by increase in the enrollment of students whose tuition is not paid by the government, the accessibility of professional education for poor groups of the population should have decreased. As Konstantinovskiy (1999) has shown, there was a considerable social differentiation in the Soviet Union in professional education accessibility (first of all in the higher education) which has even grown in the middle of the 1990s. Children who have graduated from schools in small towns and villages, and children whose parents were workers or agricultural workers had less opportunity for get higher education. Similar results were found by Cherednichenko (2004) for 1998-2001, and by Roshchina (2005) for 2000-2004.

Despite the variety of recent works on inequality in education in Russia we still have no good reason for saying whether professional education nowadays strengthens social inequality or helps to alleviate it. The other question is whether the intergenerational educational mobility is higher in modern Russia than it was in the former Soviet Union.

**The research objective** of this paper is an estimation of intergenerational educational mobility in Russia for 3 cohorts: born in 1946-60, 1960-75, 1976-90 (or, in other words, an estimation of the equality in access to an extra level of education for children from families with different levels of parents' education).

## 2. Theoretical background

The high educational level of the population is a blessing for a society. First, education is one of the tools of the economic growth due to the increase in scientific and technical potential of people. Second, any increase in the educational level causes income growth which is the factor of increase in a consumer demand and thus it would be an accelerator of the economy. Third, education is one of the few channels of ascending social mobility.

That is why the question of equality in access to education and of equity in education in general is very important. The absence of equal access to education means growing of an economic, social and cultural inequality, closing a way into the top class for people from the bottom strata of the society. To estimate whether there is some unjust inequity in education it is necessary to find factors of this inequality. As a rule, inequality is considered as equitable if it is the consequence of unequal efforts and abilities of people. On the contrary, if the inequality of chances is due to the differences in social status, incomes, gender, race, etc., it is judged by society as unjust.

From the point of view of the economic theory, education is an investment into the human capital (Becker, 1964; Mincer, 1958). People decide to invest because they expect a certain return to this investment in human capital due to the future increase in their productivity and incomes. When an individual is choosing the amount of this investment he/she compares this expected return with direct and opportunity costs (the first should be higher). According to Becker's hypothesis the amounts of investments in the children human capital differ because of the differences in families' resources (money, time, human capital of parents). The income influences investments in education of children positively, while the number of children – negatively. The higher the human capital of parents is, the more knowledge and skills they can pass to their children, the more is the investment of parents into the human capital of children. Thus, the social differentiation in education is influenced by the differences of students' families in their families' capitals.

The theoretical explanation of dependence of children income, education and status from those of their parents were proposed by Becker and Tomes (1979, 1986) using the idea of the allocation of resources within the family. First of all children have to do some investment in human capital facing the borrowing constraints. Second, parents' educational level influences the skills and knowledge of children and their ability to produce incomes. The other source of ideas about social (including educational) mobility are sociological researches of Sorokin (1927) and Goldthorpe (1992).

In the theoretical model of Becker and Tomes (1979, 1986) the intergenerational income mobility is modeled as follows:

$$\ln Y_{i,t} = \beta_0 + \beta_1 \ln Y_{i,t-1} + \beta_2 X_{i,t-1} + \varepsilon_{i,t}$$

where  $t$  is index of the generation and  $i$  is index of the family,  $\beta_0$  is the average income of the children in generation  $t$  and  $Y_{i,t}$  is the children's income (when they are adults),  $Y_{i,t-1}$  is the income of parents (generation  $t-1$ ),  $X_{i,t-1}$  is the vector of control variables, and  $\varepsilon_{i,t}$  is unobserved components. Here  $\beta_1$  measures the relation between the income of individuals and the income of their parents.

The same model is used to measure the correlation between education levels (it could be measured by years of schooling), occupational status, social status of children and of their parents. It can be interpreted as an estimation of inequality in education, if the educational level of child depends on family capital, including parents' education. Intergenerational mobility is higher if the link between probability to get a diploma and the social factors is weaker. At the same time the higher is the percent of educated people the lower could be level of ascending intergenerational mobility in the future.

Empirical research of Jencks *et al.* (1972), Featherman and Hauser (1978), Mare (1981, 2001) have shown the high level of dependence between education and incomes of children and their parents. Intergenerational mobility during the last 30 years was studied in different countries: by Atkinson (1981) and Atkinson, Maynard and Trinder (1983), Dearden *et al.* (1997) in the UK; by Rauum *et al.* (2003, 2005) in Norway; by Checchi and Flabbi (2005) in Italy; by Card (2005) in the USA. Solon (1999) made the review of the intergenerational mobility in the labor market; d'Addio (2007) has found some evidence for the OECD Countries in intergenerational transmission of disadvantage.

Empirical research analyzed the probability of the transition to the next educational level in different countries in the context of family status and social factors: an educational level of parents, cultural level of a family, parents' occupation and so forth. Robert and Bukodi (2000) have carried out research on data for Hungary, De Graaf (1988) for Germany, De Graaf (1986) for the Netherlands, Sin-Kwonk (1998) for Czechoslovakia. Comparisons between some countries have been made by Shavit and Blossfeld (1993) and Rijken and Ganzeboom (2000). Results have shown that social origin influence becomes much lower with the increase of the educational level; the inequality in the access to education decreased throughout the 20th century. Konstantinovskiy (1999) was among the first to analyze the inequality of the access to education in Russia and the former USSR. He studied educational plans of pupils in high school, their relation with families' characteristics, estimated the dependence of chances to be enrolled in higher school on social origin. Some projects of Independent institute of the social policy were devoted to the analysis of inequality in the higher education in Russia (Roshchina, 2005). The high dependence of social status of children on those of their parents' was found by Burlutskay (2000) and Reutova (2004) for Russia and by Oksamitnaya (1999) for Ukraine.

### 3. Research methodology and database

The model tests the probability to get the education of a given level depending on parents' education and some other variables. The main tool of the analysis is regression estimation. In this model the dependent variable is the probability of a child to obtain a certain educational level (or to be studying at this level of education). The dependent variable measures the educational level of a respondent (has the Diploma or is studying now) and has 5 levels:

- University (base outcome);
- Secondary professional school;
- Primary professional school;

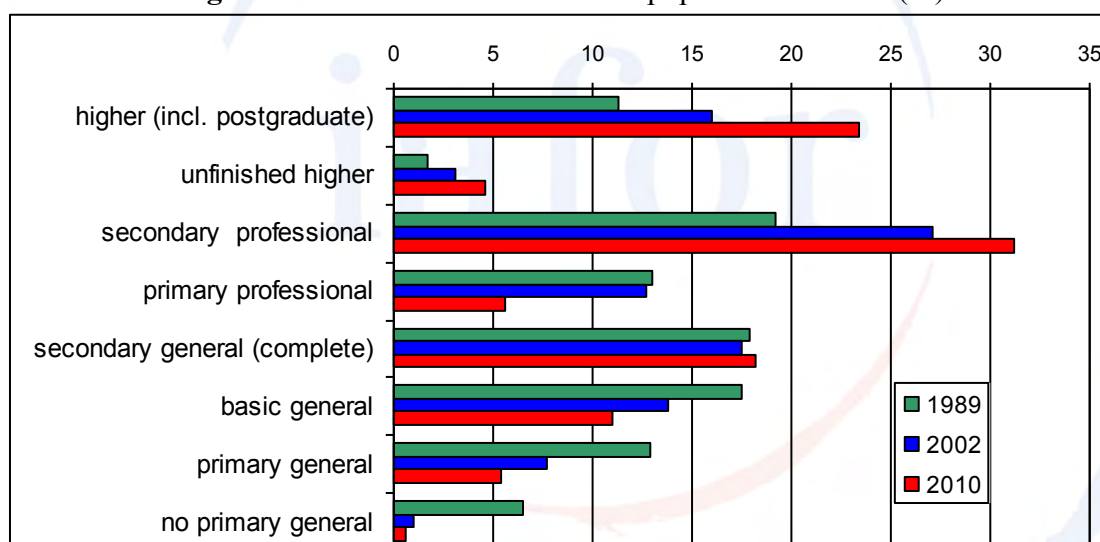

- High school;
- No high school diploma.

Independent variables are characteristics of a respondent (gender, age, place of birth, ethnicity) and of his/her parents (educational level, professional status, Communist Party membership) when respondent was 15. The data source is Russian Longitudinal Monitoring Survey (RLMS-HSE)<sup>2</sup> in 2006-2011. The main data about respondents and their parents were collected in 2006, but the information about respondents' education was found in all following rounds due to the panel nature of data. The sample of RLMS-HSE is representative for the Russian population as a whole.

#### 4. Stylized facts

During the past 20 years the educational level of the Russian population has significantly increased. According to Russian population census of 1989 only 45,2% of people had diploma on some professional education (including 11,3 % - university diploma or unfinished higher education), and the educational level of 19,4% was only high school or even lower. By 2010 the percentage of people who has graduated from professional school has grown to 64,8 % (including 28% - University diploma), and the percentage of those who had an educational level of primary school and less has declined to 6 % (figure 2).

**Figure 2.** Educational attainment of population over 15 (%)

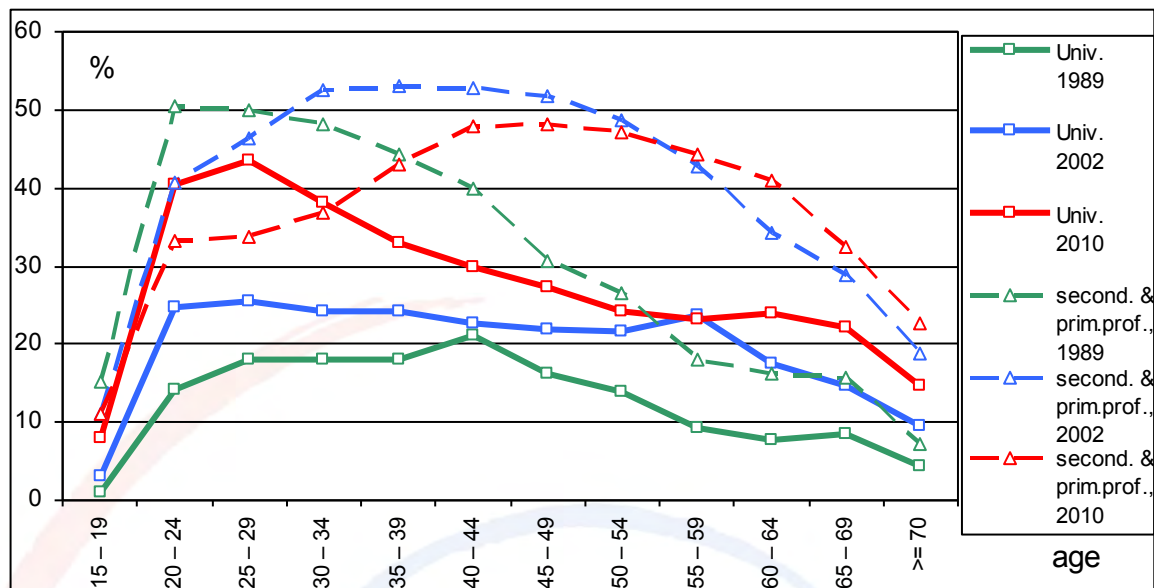

Sources: *Population censuses data*, Russian Federal State Statistic Service - RFSSS.<sup>3</sup>

The comparison of profiles age-education for 1989, 2002 and 2010 shows a solid growth of the proportion of population with primary and secondary professional education of the cohort over 35. These profiles also imply that the educational level of the cohort over 50 is significantly lower. The percentage of people with higher or unfinished higher education of all ages has grown by 1,3 – 1,8 times, and for the people older than 55 – by 1,8 – 2,6 times (figure 3).

<sup>2</sup> «The Russia Longitudinal Monitoring Survey (RLMS-HSE)» is conducted by National Research University - Higher school of economics and research center "Demoscope" with the participation the Carolina Population Center at the University of North Carolina at Chapel Hill and Institute of Sociology, Russian Academy of Sciences. (See <http://www.hse.ru/rlms>, <http://www.cpc.unc.edu/projects/rlms>)».

<sup>3</sup> [http://www.gks.ru/free\\_doc/new\\_site/perepis2010/croc/perepis\\_itogi1612.htm](http://www.gks.ru/free_doc/new_site/perepis2010/croc/perepis_itogi1612.htm)

**Figure 3.** Educational attainment of population (% of age groups)

Sources: *Population censuses data*, Russian Federal State Statistic Service - RFSSS. <sup>4</sup>

As it was mentioned above, in Russia in 1995-2010 there was a restructuring of professional education. Between 1996 and 2010 the number of Universities has grown by 1,5 times, and the number of their students – by 2,5 times. The percentage of students in higher schools among all students of the professional education has grown from 43,5% to 69,2%, and the percentage of students in primary schools among all students of the professional education decreased from 26,4% to 9,9%.<sup>5</sup>

RLMS-HSE data demonstrate similar dynamics. In 1994 among all respondents of the age over 15 only 16,7% had university diploma, 39,8% - primary professional or secondary professional education diploma, and 43,5% - the high school diploma or lower. However in 2010 these figures have grown to 25,5%, 37,4% and 37,1% accordingly. The survey also confirms the conclusion based on the RFSSS (Russian Federal State Statistic Service) data: the educational level in the older age groups is significantly lower (table 1 in Appendix).

Thus, it is quite obvious that during the recent 15 years the absolute accessibility of education (mainly of higher education) has grown. However it should be pointed out that here the absolute accessibility is considered as chances of an individual to enter the professional school that depends directly on the increased relative capacities of the universities and other educational institutions (ratio of number of places to number of the young of corresponding age). But such a concept of accessibility seems to be too simplified. As it was argued above, the inequality in access to education of a certain level is due to differentiation between individuals (excluding his/her own abilities and effort) and to social and economic distinction between their families. Therefore, the rise in the number of students because of the enrollment of those who pay tuition fees themselves (as opposed to government-paid spots) can increase accessibility of education only for rich social groups, but not for the whole population.

The high correlation between parents' educational levels and those of their children confirm the hypothesis that the strong inequality in the accessibility to education is still present. The RLMS-HSE data for the year 2006 contain information on parents' level of education when respondent was 15. The other questions were about whether respondent's parents were members of the Soviet Union Communist Party before 1991. Under socialism in Russia and in some other countries of Eastern Europe parents' membership in the Communist Party was a substantial part

<sup>4</sup> [http://www.gks.ru/free\\_doc/new\\_site/perepis2010/croc/perepis\\_itogi1612.htm](http://www.gks.ru/free_doc/new_site/perepis2010/croc/perepis_itogi1612.htm)

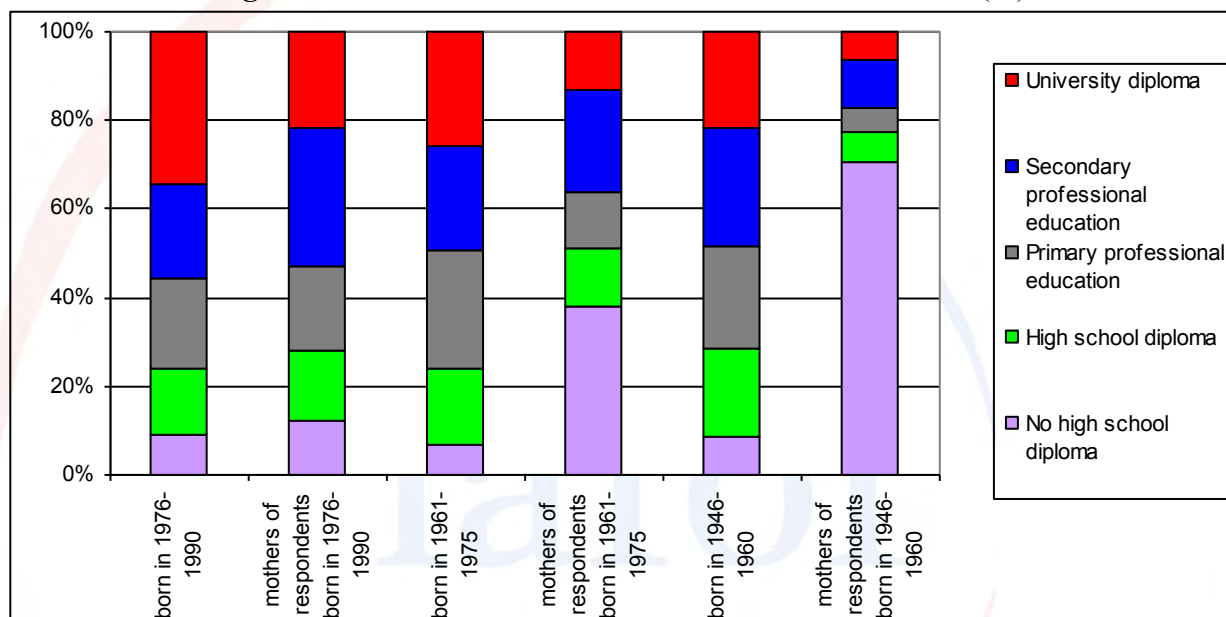

<sup>5</sup> Russian Federal State Statistic Service - RFSSS

<http://www.gks.ru/wps/wcm/connect/rosstat/rosstatsite/main/population/education/>

of social capital, and several researches have shown that membership in the party was a significant factor of children's chances to obtain an university diploma.

According to the tables 1-2 in the Appendix, for the three given cohorts of Russian population in 2006-2011 we can see the strong dependence of the educational level of a respondent on parents' education. Thus, among all respondents born in 1946-60 only 22% have graduated from a higher school. But the percentage of children born in 1946-60 with higher education rose to 67,4% if mother had an university diploma, to 40,4% if she had secondary professional education, and to 31,1% if she had the high school diploma. Therefore, for those who were born in 1946-1960, any next level of parents' education, in comparison with unfinished high school, raised chances of a child to have university diploma (see table 2 in the Appendix).

**Figure 4.** Educational level of cohorts and of their mothers (%).

Sources: RLMS-HSE 2006-11. Computations from the author.

In contrast, for cohorts born in 1961-1975 and in 1976-1990 only secondary or higher professional education of parents did have positive influence on the probability for a child to be enrolled into a University. For those whose father or mother had diploma of primary professional school, of high school or lower, this probability was smaller, than for the whole population (table 1 and 2). This implies that since the second half of the 1970s, educational mobility has decreased: it became more difficult for children from families with lower level of education to move to a more educated group. The strengthening of educational inequality is also confirmed by the evidence that in two older cohorts only about 10% of children, whose parents had no high education, got the same level of education, and in younger cohort this share is 25%.

As fig. 4 shows, the rising intergenerational educational mobility was lower for the younger cohorts. In some part it is due to the increased educational level of parents: the higher is the education the lower could be level of rising intergenerational mobility. So, 76,1% of children born in 1946-60 had the educational level higher than those of their mother, and only 42,5% of children born in 1976-90.

According to RLMS-HSE data the membership of parents in the Communist Party raised chances for their children to obtain higher education, but it didn't influence the access to other levels of professional education (see table 4 of the Appendix). For those who were born after 1976, the father's party status was more important than the mother's one. The educational chances always were worse for people born in villages. So, 29,1% of children born in 1946-60 in towns had university diploma and only 15,2% among those born in villages. For cohort born in 1976-90 the corresponding shares were 41,2% and 23,9%.

## 5. Regression estimation

Let us now estimate the model of probability to obtain the education of a given level depending on characteristics of individual and his/her parents for Russian people born in 1946-1990. Independent variables are:

- educational level of mother and father;
- whether mother and father were not members of Soviet Union Communist Party;
- whether respondent was born in the village;
- region where respondent was born;
- age of the parents when respondent was born;
- gender, age and ethnicity of respondent.

The method of this model estimation is a multinomial regression; base outcome is «respondent has university diploma or he/she is studying in university». Model was estimated for all three cohorts together (Appendix, table 4), and also for each cohort separately (Appendix, table 5).

Regression estimation for the whole sample demonstrates the significant level of dependence of respondent's education on his/her parents' one. If the father does not have high school diploma (in comparison with the case of father's University diploma), the probability for his child to obtain the secondary professional education is more than 2,7 time greater than to have university diploma; and the probability to not have any diploma is more than 7,7 time greater. If father's education is lower than secondary professional, it is most likely that his child would have primary professional education or would have no diploma. However, if father's education is secondary professional, the same level of the child's diploma is anticipated. This probability is more than 1,7 time greater than his child have higher education. So, the greater the father's human capital is the higher are chances of a child to be more educated. The same conclusion could be made about the influence of mother's education, but the impact of the latter is greater.

As the table 4 in the Appendix shows, the following factors have positive impact on the child's chances of having educational level lower than university diploma:

- parents' human capital is low;
- the respondent was born in a village;
- father wasn't a member of the Communist Party of the USSR;
- respondent's gender is male (excluding secondary professional education).

In general, given all other factors equal, compared to the oldest cohorts, the chances of the younger cohort (especially born in 1976-90) of not having any educational certificate are higher, than having a university diploma. But there is no impact of the year of birth on the probability to have diploma of high school in comparison with the university diploma. We could find no influence of the region where the respondent was born, of mother's membership in the Communist Party, very low influence of parents' age, and only some impact of respondent's nationality (in general North Caucasians, Tatars and Bashkirs had better chances in education).

The general conclusion is that there was no equality in access to professional education in the USSR. The most serious barriers were small amount of parents' human capital and parents' political capital (Communist Party membership), and a village as the birthplace (that may appear as low cultural capital, low family income, worse training in high school, great distance to educational institutions, etc.). Unfortunately, there are no data about family incomes (when respondent were 15) and type of school where respondents had studied, as most research insist that these factors are very significant too.

Let's now see if there is a difference in factors of the accessibility in education between different periods of Russian history. We take three cohorts. The youngest one consists of respondents born in 1976-90. They turned 15 during 1991-2005, and so they could be the applicants in the schools of professional education (primary, secondary or higher) in the first decade of post-socialism. The people in the second cohort (born in 1961-75) turned 15 in 1976-90, so, we can measure the difference of chances at that époque of the late socialism. And respondents in the oldest cohort

(born in 1946-60) turned 15 in 1961-1975: this period is the earliest to test the issues of the inequality of educational chances in the USSR (see table 5 in Appendix).

As regressions estimations show during all three periods people suffered from inequality in access to professional education (as there are significant coefficients in all models). Parents' human capital always had the strongest effect on educational chances. But the negative impact of its' low volume as a rule increased from the earlier period (1961-1975) to following ones (1976-1990): for example the child born in 1946-60 whose mother had not any diploma had the chances to remain at the same educational level 6,2 times greater than to graduate from university; but for those who were born in 1961-1975 this ratio was 27,3. For the cohort born in 1976-90 the probability to have no diploma or to graduate from primary professional college if mother has primary or secondary professional education increases in comparison with the cohort born in 1946-60. At the same time father's human capital became more important for child's probability of having secondary professional education, but mother's one became less important. As a rule, the educational level of mother had stronger impact than the father's one.

The influence of respondent's gender is very high for all levels of education excluding secondary professional colleges (in comparison with University). Young men had more chances to remain without any diploma, or to have diploma of high school or of primary professional school than to graduate from the university. Their access to secondary or higher professional education was the highest for people born in 1946-60. Regressions estimation show that to be born in a village resulted in great probability to remain without any professional education for the oldest and the youngest cohort. But the chances to obtain some professional education were the best for those who were born in 1961-75.

As data show if father was not a member of the Communist Party in the Soviet period his child (born in 1946-60 or in 1976-90) had more chances to not have any diploma or to have the high school diploma. There was no dependence of the probability to enter in secondary professional school in comparison with the university from father membership in the Communist Party or in all periods. And the influence of father membership in the Communist Party was the lowest for the cohort born in 1961-75. As data show, 56,7% of the children born in 1976-90 whose fathers were the members of the Soviet Union Communist Party obtained university diploma, and only 32,1% of the same cohort whose fathers were not Party members (Appendix, table 3). The corresponding percentages for people born in 1961-75 were 39,7% and 22,5%. This fact let us conclude that the political capital of parents (Soviet Union Communist Party membership) were transformed in their social and human capital and had positive influence on educational chances of children even after the USSR liquidation.

There is some influence of respondent's nationality and of his/her place of birth on professional education accessibility, but it isn't strong (not significant for most of dummies).

## 6. Conclusion

The main conclusion is that the inequity in access to professional education was strong for all three cohorts. RLMS-HSE data demonstrate that factors of the family capital (first of all an educational level of parents) represent an essential barrier of educational opportunities of high schools graduates. The existing social inequality of children's families is fixed in high school as children of poorer and less educated parents, as a rule, study at bad schools and are less successful in education. Parents' human capital always had the greatest effect on educational chances among all other factors.

The negative impact of parents' low human capital was stronger for younger cohort (born in 1976-90) than for the older one (born in 1946-60). That is why although the absolute accessibility of professional education in modern Russia increased, the relative accessibility of professional education (i.e. their dependence on parents' education) decreased. The ascending intergenerational educational mobility became lower.

Today the system of the Russian professional education is, to the great extent, the mechanism of fastening the existing social inequality rather than of social mobility. Students of the primary professional education are children who have graduated from bad schools, whose parents have a low social status; they have humble expectations about their future employment. Students of the universities are children of parents with a high social status; they graduated from much better schools, and have aspirations about their future job. Students of the secondary professional education were raised in the families with the moderate social positions, they graduated from medium range schools, their plans for the near future are connected with universities enrollment rather than with work-related issues.

Thus, in the Russian social hierarchy the primary professional schools and the universities represent the bottom and the top levels where it is possible to move aside, but not upwards, on other words, they allow only horizontal social mobility. Moreover, only the secondary professional schools look like a ladder to the next «social level» giving their students the possibility to be enrolled in the universities and then to get good employment.

## Appendix.

**Table 1.** Education of respondents, their fathers and mothers by cohorts, Vert% (RLMS, 2006-11)

	Respondents year of birth			Total
	1976-90	1961-75	1946-60	
<i>Education of the respondent</i>				
No high school diploma and not studying now	9,2	6,8	8,5	8,2
High school diploma	14,9	17,4	20,0	17,3
Primary professional education (studying now or has the diploma)	20,4	26,4	23,3	23,3
Secondary professional education (studying now or has the diploma)	20,9	23,6	26,3	23,5
University (studying now or has the diploma)	34,6	25,8	21,9	27,7
<i>Education of father when a respondent was 15</i>				
No high school diploma	17,5	41,1	69,3	40,6
High school diploma	15,7	10,3	4,1	10,5
Primary professional education	28,1	18,2	9,2	19,2
Secondary professional education	18,4	13,9	8,0	13,8
University diploma	20,3	16,5	9,4	15,8
<i>Education of mother when a respondent was 15</i>				
No high school diploma	12,4	38,0	70,7	38,2
High school diploma	15,8	12,9	6,7	12,1
Primary professional education	18,6	12,7	5,4	12,8
Secondary professional education	31,2	23,2	10,8	22,5
University diploma	21,9	13,0	6,4	14,4

**Table 2.** Respondents' and their mothers' education level by cohorts, Vert% (RLMS, 2006-11).

Cohorts	Educational level of respondent	Mother's education when the respondent was 15				
		No high school diploma	High school diploma	Prim.prof. education	Second.prof. education	University diploma
1976-90	No high school diploma	24,7	11,1	8,4	5,4	2,1
	High school diploma	15,3	20,4	16,2	12,2	11,2
	Primary prof.education	25,7	23,5	31,4	16,4	9,1
	Secondary prof.education	16,7	25,4	21,4	24,9	13,0
	University diploma	17,7	19,7	22,6	41,1	64,6
1961-75	No high school diploma	9,6	7,8	5,8	3,1	,8
	High school diploma	21,7	18,3	13,4	14,3	11,8
	Primary prof.education	32,5	26,9	33,2	20,4	8,9
	Secondary prof.education	23,3	25,5	24,7	27,7	16,6
	University diploma	12,9	21,5	23,0	34,5	61,8
1946-60	No high school diploma	10,6	2,7	3,4	1,3	2,3
	High school diploma	21,9	15,8	13,5	16,2	10,3

	Primary prof.education	26,7	14,8	25,0	11,4	7,4
	Secondary prof.education	26,1	35,5	31,8	30,6	12,6
	University diploma	14,7	31,1	26,4	40,4	67,4

Bonkers Beat Music Kinder, Australia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

A lack of music teaching in early years education across the globe stimulated the creation of the Bonkers Beat® Music Program, enabling more children to benefit from music. The program is designed for young children from 15 months to 8 years of age and features music as an integral part in all lessons, including physical movement, languages, literacy and numeracy. The program makes learning a joy, but above all else it enhances children's multiple intelligences, helping them become better learners in the early years of their primary schooling. Music is the key element of the program. Daily music sessions are based on both traditional songs and original compositions. They incorporate singing, dancing, creative movement and the playing of instruments. The music program was based on the internationally recognised Kodaly and Orff methods of pedagogy to stimulate children's social, intellectual and emotional growth. The program also uses songs and rhythms to encourage children to follow daily routines. Spontaneous and intentional art and craft ideas are linked to themes covered in songs and are used to support the integrated curriculum and help children learn visually. This paper is based on a number of case studies of selected students who attended the Bonkers Beat Music Kinder in Brighton East, Victoria, Australia, during a period of five years, between 2007 and 2011. Individual case studies are not included in this paper.

## **Introduction / Overview**

The need for music for every child, every day, is an international issue and transcends the boundaries of language and culture. In June 2010, Bonkers Beat Music Kinder at Brighton was included in the E4Kids study run by The University of Melbourne and on 10 May 2010, the Bonkers Beat Music Program was selected to be presented at The 2010 DEECD Innovation Showcase, Victoria. Since 2004, more than 160 children attended the kinder and on 4 May 2009, a second kinder was opened in Aspendale, Melbourne. The Bonkers Beat Music Kinder Aspendale became a pilot centre for the Australian National Quality Standard and in September 2012 went through the Assessment process receiving an outstanding rating of Exceeding NQS.

## **Research Aims**

The main focus of this research is to analyse and identify the direct and indirect impact of music on children's development and behaviour. The main focus of the music program is to improve Social, Physical, Intellectual, Creative & Emotional Developmental domains in children from 0 to 8 years through a consistent approach and the use of daily music practices. From 2007 to 2010 more than twenty children with special needs attended the kinder and showed a dramatic progress in their development due to being in a mainstream environment and having music as a foundation for their learning.

## **How does Music Change the Brain?**

According to Schlaug, G., Jancke, L., Huang, Y., and Steinmetz, H., "...brain scans of musicians showed larger planum temporale (a brain region related to some reading skills) than those of non-musicians. They also found that musicians had a thicker corpus callosum (the bundle of nerve fibers that connects the two halves of the brain) than those of non-musicians, especially for those who had begun their training before the age of seven." If this is the case and music can physically change the architecture of the brain, then we should look at when the best time to introduce music is and why.

In 1994, Rauscher, Shaw, Levine, Ky and Wright, wrote in the "Music and Spatial Task Performance: A Causal Relationship," - "After eight months of keyboard lessons, preschoolers showed a 46% boost in their spatial reasoning IQ." Rauscher, F.H., and Zupan, M.A. highlighted that "Kindergarten children who were given music instruction scored 48 percent higher on spatial-temporal skill tests than those who did not receive music training."

When we listen to music, it is processed in many areas of our brain. The extent of the brain's involvement was scarcely imagined until the early nineties, when functional brain imaging became possible. Since then, many brain scans of musicians have shown that musical training physically develops part of the left side of the brain and makes an enormous impact on the development of language, reasoning, math, science, concentration, memory, self-expression, stress release and many other areas.

There are many powerful reasons why children benefit from music education. One of them is that playing music improves children's reading, verbal skills as well as increases their level of concentration, memory and self-expression. Music is powerful in helping children to develop social and emotional skills, become less stressed and enjoy learning. Playing music also builds or modifies neural pathways related to spatial reasoning tasks which are crucial for math, science, chess and so on. In 1993, there were some studies conducted comparing four groups of children. Some children had computer lessons, some had singing lessons or playing lessons (keyboard) and one group had no classes at all. The result was the following: the children who had the music classes scored significantly higher – up to 35% – than the children who did nothing additional and surprisingly, also 35% higher than children who had the computer classes. Another important

question is when is the best time to start music education or introduce music to a child? Accordingly to Tamara Koehler, Scripps Howard News Service, May 25, 2003, the "First five years of life are a crucial period for learning - a short but spectacular window of time when experiences can change the architecture of the developing brain." Long before their school years, the groundwork for whether a child will succeed and thrive is already being laid. "But what we do know is this is a critical time when you can help a child be ready for school, be at the highest level of development he or she can be" admits Dr. Harry Chugani, Professor of Pediatrics, Neurology and Radiology from the Children's Hospital of Michigan in Detroit. He also says: "We now have concrete images of the way the brain is hooked up early in life, and it is truly a remarkable period like no other in life. He also believes that 'this is a critical time when you can help a child be ready for school, be at the highest level of development he or she can be.'" Accordingly to Michael E. DeBakey, M.D., Leading Heart Surgeon from Baylor College of Medicine., "Studying music encourages self-discipline and diligence... leads to effective study and work habits. Creating and performing music promotes self-expression and provides self-gratification. Music deserves strong support in all educational systems."

### **Theoretical Framework**

The Bonkers Beat® Program features music as an integral part in all lessons, including physical movement, languages, literacy and numeracy, using the highly-regarded teaching approach of Kodaly and Orff. The main focus is on learning through music, therefore enhancing every child's development.

### **Paradigm and Methods**

Daily 30 min music sessions are based on original compositions and are integrated into the kinder curriculum. The Bonkers Beat Music Program is based on the highly-regarded teaching approach of Kodaly and Orff, including singing, dancing and playing instruments, incorporating learning stories, art and craft activities, as well as consistently using traditional songs and rhymes. All educators are trained to deliver the music program to every child, every day. Traditional songs are used for transitional times and parents are encouraged to continue music and transitional routines at home.

### **Ethical Considerations**

Children of different backgrounds, socio-economic groups and varying abilities attended Bonkers Beat Music Kinder, therefore special considerations were taken to accommodate their unique needs. A variety of interviews, surveys and observations demonstrated a wide range of multicultural communities involved in this research and continuous practice.

### **Main Findings**

Children developed an appreciation and love of music, multicultural and social identity. Furthermore, improved social skills, concentration, focus, listening skills, speech, language, gross and fine motor skills, flexibility, co-ordination, co-operation, team work, patience, imagination, self-esteem, acceptance, memory, spatial intelligence, well-being, health, self-control, sense of beat, rhythm, singing and playing instruments are all evident. Outcomes for gifted children, children with Autism Spectrum Disorder (ASD) or children with additional needs include: task focus, increased attention span, better communication skills, interaction with other children, improved speech, language skills, coordination, fine and gross motor skills, emotional responses

to music, releasing laughter or joy, cooperation, teamwork and turn-taking, confidence, leadership, imagination and motivation in music making.

### **Implications for Practice and/or Policy**

Six years of research and daily practice of music with young children aged two to five years have shown improvement in children's development regardless of their previous experiences and background. Based on facts, numbers, experiences and real life examples, this research underlined the urgency of having more children's services implementing integrated music activities into daily routines.

## **Introduction and Purpose of the Paper**

Multiracial and multiethnic individuals are theorized to have existed since the beginnings of civilization as groups of people have migrated across geographical boundaries. Historically, various cultural, ethnic, and racial groups of people have come into contact with each other over the course of time and have mixed together—even before the discovery of the “New World” when Europeans perceived they had come into contact with other races for the very first time. However, it is beyond the scope and aim of this paper to inquire into physiological, sociological and historical perspectives of how to define ‘race’. Instead, the purpose is to inquire into the ways that language – its acquisition and development, use and usage, and its policy, education and levels of competency in one or more languages, is related to the personal construction of identity of multiracial and multiethnic individuals. The fact remains that multiracial and multiethnic individuals exist in many societies and are continuing to increase in numerous countries around the globe.

A review of the literature on multiracial people and their definition and development of identity has revealed that the majority of studies have focused on the following issues and topics: counseling (Cauce et al. 1992; Wardle 2000), identity development models (Poston 1990; Jacobs 1992; Thornton 1996; Schwartz 1998) historical perspectives on mixed race individuals (Daniel 1992; Nakashima 1992; Spickard 1992), and the significance of physical appearance to identity. While there is a large body of literature that examines the relationship of language to intrapersonal identity and ethnic identity (Fishman 1977; Gudykunst and Schmidt 1987; Clement and Noels 1992; Edwards 1994; and Liebkind 1999), interestingly, however, the author did not find many research studies or writings that focused specifically on the issues of language among multiracial and multiethnic people or the relationship of language in identity development in these two bodies of research. Perhaps, the word ‘language’ needs elaboration before further discussing how language might relate to the multiracial individuals and their identities. ‘Language’ for the purpose of this investigative paper refers to the choice of language, its use and usage, the developmental growth in language proficiency, values, attitudes, practices and policy toward language use as determined by the family, school and community or national context in which it is acquired and employed by a biracial or multiracial individual. ‘Language’ is not limited to being simply, a tool of communication but is also understood as means to develop social relationships, can be highly symbolic, and is utilized to navigate the self

in world.

The goal of this paper is to create an initial framework towards understanding the relationship of language and identity in multiracial and multiethnic individuals. There have been several questions that have guided the research and process of constructing this inquiry. They are: 1) How are the words multiracial and multiethnic defined? 2) How is language related to identity? How is language related to ethnicity? 3) What kinds of factors are involved in how a multiracial or multiethnic identity formation? 4) What is the relation of language to multiracial individuals and to the formation of their identity? This paper will: 1) Examine definitions and terminology relating to multiracial and multiethnic individuals along with bilingualism and the concept of biculturality; 2) Consider how language interrelates to identity; 3) Explore factors involved in multiracial identity formation; 4) Highlight why the topic should be further examined and to make suggestions towards a cohesive body of research in the future.

### **Exploring Terminology:**

In order to properly frame the scope of this paper, it is important to ascertain the basic concepts and to define what is meant by various terms that are relevant to describing people who have multiple cultural, linguistic, social, and racial heritages. Before exploring frameworks of multiracial identity formation and the relationship of language and identity, it is important to clarify the meaning of some of the terminology that is associated with this topic of study. First, it is necessary to describe what is meant by the terms: biracial, multiracial, multiethnic, and mixed-heritage individuals. These words are often used interchangeably but some researchers have preferences for using certain terms because they denote different things to different people. Some terms are more political than others so particular researchers feel that certain terms are more appropriate to use. It is important to remember that there is no general consensus by researchers as to what these terms actually mean, nor are there prescriptions as to the fashion that they should be used. The author's preference is to use the terms biracial and multiracial interchangeably. However, the author will also explore terms such as mixed-heritage and multiethnic because they are helpful in further expanding our knowledge of multiracial individuals and raising awareness of the complexity of the issues involved. The terms 'bilingual' and 'bicultural' will also be explained because they have relevance to investigating how language is specifically related to the identity of multiracial and multiethnic individuals.

**Biracial:** According to Root (1992), the term biracial refers to “someone with two socially and phenotypically distinct racial heritages—one from each parent” (11).

**Multiracial:** A multiracial individual is a person for whom at least one or both of the individual’s parents are biracial or multiracial and whose other parent is monoracial. This term is a more inclusive one because it can be used to describe all people who are racially mixed, whether it may be two, three, or more different racial heritages and in various degrees and combinations. Root (1992) suggests that this definition of the word multiracial possibly extends to include individuals with biracial or multiracial heritage to the grandparents’ generation.

**Mixed Heritage:** According to Stephan (1992), the term race suggests that there are biological divisions of human groups, a distinction that is probably fictional in terms of physiology, but is a real society construct in our societies. The term ‘heritage’ suggests a combination of biological race and cultural factors in distinguishing groups or individuals. A mixed-heritage individual is the offspring of parents that are of two different ethnic/racial heritages. Another term that is used in a similar fashion is “mixed-race,” which describes the genetic background of an individual as a combination between two or more different races. This differs from the term ‘multiethnic’, explained below.

**Multiethnic:** Kerwin and Ponterotto (1995) describe ethnicity as a group of people’s culture that is vital to aspects of the group’s values, attitudes, perception, needs, modes of expression, behavior, and identity. Ethnic identity is significant according to Stephan (1992) because it is the identification of an individual or group of individuals with a specific culture that establishes one’s self-meaning and overrides all other people’s judgments of the self. A multi-ethnic individual is characterized by two or more different distinctive cultural heritages. A bi/multiracial individual will likely be a multiethnic individual as well. However, the converse does not apply, as multi-ethnic individuals are not necessarily multiracial. If a child is born and raised between a Chinese mother and Korean father who are both monoracial, the child will be multiethnic but may not necessarily perceived herself or be perceived as bi/multiracial because both parents are Asians.

**Bilingual:** According to Baetens Beadsmore (1986), bilingualism can be interpreted as, a method allowing someone communicate efficiently, imposed on or chosen by them, between two or more worlds, using two different linguistic systems. Bilingualism might be understood as the ability to use two languages in a manner that will allow the individual to achieve certain goals within his or her life. If a person can communicate verbally with other human beings and use language that entails the activities necessary in their daily life, they are usually thought to be bilingual. Although one can view language as a merely a communicative tool, the author's perception of language is not limited to this purely instrumental view of language as it is deeply inter-related with a person's self and social identity. Through the means of language, we transmit our ideas, knowledge, emotions, and culture to other human beings. Language helps us to create, maintain, and develop relationships not only with other people but also within ourselves. It encompasses every aspect of a person's life and the author believes that the development and use of language is a basic component that characterizes us as human beings. If a person lacks linguistic capabilities, this may inhibit them from gaining access to resources and relationships that might be crucial to their lives. Language, at times, can be utilized as markers of social groups and to distinguish ethnicities of people.

**Bicultural:** La Framboise et al. (1993) described biculturalism as a state where the competencies and sensitivities associated with two cultures inside a single individual became combined and coexist together. This term is relevant to multiracial and mixed-heritage individuals because it has the potential for reframing our perception and thus societal acceptance of these people as "doubles" who have the ability to thrive in more than one culture, within two or more racial or ethnic groups, or in a multicultural society. Although at times, biculturality or the aspect of living in between two worlds is described as a struggle or source of conflict (LaFromboise et al., 1993), there is promise in utilizing this concept in addressing multiracial and multi-heritage individuals because it can help us frame our recognition and validation of these people in terms of duality or multiplicity of identities, abilities, and perspectives. A bicultural framework allows multiracial and multi-heritage individuals to be perceived, understood and accepted as people who are of more than one racial, ethnic, or cultural background rather than in a social rubric where people are categorized, or even castigated, as being a member of a certain race—never being valued as being 'both' or possessing a multiple racial heritage but as being 'either/or' —simply because of the person's physical or superficial appearance.

## **Exploring the Relationship of Language and Identity**

This section will examine two different viewpoints of authors who have explored the relationship of language and identity. The goal is to highlight the complexity and many ways in which the relationship of language and identity can be researched, examined, and understood. Language can be the means to a shared experience and thus a shared identity. It can be the means by which a person expresses and negotiates his own identity, and it can be symbolic of one's group or personal identity. These researchers particularly focus on the relationship of ethnicity and language but do not address how the concept of race might relate to language and identity. This omission may be related how race and ethnicity are commonly understood. Race tends to be viewed as a way of categorizing people according to physical features, their biological genes, and their hereditary ancestors (Spickard, 1992). Ethnicity, however, tends to be defined on the basis of objective characteristics such as national origin, language, culture, religion, geographic boundaries and is often seen as a focal point of identity (Liebkind, 1999). Phinney (1990) suggests that ethnic identity might include aspects of social identity, sense of shared values and attitudes, behaviors, and feelings of belonging and commitment. It is rare for the concept of race to be associated with aspects of language because race is not based upon criteria such as social behavior or cultural knowledge but according to physical appearance and ancestry. Yet, the study of ethnic identity is considered to be related to aspects of social behavior and in the ways that a person communicates and interacts with others who may be similar and dissimilar to whom they are. Therefore, language as the basic means for communicating with and transmitting ideas, values, and knowledge to other human beings is an important component to the inquiry into ethnicity and ethnic identity. Nonetheless, perspectives on the relationship of language and ethnic identity are valuable because multiracial individuals are most likely multiethnic as well.

### *Heller's view of Language and Ethnicity*

Heller (1987) argues that the basis of ethnicity is located in the networks of relationships that individuals form and in the daily activities of a person. In her view, ethnicity is a social construct and in order to examine how ethnic identity develops, she maintains that it is necessary to investigate social interaction, which in turn is the process whereby people communicate these constructs with one another. She states:

Language is important here as a means by which access to networks is regulated: If you do not speak the right language, you do not have access to forming relationships with certain people, or to participate in certain activities. Beyond this basic principle, there is the consequence of continuous interaction over time within social networks: shared experience, shared knowledge, shared ways of looking at the world, and shared ways of talking. Shared language is basic to shared identity, but more than that, identity rests on shared ways of using language that reflect common patterns of thinking and behaving, or shared culture (181).

From this perspective, language is a significant component to establish social relationships with other people. If a person does know how to communicate in a certain language, this means that they will not be able to interact with members of this group, nor will they have access to the shared knowledge, common worldview, nor will be able to learn how to behave and speak as a member of this group. If a multiracial individual does not learn the language of one of their ethnic heritages, this probably means that they will not be able to participate in the activities or interactions of the group, therefore they will most likely not be able to fit in as a member of the ethnic group. Not knowing a language may further cause a multiracial person to feel distant and not belong to one of their social groups to which they feel an affinity. This opinion might be a strong position to take on the relationship of language and identity, yet it seems well founded because Heller argues that the basis of a shared identity is a shared language, which serves as the means to express and represent mutually shared ways of thinking or behaving. How much language an individual needs to know to be able to communicate with a group to thus share an identity is a question that should be posed to test the strength of this argument. Nonetheless, Heller's perspective on the relationship between language and identity is vital to consider because it recognizes language as a central component to communication, interactions, and social relationships. Lacking sufficient capabilities in a language would likely mean that a person loses the opportunities to access social relationships with an ethnic group or community, and thus would be denied the right to share an identity and cultural perspective with that ethnic group of people.

#### *Myers-Scotton's view of Language and Ethnicity*

Myers-Scotton (1991) maintains that codeswitching is the selection of two or more linguistic varieties in the same conversation. From her perspective codeswitching can

be seen as a form of ethnic expression. Her findings and discussions derive from studying conversations and examples of codeswitching among multilingual and multiethnic individuals in Kenya. She argues that because Africa is multiethnic in context, there is tension between the public and private expressions of the self. Individuals in these settings code-switch to negotiate and express their ethnic identities. Code choice is indexical and an on-going process of negotiation that depends on the participants involved. Speakers weigh the possible costs and rewards for making one language choice over another. Myers-Scotton describes various forms of codeswitching such as, non-marked, marked, 'permissible' marked, and 'exclusive' marked types. Shared ethnicity encourages the use of ethnic language in a public space. She suggests a marked switch to an ethnic language is a negotiation to decrease or increase the social distance between two or more speakers. The use of an unmarked language, such as a common lingua franca in that society or region neutralizes the relevance of ethnicity and can bring people closer or move them further apart as well. From this perspective codeswitching and the use of more than one language in a single conversational interaction can be seen as a way to negotiate a person's identity and social relationships. This can be important to consider in light of multiracial individuals' experiences. The choice of using a certain language or not using the language in a particular situation can be an expression of a person's identity in order to gain acceptance by increasing or decreasing the social distance between oneself and speakers from other ethnic groups. Language can be utilized to initiate inclusion or a sense of unity but can also be employed to exclude people as well. By codeswitching to the ethnic language of a particular person or group, a multiracial individual with bilingual or multilingual capabilities maybe able to promote awareness in those to whom they are communicating that they are someone who can speak their language and thus illustrate they are someone who is similar to the speaker and or is a member of the same ethnic group. However, it is important to note that codeswitching is also a process of negotiation and thus cannot be successful unless the person with whom the individual interacts is willing to accept the speaker's assertion of his or her identity. Nevertheless, an individual who can codeswitch or negotiate what language to speak in a conversation has a certain degree of power to assert who he is and can express the identity in contrast to an automatic categorization of an individual's ethnic identity by others according to how he or she physically appears or is socially perceived.

## **Factors Involved in Multiracial and Multiethnic Identity Development**

For many years, scholars in various disciplines, such as philosophy, psychology, political science, sociology, anthropology and education, have explored the concept of identity and the self. The concept has been examined and studied from varied perspectives, producing a range of ideas and questions concerning how a person defines him or herself, whether or not identity is static or dynamic, and how identity relates to the group and other beings. Stephan (1992) maintains, “[i]dentities are meanings that the self acquires through social interaction, and as such are crucial to an understanding of an individual’s sense of him or herself”(51). From this perspective, identity might be thought of the way that a person makes sense of him or herself in relation to other beings. A person defines who he or she is through social interaction with others, through how they are categorized and understood by others, and possibly through how much a person may or may not internalize the views of others. It is important to recognize that one’s social relationships and interactions with others, the extent to which an individual is affected by how others evaluate him, and how much a role that the perceptions, views, and categorization by the other people in a society play in how an individual of any background, whether of a single race or ethnic heritage or multiple heritages, comes to understand and value him or herself. Cooley (1998) proposes what is known as the “looking-glass self.” He suggests that an individual forms images of him or herself through the perceptions of others. In his view, an individual relies on the socially reflected images of his or herself to help determine who he or she is and to construct of sense of self esteem or pride. A person may receive mixed messages and be treated differentially by varying people in their social lives. In addition, the degree to which a person internalizes all the views in a uniform way is variable. The views of family members, peers, or other respectable figures may be more significant than views of people who are not as influential to an individual’s life. If people are highly influenced by the views of others, where these views are likely to be a mixture of both positive and negative, then this may also mean that an individual may not always have concise or clear understanding of who he or she is. Their own image and understanding of themselves will be a mixture of both positive and negative views about themselves. In the case of multiracial individuals, certain people may be supportive of their duality or complexity of cultural and racial heritages while others may question who they are, asking the person to justify their background because of their physical ambiguity, or may even devalue that person because he or she are not a “pure” member of the group. Views that will be internalized by the individual will vary according to

the environment or particular setting and, as the multiracial individual moves in and out of varying social contexts, he or she may be evaluated in multiple or ambivalent ways. This implies that a person may not have a concrete identity at any given moment because the individual might be influenced by the views of others in a particular setting or moment in time. Moreover, this may suggest that a person's identity may not be static and can develop over time.

The processes of identity formation for multiracial individuals is complex since factors such as the family, immediate social context, geographic location, the individual's physical appearance, the school and educational environment, a person's peers, the individual's language capabilities, gender, and social class are likely to influence how a multiracial person will identify him or herself racially, ethnically and culturally. These factors do not influence all biracial or multiracial people uniformly. Each individual is born to a set of unique conditions so it is extremely difficult to generalize and approximate how much of single or multiple factor will be critical to the individual. All of these factors are influential in the processes of identity formation of any individual regardless of whether they are multiracial or monoracial. Nonetheless, it is important to identify some of the factors that are significant to how a multiracial individual will self-identify and come to terms with the self.

### *Family*

The family of the biracial individual is significant to the individual because it is the primary environment in which they are enculturated in their first culture or cultures. The parents' specific ethnic and racial backgrounds can be important as well. The number of siblings, whether or not both parents are still married or together, and the existence of extended family will be influential to that person. The individual will learn and develop ways to utilize the cultural values and attitudes, knowledge or concepts, rituals, and language that is acquired in the socialization processes of the family. The language that one learns in childhood and throughout their lifetime will play a decisive role in who the individual can interact with, what kind of opportunities they can have access to, how the person will be judged by others because of their language, and how the biracial individual will identify him or herself culturally and ethnically.

Factors such as the class background and the immediate social context of the individual

are vital to consider as well. The social class of the multiracial individual and his or her family will determine where the family lives, what kind of races, cultures, and social groups they might interact with, and the types of social and educational opportunities available to them. Gender will be a factor influencing aspects of education, socialization, language use, sexuality, and the social roles of a person. The immediate social context will determine aspects of language, peer interaction, education, social and cultural values, and the concepts about race. Depending on where a person grows up, this will influence how a person will be socialized and how they may define who they are as a person.

Finally, the school and peer interaction will have a bearing on the processes of socialization, acquisition of cultural and academic knowledge, whom the individual interacts and associates with frequently, who the role models are, what language the individual will learn and use, and how knowledge and values about the concepts of race and ethnicity are affected. Although the family is not solely responsible in making decisions about an individual's life or their surrounding environment, parents do make choices to some degree where to live, how to raise their children, what language and culture they choose or not to pass on to their children, and what type of school the individual will attend. Consequently, the family is a crucial element that influences the development of identity and self-definition among multiracial and mixed heritage individuals.

### *Physical Appearance*

The physical appearance of a multiracial individual is a significant component of a person's identity. A person's internal view of how they think they physically appear may not necessarily match how others view them and categorize them. As individuals become aware of their perceived physical or superficial differences in comparison to those around them, it may lead to a sense of isolation or feelings of ambiguity about their group identity. Kich (1992) describes how the recognition and being identified as different can lead to certain types of feelings and experiences among mixed race individuals. Even among siblings within a single family, physical appearance can vary and this can be a source of mixed emotions. Siblings can feel close to one another and retain a strong sense of assurance because they may feel there is someone in the family that resembles who they are, who they look like, and who also like them, do not look like their parents or others in society. However, individuals can also have ambivalent feelings because they may feel that they look more like one of their parents or because

they may think that one of their brother or sisters look to be more of one race than the other, causing people around them to evaluate and treat members within a single family differentially.

### *Social Perceptions*

A multiracial person cannot completely choose an identity for him or herself. The identity of a person is negotiated through the interaction with others. Taylor (1994) provides us with insight into the process of identity formation in how an individual weaves together both the external opinions of others and the internal self. “We define our identity always in dialogue with, sometimes in struggle against, the things our significant others want to see in us...thus in discovering my own identity doesn’t mean that I work it out in isolation, but that I negotiate it through dialogue, partly overt, partly internal, with others.” (32-33).

### **Suggestions for Future Research**

Forthcoming research to construct a more holistic framework should further examine how a multiracial or multiethnic individual’s identity transforms over time and should consider from various angles and with different methodologies, how and to what extent language is significant in a multiracial or multiethnic person’s identity. It should also attempt to document specific cases of multiracial or multiethnic people where language is highly relevant and vital to their identities.

The author believes that the question of how language and identity interrelate is important to not only multiracial and multiethnic individuals, but to those who are multilingual, and multicultural, as well as to the members of educational institutions, social organizations, and companies in which they learn and work. The author is hopes this current framework and research in the future will not only address issues that are pertinent to multiracial and multiethnic individuals, but will also capture the experiences and issues relating to the role language and the development of identities of a much larger audience.

*Integration of Inclusive Education Subject in the Curriculum of Pre-service Teachers  
towards Transformation: Exploring its Impact and Effectiveness*

Abstracts

In response to the growing currency towards inclusion around the world, teacher education institutions have shifted into pedagogy of teacher training in line with inclusive education. Ensuring the competence of pre-service teachers to cater to the needs of increasing range of diverse learners has been a great responsibility of schools of teacher education. From the perspective of the 155 pre-service teachers as respondents, this study seeks to evaluate the impact of inclusive education subject, a one-semester course in the School of Teacher Education of Saint Louis University, Baguio City that offers training on inclusive education practices to the pre-service teachers in changing their viewpoints toward inclusion, in preparation to their professional career. The study also examines the effectiveness of the subject in terms of the five strands namely: year level offering, course objectives, course content, teaching strategies, and effectiveness of the instructor. Through the administration of a validated questionnaire, findings showed that the subject has left a great impact on the pre-service teachers in instilling positive perception specifically in responding to diversity and acceptance of different students. Moreover, the study has also discovered that the inclusive education subject is generally very effective across the five strands identified. The findings of this study are significant in the improvement of the curriculum and possible dissemination of inclusive education subject to other teacher education institutions in the country.

## Introduction

Inclusion of students with disabilities into mainstream schools is a worldwide trend. This philosophy has changed dramatically over the past two decades and several countries have led in the effort to implement policies which foster the integration and, more recently, inclusion of these students into mainstream environments. It has been featured highly in the educational priorities of many countries (Angelides, 2008) such as Philippines, India, USA, Canada, United Kingdom, and Australia as evidenced by their establishment of educational policies and legislations to promote inclusive practices (Sharma, Forlin, & Loreman, 2008). Here, although the movement of inclusive education has gained momentum in recent years, a key element in the successful implementation of the policy is views of the teachers who have the major responsibility for implementing it (Avramidis & Norwich, 2002). It is argued that teachers' beliefs and attitudes are critical in ensuring the success of inclusive practices since teachers' acceptance of the policy of inclusion is likely to affect their commitment to implementing it (Norwich, 1994). Inclusion requires commitment from a range of stakeholders including governments, teacher training institutions, schools, teachers, and the school community if it is to be successful. As we move towards an inclusive future, it is teacher training institutions that will become pivotal in ensuring that teachers have the appropriate attitudes and skills to further this agenda (Sharma, Forlin, Loreman, 2006).

Inclusive education is related to the effort of overcoming barriers that prevent the participation and learning of all children, regardless of their race, gender, social background, sexuality, disability or attainment in schools (Booth & Ainscow, 1998). Inclusive education does not only focus on the barriers that students face but also, as Booth and Ainscow (2002), cited by Angelides (2008) argue, focuses on the development of cultures, policies and practices in educational systems as well as in educational institutions in order for them to be able to respond to the diversity of their students and to treat them equally. With this, we should also take a giant look at the responsibility of teachers in creating an inclusive environment of meaningful learning. From the moment they entered their pre-service teacher education, to their workplaces later, these aspiring teachers must have enrolled and mastered the pedagogy of implementing inclusive education in their teaching, in their methodologies, and in their viewpoints. As early as in their pre-service career, they have to develop concern for children with disabilities, and change their negative attitudes into positive ones in order to eliminate the prejudicial aspects of a teacher towards these children. A big responsibility also lies in the shoulders of colleges and universities offering teacher education to properly train their pre-service teachers, their professional education teachers, and the review of the curriculum they have to offer to their students.

Simui (2009) as cited in the report by the European Agency for Development in Special Needs Education (2010) propounds that teacher education should be at the "center" of inclusive education reform hence, the need to see pre-service teacher education as a beginning in the long journey of inclusive education. He further argues that preparing teachers for inclusive education should include strategies aimed at transforming teachers' practices, which are largely influenced by their attitudes, beliefs, and values. According to Avramidis (2002), beginning teachers need not only the skills and knowledge base to be successful in inclusive education environments, but also need to develop positive attitudes and sentiments towards their work in this area in order to ensure inclusive future in their classrooms. He further added that inclusive education is not about training special educators for special children, but about getting teachers to challenge the way they conceptualize difference and educational failure.

According to Franzkowiak (2009), introductory courses on inclusive education should be mandatory for all teacher education students, that bachelor and masters courses should include inclusive education and combined degree programmes for primary and special education should be promoted. The collegiate career of these students is the big stepping stone to their future professional undertakings with inclusive education in their minds and hearts.

Several studies have investigated pre-service teachers' concerns about inclusive education (Loreman *et al.*, 2005; Bradshaw & Mundia, 2006; Subban & Sharma, 2006), their readiness for teaching diverse learners (Forlin *et al.*, 1999; Engelbrecht & Forlin, 1998; Forlin, 2001), and their attitudes towards inclusive educational practices (Carroll *et al.*, 2003; Sharma *et al.*, 2003; Loreman *et al.*, 2005; Subban & Sharma, 2005). There was also a study that has conducted research on the impact of training on the attitudes of pre-service teachers and their sentiments on students with disabilities (Sharma, Forlin, & Loreman, 2008).

Researches have however been conflicting. Some studies have suggested that teachers with more experience show less positive attitudes toward inclusion (Harvey, 1985; Forlin *et al.*, 1996), while other studies found that as teachers' experience with pupils with special educational needs or SEN increased so did their confidence (Leyser *et al.*, 1994; LeRoy & Simpson, 1996). Studies of both pre-service and in-service teachers have also shown that attitudes can be influenced by the type of preparation they received (Wilczenski, 1993; Avramidis *et al.*, 2000). The importance of training in helping to form positive attitudes towards inclusion has been further supported by research suggesting that teachers who had specific training to teach students with learning difficulties expressed more positive attitudes towards inclusion as compared to those who had not (Shimman, 1990; Beh-Pajooah, 1992). Beare (1985), however, cautions that attitudes once set are in fact very difficult to change and that it might therefore be more effective to focus closely on the preparation of pre-service teachers. The suggestion is that if student teachers complete their pre-service education without having developed positive attitudes towards inclusion this will adversely affect the successful accommodation of learners with special educational needs into mainstream settings (Tait & Purdie, 2000). Blair (1983) concluded that improved provision at pre-service together with a more aggressive approach towards training for inclusion-based practices would be the best point to begin in teacher education. Lambe and Bones (2006) found that positive attitudes did exist in student teachers at the start of their pre-service training, concluding that this stage of teacher education was the most affective time to nurture these attitudes by the provision of high quality training. If attitudes can be formed by the quality of pre-service provision, then it seems reasonable to conclude that the school-based placement experience may be a key time when attitudes towards inclusion may be influenced.

However, there has been no study yet that has researched on the impact of the inclusion of inclusive education subject in changing the viewpoints and perceptions of pre-service teachers and eliminating their barriers toward inclusion.

In the Philippines, only Saint Louis University's School of Teacher Education (SLU-STE) in Baguio City offers a great deal on inclusive education implementation in its curriculum, with a 3-unit subject about it entitled "Inclusive Education" for pre-service teachers. This subject is offered since 2002 in the second semester of the first year level. Facilitated by a professional educator, the subject mainly focuses on the principle of inclusive education, accepting and valuing differences, understanding disabilities, and ending all forms of discrimination in a school setting. This study seeks to address this by considering the impact

of teacher education focusing specifically on offering an Inclusive Education subject to pre-service teachers to work in inclusive regular classrooms and their attitudes and concerns about inclusive educational practices.

This study shall attempt to find out whether pre- service teachers, specifically the fourth year practicumers of the School of Teacher Education (STE) of Saint Louis University in the City of Baguio were greatly impacted by the Inclusive Education approach they received from their pre- service education in their field observations, practicum, or field studies. The study seeks to answer the following questions: what is the impact of the subject Inclusive Education in affecting the viewpoints and perceptions of pre- service teachers toward inclusion and embracing students with disabilities? How effective is the subject – Inclusive Education- in terms of the appropriateness of the year level offering, course objectives, course content, course teaching strategies, and effectiveness of the instructor in the developing inclusive orientation to these pre- service teachers? The findings of the study shall help the administrators of teacher education institutions to effectively design a curriculum in lined with meeting the trend of inclusive education.

## **Methods**

### *Subjects and setting*

The researchers chose the fourth year teacher education students who are already having their practicum or on- the- job training as the subjects of the study. These students were taken regardless of their specialization, whether they are majoring in English, Mathematics, Biological Sciences, Physical Sciences, Social Studies, MAPEH, General Education, Special Education, Filipino, and Pre- School.

All of the 155 fourth year practicum student of STE in the second semester of SY 2011-2012 were taken as respondents for the study. However, out of 155 fourth year practicumers, the retrieval of data was gathered only from 142 respondents.

### *Instrumentation and data collection procedure*

Data collection and analysis followed quantitative research methods. The main tool used in this study is a questionnaire divided into two parts, both of which are to be answered in a four-scale basis. The first part is a 22- item set of statements about the impact of Inclusive Education subject (Educ 101) in affecting the viewpoints and perceptions of pre- service teachers toward inclusion, based on a literature review made by the European Agency for Development in Special Needs Education (2010). The second part of the questionnaire is a 65-item set of phrases and statements about the effectiveness of the subject in terms of five strands: year level offering, course objectives, course content, course teaching strategies, and effectiveness of the instructor. Such part is based on the syllabus of the subject secured from the Professional Education Department.

Prior to the administration of questionnaires, the questionnaire was validated through a reliability test using Cronbach's alpha coefficient.

The testing was conducted to 33 pre-service teachers and resulted to the following reliability coefficients:

Area / Aspect	Reliability Coefficient
Impact of Inclusive Education Subject	0.9584
Effectiveness of the Subject	0.9684

Formal permission to conduct the testing of reliability of the questionnaire and the final administration was obtained from the School Dean and the head of the Professional Education Department and from the respondents, themselves. Having in mind the busy schedule of the respondents, the researchers have intently scheduled the administration of questionnaires in their classroom where their subject, "*The Teaching Profession*", is scheduled. The said subject is the only campus- based course practicumers are taking aside from the 12- unit practice teaching, as per required by the curriculum.

### *Data analysis*

The responses were averaged from obtaining the mean of the answers of the respondents in every question or statement. The mean values were interpreted according to the table presented below.

For problem number 1:

Rating	Range or Interval	Interpretation
1	1.00 – 1.74	Has no impact at all (NI)
2	1.75 – 2.49	Has a slight impact (SI)
3	2.50 – 3.24	Has a fair Impact (FI)
4	3.25 – 4.00	Has a great impact (GI)

For problem number 2:

Rating	Range or Interval	Interpretation
1	1.00 – 1.74	Not Effective (NE)
2	1.75 – 2.49	Slightly Effective (SE)
3	2.50 – 3.24	Effective (E)
4	3.25 – 4.00	Very Effective (VE)

After the interpretation of the mean values, the statements were ranked to determine which characteristics of the inclusive education subject are perceived to have great impact on the pre-service teachers and which are perceived to be very effective. The most striking top and bottom statements were analyzed based on the factors existing in the teacher education training in the school. Results were also corroborated with other researches which either supported or negated the claims of the researchers. Furthermore, the data were presented in a tabular form where the mean, interpretation, and rank are shown clearly.

## Findings and Discussion

### *Impact of inclusive education subject in affecting the viewpoints and perceptions of pre-service teachers toward inclusion*

Preparing teachers for regular class teaching has undergone a major pedagogical shift in recent years. Training institutions are now required to ensure that pre-service teachers are competent to cater for the needs of an increasing range of diverse learners. This move has been furthered by international recommendations (now more than 12 years old) from UNESCO to include content on inclusion as part of teacher training programs (UNESCO, 1994). In preparing teachers for inclusive classrooms their attitudes, beliefs, expectations and acceptance of people with diverse needs may well be challenged (Sharma, Forlin, Loreman, Earle 2006). Table 1 presents the data of the impact of Inclusive Education subject as perceived by the pre- service teachers.

As gleaned from the table, the pre-service teachers perceived Inclusive Education subject to have a great impact on their viewpoint and perception. Specifically, the pre-service teacher respondents perceived Inclusive Education subject to have taught them to accept all kinds of students leading to a positive perspective toward inclusion as well as to accept not only students with disabilities but also students with different nationalities, ethnicity, race, color, and languages. These statements obtained the highest weighted mean value of 3.58 (both having a rank of 1.5) and it correspondingly implies that inclusive education subject has a great impact on the pre-service teacher respondent's views on these areas.

These statements show that the subject was successful in instilling positive perception of pre-service teachers toward acceptance to diversity. That is, the subject focused on responding to the challenges posed by the highly diverse world people are living in today. Such perception to acceptance of diversity also leads to a positive implication towards globalization and embracing the diverse world today. Pre-service teachers accept inclusion globally, in all aspects of identity, how the world is bridged by inclusion and how it has slowly becoming a global village through the context of inclusion. Acceptance of pre-service teachers to diversity involves the idea of social tolerance or the willingness to treat anybody as a welcomed member of a group or circle, within the atmosphere of respect, fairness, and equity.

*Table 1. The Impact of Inclusive Education Subject in Affecting Viewpoints and Perceptions of Pre-Service Teachers toward Inclusion*

<b>Statements</b>	<b>WM</b>	<b>I</b>	<b>Rank</b>
1. <i>Inclusive education subject influenced me to feel sympathetic towards people from diverse backgrounds and has changed my philosophy to deal with them.</i>	3.48	GI	11.5
2. <i>The subject has imparted to me certain knowledge and understanding about the needs of different learners, teaching techniques and curriculum strategies.</i>	3.51	GI	7.5
3. <i>The subject taught me to accept all kinds of students and such will lead to a positive perspective toward inclusion.</i>	3.58	GI	1.5

4. <i>The subject has helped me in eliminating barriers towards accepting and embracing inclusion.</i>	3.48	GI	11.5
5. <i>The subject has taught me to accept not only students with disabilities but also students with different nationalities, ethnicity, race, color, and languages.</i>	3.58	GI	1.5
6. <i>The subject has taught me that there's no such thing as "different", only "unique".</i>	3.54	GI	4.5
7. <i>The subject has taught me to think multiculturally, and be socio-culturally conscious.</i>	3.46	GI	15
8. <i>The subject has instilled to me that equality will end all forms of discrimination in this world.</i>	3.47	GI	14
9. <i>The subject has taught me that there is no inferiority, no superiority, no majority, and no minority in this world.</i>	3.40	GI	20
10. <i>The subject has taught me that the basic knowledge on principles and essence of inclusion will lead to peaceful understanding not only in the classroom but also in the society as a whole.</i>	3.43	GI	17
11. <i>The subject compelled me to respect all kinds of people and learners and so as their opinions and differences.</i>	3.54	GI	4.5
12. <i>The subject has helped me to be able to manage an inclusive classroom including planning for teaching and learning, maximizing available resources, managing group works and cooperative learning and assessing children's learning.</i>	3.36	GI	21
13. <i>The subject has also changed my negative perception into manifesting positive behavior and attitudes towards children from diverse backgrounds and other learners who are marginalized.</i>	3.48	GI	11.5
14. <i>The subject has influenced me to recognize and appreciate human diversity and examine one's own beliefs and attitude related to individuals with disabilities or impairments.</i>	3.51	GI	7.5
15. <i>The subject has communicated to me that it is the knowledge, beliefs, and values of the teacher that are brought to bear in creating an effective learning environment for pupils, making the teacher a critical influence in education for inclusion and the development of the inclusive school.</i>	3.49	GI	9
16. <i>The subject taught me the educational justification of inclusion that is inclusive</i>	3.43	GI	17

<i>schools have to develop ways of teaching that respond to individual differences and benefit all children.</i>			
<i>17. It has also taught me the social justification of inclusion that is inclusive schools are able to change attitudes towards diversity and from the basis for a just, non-discriminatory society.</i>	3.43	GI	17
<i>18. It has also inculcated to me the economic justification of inclusion that is it costs less to establish and maintain schools that educate all children together than to set up a complex system of different schools 'specializing' in different groups of children.</i>	3.32	GI	22
<i>19. The subject has also taught me that inclusion concerns issues of gender, ethnicity, class, social conditions, health and human rights encompassing universal involvement, access, participation and achievement.</i>	3.48	GI	11.5
<i>20. The subject has also instilled in me that inclusion may be understood not just as adding on to existing structures, but as a process of transforming societies, communities, and institutions such as schools to become diversity-sensitive.</i>	3.42	GI	19
<i>21. It has also taught me that upon entering this profession, I should understand how I might create classrooms and schools that address issues of respect, fairness, and equity.</i>	3.56	GI	3
<i>22. The subject has also taught me to understand the historical, socio-cultural and ideological contexts that create discriminatory and oppressive practices such as isolation and rejection of disabled students, gender discrimination, poverty, and racism in education.</i>	3.53	GI	6
<b>Overall Weighted Mean</b>	<b>3.48</b>	<b>GI</b>	

The pre-service teacher respondents also perceived inclusive education subject to have a great impact where it taught them that upon entering the profession, they should understand know how they might create classrooms and schools that address issues of respect, fairness, and equity. This statement or item obtained a weighted mean of 3.56, which is third in rank, indicating that the subject has a great impact on this regard. As such, the subject has given them a bird's eye view on how to create learning atmosphere where distinct fairness, respect, and equity are ambient. This statement affirms that aspiring educators are now capable of creating such classrooms because the subject has instilled the importance of such inclusive classroom. This is also related to understanding on the responsibilities of a 21<sup>st</sup> century teacher that is to produce learner-friendly classrooms at an inclusive pace.

Looking further at the resulting statements, acceptance and humanness to cultural diversity are two important factors to consider. These two can be manifested by a positive attitude toward cultural relativism. This is because the subject has opened their minds into embracing

diverse audience that lead to a positive perception toward cultural relativism, and setting aside their prejudice and discrimination tendencies before they may advance. The subject has generally taught them the concept of cultural relativism, which encloses that culture is relative and one cannot compare the culture of another to their own. This is true to the respondents because the study is conducted in Baguio City, which is also one of the melting pots of different cultures in the Philippines. Basically, the pre-service teachers have developed the sociocultural consciousness within their systems, which will subsequently give backdrop to the acceptance and respect between the teacher and the students.

This is related to Banks' (1996), as mentioned by Villegas & Lucas (2002), sociocultural consciousness on understanding people's ways of thinking, behaving, and being that is deeply influenced by such factors as race/ ethnicity, social class, and language. Without this insight, teachers are unable to cross the sociocultural boundaries that separate too many of them from their students.

Moreover, these pre-service teachers gained inclusive values that are necessary in responding to issues in their future profession. Inclusive values are concerned with issues of equality, rights, participation, learning, community, respect for diversity, trust and sustainability, compassion, honesty, courage and joy (Booth & Dyssegaard, 2008). Seeing values as 'fundamental guides and prompts to moral action', Booth and Dyssegaard (2008) state that in education, an understanding of the values which give rise to our actions is essential if students 'do the right thing'.

Ferreira and Graça (2006) recommend that, to take full account of the diversity of the current school population, the following aspects should be included in teacher education: learning difficulties and disabilities; emotional and behavioural problems; communication techniques and technologies; symbolic representation, signification and multiculturalism; different curricula; teaching methods and techniques and educational relationships. To ensure culturally responsive teaching, Gay and Kirkland (2003) say that teacher education must include critical cultural self-reflection that takes place in a context of guided practice in realistic situations and with authentic examples.

Regarding multi-cultural education, Winch-Dummett (2006) identifies, in addition to lesson organisation and outcomes, teaching strategies and teacher communication the need for 'cultural inclusion' that includes acknowledging culturally specific activities and beliefs, promoting values and an ethos of respect for cultural diversity.

Moreover, as gleaned from the results, pre-service teacher respondents have shown the least impact on the statement that the subject has inculcated to them the economic justification of inclusion with a mean of 3.32 and ranked at 22, with discretionary great impact. This means that pre-service teachers perceive less that establishing and maintaining schools that educate all children together costs less than setting up a complex system of different schools 'specializing' in different groups of children. The respondents have also perceived less that the subject has helped them able to manage an inclusive classroom including planning for teaching and learning, maximizing available resources, managing group works and cooperative learning and assessing children's learning as indicated by the rank of 21 and mean of 3.36, still has great impact. And finally, as shown in the mean of 3.40, pre-service teachers also remarked less that the subject has taught them that there is no inferiority, no superiority, no majority, and no minority in this world. It landed on a rank of 20. All three

were interpreted as having great impact but were perceived as least in ranks according to their perception.

Analyzing further the statements, they reveal that the subject inclusive education did not focus more on the implication of inclusion in the school administration and managing strategies in the classroom at an inclusive pacing. Rather, it has generally left a great impact on the affective side of the student teachers over the need to reorganize inclusive education management which they believe is only secondary. Student teachers perceive that inclusive education cannot maintain the idea of mainstreaming all kinds of children and learners because of the difficulty of classroom management of such institutions. Skillful teachers in inclusive practices are needed in such schools where all children are generally accepted and socially mingling with each other. It is still deemed challenging for 21<sup>st</sup> century teachers to manage inclusive classrooms such that the teacher still faces difficulty in planning for teaching, learning, maximizing available resources, managing group works and cooperative learning, and assessing children's learning in a classroom where all types of children meet and clash. Pre-service teachers perceive the readiness of the school administration and teachers of today as moot to actually implement and stand the test of inclusive education. This also implies lacking of proper training into mainstreaming and inclusive practices.

Inclusion was seen as being important for social integration and building self-esteem, upholding human rights and promoting better understanding of diversity. The students had also, however, expressed uncertainty as to how inclusion would work in practice. As with many experienced teachers, the students perceived difficulties in coping with large classes and in managing resources effectively, and expressed a general concern about professional competency. By the end of the pre-service year, although the students claimed to have improved personal efficacy, many of their anxieties remained. While purporting support for inclusive education, many students had tempered this with practical concerns that ran alongside a continued attachment to the current system of academic selection with which they were familiar (Lambe & Bones, 2008).

In a related study conducted by Brownlee and Carrington (2000), it was found out that in general, pre-service teachers believed that the teacher education course needs to include more practical knowledge and more practical experience about inclusive schooling. Such training is needed to be incorporated in the course to facilitate readiness and preparation of pre-service teachers toward inclusive education. Further, according to Lambe and Bones (2008), that for student teachers, positive attitudes towards inclusion were only one factor in ensuring its successful implementation. Reviews and reports on practice will be largely ineffective unless they can impact directly on other key factors, such as the organization of schools, and on teacher education. Attitudes towards inclusion and inclusive practices may be positively affected by consideration of resources and class size, and the provision of the same level of classroom support for learners in mainstream classrooms that the student teachers found available in their special school placements.

Pre-service teachers tend to depend more on what they are currently learning in their teacher preparation programs because their experiences are still rather limited (Burke & Sutherland, 2005). There is a need to combine experience with updated knowledge. Schools should try not only to expose all of their teachers to students with disabilities but also to provide sufficient training. By doing so, teachers might see more positive effects of students with disabilities being included into the regular classroom. Research indicates that those

experiences will have a positive effect on the teachers' attitudes causing them to be more willing to participate in the inclusive movement.

Pre-service teachers also reveal that the subject did not greatly eliminate the concepts associated to diversity which are inferiority, superiority, majority, and minority. These four concepts were deemed necessarily be eliminated in the perspective or viewpoint of pre-service teachers because of the barriers they pose to acceptance and inclusion as a whole. That means inclusive education was perceived as not responsive to this phenomena and the corresponding principles of global acceptance or it might not be in the priority list of the subject.

In summary, inclusive education is perceived as having great impact in affecting the viewpoints and perceptions of pre-service teachers toward inclusion particularly in their affective side. This is indicated by the computed overall weighted mean of 3.48 which is correspondingly interpreted as "has a great impact". That is, the subject has left favorable or satisfactory impression to the pre-service teachers in terms of their viewpoints and perception. Moreover, the subject is effective in instilling positive attitudes to pre-service teachers particularly in accepting and responding to diversity.

Lancaster and Bain (2007) agree that in general, there is a positive change in attitudes after undertaking an inclusive / special education unit of study and this is the case across a number of contexts and countries (Ching et al., 2007; Kyriakou et al., 2007).

*Effectiveness of the Inclusive Education subject in terms of different strands as perceived by the pre- service teachers*

Besides evaluating the impact of inclusive education subject, it is also important to evaluate the effectiveness of the subject in terms of meeting the pre-identified strands such as: year level offering, course objectives, course content, course teaching strategies, and effectiveness of the instructor. It is very important to evaluate this kind of program such as inclusive education subject to pre-service teachers because of the underlying responsibility of teacher training institutions to offer quality teacher education programs in order to produce competent and responsive teachers of the future. An inclusive education subject being offered to pre-service teachers is unique to Saint Louis University and that it needs evaluation for its improvement or possible dissemination to other universities with pre- service teacher training institution.

*Appropriateness of the year level offering.* The first strand to be evaluated is the appropriateness of the year level offering of the subject. It must be noted that the year level offering of a certain subject is one factor for the successful implementation and training for the students. Having the nature of the subject in mind, the maturity and preparedness of the student teachers must be taken into consideration. Table 2 presents the data on the perception of pre-service teachers to the appropriateness of the year level offering of the inclusive education subject.

As analyzed from the table, respondents have perceived that the subject has encouraged them to pursue the course as it zoomed to first in ranking with a mean of 3.34, very effective. Such result implies that the subject has instilled to the aspiring teachers in STE the essence of teaching and imparting knowledge to all walks of life. This can be explained on the account that the subject is enticing in helping them find themselves in the images of professional

teachers in the future. Furthermore, they also perceive the offering of the subject as very effective in serving as a fundamental foundation of teacher education training for aspiring teachers, as it ranked in second with a mean of 3.33. This can be consistent with the result of the top- ranking statement. These two results present the importance of primacy of inclusive education subject over foundations of teaching subjects because it encompasses the basics of accepting the profession in its nature and challenges.

*Table 2. Effectiveness of the Subject according to Year Level Offering as Perceived by the Pre- service Teachers*

<b>Year Level Offering</b>	<b>WM</b>	<b>I</b>	<b>Rank</b>
1. <i>The subject has greatly affected my viewpoint in teaching, immediately after high school because the subject was offered in the first year level.</i>	3.28	VE	4
2. <i>The subject's offering in the first year level served as a fundamental foundation of teacher education training for aspiring teachers.</i>	3.33	VE	2
3. <i>The offering of the subject in the first year level has opened my mind to the principle of inclusion and apply this to higher courses in education.</i>	3.30	VE	3
4. <i>Being the first ever professional subject to be taken in college, Educ 101 (Inclusive Education) has encouraged me to pursue the course through instilling the essence of teaching and imparting knowledge to all walks of life.</i>	3.34	VE	1
5. <i>The subject's offering in the first year level has developed my early love for this profession.</i>	3.14	E	5
<b>Overall Weighted Mean</b>	<b>3.28</b>	<b>VE</b>	

Inclusive education subject being offered in the first year level is essential to the pre-service teachers because of the role of the subject in bridging their differences with each other. The subject has helped them become prepared and responsive in catering the needs of their society. It is necessary for these pre-service teachers to develop and learn inclusive practices in preparation for the future professional undertaking.

The results confirmed Angelides' (2008) study that the student teachers seem to have developed some inclusive practices. The classes they took at university seem to have steered them in this direction. In some instances they seemed to undertake leading roles among the teachers of the schools regarding the promotion of inclusive education. According to Nes (2000), the way in which teachers are trained in their initial education seems to have a serious role to play in the development of inclusive practices in the schools they will work at in future. In addition, Haug (2003) argues that if student teachers develop inclusive practices at university, these will then be transferred later to their practice as teachers.

Second to the last in rank is on the perception that the subject has affected their viewpoint in teaching, immediately after high school because of the offering in the first year level, with a mean of 3.28, still very effective. In contrast, these respondents have inconsistently perceived the offering of the subject in the first year level as just 'effective' with a weighted mean of 3.14 and correspondingly the last in rank. These least two statements mean that the offering in the first year level is not really that contributory to the development of a positive viewpoint in teaching rather it just serves as a transition to an endeavor of deeper professional

education subjects in the higher years. The nature of the subject itself eclipses the capability of the subject to develop early love for the profession. Inclusive education therefore is not equated to teaching motivation because of the disparity of inclusive approach and teaching profession.

The subject's year level offering in the first year level has been relatively rated not suitable considering the weight and importance of the subject. However, it still depends on how the students perceive it between positive and negative according to how they really intend to pursue teaching profession, and according to how they define such purpose. The result supports this claim such that the subject has been seen in two different ways. One is that the subject has helped them realize the essence of pursuing the profession, yet it doesn't necessarily mean developing early love for the profession since it is premature to say that one has fallen in love in a profession in the freshman stage. Moreover, the subject's offering to the first year level can also be friendly to pre-service teachers because of the fact that the subject builds the necessary foundation for moving up to higher courses of professional education.

The results of the table shows that the appropriateness of the year level offering has been seen and perceived by the pre-service teacher respondents as very effective, in general, as indicated by the overall weighted mean of 3.28. This means that the subject's offering in the first year level is rated appropriate in changing viewpoints of pre-service teachers toward developing positive attitudes on inclusion. It is very effective in establishing primary foundation for aspiring professional teachers to pursue teaching and not to be confused with environmental dictation and peer pressure, as some of the current trend presents.

*Course objectives.* The course objectives are also evaluated to see if these were met by the subject as perceived by the pre-service teachers. It is important to evaluate these because objectives serve as the guide of the instructors in delivering the said subject.

Table 3 presents the effectiveness of the subject in terms of the course objectives as perceived by the pre- service teachers.

*Table 3. Effectiveness of the Subject in Terms of the Course Objectives as Perceived by the Pre- service teachers*

<b>Course Objectives</b>	<b>WM</b>	<b>I</b>	<b>Rank</b>
<i>Cognitive</i>	3.35	VE	5
<i>Affective</i>	3.52	VE	1
<i>Psychomotor</i>	3.41	VE	4
<i>NCBTS – Based Objectives</i>	3.44	VE	2
<i>21<sup>st</sup> Century Skills-Based Objectives</i>	3.43	VE	3
<b>Over-all weighted mean</b>	<b>3.43</b>	<b>VE</b>	

As seen in the result, the pre-service teachers remark the affective objectives as the most effective among the five general objectives of the course. The affective objectives obtained a mean of 3.52, and have the highest in rank as very effective. This means that the subject primarily gave importance in identifying, understanding, and addressing how people learn and that the pre- service teachers perceive the significance of the subject in touching their emotions and instigating attachments with a degree of acceptance or rejection. This implies that the pre-service teachers have manifested positive behavior and attitude towards children with special learning needs and other learners who are marginalized. They have also recognized and appreciated human diversity and examine one's own belief and attitude

related to individuals with disabilities. This result represents the basic nature of the subject, which is responding to diversity and embracing inclusion, which is consistent to the first problem that the subject taught the pre- service teachers the value of accepting diversity and have positive attitudes toward inclusion.

Examining further the result, the National Competency Based Teacher Standards- Based objectives ranked second in the 'very effective' thread of the result. It has obtained a mean of 3.44 which implies that pre- service teachers have realized the importance of the domains in the framework of competent teachers in the future. This is parallel with the affective domain because this objective defines the teaching competency of the pre- service teacher and how will he/ she deal with the affection and recognition of learners' diversity and differences. This also implies that the subject has not only instilled appreciation and affection to diversity but also taught the pre- service teachers on devising learning activities, teaching methods, instructional materials, or resources appropriate to the learners aligned with the objectives of the lesson. The subject has instilled concern on holistic development of diverse learners by planning varied activities that will cater to their needs.

Probing more the result of this strand, it came out that the cognitive objectives made it to the last rank with a mean of 3.35, at least very effective. This shows that the nature of the subject defines itself more in the affective orientation and accepting diversity over the theoretical and conceptual understanding of what inclusive education is. The result affirms the fact that the pre- service teachers have preference on manifesting positive behavior than possessing basic knowledge and understanding with theories and concepts. Indeed, meeting cognitive objectives is only secondary to the innate feeling of emotion attached to responding to diversity.

The result indeed confirms with Molina (2006) that the evidence to demonstrate that theoretical classes and reading are not sufficient to modify teachers' and students' negative attitudes towards pupils with special educational needs.

In summary, the course objectives were met and were evaluated by pre- service teachers as very effective with an over-all weighted mean of 3.43. The inclusive education subject has met the five objectives effectively with a preconception on the affective objectives since the nature of the subject is more on accepting and responding to diversity. Thus, the acquisition of knowledge and theories about inclusive education will serve only secondary. There is a clear disparity between molding an inclusive teacher and a teacher who knows inclusive education.

*Course content.* Course content consists of topics that concern to the completion of inclusive education. It is part of the evaluation to see if these are effective and functional in the career of the pre- service teachers. The course content is one of the factors that will tell if the subject molds and produces inclusive teachers in the future. The results of the perception of the pre-service teachers in the effectiveness of content are seen in table 4.

As revealed in the table, the topics on understanding the diverse educational needs of students with disabilities and facilitating acceptance and individual differences and friendships are found out to have the highest in ranking. These are supported by the mean value of 3.52 which both achieved a rank of 1.5, which means very effective. In addition, the topic on promoting communication and collaboration to inclusive settings is also a very effective course content in Inclusive Education with 3.51 as its mean, and a corresponding rank of 3.

The top three topics on inclusive education are perceived by the pre- service teachers as very effective and subsequently mean functional to their pre- service career.

*Table 4. Effectiveness of the Subject in Terms of Course Content as Perceived by the Pre-service Teachers*

<i>Course Content</i>	<i>WM</i>	<i>I</i>	<i>Rank</i>
<i>1. Introduction on content, objectives and rationale, structure, and major terms used in Inclusive Education.</i>	<i>3.38</i>	<i>VE</i>	<i>13</i>
<i>2. Benefits, elements, and principles of inclusion on education.</i>	<i>3.39</i>	<i>VE</i>	<i>11.5</i>
<i>3. Moving Policy Forward through developing inclusive education systems, challengers to policy makers, RA 7277, and ten reasons for inclusion.</i>	<i>3.35</i>	<i>VE</i>	<i>14.5</i>
<i>4. Barriers to learning.</i>	<i>3.27</i>	<i>VE</i>	<i>18</i>
<i>5. Responding to diversity through the nine golden rules of inclusion.</i>	<i>3.33</i>	<i>VE</i>	<i>16</i>
<i>6. Assessment in an inclusive classroom, purposes, individuals involved, and the components of a comprehensive assessment.</i>	<i>3.41</i>	<i>VE</i>	<i>9.5</i>
<i>7. Understanding the diverse educational needs of students with disabilities.</i>	<i>3.52</i>	<i>VE</i>	<i>1.5</i>
<i>8. 13 categories of children with special needs (IDEA)</i>	<i>3.39</i>	<i>VE</i>	<i>11.5</i>
<i>9. Factors to consider in determining and understanding the needs of culturally and linguistically diverse students.</i>	<i>3.41</i>	<i>VE</i>	<i>9.5</i>
<i>10. Promoting communication and collaboration.</i>	<i>3.51</i>	<i>VE</i>	<i>3</i>
<i>11. Facilitating acceptance and individual differences and friendships.</i>	<i>3.52</i>	<i>VE</i>	<i>1.5</i>
<i>12. Helping students make transitions to inclusive settings.</i>	<i>3.50</i>	<i>VE</i>	<i>4</i>
<i>13. Adapting large and small group instruction.</i>	<i>3.49</i>	<i>VE</i>	<i>5</i>
<i>14. Modifying instruction for diverse learners.</i>	<i>3.45</i>	<i>VE</i>	<i>7</i>
<i>15. Modifying reading, writing, spelling and handwriting.</i>	<i>3.35</i>	<i>VE</i>	<i>14.5</i>
<i>16. Modifying math, science, and social studies instruction.</i>	<i>3.30</i>	<i>VE</i>	<i>17</i>
<i>17. Modifying classroom behavior and classroom environment.</i>	<i>3.42</i>	<i>VE</i>	<i>8</i>
<i>18. Evaluating progress of students.</i>	<i>3.47</i>	<i>VE</i>	<i>6</i>
<i>Factor Mean</i>	<i>3.41</i>	<i>VE</i>	

Understanding the diverse educational needs of students with disabilities and facilitating acceptance and individual differences and friendships got the highest rank among the other topics in Inclusive Education. This shows that pre- service teachers are considering first what their students' characteristics are. Through knowing their students, teachers would eventually understand each attitude and behavior of their students. Teachers also would be able to use proper or different strategies and techniques to cater to the needs of each student. It would also lead to the acceptance of individual differences. The gap between the teacher- student and student- student would be changed to friendship if they will understand students' uniqueness. Combining these two factors which are the understanding and accepting of student, would promote communication and collaboration which consequently ranked third of the course content. The teaching- learning process would be successful because of exchanging of idea between teacher- student and student- student and vice versa.

An example of the importance of collaboration is about the collaborative problem-solving. According to some researches on collaboration specifically on collaborative problem-solving, students are asked to solve problem-solving whenever a physical, social or instructional exclusion of a student occurs. To create a climate of shared responsibility, students are encouraged to initiate the process themselves. During the session, the teacher leads the students through the steps of a structural process; identifying the issue, discussing all possible solutions, screen solutions, choosing and evaluating solution. Collaborative problem-solving (CPS) is judged to be an effective program to promote inclusion, and easy to implement according to the teaching staff (Salisbury, Evans and Palombaro, 1997), as cited by Meijer (2001).

Results also show that barriers to learning as a course content is very effective with a mean of 3.27 which is the lowest rank among the course content. Also, modifying Math, Science, and Social studies instruction of inclusion is very effective with a mean of 3.30 and a rank of 17. Finally, responding to diversity through the nine golden rules of inclusion is also one of the course contents that is very effective but still in the lower rank. It obtained 3.30 as its mean and has a rank of 16. These are three topics perceived by the pre-service teachers as least in ranking.

Barriers to learning got the lowest rank in the course content of Inclusive Education. This means that there are still difficulties for the pre-service teachers to remove the barriers amidst the challenge of inclusive education. The topic identified four barriers of learning, namely: systematic, societal, pedagogical and medical barriers. These barriers have not been well responded by the subject and that the pre-service teachers did not clearly understand how will these barriers be surpassed. Lack of examples of real scenarios is one of the reasons why this topic was not really perceived as effective relative to the other topics in inclusive education. This is due to the fact that the said topic was discussed in theory, not in practice.

Furthermore, the topic on modifying Math, Science, and Social Studies instruction is also where the pre-service teachers had a hard time in understanding. Pre-service teachers perceived this course content as difficult because of the fact that not all pre-service teachers are interested and are specializing in Math, Science and Social Studies. Other specializations such as Filipino, English, and MAPEH also pose diverse challenges to teachers in instruction and so must be dealt to be modified too. The modification of the instruction in Math, Science, and Social Studies is a topic that is not perceived as fit for all pre-service teachers because of the differences in their specializations.

Auxiliary to the least perceived topics is the topic on responding to diversity through the nine golden rules of inclusion. In the rules of inclusion, it includes how to maintain the integrity of the activity, keeping the goals of the activity/ program when making modifications, challenging all participants and encouraging participants to value differences. Pre-service teachers have that mindset that this course content could be effective in the subject but it is difficult to implement or apply. They would think of an activity that could challenge each individual to participate or collaborate with each other. Activity that would promote valuing differences the students have. To be able to do this, teachers themselves must show to their students that they are accepted and they belong to the learning.

Therefore, the course content on inclusive education subject is very effective with a computed overall mean of 3.41. This means that the subject's topics are indeed essential and functional to the training of pre-service teachers towards inclusion. The course content is

perceived by the pre-service teachers as functional and beneficial to their career. This implies that the course content contained topics that define inclusive education in schools and conveyed the salient concepts that an inclusive educator shall possess in the classroom. Specifically, the topic on acceptance of individual differences and understanding diversity were the top two topics that are effective in instilling inclusive orientation and molding inclusive teachers in the future.

*Course teaching strategies.* The course teaching strategies are also included in the evaluation to see if they're really effective in treating and delivering the course content. There must be parallelism and consistency with the two strands. Table 5 presents the perception of pre-service teachers regarding the effectiveness of the course teaching strategies.

*Table 5. Effectiveness of the Subject in Terms of Course Teaching Strategies as Perceived by the Pre- service teachers*

<b>Course Teaching Strategies</b>	<b>WM</b>	<b>I</b>	<b>Rank</b>
1. Lectures	3.34	VE	9.5
2. Sharing of educational practices	3.51	VE	1
3. Group dynamics	3.49	VE	2
4. Research	3.37	VE	7
5. Lecture and group discussions	3.47	VE	3
6. Film viewing	3.35	VE	8
7. Group report	3.34	VE	9.5
8. Online treasure hunt	3.11	E	12
9. Group presentation of differences in culture and language	3.45	VE	4
10. Simulations	3.43	VE	5
11. Invitation of guest speaker	3.28	VE	11
12. Lecture, discussion and presentation of plans and group demonstration	3.39	VE	6
<b>Overall Mean</b>	<b>3.38</b>	<b>VE</b>	

As gleaned from the table, the pre-service teacher respondents perceived that sharing of educational practices as the most effective teaching strategy in the subject, inclusive education. This is confirmed by the mean of 3.51 and the first in rank which is indicated as very effective. Sharing of educational practices involves every learner in the learning process which students become engaged/ involved in the interaction of one another. Sharing is one of the strategies that place a learner in an educational setting that can be beneficial for increasing their social opportunities. In this strategy student will share what they know and can learn from what had been shared by their co-learners, which this strategy is a two way learning process in which they will gain from each other. For the pre-service teachers, they believe that they learned a lot from sharing because of the nature or the basic framework of the subject, which is to accept differences and respond to diversity. Sharing elicits interactive and collaborative learning from the students and from the instructor. Through mutual sharing, the pre- service teachers' knowledge and experience are indirectly enhanced from the academic interaction.

Furthermore, pre-service teachers also perceived that group dynamics is a very effective teaching strategy as evidenced by the obtained mean of 3.49, ranked at second. Group dynamics is one pedagogical strategy that promotes participation and interaction. It fosters a deeper and more active learning process. Working together in groups also gives students the

opportunity to learn from and teach each other. Classroom research has shown that students often learn better from each other than they do from the teacher (Barkey et al., 2005) as cited by George Mason University (2010). Students in a group are responsible not only for learning material being taught in the class, but also for helping their groupmates learn. Looking back at the result, pre- service teachers tend to learn more through group dynamics because it allows student centred learning and gives autonomy and increased responsibility to the pre-service teachers. Group dynamics is very important in inclusive education because it represents diversity and inclusion in a classroom setting.

Moreover, pre-service teachers also perceived that lecture and group discussions were also very effective with a mean of 3.47 and correspondingly ranked at number 3. Lecture is one tool in teachers' arsenal of teaching methods; it is a key component to higher education. Lecture and group discussions, in which instructors can effectively employ lecturing and promotes student learning in which students use discussion to make connections between ideas and experiences and to reflect on a variety of meanings and interpretations of texts, experiences and phenomena. Lectures may be teacher centred yet the integration of group discussions will make the learning involving of pre-service teachers as active participants in the teaching-learning process. This strategy is parallel to the preceding results that group dynamics, discussions, and sharing of practices share common characteristics that are the involvement of pre- service teachers in the inclusive education teaching. Pre- service teachers perceive balanced learning interaction between the instructor and the students as very effective because of the capacity and power that each of which can offer.

As observed, the sharing of educational practices, group dynamics and lecture and group discussions being the top 3 of the effective teaching strategies in inclusive education promotes active learning in an educational setting. Active learning allows pre-service teachers to talk and listen, read, write and reflect as they approach course content through problem-solving exercises and other activities all of which require pre- service teachers to apply what they are learning (Meyers & Jones, 1993), as mentioned by Johnson (1999). It helps pre-service teachers become active, responsible and caring learners. They learn to interact successfully with each other and to transfer those skills to effective interactions in the society. Borich (1992) conveys that active learning promotes students' attention, increase on-task behaviour, and decrease incidence of negative behaviour (Johnson, 1999). Moreover, Freiberg and Driscoll (1992) relate that students who are actively involved and engaged in lesson learn better and faster than students who are instructionally inactive (Johnson, 1999). This finding only indicates that learner can learn more and prefers an educational setting that promotes an active learning process.

In contrast, the pre-service teachers professed that lectures and group reports as teaching strategies are less effective relative to the top ranking strategies. Both of which obtained a mean of 3.34, and both ranked at 9.5. This means that these two are too traditional for inclusive education which is a current trend. Lectures and group reports monopolize the discussion in a subject that is supposed to be interactive and democratic of sharing and group dynamics. Inclusive education subject doesn't rely on pure lectures and reporting but also authentic practices that will elicit positive perception on inclusion.

Moreover, pre-service teachers also perceived invitation of guest speaker as a less effective teaching strategy as evidenced by the mean of 3.28 and ranked at number 11. Invitation of guest speaker is used to enhance the material a teacher is covering (Mullins, 2001), as mentioned by George Mason University (2010). This strategy can only be used on subject that is only tangentially related to the course. Furthermore, this is not really possible

considering the availability of resource speakers in the country since inclusive education is just a recent development for the Philippines.

Lastly, online treasure hunt achieved the last in ranking of teaching strategies in inclusive education subject with a mean of 3.11 and is interpreted as 'effective' only. Online treasure hunts serve as a great way to hone student web searching ability and problem-solving. It involves providing students with a goal and then having them search the internet to fulfil the goal. Online treasure hunts are easy to create and the resulting interactive searches are both fun and informative for students. This strategy has quickly become one of the most popular tools for teaching students how to access the use the resources and information available on the internet. Although online treasure hunt is the most popular tool for teaching students, pre-service teachers still perceive it as inappropriate for the subject because the subject itself doesn't need online interaction but personal, face-to-face communication. Furthermore, this kind of strategy is only popular to few teachers. Other students do not prefer using online treasure hunt in a learning process because some do not know how to manipulate it and how it works. Others do not how to handle the computer either. Basically, online treasure hunt is not appropriate of inclusive education subject because the subject requires personal attachment and sharing of experiences more than integrating technology as only secondary. Inclusive education subject is not grounded on educational technology but on molding teachers to become accepting and responsive to diversity.

In summary, pre-service teachers perceive that Inclusive Education is very effective in terms of teaching strategies as confirmed by the over-all mean of 3.38. This affirms that the successful implementation of the subject in teacher training depends also largely on the teaching strategies to which the pre-service teachers are exposed with. The quality and the efficacy of the strategy to touch the lives of the pre-service teachers in developing positive attitudes toward inclusion are considered. Generally, those teaching strategies that elicit interaction and collaboration between instructor and students, and students with co-students were perceived to be the most effective strategies. Sharing, group dynamics, lecture and group discussion were all positively perceived by the pre-service teachers as consistent and appropriate in the subject inclusive education. However, pure lecture, group reporting, invitation of guest speaker, and online treasure hunt were gleaned less effective because these strategies initiates monopoly of knowledge without the active participation of the majority of pre-service teachers.

This is supported by Fox and Ysseldyke (1997), who said that the effectiveness of Inclusive Education depends largely on instructional variables; specifically teachers must show instructional flexibility and competence. Inclusive Education entangles fundamental instructional strategies which will cater to the needs of every student and essential considerations that allow teacher to maximize learning outcomes for all students. Inclusive Education teachers have the primary responsibility of providing instruction in classrooms that are characterized by extreme student diversity and in an inclusive setting. Inclusive instruction systematically varies the learning process, product, and content to match the unique learning profiles of individual students. Within an inclusive classroom, differentiated instruction may involve offering several options for what to learn, how to learn, and how to demonstrate learning (Choate, 1997), as quoted from Johnson (1999).

*Effectiveness of the instructor.* The instructor of this subject has a huge responsibility inside and outside the pre-service training because they will serve as models of inclusive practice and possess the transformative learning experiences necessary to challenge the assumptions

underlying teacher education programs. Table 6 presents the perception of the pre- service teachers on the effectiveness of the instructor.

*Table 6. Effectiveness of the Subject in Terms of the Effectiveness of the Instructor as Perceived by the Pre- service Teachers*

<b>Indicators</b>	<b>WM</b>	<b>I</b>	<b>Rank</b>
1. <i>Instructors of this subject practiced the social regard for learning that is they also exemplify equal treatment and good modeling to all kinds of students.</i>	3.54	VE	1
2. <i>The instructors of Educ101 are professionally equipped with the skills and mastery in this subject and are excellent in delivering their content through varied pedagogy and appropriate strategies.</i>	3.44	VE	4.5
3. <i>The instructors of this subject are armored with the fundamental values of character, proper attitude, humor, and values of inclusion inside and outside the four corners of the classroom.</i>	3.46	VE	3
4. <i>The instructors of this course have good classroom management skills and demonstrate gentleness in handling students from different backgrounds.</i>	3.44	VE	4.5
5. <i>The instructor has a good grasp of his subject matter and knows how to deliver it very well.</i>	3.50	VE	2
<b>Overall Mean</b>	<b>3.48</b>	<b>VE</b>	

As examined from this table, pre-service teachers perceive their instructors as role models who are practicing social regard for learning to all students. This is indicated by the weighted mean of 3.54 and is interpreted as very effective at rank 1. The social regard for learning, being the first domain in the National Competency Based Teacher Standards means that the instructors of inclusive education must be models of proper attitude in dealing with inclusion. The pre- service teachers appreciate and model the value of learning through the interactions of the instructors with them. The actions and statements of the instructors reflect an inclusive educator from within. This implies that the pre- service teachers see and appreciate the values of pursuing learning and exerting effort because their instructors demonstrate modeling and encourage positive and powerful learning.

Many researchers highlight the importance of modeling reflective practice to support pre-service teacher learning (Brownell et al., 2005; Hudson-Ross & Graham, 2000) and Sharma (2010) stresses that reflective practice, among other approaches ‘*requires academics to practice what they preach*’ (p. 109).

While there is little literature on this subject, Korthagen et al. (2005) found four forms of modelling: (1) implicit modelling, which seems to have a low impact; (2) explicit modelling; (3) explicit modelling and facilitating the translation into the student teachers’ own practice; (4) connecting exemplary behaviour to theory. Their findings confirm that some teacher educators apparently lack the knowledge and skills needed to use modelling in a productive way, to make their own teaching explicit, and to rethink the connection between their teacher education practices and public theory. They also found that experience as a teacher educator does not necessarily lead to more or better modeling and suggest that teacher educators work together and question each other during lessons and analyze each other’s practice to deepen their knowledge. Pugach and Johnson (2002) say that teacher educators ought to develop

experiences for pre-service teachers that provide them with ways to understand school collaboration as more than simply achieving good communication.

Analyzing further the result, ranked 3 statement says that their instructors are armored with the fundamental values of character, proper attitude, humor, and values of inclusion inside and outside the four corners of the classroom. This obtained a mean of 3.46. Furthermore, ranked at number 2, respondents also see their instructors as having a good grasp of the subject matter and know how to deliver it very well. This is indicated by the weighted mean of 3.50 and is rated as very effective. Pre-service teachers also notice the instructors of the subject as having good classroom management skills and demonstrate gentleness in handling students from different backgrounds. Furthermore, they also perceive their instructors as professionally equipped with the skills and mastery and are excellent in delivering their content through varied pedagogy and appropriate strategies. Both statements obtain a mean of 3.44 and both ranked at 4.5. These results denote that the pre-service teachers perceive their instructors as possessing the affective character of a teacher in teaching the subject and the necessary mastery and theoretical knowledge about the said subject. They exemplify preparedness and transformative instruction such that pre-service teachers value their contribution to the valuing of inclusion they are possessing. Instructors possess positive attitudes and that the students would also result to positive attitudes towards inclusion.

The importance of having positive attitudes toward inclusive education amongst in-service educators has been long recognized. If educators hold positive attitudes towards inclusive education it may allow and encourage practices that will guarantee, to a large extent, successful inclusion of all students (Hobbs & Westling, 1998; Wilczenski, 1992, 1995). Highlighting the need for positive attitudes Murphy (1996) states that if teachers leave from university with negative attitudes then those attitudes are difficult to change. Positive attitudes can be and need to be fostered through both training and positive experiences with students with disabilities (Hobbs & Westling, 1998). Specific studies investigating the concerns of educators and in particular pre-service teachers' concerns about inclusive education and their degree of comfort with persons with disabilities, though, are limited. Yet pre-service training may be the best time to address educators' concerns and possibly modify their negative attitudes about inclusive education as well as toward persons with disabilities.

In relation to varied pedagogy of the instructors, Bondy et al. (2007) stress that teacher educators must employ diverse approaches to learning for their students. As teacher education students ultimately will become teachers of diverse learners, teacher educators must be explicit about this aspect of teaching and learning.

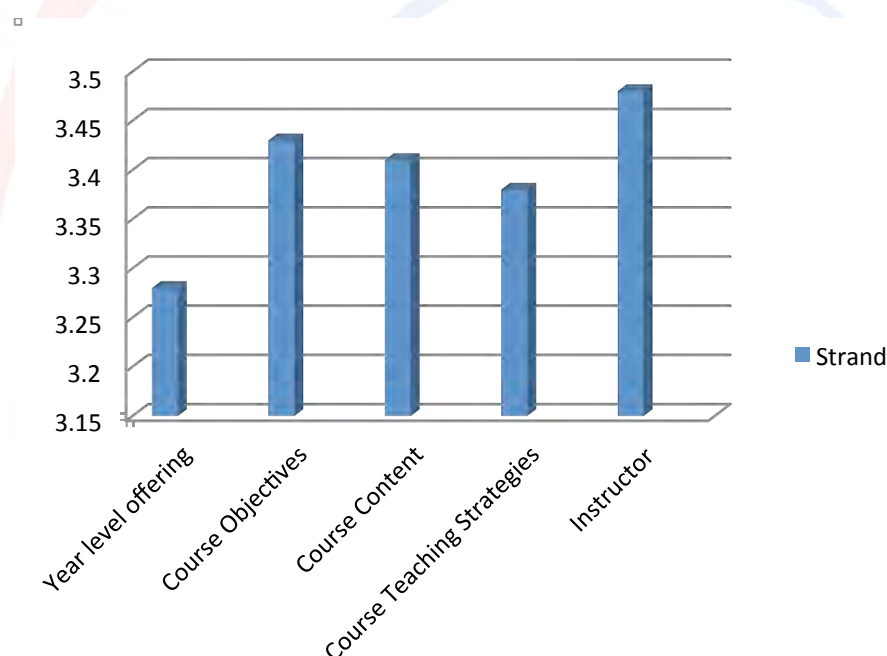

The above findings show that the effectiveness of the instructors can be distinguished in their capability to become role models first before they are able to teach the subject with conviction. Importance of theoretical background comes secondary because of nature of the subject as sensitive to the diversity and needs of the students. Instructors of this subject are expected to teach how to be inclusive and adapt to the approach of inclusive education so above anything else they are expected to be armored with inclusive values and humanness as explained earlier in the results. They are also supposed to be creating a classroom atmosphere that where there is respect, fairness, and equity, so as for the aspiring teachers to be imitating him/ her.

Generally, the pre-service teacher respondents have rated their instructors as very effective in treating and dealing with the subject and to them as well, as supported by the obtained over all mean of 3.48. This means that the instructors of inclusive education are highly equipped

with the necessary values and mastery of content expected of them as the subject instructor. This also correspondingly signifies that the instructors are generally capable in facilitating learning and implementing the approach of inclusive education to the pre- service teachers.

However, the result of this study is negated by Cochran-Smith (2004) who says that many teacher educators have not had the transformative learning experiences necessary to challenge the assumptions underlying teacher education programmes. Merryfield (2000) explained that one of the reasons why teachers are under-prepared for diversity is the lack of knowledge, experience, commitment and understanding of faculty members who teach teachers.

*Summary graph for the effectiveness of the subject.* To further analyze the effectiveness of inclusive education subject as perceived by the pre-service teachers, this graph shows which of the five strands is the most gleaned effective and which is the least perceived effective relative to the scale.

*Figure 1. Effectiveness of the inclusive education subject in terms of the strands identified*

The bar graph presents the summary of effectiveness of inclusive education subject in terms of the five strands identified from the beginning, namely: year level offering, course objectives, course content, course teaching strategies, and lastly the effectiveness of the instructor. These five strands were gleaned ‘very effective’ as interpreted in the over-all mean value of each strand. Among the five strands, the instructor is the most effective having 3.48 weighted mean as perceived by the pre-service teacher respondents of the study. Having 3.43 weighted mean, the course objectives comes next, followed by the course content with a 3.41 over-all weighted mean. Completing the list is the course teaching strategies with a close 3.38 finish, and the least ‘very effective’ strand is the year level offering with a relatively low value of 3.28.

It can be seen that the effectiveness of the instructor in teaching inclusive education subject to pre-service teachers imply that the inclusive education instruction are done by highly

qualified instructors on grounds of their knowledge and experience in terms of the subject matter. This also implies that among the five strands, the instructors' effectiveness produced positive perception, more satisfaction and more favorable impression among the respondents of the study. This can be explained by the fact that these instructors are the first professional education instructors to handle aspiring teachers and that the imitation and modeling became successful.

The course objectives revealed to be the second most very effective strand among the five. This could imply that the pre-service teachers have met and instilled the objectives of the course in their lives and applied it in their practice teaching. The cognitive, affective, psychomotor, NCBTS- based, and 21<sup>st</sup> century skills- based objectives all have the rationale towards the acquisition and learning of inclusive pedagogy in their teaching. Inclusive pedagogy focuses on extending what is ordinarily available as part of the routine of classroom life as a way of responding to differences between learners rather than specifically individualizing for some. It represents a shift in thinking about teaching and learning from that which works for most learners along with something 'different or additional' for those who experience difficulties, to an approach to teaching and learning that involves the creation of a rich learning environment characterized by lessons and learning opportunities that are sufficiently made available to everyone so that all are able to participate in classroom life (Florian, 2010; Florian & Black-Hawkins, 2010; Florian & Kershner, 2009). Therefore, the course objectives have become very effective in meeting such pedagogy.

The third most effective strand as gleaned by the pre-service teacher respondents is the course content and closely tied with the course teaching strategy. These two were perceived positively by the respondents as to their functionality to their theoretical basis of inclusion. Of course, the course content will only be delivered through appropriate course teaching strategy. As a result of this study, the respondents gave primacy to the effectiveness of the instructor and course objectives over the course content and the teaching strategies. This finding could imply that the pre-service teachers gave more remarkable feeling or attachment to their instructor as to how he/she dealt or treated the subject matter with conviction. Furthermore, it could also imply that the course content and strategies were just secondary to the respondents. The teacher educators were used as models of imitation in teaching how to teach. This could be supported by the claim of Korthagen, Loughran, and Lunenberg (2005) that teacher educators not only have the role of supporting student teachers' learning about teaching, but they also model the role of the teacher. They also say that teacher education profession is unique: *'During their teaching, doctors do not serve as role models for the actual practice of the profession i.e. they do not treat their students. Teacher educators, conversely, whether intentionally or not, teach their students as well as teach about teaching'* (p. 588).

Lastly, pre-service teacher respondents have least perceived the effectiveness of the year level offering as found out in the obtained weighted mean of 3.28, relatively lower as compared with its antecedent strands. This means that the respondents generally do not see the year level offering of the subject as neither appropriate nor unfit for the first year level. It was found out that these pre-service teachers reveal that the year level offering does not produce favourable impression among them unlike the top four strands above. This could also imply that the pre-service teachers find it relatively ineffective for them to be taking a subject that concerns inclusion and very sensitive to practice teaching.

## Conclusion

This study has found out that inclusive education subject has left a great impact in affecting the viewpoints and perceptions of pre-service teachers in Saint Louis University- School of Teacher Education. The impact it has made to these teacher candidates is manifested in the response that inclusive education subject is indeed beneficial and contributory to their overall make-up as a teacher to cope with the greater currency and demand occurring upon inclusion worldwide. The respondents have seen the need, importance and functionality of the course in pursuing their aspirations as teachers who are inclusive, sensitive, and accepting of differences and diversity into the so-called classroom of the future. They have understood and instilled the inclusive values of respect, fairness, and equity through the subject and manifested these together with humanness and sociocultural consciousness into their practice teaching or on the job teacher training. The idea of inclusive education subject is basic. It is for the future teachers to become responsive and accepting to diversity in the context of eliminating barriers towards developing positive perceptions, and eventually attitudes toward inclusion. This has been shown by the resulting impact it has created to these pre-service teachers, who are in the field for practice teaching.

Correspondingly, the evaluation of the inclusive education subject in terms of its effectiveness in five strands namely: year level offering, course objectives, course content, course teaching strategies, and effectiveness of the instructor has resulted to 'very effective' interpretation. This implied that the inclusive education subject generally produced a favorable impression to the respondents. The effectiveness of the subject is consistent in the five strands which mean that pre-service teachers have positively gleaned learning and collectively showed satisfaction with the way the subject is taught, delivered, and modeled. It is indeed very effective in instilling inclusive orientation to the pre-service teachers. Specifically, the instructors have shown very effective performance and have marked relatively high rating among the respondents. In contrast, the student teachers did not equally give favorable impression to the year level offering of the subject because of the nature of the subject and the maturity level required of them. Subsequent to the effectiveness of the subject is the challenge and implication that the administrators and teacher educators must develop a more integrated inclusive education framework with improved syllabus on teacher preparation in order to adapt to the test of this dynamic world.

Abstracts

This paper will explore how one newly established English language program is being developed to balance the issues of administrative expectations, and learner population needs and resources within the overall, larger curricular objectives of the institution. In this new and evolving structure, a significant amount of class time was committed to CBI (Content Based Instruction) in student centered group projects using materials (texts) taken from core medical courses. The overall learner response to this new CBI, student centered structure was qualitatively measured using two student-generated essays: a Presentation Reflection and a Personal Assessment. Learners were prompted to respond to questions relating to specific elements of this structure. The responses given in these essays suggests that the use of Medical texts taken from the learners' core curriculum, student centered instruction, and an adapted literature circle framework together created a dynamic component of language learning instruction and contributed to stated, long-term administrative objectives.

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

One of the most important tasks of any instructor/curriculum developer is the need to balance a variety of learning factors, both environmental and demographic, to the service of the specific circumstance of institutional expectations and learner capacities. In a worse case scenario, if there is a combination of seemingly arbitrary academic benchmarks established by administrative bodies without consideration for the overall academic workload or learners' needs, instructors can find themselves squeezed between institutional expectations and the inadequate resources-in both time and proficiency-of learners. There is potential for such a development within highly competitive institutions such as medical universities, where the need to maintain increasingly sophisticated professional skills weighs heavy on both administrators and learners alike.

This study suggests that within an established curriculum an additional L2 requirement can be designed to not only mitigate against learner frustration or 'burn out', but can be supportive of one of the overall academic objectives of the institution; namely, the development of L2 communicative competence both within their peer group and over time in the larger English-speaking professional community.

In 2011, the Nagasaki University School of Medicine began a new English language component to the medical curriculum. This component established two new requirements for all incoming first-year students. All students are now required to take one additional English language course for each year of their first four years of study. These courses are for the medical department only and are credited courses in addition to their other required language courses. Furthermore, incoming students are required to achieve a 750 score on the TOEIC test by the end of their fourth year of study. Those who fail either to gain the additional four credits in English language study, or attain a score of 750 on the TOEIC, will not be allowed to move on to their fifth year of study.

The addition of the Medical English courses and TOEIC requirement were implemented in response to the recognition that in order to communicate with fellow professionals internationally, as well as stay current in international medical research and practical developments, a continuing commitment to the development of overall English language communicative competence must be made. In addition to these requirements, the School of Medicine is also reaching out to other medical institutions internationally and bringing more foreign, English speaking researchers to lecture on campus. In an effort to further promote the use of English at the institute, the newly created Graduate School of Biomedical Sciences offers courses in English including a Masters of Tropical Medicine, a Doctor of Philosophy in Pharmaceutical Sciences, and a Doctor of Philosophy in Clinical Pharmacology.

With administrative benchmarks established, it was necessary to design lessons that take into consideration not only these goals, but also the learners' already busy schedule (see appendix 1) and determine how many hours of study they could reasonably be expected to complete, English proficiency level, and a variety of other factors, in order to maximize the positive impact of the course on the learner population. The two main research questions are:

1. How will a student centered classroom organizational structure incorporating CBI material affect student motivation?

2. What impact will a student centered, task-based approach using CBI within a quasi-literature circle framework have in promoting the department's curricular goals?

#### THE LEARNER POPULATION

The participants were 57 male and female Medical freshmen students divided into three classes. All participants were Japanese Nationals between the age of eighteen and twenty years of age. Each class of 18 to 20 students was then divided into groups of four to five students per group. In addition to the CBI reading circle group tasks discussed in this article, approximately sixty minutes of the ninety-minute class was dedicated to a mixture of instruction in test taking strategies and vocabulary instruction in order to help learners meet the relatively short term TOEIC exam requirement. There was no internationally recognized, standardized test required of the students prior to enrollment.

#### CLASS STRUCTURE

The segment of each class period using CBI was inspired by the idea of literature circles as popularized by educator Harvey Daniels. The structure originated by Daniels (2002) was further adapted to ESL learner needs by David Krise and others at the English Learning Center at Michigan State University, where the concept was first introduced to one of this paper's authors. As in this ESL setting, the system implemented in the Japanese EFL context maintained the use of different roles for each group member. These roles were that of Discussion Director, Passage Picker, Word Finder, Connector, and depending in the size of the group, a Reporter. While this framework of the literature circle as used in an ESL context remains largely intact in this adaptation, there are some significant differences. One important difference is in choice of texts. The texts were not enduring works of literature but rather medical educational materials written in the target language. For this reason, the authors prefer to use the term 'reading circles' to refer to this structure. Each group consisted of four to five learners. In this first attempt of the reading circle structure, learners were told to select a reading from their Human Biology textbook section 'Biology Matters'. These sections of the textbook contain short articles that relate the technical concepts in the book to everyday issues. The readings are divided into four topic areas: Health, Science, Bioethical, and Historical. The choice of readings in these topic areas was left to the group itself. Each group was then given a particular text analysis task to complete and then share with the other members. Reading circles further depart from the more common literature circle structure in that the overall objective of group work was to use these various role assignments together to create a presentation to teach text content to the other member of the course. To facilitate this, an additional role was developed-the Presentation Manager-which would distill and organize the information organized by the other independent role assignments. The Presentation Manager was tasked with incorporating the information accumulated by each member's role in the reading circle and together with the other members, develop an eight to ten minute presentation on the text subject matter. (See appendix 2) Learners were explicitly told that the purpose of their presentation was to 'teach' their fellow students important information from their reading.

These reading circles followed a task-based learning structure. The pre-task part of the lesson consisted of establishing roles and expectations for the task. After expectations are established, learners fulfill their individual roles and group presentation project while the instructor does not directly guide the group's progress.

By not giving explicit guidance to groups, the instructor insures that much of the content and constructed meaning will originate with the learners themselves thus establishing the necessary learner-generated language required of a task structure as defined by Ellis (2006), de la Fuente (2006). The post-task evaluation is given through instructor feedback on group presentations and assessment of L2 usage and group generated materials such as handouts and power points.

Learners had to become familiar with both key terms and communicative strategies through discussion and group work over the course of this assignment. Lee and Munchi (2006) suggest that this recursive use of multiple modal input and required learner output promotes the long-term productivity of target vocabulary in learners. Communicative skills such as speaking and listening were further supported by the recursive nature of this task. Learners had to first read the chosen text, write specific information based on their group role, convey and confirm meaning both in writing and speaking within the group, and then produce written and spoken material for their presentation.

#### USE OF L1

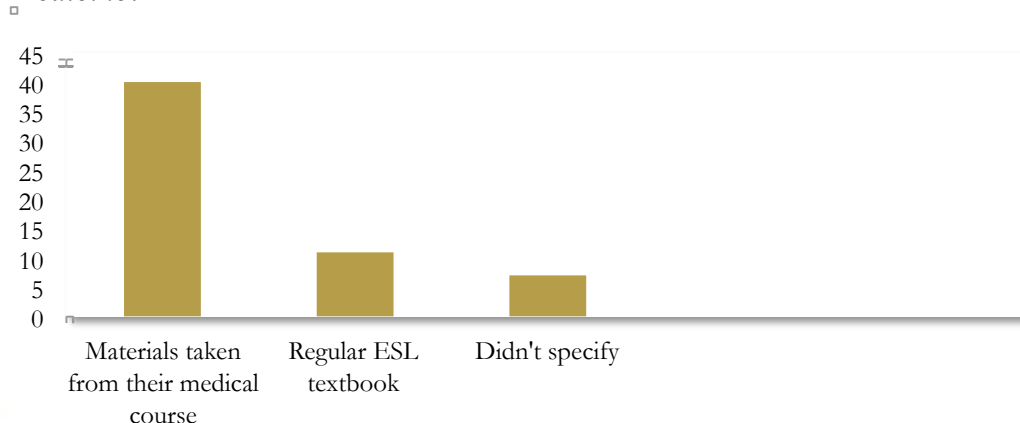

In the instructional handouts the responsibilities of each group member and the responsibility of the entire group to produce a 'teaching' presentation was thoroughly discussed. The use of the L1 was also addressed both in the class syllabus and in the handouts. Learners were told that while the L1 was not forbidden, use of the L1 should be as limited as possible. The exception to exclusive use of the L2 was in circumstances where the L1 supported comprehension of complex ideas or vocabulary, and where the L1 would allow for a more complete understanding of English content in the presentation. While some educators do not allow learners to use the L1 in the L2 classroom, recent research suggests that inclusion of the L1 in the classroom in the form of code switching may not have a negative effect on overall L2 acquisition (Tian & Macaro, 2012). Furthermore, to stigmatize the use of L1 especially in a CBI, EFL environment may serve to diminish the motivation to learn the L2 due to this imposed superficiality. As Levine, (2011, p. 5), states, "For us to deny, in our pedagogy, a role for the cognitively and socially dominate language, is to ignore a large part of the L2 learning process and the individual learner's personal experience." It is perhaps more supportive of the overall medical curricular goals to allow for the L1 in L2 study and recognize that one main goal is effective bilingual communication (Liebscher & Daily-O'Cain, 2005). Given the uniformity of this population's curriculum, culture, and age, it can be argued that these learners constitute a 'community of practice' described in Werner (1998) as stated in Liebscher. & Daily-O'Cain, (2005. P. 236).

#### ASSESSMENT

As part of their final class assignments, learners were given written instructions on what to include in two final essays: a Presentation Reflection and a Personal Assessment. These instructions contained prompts asking the learners to give their opinion on specific aspects of the course.

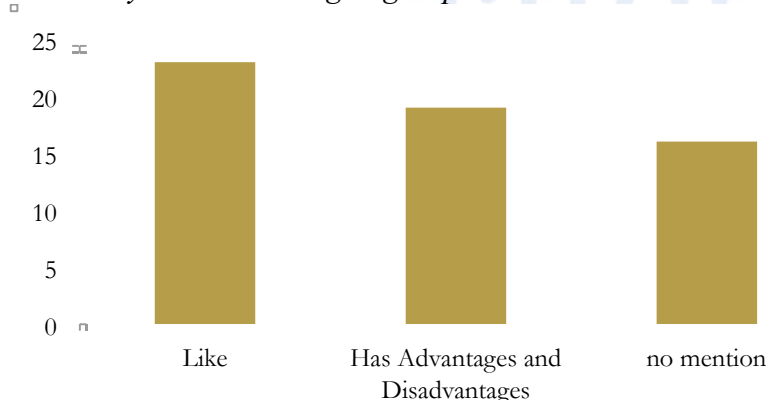

The questions related to the reading circle portion of the course and learner responses are as follows.

*'Would you prefer to have a regular English language textbook in class or would you rather use textbooks and materials taken from your studies at the School of Medicine?'*

A large majority of learners stated that they preferred using CBI materials in the class. The comments made by students who favor content material use consistently stated that it helped them better understand their core medical content. One student's comment, "We are interesting in medicine so we are motivated to learn about it." was indicative of the instructors assumption that intrinsic motivation would be bolstered by CBI in this context.

*'How do you like working in groups in class?'*

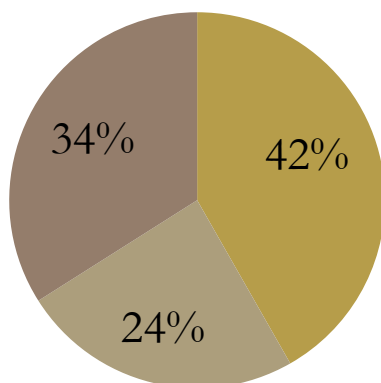

The advantage and disadvantage responders all has the same concern about group work. Many felt that this structure allowed a few students to do more work than others. Some of these students had comments like the following, "I think it is good to do working in groups, but as classes goes on , we come to depend on one person." However the respondents who indicated they favored group work (the 'Like' respondents) often expressed relief that they were able to confirm meaning and practice speaking in smaller groups prior to speaking in front of the class. As one student stated, "If I had to announce my opinions in English for all of the members in the class, I may have hesitated to express in English. However, thanks for the group system, I didn't hesitate in English I feel I can communicate with members in English."

*'How do you feel about being able to use (some) Japanese in your classroom discussions with fellow students?'*

□

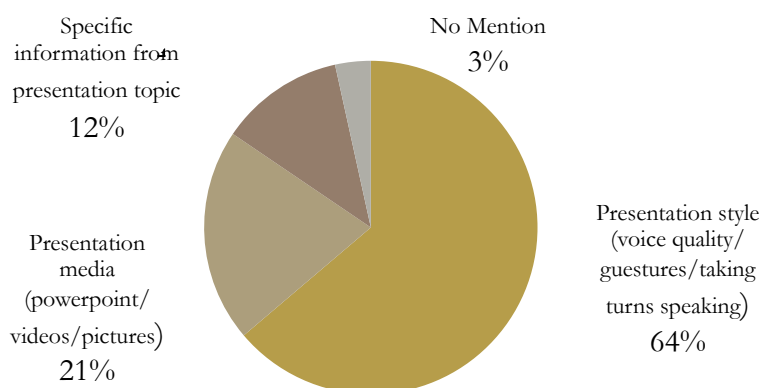

■ Japanese (L1) ok   ■ Some (supporting) L1 use   ■ NO L1

The number of students who felt that the L1 should be forbidden in the class was quite large at 34% of total respondents. This may indicate either confusion with when and how L1 use can help to support understanding of the L2. It may also indicate the desire for greater practice in the L2 in the classroom given the learners' time constraints and the inaccessibility of the L2 in their everyday surroundings. One learner wrote, "Being able to use Japanese in this class is sometimes confident for me , but if we use Japanese too often, we can not evolve our English skill."

A plurality of respondents did however favor at least some L1 use in the classroom. One learner stated, "I think to use some Japanese in classroom is O. K. sure we should use English, but sometimes our English level is not enough to solve a question. If we can use Japanese in classroom, we can deal with such a question." Another wrote, "Using japanese is very important because I can not express details in English. If I have to use only English, I can not ask others and ask very difficult medical things... It is true that if you forbid speaking japanese we speak English, but maybe we seldom talk and we cannot enjoy the class."

*‘What (if anything) did you learn from watching other groups’ presentations? What are some things you observed that you think were excellent?’*

Learners mostly focused on the presentation style and not content. The percentage of learners who stated that they learned specific details from viewing the presentations of others was low. This is to be expected of learners inexperienced with presenting, especially in a target language. The responses further show that many learners focused on qualities of the spoken presentation. In mentioning the importance of speech qualities such as volume and speed, as well as gestures and aspects of L2 pragmatics such as turn taking and body language, indicates that learners are aware of the importance of communicative factors other than simple accuracy.

#### Discussion

The CBI, student centered reading circle component of this course is time consuming to establish, but once the basic roles and responsibilities are understood, learners can effectively direct their own group's understanding and production of the content. The texts being used were concurrently being used in their core medical courses, thus increasing their relevancy to their everyday world and promoting both intrinsic and extrinsic motivation.

The problem of unbalanced sharing of group responsibilities inherent to group work can be mitigate by monitoring activity and changing roles and group members with each new reading. In following years, the goal of the course is to do three presentations for each 15-week semester. In the following year, the instructor will generate a scoring rubric for the presentations and guide learners in developing a learner-generated rubric in order to further draw attention to important aspects of speaking and pragmatics in English presentations.

In future, the inclusion of the CBI component will be limited to a smaller number of learners initially. This is necessitated by the TOEIC requirement and the seeming inability of a large number of learners to make the required score in the time allowed without concerted effort. In other words, greater emphasis on test-taking strategies and specific (TOEIC) vocabulary instruction takes precedence over the CBI component for some low-proficiency learners. Due to the TOEIC requirement, a yet-to-be determined diagnostics test will be used to divide learners according to proficiency level. The CBI/Presentation circle component will be limited to 'safe'

students, meaning those with TOEIC scores of 500 or more in their first year at the medical school.

One unforeseen challenge at the onset of this new Medical English program was what can be called the inertia of the status quo. The medical students are required to take other English classes at the main campus as well as the School of Medicine classes (see appendix 1). Coordinating content with these other instructors has proven difficult. In addition, the medical students are often mixed in with other majors and the class focus is often on conversational English. Attempts will continue to be made to increase the communication and transparency among instructors. Gradually it is hoped that such efforts will create courses that contribute to synergetic instruction rather than courses that compete with each other for learners' valuable outside class time.

### Conclusion

The pedagogical approach guiding classroom instruction was a significant departure from the usual teacher-centered approach dominant in Japanese educational institutions. The first research question asked how student centered classroom organizational structure incorporating CBI material affect student motivation. Learner feedback suggests that Content based materials promote both intrinsic and extrinsic motivation in this population of learners.

Responses concerning the second research question pertaining to goals of the medical department, that being the development of the English communicative proficiency learners will need in communicating with each other and within the larger professional community in English, were inconclusive. This is not surprising given the fact that the entire Medical English program itself is nascent. However the positive responses from learners concerning their ability to construct meaning and produce the L2 independent of explicit instructor modeling suggests that communicative confidence in the L2 was bolstered through this structure. As one student wrote, "I think that a good point in working in groups in class is that it presses for improvement in quality of our speaking and reading English skills. I can boldly speak English now in spite of making a lot of mistakes. The courage is also an English skill which is grown in these classes." The authors believe future research will show that this foundation in independently fostered confidence will support L2 skills development in accordance with administrative goals. Future research to determine if learners are able to increase the amount of specific, content information learned through presentations as both the knowledge of the content, and their communicative skills evolve, is another area of research interest.

In conclusion, it is hoped that this short investigation into the effectiveness of reading circles and CBI in a student centered EFL context will encourage future research in this evolving pedagogical concept.

Abstracts

The role of Text enhancement in second language learning and teaching has received attention in the literature. The present study used a pretest/posttest design to investigate text enhancement's effectiveness in teaching and learning Chinese classifiers. Subjects were six English speaking students in a third semester level of Mandarin, Chinese course at a university in the United States. They were asked to take a picture-cued sentence production test and a grammaticality judgment test after reading the treatment texts. The results showed that the subjects did not do significantly better after the treatment. These findings will be useful for Chinese language teachers who need to decide if text enhancement is effective in teaching Chinese classifiers.

## Introduction

Input enhancement is a technique to draw learners' attention to a second language feature, such as grammar. Text enhancement is a type of input enhancement. It attempts to draw learners' attention to a target language feature in written input. The role of text enhancement in the field of second language acquisition (SLA) has been a topic that has received some attention in the literature. Some scholars have claimed a strong role for text enhancement (e.g. Shook, 1994; Jourdenais, Ota, Boyson, & Doughty, 1995). In this research, it has been found that text enhancement has a positive effect on learners' acquisition of a second language. However, others have claimed that text enhancement does not promote acquisition at all (e.g. Leow, 1997; Izumi, 2002; Wong 2003). In these studies, they found that text enhancement did not have an impact on the knowledge and acquisition of the target forms. The purpose of the present study is to provide additional research on the role of text enhancement, specifically on the acquisition of the Chinese classifiers.

## Background

The importance of the role of input in SLA is not surprising (cf. Krashen 1985). In the recent years, research has focused on how input may facilitate learners' acquisition. One of the principles of input processing VanPatten (1996) proposes is that learners process input first for meaning and content words before grammar. VanPatten further explains that learners process content words before forms; lexical items before grammatical items for meaning; and more meaning morphology before other morphology with less or no communication value. Increasing research has concerned about what type of instruction is effective for learners to notice a target form from the input. Input enhancement, which is any attempt to draw learners' attention to forms, has also received a considerable amount of attention in SLA. Sharwood Smith (1993) states that input enhancement can come in various techniques to highlight language forms. Its purpose is to make language items in the input salient which may have an effect on learners' acquisition of a second language, although without assurance. In line with Sharwood, Wong (2005) emphasizes that the salience of input does not guarantee that input will switch to intake. A body of research, such as Leeman (2003), Fotos (1994), and Trahey & White (1993) investigated different types of input enhancement, including recasts, interactive grammar tasks, and input flood respectively. These studies provide mixed results about different types of input enhancement. Leeman's study revealed that recast and enhanced salience had an effect on the subjects of the study learning Spanish agreement. Fotos' study indicated that interactive grammar tasks did not have any significant gains for the subjects in the study, whereas the subject in Trahey & White's study noticed the English adverb placement with input flood.

Text enhancement, which is a focus on a number of research studies, is another type of input enhancement and is sometimes referred to as typographical input enhancement. Wong (2005) explains that text enhancement is to draw learners' attention on the target language features which they may not notice from written input with meaning connection. A number of studies have been conducted to test the effectiveness of typographical input enhancement and they provide mixed results.

One of the research questions in the study of Shook (1994) was to investigate the effectiveness of textual enhancement by having an experimental group read an enhanced text and a control group read an unenhanced text. The target forms chosen in this study were the present perfect verb tense and the relative pronouns *que/quien(es)*. Subjects were first and second year students of Spanish. They had to do two production and recognition tests on both the target forms. Results indicated that the experimental group performed better than the control group on the assessment tasks. In other words, textual enhancement had a positive impact on the acquisition of the present perfect verb tense and the relative pronouns in Shook's study.

Another study that has found textual enhancement is effective in drawing learners' attention on forms was conducted by Jourdenais et al (1995). The purpose of this study was to identify if typographical input enhancement makes target forms more noticeable and has an impact on learner on-line processing of L2 grammatical features. The targeted forms chosen in the study of Jourdenais et al were preterit and the imperfect forms on Spanish which has communication value. Subjects in this study were native English speakers in a second semester Spanish course. This study also showed that text enhancement has an effect on learners' production of the second language.

Despite that fact that the above studies reported that written input enhancement has a positive impact on learning L2 targeted features, more research has found textual enhancement ineffective in helping learners acquire target language forms. Leow (1997) examined the effects of typographical enhancement and text length on 84 Spanish students of native English speakers. The form chosen in this study was the impersonal imperative Spanish forms of which the subjects had limited knowledge prior to the study. The result showed that written input enhancement had no significant effect on learners' comprehension of the passage and that it did not draw attention to the target forms successfully.

Leow (2001) conducted another study to find out whether using text enhancement would have an effect on noticing the targeted form, the formal imperative command in Spanish. There were 38 participants in the study. They were divided by an experimental group and a control group. Subjects had not had any instruction on the target forms prior to the study. Assessment was in the form of a written production and a recognition tasks. Results showed that there was no significant difference between enhanced and unenhanced groups on noticing the target form.

However, several studies have reported positive effectiveness of text enhancement to draw learners' attention to targeted features in spite of its ineffectiveness in promoting acquisition and production of the features. Alanen (1995) studied the helpfulness of textual enhancement with and without explicit rule instruction on grammatical morphemes in Finnish. In this study, the findings suggested that textual enhancement created a positive impact on the subjects in noticing the targeted forms but failed to facilitate learners' production of the L2. Alanen further stated that giving learners explicit rules of the target forms tended to be more effective than using textual enhancement alone.

White (1998) investigated whether text enhancement promoted the acquisition of possessive determiners of English on French speaking children. Subjects were 84 6<sup>th</sup> grade Francophone Quebecois English as a Second Language learners in a French elementary school. The subjects were divided into three treatment groups. The first group was given passages with textual

enhancement on the possessive determiners plus extensive reading and listening with the target forms; the second group was given the same passages with the enhanced passages only; and the third group was given the unenhanced version of the passages. Subjects were asked to answer questions on possessive determiners related to the story on the assessment task. Results indicated that text enhancement did not have a significant effect on acquisition of the target form. However, the textual enhancement led the subjects use the target form more frequently, although not accurately. In other words, subjects noticed the targeted form in this study.

A more recent study that reports textual enhancement facilitates learners noticing language features is Wong (2003). Wong investigated if typographical enhancement and simplified input had an impact on adult French learners of native English speakers, learning the past participle agreement in relative clauses, which had no communication value, in French. Subjects were divided into four groups. They differed with respect of (+/-) textual enhancement and (+/-) simplified input. All subjects had no formal instruction on the targeted form. They were asked to perform an error correction task in which they had to correct the errors in a text, and to do a free recall task after reading a text. Results revealed that text enhancement did not have an impact on the knowledge and acquisition of the target form, but it helped the learners notice the structure.

Nevertheless, studies have also shown that text enhancement also creates negative effects on students' learning of a second language. For example, Overstreet (1998) identified the effect of text familiarity on the comprehension and production of the students. The subjects were students in the third-semester Spanish at the University of Illinois. All subjects had received some instruction on the difference between the preterit and imperfect before the study. Overstreet reported that there was no positive effect for either text enhancement or content familiarity on production and recognition. However, there was a negative effect on subjects' comprehension of the passages. Overstreet concluded that the text enhancement had taken subjects' attention away from the overall comprehension. Albeit research indicated that text enhancement alone did not promote second language acquisition, text enhancement with a combination of output seems to facilitate language learning process. Izumi (2002) examined whether text enhancement alone has an effect on the acquisition of object-of-preposition type of relative clauses, as well as if output leads learners to reach the acquisition of the target form though attending to the input. There were four experimental groups and a control group in the study. The first group received enhanced input and did not require output; the second group received unenhanced input and output was required; the third group received enhanced input and output was required; and the fourth group received unenhanced input and output was not required. The results revealed that subjects in the output and enhanced input group outperformed in the assessment tasks, and that those received enhanced input only did not do better than subjects received unenhanced input. Izumi concluded that text enhancement had a significant main effect on noticing the target structure but failed to promote acquisition, but output along with text enhancement had a positive effect on learning.

#### Motivation of the study

The following two reasons have led to the motivation of the present study. First, the findings of the previous studies revealed mixed results of text enhancement. Wong (2005) stated that it is not easy to conclude whether text enhancement is effective as an input enhancement technique.

Second, most of the target forms used in the studies conducted on text enhancement were in Spanish, English, and French. No target form of Mandarin, Chinese has been used in any textual enhancement studies yet. VanPatten (2007) points out “the type of linguistic structure used in an instructional treatment might make a difference (p. 173).” Therefore, the purpose of the present study is to provide additional research on the role of text enhancement, specifically on the acquisition of the Chinese classifiers.

### Research Questions

1. Does text enhancement have an effect on learners’ knowledge of Chinese classifiers?
2. Does text enhancement have an effect on learners’ usage of Chinese classifiers?

### Method

#### *Subjects*

Originally, there had been thirteen participants in the study. They were in the third semester level of Mandarin, Chinese course at a University in the United States. However, three participants were in the process of withdrawing from the course due to personal issues, two subjects were non-native English speakers, and two subjects did not show up in one of the tests. Therefore, these subjects were excluded from the final subject pool. Thus, there were six subjects in the present study. All of the participants had two and a half semesters of instruction in Mandarin Chinese and had received some instruction of the target forms prior to the study.

#### *Target form*

The target items chosen in the present study were classifiers of Mandarin, Chinese. A classifier is used whenever counting occurs in the Chinese language. There are about 80 classifiers in the Chinese language, of which seven were selected for this study. These seven targeted classifiers are related to clothing only. Learners had been reported to have difficulty acquiring those classifiers by their instructor. The seven targeted items were: 条(tiáo), 件(jiàn), 套(tào), 双(shuāng), 只(zhī), 副(fù), and 顶(dǐng). The usage of classifiers is “number+ classifier+ item.” Their definitions and examples are described as follows.

1. 条(tiáo) : Classifier for long and thin objects.

一 条                      围巾 [One scarf]

2. 件(jiàn) : Classifier for an item of clothing, luggage, incident, job...etc.

三 件                      衬衫 [Three shirts]

3. 套(tào) : Classifier for a set of books, a suit of clothing, a suite of rooms.

两 套                      西装 [Two suits]

4. 双(shuāng) : Classifier for things in pairs.

四 双                  手套 [Four pairs of gloves]

5. 只(zhī) : Classifier for certain implements or containers.

五 只                  手表 [Five watches]

6. 副(fù) : Classifier for eyewear.

七 副                  眼鏡 [Seven pairs of glasses]

7. 顶(dǐng) : Classifier for hats and caps.

六 顶                  帽子 [Six hats]

### *Materials*

The following materials were used to conduct this study: a pre-test which included 28 sets of pictures with a question sheet, and a grammaticality judgment question sheet. The treatment included two enhanced reading passages, a question and answer sheet for the reading passages. The materials for the posttest were the same as the pre-test but with the questions changed. The vocabulary used in the entire study was words that subjects had previously taught.

### *Treatment texts*

Two passages (see Appendix A) were written for the treatment task. The first passage had about 130 words and contained three classifiers, whereas the second passage had about 120 words and contained four classifiers. Each classifier appeared twice in the passage. The level of difficulty of the passages was similar to what the subjects had been reading in class. The content of the first passage was based on shopping whereas the second passage was about what kinds of clothing items the characters in the story liked. Two question sheets (see Appendix B) with two inferential questions related to each passage were, then, given to the subjects after they finished reading. The purpose of asking subjects to answer some inferential questions was to have them do something with the input (Lee & VanPatten 1995). That is, to keep their focus on meaning. The decision of having subjects answer inferential questions instead of other kinds of comprehension questions was to avoid (1) the subjects producing any pushed output with classifiers, and (2) to avoid providing further input from the questions themselves. The questions were written in English and subjects were allowed to write their answers in English. There was no right or wrong answer for the inferential questions. An example of an inferential question would be,

‘If you had a girlfriend whose shopping habit was like the girl in the story, how would you feel?’

## Assessments

### *Pretest and Posttest*

The selections of the testing measures in the present study were modified based on the two of the written testing measures used in Izumi (2002)'s study. They were picture-cued sentence production test and grammaticality judgment test.

*Picture-cued sentence production test* The purpose of this test was to measure the subjects' usage of Chinese classifiers on clothing before and after the treatment. Subjects were shown 28 sets of pictures of which 14 of them were distractors (see Appendix C). Subjects were given an answer sheet (see Appendix D) and they were asked to write down the difference between the two pictures in each set. The purpose of asking the subjects to compare two pictures was to lead them to use classifiers because the pictures are different in the amount of a particular of item of clothing. For example, picture A had two T-shirts and picture B had four T-shirts of the same kind and color. The only difference between the two pictures was the quantity. The subjects were to write down the difference between these two pictures in a sentence, such as,

A 有 兩 件 T 恤 但 是 B 有 四 件 T 恤 。 Or  
*A you liang jian T xu dan shi B you si jian T xu.* [A has two T-shirts but B has four.]

Subjects were allowed to write down the answer in pinyin (the Romanized pronunciation of Mandarin Chinese) because the purpose of the test was not to test the subjects' knowledge of Chinese characters.

*Grammaticality judgment test* The purpose of this test was to find out the subjects' receptive knowledge or understanding of Chinese classifiers on clothing before and after the treatment. The subjects were given a test sheet (see Appendix E) on which there were 14 questions about classifiers and seven distractors in the multiple choice format. There were three choices for each question. The subjects had to identify which sentence in each question is correct. The questions were written in both Chinese characters and pinyin which was put on top of the Chinese characters. The reason of putting pinyin was the same as the picture-cued sentence production task mentioned above. An example of a question on the grammaticality judgment test would be,

*wo you yi zhi qun zi*

- a. 我有一只裙子。  
[I have a dress] (with the classifier for watches and bracelet.)

*wo you yi ding qun zi*

- b. 我有一頂裙子。  
[I have a dress] (with the classifier for hats.)

*wo you yi tiao qun zi*

- c. 我有一条裙子。  
[I have a dress] (with the classifier for dresses.)

Each correct classifier appeared in two questions because at times one classifier can be used for more than one kind of item for clothing.

The selections of the tests used for the post-test were the same as those used in the pre-test except for the following changes to avoid practice effect.

- A. For the picture-cued sentence production test, the styles of the pictures, the types of some of the clothing items, and the order of the pictures were different. However, because of the limitation of the different types of clothing for each classifiers, and the subjects' limited vocabulary knowledge in the target language, 26 out of 28 items appeared in the pre-test were used again in the post-test (see Appendix F).
- B. For the grammaticality judgment test, the subject and verb choices as well as the order of the questions were different from the pre-test (see Appendix G).

### *Procedure*

A pilot test had been given to an upper level class of Mandarin, Chinese at the same university prior to the pre-test. The purpose of the pilot test was to ensure that the subjects would be able to understand the questions and procedure of the test.

On the day of the pre-test, the instructor explained to the subjects the purpose of the test and provided instruction on how to do the test. Then, the instructor administered the picture test. When all of the subjects indicated that they had finished one set of picture, their instructor moved on to the next set of picture.

During the next class period, the grammaticality judgment test was given to the subjects. The reason of separating the two tests into two class periods was to avoid subjects being too focused on the target forms.

One week after the pre-test, the treatment began. On the day of the treatment, the subjects were given the first passage with enhanced effect. After they finished reading, they were given a question and answer sheet to answer the inferential questions. Then, they were given the second passage with enhanced effect. When they finished reading, they were, then, given another question and answer sheet to answer the inferential questions. The subjects were not allowed to look at the passages in order to answer the questions.

Two days after the treatment, the two tasks of the posttest were given to the subjects. After the production-cued sentence task was completed, the instructor directed the subjects to do some classroom activities before the grammaticality judgment task was given out to avoid the subjects being too focused on the target forms.

### *Scoring*

In the picture-cued sentence production test, only the sentences related to the classifier pictures and the target classifiers were scored. One point was given to each classifier used correctly in each picture, meaning the maximum score that each subject could receive in each set of picture was two. Since there were fourteen pictures related to the targeted items and the rest were disactors, the range of possible scores for this test was 0-28.

In the grammaticality judgment test, only the fourteen questions for the target forms were scored, and one point was given to each correct answer. Therefore, the range of possible scores was 0-14 for the judgment test.

## Result

### *Results of the Knowledge Scores*

Table 1 displays the descriptive statistics for the total test scores on the pretest and the posttest of the grammaticality judgment test. The results of the mean scores indicated that there was no significant difference between the pre-test and posttest. Paired *t*-test was used to calculate the differences between the pretest and posttest. The *t*-value of the grammaticality judgment test was -0.213, whereas  $p = 0.8396$ ; i.e.  $p > .05$ . Therefore, text enhancement did not have a significant effect on learners' knowledge of Chinese classifiers.

-----  
TABLE 1 ABOUT HERE  
-----

### *Results of the Usage Scores*

Table 2 displays the descriptive statistics for the total test scores on the pretest and posttest of the production test. The results of the mean scores indicated that there was no significant difference between the pre-test and posttest. Paired *t*-test was used to calculate the differences between the pretest and posttest. The *t*-value of the picture-cued production test was -0.85, and the  $p = 0.4341$ ; i.e.  $p > .05$ . Therefore, text enhancement did not have a significant effect on learners' usage of Chinese classifiers.

## Discussion

The results reported in the result section are interesting. The findings match some of the previous studies on text enhancement (e.g., White 1998; Wong 2003) in which they also reported that there was no main effect on acquisition of targeted language items with text enhancement in their studies. Three reasons can be explained why text enhancement failed to promote the subjects' knowledge and production of the targeted classifiers in the present study.

First, the subjects in the present study were only exposed to the enhanced text once. They were only given an enhanced passage without any explanation or instruction of the classifiers. One time exposure with text enhancement does not promote acquisition. We cannot test the effectiveness of text enhancement with Chinese learners of English with just one exposure.

Second, there were seven targeted classifiers in the present study which exceeded the number of targeted language items in other previous studies that only focused on one or two grammatical items. One of the principles that Lee and VanPatten (1995) suggested for learners to process targeted language items is to focus on one thing at a time. Subjects in the present study may have been benefited more if they were presented only one classifier in an enhanced text.

Third, based on the previous studies, such as Izumi (2002), text enhancement can only promote noticing but does not guarantee processing. VanPatten (2004) briefly mentioned that text enhancement does not help learners make form-meaning connections. In other words, the subjects in the present study may have noticed the targeted classifiers, but could not process them to make form-meaning connections.

Finally, the small amount of participants may have affected the results on text enhancement. There were only six subjects in this study that cannot provide a strong evidence of text enhancement not being able to increase learners' knowledge and production of Chinese classifiers.

It is worth mentioning that the mean scores of both of the pre and post grammaticality judgment tests, ( $M = 5.5$ ,  $SD = 2.35$ ) and ( $M = 5.833$ ,  $SD = 1.94$ ) respectively, are significantly higher than the mean scores of the pre and post picture-cued sentence production tests ( $M = 1$ ,  $SD = 2.45$ ) and ( $M = 1.833$ ,  $SD = 2.23$ ) respectively. We can conclude that the subjects understood classifiers a lot more than they could produce them.

#### Educational importance of the study

The present study provides an important insight to teaching Chinese as a foreign language. First, there is not a large amount of research done specifically on Chinese as a foreign language. Second, because Chinese has become a fast developing foreign language subject in the field of second language education, thus, there is a great need of research on improving teaching and learning of Chinese. Third, research has shown that it takes U.S. learners longer time to reach a certain proficiency level of Chinese than to achieve the same level in other foreign languages (Omaggio-Hadley, 2001). Therefore, the finding of this study provides information of whether text enhancement is effective in helping learners acquire Chinese classifiers. The results indicated that text enhancement does not show effectiveness with the subjects' learning Chinese classifiers. This result is in line with some of the previous studies. The reasons of the failure of text enhancement in the present study are probably due the following reasons. First, the number of targeted items (seven classifiers total) might have distracted the subjects' attention. Second, it might be due to the fact that text enhancement could help the subjects notice the language items but not process them. In other words, text enhancement in this study failed to promote any acquisition effect. Third, the subjects were only exposed to the enhanced text once that may have made a difference if they were shown the enhanced text multiple times. Fourth, there were only

six subjects in this study that cannot provide a strong evidence of text enhancement not being able to increase learners' knowledge and production of Chinese classifiers.

The above reasons are also the limitations of the present study. Therefore, for future research suggestions, fewer target items need to be focused. Also, subjects need to have more exposure to enhanced texts, and the number of subjects needs to be increased so as to see the effects of text enhancement.

#### Acknowledgments

I would like to express my gratitude and special thanks to Professor Bill VanPatten for providing valuable advice in this study. I would also like to express my thanks to our colleagues, Yan-Yi Chuan and Takashi Izumi who contributed their time and effort in the data collection process.

## Appendixes

### Appendix A

#### Passage 1:

Xiàge xīngqī shì XiǎoNíng de gēge de shēngrì, XiǎoNíng gēn tāde nǚpéngyǒu

下个星期是小宁的哥哥的生日，小宁跟他的女朋友

XiǎoFēi yìqǐ mǎidōngxī. Tā mǎile yí **jiàn** hànshān gěi tāde gēge. Tā yě mǎile

小菲一起去买东西。他买了一件汗衫给他的哥哥。他也买了

yí **tào** xīzhuāng gěi tāde bàba.

一套西装给他的爸爸。

XiǎoFēi hěn xǐhuān piàoliàngde yīfú. Tā mǎile sān **jiàn** chènshāng hé liǎng **tào**

小菲很喜欢漂亮的衣服。她买了三件衬衫和两套

shuìyī. Tā hěn xiǎngmǎi yí **zhī** shǒubiǎo gěi XiǎoNíng, kěshì tā bù xǐhuān. Míngtiān shì

睡衣。她很想买一只手表给小宁，可是他不喜欢。明天是

tāde shēngrì, XiǎoNíng yě xiǎngmǎi yí **zhī** shǒuzhuó gěi XiǎoFēi.

她的生日，小宁也想买一只手镯给小菲。

Passage 2:

XiǎoNíng hé tāde gēge fēicháng xǐhuān màozi hé mòjǐng. XiǎoNíng yǒu

小宁和他的哥哥非常喜欢帽子和墨镜。小宁有

shí **dǐng** Màozi hé shí **fù** mòjǐng. Tā gēge yǒu shíwǔ **dǐng** màozi hé shíbā **fù** mòjǐng.

十**顶**帽子和十**副**墨镜，他哥哥有十五**顶**帽子和十八**副**墨镜。

Tā gēge gèng xǐhuān shǒutào, tā yǒu shíliù **shuāng** shǒutào.

他哥哥更喜欢手套，他有十六**双**手套。

XiǎoFēi fēicháng xǐhuān chúnzi hé xiézi. Tā yǒu èrshí **tiáo** chúnzi hé

小菲非常喜欢裙子和鞋子。她有二十**条**裙子和

sānshí **shuāng** xiézi. XiǎoFēi de jiějie hěn xǐhuān wéijīn he yǎnjìng. Tā yǒu shíbā **tiáo**

三十**双**鞋子。小菲的姐姐很喜欢围巾和眼镜。她有十八**条**

wéijīn, hái yǒu shí **fù** yǎnjìng.

围巾，还有十**副**眼镜。

*Appendix B*

Question sheet 1:

Please answer the following questions based on the passages you have read.  
Please answer the question in English.

Q1: What do you think about the relationship between XiǎoNíng and his brother?

Q2: What do you think about the relationship between XiǎoNíng and his girlfriend, XiǎoFēi?

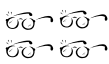

Question sheet 2:

Please answer the following questions based on the passages you have read.  
Please answer the question in English.

Q3: Please compare your own fashion taste with XiǎoNíng and his brother.

Q4: If you had a girlfriend like XiǎoFēi and her sister, how would you feel?

Q28. What is the difference between picture A28 and B28?

Appendix E Grammaticality Judgment Test (Pretest)

For each of the sentence below, find the correct sentence and circle the corresponding letter A, B, or C.

1. Zhè sìjiàn wàitào hěn nánkàn 。

A. 这四件外套很难看。

Zhè sìtiáo wàitào hěn nánkàn 。

B. 这四条外套很难看。

Zhè sìgè wàitào hěn nánkàn 。

C. 这四个外套很难看。

2. Nǐde lùsè shǒutào hěn piàoliàng 。

A. 你的绿色手套很漂亮。

Lùsède shǒutào hěn nǐ piàoliàng 。

B. 绿色的手套很你漂亮。

Hěn lùsè piàoliàng nǐde shǒutào 。

C. 很绿色漂亮你的手套。

3. Zhè wǔtiáo shǒuzhuó tài hǎokàn le 。

A. 这五条手镯很漂亮。

Zhè wǔshuāng shǒuzhuó tài hǎokàn le 。

B. 这五双手镯很漂亮。

Zhè wǔzhī shǒuzhuó tài hǎokàn le 。

C. 这五只手镯很漂亮。

4. Tā yǒu jiǔdǐng shuìyī 。

A. 他有九顶睡衣。

Tā yǒu jiǔtào shuìyī 。

B. 他有九套睡衣。

Tā yǒu jiǔgè shuìyī 。

C. 他有九个睡衣。

5. Wǒ hé hóngchènshān chuāng niúzáikù 。

A. 我和红衬衫穿牛仔裤。

Wǒ chuāng hóngchènshān hé niúzáikù 。

B. 我穿红衬衫和牛仔裤。

Niúzáikù hé hóngchènshān chuāng wǒ 。

C. 牛仔裤和红衬衫穿我。

6. Māma zuì xǐhuān zhè sāndǐng shǒutào 。

A. 媽媽最喜欢这三顶手套。

Māma zuì xǐhuān zhè sāntào shǒutào 。

B. 媽媽最喜欢这三套手套。

Māma zuì xǐhuān zhè sānshuāng shǒutào 。

C. 媽媽最喜欢这三双手套。

7. Bàba zuì ài zhè sìzhī màozi 。

A. 爸爸最愛這四只帽子。

Bàba zuì ài zhè sìdǐng màozi 。

B. 爸爸最愛這四顶帽子。

Bàba zuì ài zhè sìjiàn màozi 。

C. 爸爸最愛這四件帽子。

8. Wǒ mòjìng hēisè yàomǎi 。

A. 我墨镜黑色要买。

Hēisè mòjìng yàomǎi wǒ 。

B. 黑色墨镜要买我。

Wǒ yàomǎi hēisè mòjìng 。

C. 我要买黑色墨镜。

9. Gēge yǒu liǎngtào xīzhuāng 。

A.哥哥有兩套西裝。

Gēge yǒu liǎngge xīzhuāng 。

B.哥哥有兩個西裝。

Gēge yǒu liǎngzhī xīzhuāng 。

C.哥哥有兩只西裝。

10. Tā yǒu sānge hànshān 。

A.她有三個汗衫。

Tā yǒu sānjiàn hànshān 。

B.她有三件汗衫。

Tā yǒu sāntiáo hànshān 。

C.她有三條汗衫。

11. Nǐde zōngsè xīzhuāng bù xǐhuān wǒ 。

A.你的棕色西裝不喜歡我。

Wǒ zōngsè xīzhuāng bù xǐhuān nǐde 。

B.我棕色西裝不喜歡你的。

Wǒ bù xǐhuān nǐde zōngsè xīzhuāng 。

C.我不喜歡你的棕色西裝。

12. Wǒ bù xǐhuān nà yífu yǎngjìng 。

A.我不喜歡那一副眼鏡。

Wǒ bù xǐhuān nà yíjiàn yǎngjìng 。

B.我不喜歡那一件眼鏡。

Wǒ bù xǐhuān nà yíshuāng yǎngjìng 。

C.我不喜歡那一雙眼鏡。

17. Jīntiān huángsè màozi dài wǒ 。

A.今天黃色帽子戴我。

13. Nǐ méiyǒu liǎngfù shǒubiǎo 。

A.我有一副手錶。

Nǐ méiyǒu liǎngzhī shǒubiǎo 。

B.我有一只手錶。

Nǐ méiyǒu liǎngjiàn shǒubiǎo 。

C.我有一件手錶。

14. Nǐ yǒu jīnsè shǒubiǎo mā?

A.你有金色手錶嗎?

Jīnsè shǒubiǎo nǐ yǒu mā?

B.金色手錶有你嗎?

Nǐ shǒubiǎo jīnsè yǒu mā

C.你手錶金色有嗎?

15. Jiějie chuāngle yíshuāng chángkù 。

A.姐姐穿了一雙長褲。

Jiějie chuāngle yítiáo chángkù 。

B.姐姐穿了一條長褲。

Jiějie chuāngle yíge chángkù 。

C.姐姐穿了一個長褲。

16. Nǐ yǒu sānshuāng píxié mā?

A.你有三雙皮鞋嗎?

Nǐ yǒu sāntiáo píxié mā?

B.你有三條皮鞋嗎?

Nǐ yǒu sāntào píxié mā?

C.你有三套皮鞋嗎?

21. Tā yǒu yíding màozi 。

A.他有一頂帽子。

Wǒ dài huángsè màozi jīntiān 。

B. 我戴帽子黄色今天 。

Jīntiān wǒ dài huángsè màozi 。

C. 今天我戴黄色帽子 。

Tā yǒu yíjiàn màozi 。

B. 他有一件帽子 。

Tā yǒu yíge màozi 。

C. 他有一个帽子 。

18. Dàgē māile sījiàn wéijīn 。

A. 妈妈买了七件围巾 。

Dàgē māile sīge wéijīn 。

B. 妈妈买了七个围巾 。

Dàgē māile sītiáo wéijīn 。

C. 妈妈买了七条围巾 。

19. Zhè liǎngtào mòjìng hěn hǎokàn 。

A. 这两套墨镜很好看 。

Zhè liǎngshuāng mòjìng hěn hǎokàn 。

B. 这两双墨镜很好看 。

Zhè liǎngfù mòjìng hěn hǎokàn 。

C. 这两副墨镜很好看 。

20. Māma méiyǒu lánse wéijīn 。

A. 妈妈没有蓝色围巾 。

Māma lánse wéijīn méiyǒu 。

B. 妈妈蓝色围巾没有 。

Lánse wéijīn méiyǒu māma 。

C. 蓝色围巾没有妈妈 。

Appendix G Grammaticality Judgment Test (Posttest)

For each of the sentence below, find the correct sentence and circle the corresponding letter A, B, or C.

1. Nǐ méiyǒu liǎngfù shǒubiǎo 。

A. 我有一副手表。

Nǐ méiyǒu liǎngzhī shǒubiǎo 。

B. 我有一只手表。

Nǐ méiyǒu liǎngjiàn shǒubiǎo 。

C. 我有一件手表。

2. Nǐ yǒu jīnsè shǒubiǎo mā?

A. 你有金色手表吗?

Jīnsè shǒubiǎo nǐ yǒu mā?

B. 金色手表有你吗?

Nǐ shǒubiǎo jīnsè yǒu mā

C. 你手表金色有吗?

3. Jiějie chuāngle yīshuāng chángkù 。

A. 姐姐穿了一双长裤。

Jiějie chuāngle yītiáo chángkù 。

B. 姐姐穿了一条长裤。

Jiějie chuāngle yìge chángkù 。

C. 姐姐穿了一个长裤。

4. Nǐ yǒu sānshuāng píxié mā?

A. 你有三双皮鞋吗?

Nǐ yǒu sāntiáo píxié mā?

B. 你有三条皮鞋吗?

Nǐ yǒu sāntào píxié mā?

C. 你有三套皮鞋吗?

5. Jīntiān huángsè màozi dài wǒ 。

A. 今天黄色帽子戴我。

Wǒ dài huángsè màozi jīntiān 。

B. 我戴帽子黄色今天。

Jīntiān wǒ dài huángsè màozi 。

C. 今天我戴黄色帽子。

6. Bàba zuǐ ài zhè sìzhī màozi 。

A. 爸爸最愛這四只帽子。

Bàba zuǐ ài zhè sìdǐng màozi 。

B. 爸爸最愛這四頂帽子。

Bàba zuǐ ài zhè sìjiàn màozi 。

C. 爸爸最愛這四件帽子。

7. Dàgē mǎile sìjiàn wéijīn 。

A. 大哥买了四件围巾。

Dàgē mǎile sìge wéijīn 。

B. 大哥买了四个围巾。

Dàgē mǎile sìtiáo wéijīn 。

C. 大哥买了四条围巾。

8. Nà yítào mòjìng hěn piàoliàng 。

A. 那一套墨镜很漂亮。

Nà yīshuāng mòjìng hěn piàoliàng 。

B. 那一双墨镜很漂亮。

Nà yífù mòjìng hěn piàoliàng 。

C. 那一副墨镜很漂亮。

9. Māma méiyǒu lán sè wéijīn 。

A. 妈妈没有蓝色围巾。

Māma lán sè wéijīn méiyǒu 。

B. 妈妈蓝色围巾没有。

*Process vs. Product: Does Competition have a place in the Teaching of Art?*

Chor Leng Twardzik Ching

0056

National Institute of Education, Singapore

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This paper details the process of guiding a group of art students in a competition to be chosen as the winning artist to create an iconic sculpture in the National Institute of Education (NIE) for the Inaugural Youth Olympic Games held in Singapore in 2010. From supervising students in the planning stages to the judging of the artworks, I will be examining the artistic process, the role of a teacher, the role of assessment in art, ethics in art, its impact on the teaching of art and the learning of students.

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## **Background**

Most of the students that took part in the competition were youths between 16-21 years old and are pursuing their diploma or degree to be teachers in primary/secondary school. I am their Instructor and an active artist and have taught art at the secondary, college and university level in many different contexts. I currently teach future teachers of art at NIE in Singapore. My job is to facilitate their growth as teachers and also to encourage their passion as young artists so that when they become art teachers themselves they will be able to encourage the artistic passion of their students and understand the value of the arts.

## **Youth Olympic Games: Legacy Artwork Competition**

NIE hosted the inaugural Youth Olympic Games Village (YOGV) 2010 and wanted to commemorate the event with a permanent public sculpture on campus. Unlike other corporations or institutions that would have commissioned an artist to design an artwork, NIE being an educational institution, decided to engage our own students in designing the sculpture. This decision shows the confidence the institution has in its students' and their instructors' abilities. The Visual and Performing Arts academic group was happy to spearhead this project and saw it as a chance to nurture and showcase our students' artistic prowess. It was an opportunity not to be missed and I was put in charge of this project.

It was suggested that we structure the process as a competition because competitions are seen to garner attention from press as well as participants and so would benefit the school with positive publicity. The whole premise of the Olympic Games/Youth Olympic Games is predicated on competitive sports, so making this into a competition didn't seem too far-fetched. There would be 5 consolation prizes and a single grand prize. The grand prizewinner's design would be the YOGV Legacy Sculpture and would be installed in a prominent place on campus.

## **Student as Artist: Classmates as Competitors**

The students were mostly first year students in either the diploma or degree in art education programmes and had foundational art training in drawing and painting. They were given 12 weeks to come up with a proposal, construct a 3 dimensional maquette and mount an exhibition where the judging of their artwork would take place. A project brief was given with details on deadlines, budget, proposal requirements, material requirements, scale, exhibition and the element of competition. I exposed them to examples of artworks that were created for past Olympic games as well as works of other prominent artists who make public art such as Claes Oldenburg, Dale Chihuly, Antony Gormley and Robert Smithson. They were in awe of the scale of public art and the possibility that their own design could be the artwork that would be monumentalized. The briefing got them excited and they realized that being given the opportunity to make public art as a first year student was unprecedented. After the briefing, they were told to do their own research either in the library or the Internet and come up with 1 to 3 ideas for a sculpture.

Out of 23 students only one proposal could be chosen as the YOGV Legacy artwork to be constructed on campus. They were focused and worked hard on developing their ideas. The competition was on.

Image of research process

### Art making Process

In my approach as their teacher, it was not time to pick favorites, it was time to encourage and advise. They kept a sketchbook of all their ideas and I would meet with each individual student and listen intently to each one of their ideas and discuss with them what they feel is their best proposal. I would also guide them if they felt stuck towards research into artists who were looking at the same ideas or working in the same genre. The discussions also covered details such as:

- 1) concept and meaning: the artwork had to represent the Youth Olympic Games
- 2) scale: it should be large enough that it has physical impact yet manageable enough to be built on campus
- 3) medium: it should be made of durable material so it will last as a public sculpture
- 4) budget: both the budget of the maquette and the eventual artwork is considered
- 5) visual impact: the eventual sculpture had to have visual impact as public art in order to be effective

When it came time to make the maquettes, they were given instruction on woodworking, clay molding, wire sculpting, plaster casting and papier mache. They then had to choose which technique they would employ to make their maquette and were given 3 hours every week, over the next 2 months to create them. After the completion of these maquettes the group had to organize all aspects of the exhibition in which their artworks would be judged.

During the next 2 months the sculpture workshop was a frenzied workplace. Although their class was only 3 hours a week, students would spend their free time in the studio casting, cutting, gluing and sanding. There was a helpful and collaborative spirit amongst the students instead of a tense competitive one that might be expected. They were feeding off each other's creative energy and building camaraderie in the process. I was delighted with both their artistic as well as personal progress as budding art teachers.

The best teachers are often the ones who stay passionate in their field. According to Robert L. Fried in *The Passionate Teacher: A Practical Guide*, he argues that when a teacher is passionate whether in their field of specialization, in issues facing the world or children, many difficulties can be overcome constructively.<sup>1</sup> This passion becomes infectious to the students they are teaching and provides students with an opportunity to take ownership of their own learning. The passion of the students was visibly tangible in the studio. My hope is that when they become teachers themselves they will exude the same passion when they are teaching their students.

### **Judging**

As their teacher, I excluded myself as a judge for the competition of their final artworks as I felt that it would compromise the integrity of the competition. I had worked too closely with the students and if I were a judge, I may be biased and pick my favorite student instead of the best proposal. The selected judges were comprised of a physical education professor because the work was based on the Youth Olympic Games, and two art professors for their visual art and aesthetic expertise. The judges were told that the winning proposal would be made into a public sculpture commemorating the YOGV on campus and were not given any other guidelines.

It was interesting to observe the judging after having been the main supervisor of the students and knowing the process of the making of each of the maquettes and how the students' problems were solved. The judges were not looking at the art making process as one of the criteria in the competition. The reasoning behind this stems from the winning artwork needing to be fabricated into an iconic public sculpture representing the Youth Olympic Games and not an artwork identified with the concept of "process" and the individual identity of the artist. Visual impact and appropriate concept would take precedence. My own personal opinion and foreknowledge of these very factors would have prevented me from picking the final winning pieces that were selected as I value the process over the final work or at least in equal weight. These discussions of process versus product are imperative and in retrospect should have been discussed with the judges and others involved in the organization of the competition.

### **Controversy**

When the winner was chosen and announced, it was controversial. The student whose work was chosen as the winning entry was one of my worst students in terms of classroom effort, she was always skipping class, asking her friends to help her make her work and drilling the lecturer for ideas and then using them wholesale. None of this was made known to the judges prior to the judging in an attempt to keep the competition fair. The maquette of her work was presented in a visually current and dazzling way using a projection of an image onto a 3 dimensional surface: a

---

<sup>1</sup> Fried, R. (2001). *The passionate teacher: A practical guide*. Boston: Beacon Press.

decision on her part that won the day. Consequently she also received the assistance of two experienced artists who happened to be in the gallery at the last minute in problem solving the hanging of the audiovisual equipment at the correct angle. The winner/student teacher/artist dropped out of school soon after winning the competition. I have a nagging suspicion that she feels that being a teacher is too much hard work compared to being an artist. After all she did not have to put in too much effort to win this competition. Did winning the competition make her cut short her journey to becoming an art teacher? This question still haunts me to this day.

The Judges' decision created a debate about the difference between judging an artwork for a competition and grading an artwork in class, and the importance of the process over product in artistic learning. As this was also a class project, I would be grading them. I had to reassure the students that the judges' decision would not affect my assessment of their work and the subsequent grading. In other words, the winning artworks would not necessarily be the highest scores in class.

This scenario can be viewed as a lesson on artistic integrity and questions the idea that winners of competitions are necessarily the most hardworking or deserving; it also raises questions about ethics in art education and the arts. What is the difference between assessment criteria in school and the criteria in the art world?

### **Assessment Criteria in class versus Competition Criteria in the Art World**

Being an artist and being an art teacher are very different occupations. Although they are not mutually exclusive, I find that I have to tell students that what you do to achieve good grades in class will not necessarily get you anywhere in the art world. Lets explore the dichotomy.

#### Criteria for an 'A' student in art class – taken from Assessment Criteria in 'O' Level' Art, Singapore

##### Gathering and Investigation of Information (20%)

-their ability to gather extensive information relevant to the chosen theme and show keen observation and astute perception, and creative interpretation. The investigation is recorded in a detailed and comprehensive manner.

##### Exploration and Development of Ideas/Concepts (20%)

- their ability to show accomplished and expressive ideas/concepts in an interpretative manner. Works produced reflect a sustained original effort and show an informed understanding of artists/artworks and meaningful application of knowledge towards the final work.

##### Aesthetic Qualities (20%)

- their ability to show an in-depth understanding of art elements and principles and use this understanding to exploit expressive and representational possibilities effectively.

##### Selection and Control of Materials and Technical Processes (20%)

- a highly sustained and accomplished manipulation of materials and technical processes. Works are experimental and include an understanding of the expressive potential of materials and processes.

#### Personal Response (20%)

- their ability to create works which are highly experimental, engaging and sophisticated.<sup>2</sup>

#### Competition Criteria in the Art World

Ability to engage an audience and hold their attention by whatever means possible. Period.

Case in point - The Turner Prize is an annual prize awarded to a visual artist under the age of 50 who is living, working or born in Britain. It is Britain's most prestigious art prize and arguably one of the most prominent art awards in the world today with the prize money amounting £25,000 for the winner. The prize has propelled the careers of several well-known artists including Damien Hirst, Anish Kapoor and Racheal Whiteread. Artists are chosen based on an exhibition of their work in the preceding year. Although artists working in all media are included, the prize has been noted to favour conceptual art from which most of its controversy derives.

The 2001 Turner Prize winner was Martin Creed. His winning artwork *Work No. 227: the lights going on and off* is a piece where the lights in an empty room turn on and off at five second intervals controlled by an electrical timing switch. When accepting the prize, he was quoted as saying, "I think people can make of it what they like. I don't think it is for me to explain it."<sup>3</sup> Arguably the most famous art prize in the world, Creed's win that year was certainly controversial and garnered both attempts at deep philosophizing and expressions of pure outrage. It did clarify one thing, contemporary art does not conform to most of the criteria used in the education of art.

Elliot Eisner wrote in 1973:

*Critics of art, literature, music, dance, and poetry do not assign painters, writers, composers, dancers and poets behavioral objectives. Yet critics lose no time in evaluating their work. One does not have to have an objective in order to evaluate or appraise the quality of experience or of art. One can and does look backwards, as it were, not to see if artists realized specific objectives that were assigned in advance but rather to determine what they did achieve. Indeed art at its best enables both critics and artists to expand their criteria regarding the nature and quality of art. Some of the greatest art forms man has produced have been iconoclastic. They fit none of the criteria that existed at the time they were created.*<sup>4</sup>

<sup>2</sup> [http://www.seab.gov.sg/oLevel/2013Syllabus/6123\\_2013.pdf](http://www.seab.gov.sg/oLevel/2013Syllabus/6123_2013.pdf)

<sup>3</sup> [news.bbc.co.uk/2/hi/entertainment/1698032.stm](http://news.bbc.co.uk/2/hi/entertainment/1698032.stm)

<sup>4</sup> Eisner, E. (1973). *Do behavioural objectives and accountability have a place in art education?* Art Education, 26 no. 5.

Conceptual Art is an art movement that did not fit any criteria that existed at the time it was created, but has had a lasting influence on contemporary art. It peaked in the 1960's whereby the concept of an artwork takes precedence over its visual or aesthetic concerns. It first gained notoriety for being controversial and for challenging existing assumptions and authorities in art. Conceptual art is an example that clearly illustrates the dichotomy between contemporary art and art in the classroom. And who better to illustrate this than Marcel Duchamp, who some consider to be the father of Conceptual Art.

Duchamp once considered himself a painter. His paintings in the early 20<sup>th</sup> century had been inspired by cubism and futurism. The story goes that he tried to enter one of his paintings *Nude Descending a Staircase, No.2* into an art exhibition and was asked to either change the title or to voluntarily withdraw the work. The reason he was told was that, "*a nude never descends the stairs—a nude reclines*"<sup>5</sup>. Disillusioned, he was said to never paint seriously again, choosing instead to become a chess player. In between his chess games, as it turned out, he made headlines in the art world, not for making 'traditional' paintings but for challenging the existing art world. He set out to question several assumptions, 'What is art?', 'Who has the authority to decide what is art?'. The Society of Independent Artists was having an exhibition and the only criteria for entering work into the show was simply for each artist to pay \$6. He then went about to test this seemingly democratic criteria by entering the infamous 'Fountain', 1917, an overturned urinal, under the pseudonym R. Mutt. As it turns out, 'Fountain' was rejected despite the fact that it had fulfilled the only criteria of the \$6 payment. It created a scandal. Everything else is history.

Another Duchamp artwork, *Sixteen Miles of String* tests the boundaries of control and power. The exhibition 'The First Papers of Surrealism' in 1942 invited Duchamp to be one of the exhibiting artists. He waited for the whole show to finish being installed before he crept into the exhibition site just before the opening and proceeded to haphazardly unravel 16 miles of string in the space as if wrapping up the exhibition like a parcel. The string acted as a barrier and the visitors' viewing of the show in the gallery was compromised. Instead of appearing at the opening, he sent a bunch of children in his place, instructing them to create a ruckus and to tell everyone that Duchamp had sent them. This blatant disregard for authority effectively disoriented the crowd. It draws power from childish pranks and an anarchist spirit and sets the tone for later generations of rebellious art making.

Conceptual Art is controversial mainly because it constantly pushes the boundaries of what art is or can be, causing the mother of all questions in the art world, 'What is Art?' This question is both a form of self-critique and self-renewal and is a double edged sword. On the one hand it devalues what art has been defined as up until its arrival; Piero Manzoni famously canned his own excrement and sold it as art and many years later the cans began to bulge and explode in archival museum storerooms, on the other hand, the question liberates art from what it ought to be, allowing artists to create in a more exploratory way in all genres.

What does all this have to do with assessments in art? Simply put, how would you assess a student's excrement in a can presented to you as their final assignment? Here are several possibilities:

---

<sup>5</sup> Gunnar, Olsson (2007). *Abysmal: A Critique of Cartographic Reason*. University of Chicago. p. 155. ISBN 0-226-62930-9. Retrieved 2 December 2010.

1. "This is not art so it is graded as an 'F'"
2. "It has been done before, this is plagerism, therefore 'F'"
3. "I don't know if this is art so I might as well not teach what I do not know" and start looking for a new job
4. "This is interesting. What boundaries are you pushing? Where will you go from here?"  
Pass the student for handing in the assignment
- 5.

At this point, I need to clarify that I feel issues in contemporary art such as the above mentioned examples should not be avoided, in fact, it should be taught so that students could decide for themselves what kind of artist/ teacher/human being they want to be. My point is that if a student turned up one day deciding to 'challenge the system' as they sometimes do, he/she would be sorely disappointed with their grade. But in the larger context, what is a grade compared to an epiphany of self?

As Richard Hickman has pointed out,

*It is however not the nature of assessment that is the problem, it is the value which is given to it. There is a need to change the 'mindset' with regard to assessment and to demote the status of it, in art and design, this would entail celebrating the essential qualities of aesthetic making and the activities which make art and design teaching worthwhile, including the freedom to fail and the security of knowing that what is personal, idiosyncratic and challenging of convention will not be judged against some remote and impersonal standard of excellence.<sup>6</sup>*

### **Remote and Impersonal standard of excellence**

The students were outraged at who the winner was because to them, it was a *remote and impersonal standard of excellence*. They judged the work based on their personal opinion of who the winner was as a person and not the artwork itself. It was not because the work was weak or unimpressive or unsuitable for the theme but because they knew what kind of student she was. They were her classmates, and noticed that she was often absent without good reason, asking friends to cover for her, asking friends for help with her work constantly giving excuses as to why she cannot be there to set up her work for the exhibition. In other words, they were upset that she of all people was picked as the winner despite her lack of interest in the class, the subject, the project and the work. They felt she did not deserve it because she did not work for it. This I suspect is the reason most conceptual art, including Martin Creed's win is still so controversial. Not because the work is not interesting, challenging or engaging, it's simply because the effort invested did not merit the reward garnered.

Assessment criteria have long been a debate especially in formal Visual Arts education and the tendency is to try to keep up with the times. Tom Hardy argued that assessment criteria for high school students are too rigid and judging an artwork by documentation of process is rewarding the mediocre and does not fully acknowledge the gifted artist who makes art that has the 'Wow'

---

<sup>6</sup> Hickman, R. (2007). (In defence of) whippet-fancying and other vices: Re-evaluating assessment in art and design. In T. Rayment (Ed.), *The problem of assessment: In art & design*. Bristol: Intellect Books.

factor.<sup>7</sup> The problem with assessing art by the ‘Wow’ factor is one of subjectivity, whom does this work ‘Wow’? Is the viewer a white American female or an elderly Asian gentleman? There are definite inherent cultural biases that are not accounted for in the assessment of art assignments. (Atkinson, D. 2011)

Is there a problem with rewarding product over effort? Many people seem to still believe in the product of the artistic genius and that they have the ability to tell the difference between the good and the bad. People are passionate about the art debate because they trust their own taste over everyone else’s. This is only a serious problem if you are a person in power deciding who gets the ‘A’ or who wins the prize. In general, in the world of commerce it is not a problem at all, in fact, it is how consumerist culture works. Messages from advertisers constantly tell us what truth and beauty is until the brainwashing sets in and we all desire the same thing. (Nigel, S. 2005) This is also how the art world works. How did the Mona Lisa become one of the world’s most coveted paintings? Did the world take a vote and decide? Or was it ingenious publicity by the world’s most powerful art museum?

*I love the gallery, the arena of representation. It's a commercial world, and morality is based generally around economics, and that's taking place in the art gallery.*<sup>8</sup>

Jeff Koons is arguably the wealthiest living artist of our time. And if one judged the success of an artist by fame and wealth, he would come up tops. His self-propagated legend is that he started as a young Wall Street trader, and he was extremely talented at making money. He understood what people wanted, and saw an opportunity to make a product that would sell for much more than the sum of its parts, and that product he deduced would be his art. His work range from pornographic sculptures to giant balloon dogs, objects that people covet, objects many would argue, has the ‘Wow’ factor. *Tulips* which was sold for US\$33,682,500 in 2012 is his latest auction world record. Koons has a ‘factory’, much like Andy Warhol’s, staffed by 90 technicians that produce his artworks upon demand. He has been sued several times for copyright infringement over his use of pre-existing images and artworks of other artists in his own works, and has lost.<sup>9</sup>

This plagiaristic behavior would not be condoned in a school setting much less taught. But why not? Koons is one of the most famous and wealthy artists in the world. Do we not want our students to know how he became successful so they can model their careers after him? We would inspire our students with stories about Nobel laureates and how they achieved what they did, so why not inspire them with Koon’s story? Do we not want our students to succeed? This further emphasizes my point about the discrepancy in the art world and that of the education world. In education, we would like to think of ourselves as purveyors of morals but in the art world as Koons suggests, ‘...*morality is based around economics...*’ Perhaps this is a good topic for discussion on plagiarism and morality.

---

## Competition within Education

*Competition - the activity or condition of striving to gain or win something by defeating or establishing superiority over others*<sup>10</sup> is the opposite of cooperation. Alfie Kohn, asserted that competition actually has a negative influence on the achievement levels of students, and that it "turns all of us into losers" (Kohn, A. 1986)

*The real alternative to being Number One is not being Number Two; it is dispensing with rankings altogether*<sup>11</sup>

Competition also implies that there is a definitive goal in mind. In a running race, for example, it would be the finish line. In a quiz, the goal would be to choose the most correct answers. In visual art, as already mentioned, the criteria are at best subjective, which puts the assessor in the position of power. The assessor having inherent biases, determined by factors including cultural background and socio-economic upbringing will try, impossible as it may be, to be objective in their judgment. Competition also denotes that there is a definite 'winner' and several sure 'losers'. Without set criteria, the 'winner' will not know how or why they have succeeded and the 'losers' will not even have had a benchmark to compete against in the first place.

Image of student with his artwork

## Process based Assessment

Assessing student's working processes on the other hand can prove to be more rewarding for the student and the teacher. Charting a student's progress based on their own growth and creative output correlates with the creative arts principle that there are no right or wrong answers. The teacher plays the role of advisor and facilitator in their learning journey, learning and discovering new possibilities along the way together with the student instead of holding to their own 'infallible' tower of knowledge. I believe this second approach is an area that needs to be addressed through further research in the field of arts education. Can process evaluation replace other types of assessment or take up a greater percentage of other types of assessment scores? It would seem a necessary possibility to explore given the significance of process in the development of the last century of art making.

Assessments according to Hickman should be part of the artistic process and serve to, help students to recognize their own achievements, enable reflection, clarify teachers' aims, cover the syllabus, support students' development, document students' progress, and provide criteria to support professional judgements.<sup>12</sup> All of the benefits of the artistic process seemed to be nullified by the judging of the work and the choosing of an ultimate winner. The emphasis on the end product rather than the journey of process discourages creativity and experimentation. (Ross, M. 1986) If teachers teach in order to achieve very specific goals, students in order to please and receive validation will try to conform to the criteria, rules and goals given. Those who do not, are not able to or refuse to conform will be penalized and labeled difficult or unintelligent. As Ken Robinson has aptly put it,

*...if you're not prepared to be wrong, you'll never come up with anything original...And by the time they get to be adults, most kids have lost that capacity. They have become frightened of being wrong.*

*...And the result is that we are educating people out of their creative capacities...I believe this passionately, that we don't grow into creativity, we grow out of it. Or rather we get educated out of it...*<sup>13</sup>

I would therefore argue that competition has no place in the teaching of art because it is based upon establishing ones superiority over others. This quality of "better than" is known to be a factor in dampening creative endeavor. The role of art education should be a sanctified ground where learning through exploration, collaboration, dialogue and encouragement are standard practice. Providing students with the opportunity to experiment and find solutions for their own enquiries creates an atmosphere that allows for the making of mistakes without the fear of being penalized. This fostering of creativity empowers students to be confident in their own voices instead of having to seek constant validation. If and when students do choose to enter into competitions of their own volition, they will understand that it is only one of many avenues and opportunities that they will encounter in their lifelong development and will not feel it is the be all and end all of their career or their art making.

*The Role of Higher Education System in Changing Students' Attitude toward their  
Field Study (Major)*

Shapour Zarifian\*<sup>1</sup>, Aaliyeh Ghassemzad DeJani\*<sup>2</sup>

0438

\*<sup>1</sup>University of Tabriz, Iran, \*<sup>2</sup> Tabriz Medical Science University, Iran

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstract

Many of students that accepted in universities of Iran through entrance examination haven't interested in or positive attitude about their field study, which has essential role in their learning, participation and achievement. This descriptive-correlation research was conducted to determine the role of higher education system in changing attitude of students about their field study in faculty of agriculture. Likert scale in five level used for identifying students' attitude about their majors. Mean rate more than 3 in Likert scale show positive attitude. Sample students selected by stratify random sampling of 11 majors in faculty of agriculture of Tabriz University (n=300). Results showed that: 33% of students have positive attitude to their majors, students' attitude average were 3.35 and seniors' average were a few more than juniors. Senior students' attitude about their major has increased a few during 4 year educating in the university. Females have positive attitude than males. Gender, Field study, Interested in agriculture and live in village, Engineer degree, Place of birth, profitability of scientific agriculture have significant relation with students' attitude to their field study that could create positive attitude in students about agricultural majors.

Keywords: Agricultural field, Attitude, Educational course, Higher Education, Major.

## 1. Introduction

High school graduates in Iran for continuing education in public universities should take part in the entrance examination. Based on rating in entrance exam, about 10 - 15 percent of 1.5 million Participants at the entrance are accepted. Since education is free in public universities, university degree has social reputation in the community and increases the possibility of finding a suitable job, high school graduates according to their rank in the entrance exam, trying to be admitted in one of university courses. They could select about 100 fields, that haven't serious interest to many of them. If, they accepted in certain of these academic fields, certainly won't have sufficient interest and motivation for learning. This caused, lack of student participation in learning process, wasting time, energy and capital of the country.

In these conditions, the system of university education has an important role in creation or strengthening the motivation and positive attitude to academic field. Studies have shown that attitudes have an impact on behavior change and learning and according to them can predict and control behavior (Seif [6], Ajzen and Fishbin [3]). The research showed that students' previous knowledge of field make a positive attitude toward field and this has an impact on their learning and achievement (Abadi and Zamany [1], Dyer and Osborn [4], Chun and Julia [7]). Hedjazi and Omidi [9] and Entwistle [5], showed that one of the factors that impact on student's achievement is their attitude and interest to their field. Zamani and Azadi [2] and Hedjazi et al [8], Believed that the positive attitude to major is causes of success in learning, educational activities and employment. As attitude is a behavioral characteristic that can be changed or strengthened through education. By cognition attitudes of the students in their academic disciplines, we can predict their behavior in school and design appropriate higher educational program for creating a positive attitude and interest to the field. In this research we want to know: If, agricultural higher education system could change or strengthening the attitude and motivation of students toward their majors? Was significant difference between senior and junior students attitude toward their majors?

## 2. Methodology

This survey was descriptive-correlation, applied and attitude- approach research. Research device was a questionnaire with closed answers about properties of agricultural higher education contents, position of agriculture in society. Students' attitude were estimated by answering to closed-ended questions in Likert scale with five levels. Average score of responses was calculated. Average more than 3 was considered as positive attitude towards the major. Statistical population was senior and junior students in 11 department of agricultural faculty of Tabriz University that sample students (n=300) selected by stratify random sampling.

### 2.1. Hypothesis

There are differences between senior and junior students' attitude average. (U-Test)

There are differences between male and female students' attitude average. (U-Test)

There are differences between departments' senior students' attitude average. (Kruskal- Wallis Test)

There are differences between departments junior students' attitude average. (Kruskal- Wallis Test)

Birth place was effect in attitude of students.(U-Test)

## 2.2. Variables

Students' attitude average (ordinal scale) was dependent variable. Gender, place of birth, Department, kind of student (senior or junior), Interest in Rural and Agriculture, Profitability of Scientific Agriculture and Engineering Degree was independent variable. U-test, Kruskal-wallis test and Spearman correlation were used for test the research assumptions by SPSS package. (Table 1)

## 3. Conclusion

Students' diploma grade point average was 17.2 that show they were top grade graduates. Students' interest mean to agriculture were 3.35 and seniors' mean were more than juniors. This means that educational system couldn't change or increase students' interests to agricultural activities in 4 year. 31% of students only for entering to university, selected agricultural majors and don't have any interest or knowledge about agriculture. More than 40% of seniors and juniors selected agricultural majors instead of other majors because of graduate with engineer diploma. 33% of students have positive attitude and recommended to other study agriculture majors. 58% said if participate in entrance exam again, selected other majors. This showed that content of agricultural higher education system couldn't effect to students' attitude and interest to agriculture. Attitude average between senior and juniors were no significant. But average of senior toward their majors were a few more than juniors. Females had positive attitude toward their majors than male and difference between their averages were significant. Attitude average difference between departments' students was significant. Students of Livestock department had positive attitude more than the other students. Machinery department students had positive attitude less than the others. Students, who were born in village, had positive attitude toward their majors than the other and difference between two groups was significant. Based on students opinion, gender ( $r = 0.1$ ), field study ( $r = 0.4$ ), interested in agriculture and live in village ( $r = 0.4$ ), profitability of scientific agriculture ( $r = 0.3$ ), Engineering Degree for graduates ( $r = 0.2$ ) and Place of birth ( $r = 0.3$ ) has significant relation with students' attitude. By the way this variables could create or strengthening the positive attitude of students to their agricultural field.

## 4. Recommendation

As 58% of students intended to change their majors. This result showed that higher education system content couldn't affect the students' attitude and interest during the study. So, governmental universities must review content and structural of agricultural higher education system as soon as possible and match them with students' interest and labor market. Students before selecting university majors, getting to know about properties of majors by mass media programs or in high school work shops. Government and private sector improve agriculture labor market. So, students with interest and hope of future employment try to learn.

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The purposes of this research were (1) to use methods improving students' ethical behavior; and (2) to evaluate the ethical behavior of pharmacy technician students by parents, teachers and students. The data collecting instrument were methods improving students' ethical behavior (parents involved activities, religious activities and classroom activities), a questionnaire and an evaluation form. Data analysis used mean, standard deviation, t-test and content analysis.

The research findings revealed that: 1) The results of using the developed method

showed that encourages families to have a good relationship between parents and students. Religious activities influenced as reminder to students to practise their religion is the right way. Classroom activities affected students to improve their inappropriate behavior and take pride in doing good deeds and; 2) The results of students' behavior showed the increase of some behavior was significant. For example, patience, conservation and saving, responsibility, generosity, punctuality and critical problem solving. Conversely, integrity, politeness, courage, dedication was not significantly.

Key word: Moral Behavior, Pharmacy Technician Students

iafor

The International Academic Forum

[www.iafor.org](http://www.iafor.org)

## **1. Introduction**

All 7 Sirindhorn Colleges of Public Health under Praboromarajchanok Institute are responsible for producing health personnel to work in public health care service system. The pharmacy technicians have technical and supportive tasks for pharmacy. The pharmacy technicians work under direct supervision of a licensed pharmacist, and perform many pharmacy-related functions to meet the needs of the users, society, and community.

The Diploma of Public Health Program (Technical Pharmacy) of Sirindhorn College of Public Health under Praboromarajchanok Institute is currently 2-year curriculum.

Educational institutes in Thailand have realised the importance of providing quality of learning and the promotion of virtue ethics to student to be knowledgeable and a better life in a normal social life as well as to help society. (National Education Act., Thai, 1999)

To accomplish that the development of moral behavior and professional ethics is a crucial subject for the of pharmacy technician students. This is a three credits subject emphasizing on fundamentals of moral and professional ethics, relationship between ethics and role of public health personnel, public health reasoning usage in problem solving and living, moral development for being role model in living and working. Kohlberg (1975) defined moral development as a process which is expected to change according to moral reasoning. According to Kohlberg (1984), each new cognitive structure transforms and displaces the structure that defines the previous stage, causing stages to develop in an invariant developmental manner.

Thai life and culture has been refined from the family and the teachings of religion as a main anchor for the individual to behave in a proper way. Students' ethical behavior development method has to be integrated several organisations such as family, religion and educational (Tidaporn, 2003:46, Suvimon and Noungluck, 2000: 19-21) The ethical development of students' ethical behavior that is useful and important force in developing countries in the future.

## **2. Research Objectives**

- 2.1 To use methods of the moral behavior development of pharmaceutical technique students.
- 2.2 Evaluate the ethical behavior of pharmacy technician students.

## **3. Definitions**

### **3.1 Method of the moral behavior development**

Means that activities were designed to develop the entirely appropriate students' moral behavior combined with activities in family, religious and classroom. The moral behavior of students was at least one semester.

### **3.2 The family activity**

Means that leisure activities of students and also the classroom activities with their parents.

### **3.3 The religious activity**

Means that the daily religious activities and the High Holy Days.

### 3.4 The academy activity

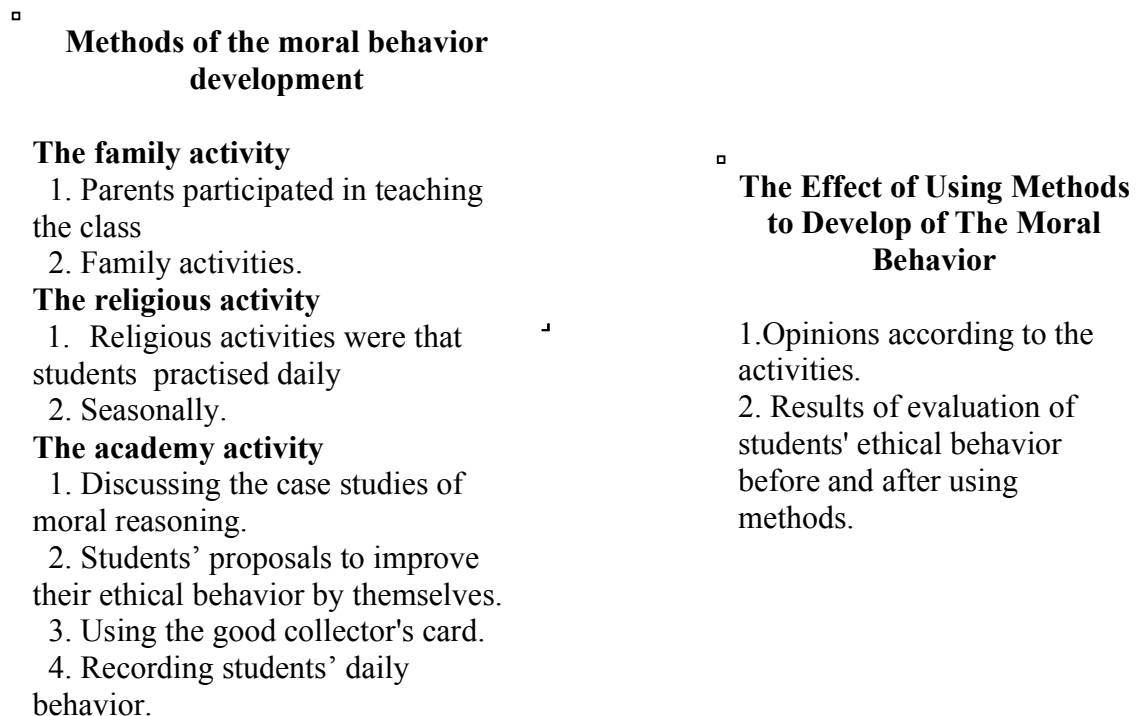

Means that activities for discussing the case of moral study, the proposal of developing ethical behavior, the good collector's card and the student diary.

### 3.5 The moral behavior of students

Means that ten behavior from desirable feature of the pharmacy technician curriculum and the expectations of employer consisted of responsibility, integrity, patience, generosity, conservation and saving, politeness, punctuality, critical problem solving, courage, dedication

## 4. Research Conceptual Framework

The researcher analyzed curriculum of Diploma of Public Health Program (Technical Pharmacy) of 2007, literatures, and related research to establish moral behavior of students. Then, the researcher surveyed the opinions from the related persons. The conceptual framework has been shown as figure 1

**Figure 1:** Research Conceptual Framework

## 5. Research Methodology

### 5.1 Population and Sample:

Parents, teachers and students of Sirindhorn Colleges of Public Health, Yala, Thailand

### 5.2 Research method was as follows:

The research was divided into two phases;

**5.2.1 Phase I :** applying the development of moral behavior to the students of pharmacy technicians about five months

- 1) Study related documents.
- 2) Coordinate and clarify the activities to the parents.

- 3) Clarify the activities of teachers.
- 4) Inform the student activity and behavior.
- 5) Follow-up student activities.

**5.2.2 Phase II :** evaluating the students' behavior by parents, teachers and students.

### **5.3 Research Instrument:**

**5.3.1 Method of the moral behavior development:** consisted of activities three domains

**1) The family activities;** parents participated in teaching the class and family activities.

1.1) Parents participated in the class for teaching for three times per semester. They shared their belief with students how to dribble, work experience, occupation, etc.

1.2) Parents and students had participated in some family activities at least once a week. Most students helped their parents do the housework.

**2) The religious activities;** religious activities were that students practised daily and seasonally.

2.1) Religious activities were that students practised daily; prayer and chanting monks.

2.2) Seasonally religious activities, particularly, fasting during the month "Ramadan" and activities of the Hari Raya day that Islam students joined. For Buddhist students did the merit activities on the day of the tenth month.

After religious activities finished, the students' perceptive reflection of these activities and the use of collaborative learning in classroom were reflected.

**3) The academy activities;** classroom activities consisted of moral case studies, merit collection card and behavior diary. All events demonstrated that the reflection of outcome from students and teachers. This consisted of the following activities.

3.1) Discussing the case studies of moral reasoning. These studies were eight cases to practice students' ethical reason for solving general problems.

3.2) Students' proposals to improve their ethical behavior by themselves. For example, the development of voluntary generosity to help others, responsibility, punctuality, and conservation and savings.

3.3) Using the good collector's card.

Teachers would assess students' behavior and give student the card when he/she expressed the proper moral behavior. In addition, the students' ethical behavior was focus on responsibility, integrity, generosity, punctuality. Moreover, it would depend on the discretion of the instructor.

3.4) Recording students' daily behavior that showed the following issues:

3.4.1) Their impressed behavior or the weak points to be improved.

3.4.2) The reason for such behavior.

3.4.3) The outcome of that behavior.

The students recorded their daily behavior at least once a week and the teachers reflected their behavior by comments.

**5.3.2 The questionnaire of the students' opinions** towards activities used to develop students' ethical behavior was a 5-rating scale

Section 1: Individual information

Section 2: Opinions regarding activities to develop students' ethical behavior

Section 3: Recommendation with open-ended questions

The rating scales were rated with the score as follow as:

1 = Lowest

- 2 = Low
- 3 = Medium
- 4 = High
- 5 = Highest

The criteria was interpreted as follows: Mean between

- 1.00-1.50 = Lowest
- 1.51-2.50 = Low
- 2.51-3.50 = Medium
- 3.51-4.50 = High
- 4.51-5.00 = Highest

### 5.3.3 The evaluating form of ethical behavior of students.

The questionnaire used to assess the results of students' ethical behavior after finishing all activities by rubric scoring form were created by researcher and validated by a panel of three people and make the modifications suggested before using it.

### 5.4 Data collection:

For data collecting, there were two parts consisted of students' opinions towards all activities that collected by questionnaire when all activities finished and rubric scoring assessment of individual student behavior that used to evaluate before and after all approaches.

### 5.5 Data analysis:

5.5.1 Quantitative data was analyzed and presented as percentage, frequency, mean, standard deviation and pair t-test

5.5.2 Qualitative data was analyzed by using content analysis.

## 6. Results

### 6.1 The activities to develop students' ethical behavior.

**Table 1** Means of samples' opinions according to the activities.  
(Top three average scores of each activity part)

Item	Mean	S.D.	Level
<b>The family activities</b>			
To promote good relationships between parents and students	4.68	.48	Highest
Parents contribute to the development of students' ethical behavior	4.54	.51	Highest
Encourage students to make good	4.46	.51	High
<b>The academy activities</b>			
Moral behavior development projects contribute to ethical development of students	4.68	.51	Highest
Recorded daily behavior can help improve students' inappropriate behavior	4.44	.62	High
The case study allows students to solve problems by reasoning	4.29	.71	High

**Table 2** The daily record of student behavior. (Top three percentage of the behaviors)

Recorded daily behavior	The reason for such behavior.	The outcome of that behavior.
<b>Behavior to impress (75%)</b>		
1. Completely work assignments (14.9%)	A role that needs to be done	Work is completed on time.
2. Help others and help their parents to work (13.4%)	To lighten the burden on parents	Good relationships within the family.
3. Religious rites (11.8%)	Important to follow the religion	Feel good
<b>Behaviors that need to be improved</b>		
1. Not punctual and Go to class late (14.6%)	- No plan - Going to bed late.	Loss quality of their work.
2. Irresponsible (13.4%)	Lack of preparation	Others are not convinced
3. Dispute with someone without a reason (13.4%)	Can not control emotions	Make others people sad.

**Table 3** Satisfaction of students and teachers to use the good collector's card.  
(Top three average scores)

Item	Mean	S.D.	Level
Regarded as a good student.	4.64	.52	Highest
Encourage students to take pride in doing good deeds.	4.42	.59	High
Encourage students to make good.	4.36	.62	High

Table 1-3 showed the topics with the highest level were family activities to promote good relationships between parents and students ( $\bar{x} = 4.68$ ) and moral behavior development projects contribute to ethical development of students ( $\bar{x} = 4.68$ ). For student dairy to record their daily behavior showed that most impressing behavior is recorded 75.5 percent were completely work assignments, help others and help their parents to work, and behaviors that need to improve (24.5 percent were not punctual, and irresponsible, dispute with someone without a reason). Students were improved bad behavior after review their record daily behaviors. Teachers and students were satisfied with the loyalty to the highest level regarding as a good student and encourage students to take pride in doing good deeds.

## 6.2 Evaluating the students' behavior

**Table 5** Evaluation of students' ethical behavior by all parties before and after using methods to develop of the moral behavior.

Item	Pre	Post	Sig.
Responsibility	3.41	3.95	.025*
Integrity	4.10	4.34	.172
Patience	3.42	4.39	.001**
Generosity	3.97	4.46	.036*
Conservation and savings	3.10	3.84	.008*
Politeness	4.02	4.39	.088

Punctuality	3.15	3.75	.014*
Critical problem solving	3.27	3.89	.010*
Courage	3.42	3.89	.065
Dedication	3.64	3.90	.191

\*P< .05, \*\* P< .01

Table 5 the evaluation of students' ethical behavior showed the increase of some behavior was significant. For example, patience, conservation and saving, responsibility, generosity, punctuality and critical problem solving. Conversely, integrity, politeness, courage, dedication was not significantly.

## 7. Conclusions and Discussions

There were three domains applying in the methods to develop students' moral behavior. First, parents involved activities. Second, religious activities. Third, classroom activities. The findings in the activities which develop students' ethical behavior revealed that: The topics with the highest level were family activities promoting good relationships between parents and students ( $\bar{x} = 4.68$ ) and the moral behavior development projects conducted by the students ( $\bar{x} = 4.68$ ). For the students' diaries recorded their daily behavior revealed that the impressive behaviors (75.5 percent) were getting their assignments done perfectly, helping others and their parents to work, and the behaviors that need to be improved (24.5 percent) were tardiness, irresponsibility, dispute with someone without proper reason. Students improved their bad behavior after reviewing their recorded dialy behaviors. Both teachers and students were satisfied with the merit collector's card to the highest level regarding as a good student and encourage students in doing good deeds. The findings of using the method to develop the students' moral behavior showed that the students' behaviors which significantly developed were patience, conservation and saving, responsibility, generosity, punctuality and critical problem solving. But integrity, politeness, courage, dedication were not significantly developed.

Students' ethical behavior development method has to be integrated several organisations such as family, religion and educational institute. The result of combination would be successful if the complementary activities offered to students for long time, so students may change their opinions and behavior more permanent than short period.

The reason why students thought their ethical proposals might develop their behavior is that students had authority to choose what ethical behavior they would like to improve and design the activities by themselves. As a result, the activities can promote students to learn their needs and understand their soul. In addition, the activities can provide the chances for students learning how to work as teams. They can share ideas and exchange in the suitable way that based on the difference of view points. Moreover, this can improve their both good leadership and followership; also train them a systematic working with critical thinking. Furthermore, the activities can make students relax from stress of study.

Most students and teachers felt satisfied with the good collector's card at the highest level because they believed that this method can encourage student do merit and also make them proud of the actions, so they may attend to do the merit actions again. Student supporting not only use the good collector's card, but also offer them a merit certificate, presents and announcing the actions to colleagues.

The good way for student self-assessment in terms of ethical behavior is the dairy record. Student can learn their strength and weakness point by their evaluation and teachers' comments. They knew what a good or bad behavior was and how to continually progress their behavior to peacefully adjust their life at the social nowadays.

The view points of parents, teachers and students towards students' ethical behavior particular of patient, saving, responsibility, generosity, punctuality and critical problem solving showed the increase of some behavior was significant. This maybe because the projects that students manage by themselves can improve their ethical behavior in their quality process (plan, do and check) in terms of ethical and academic aspects. Consequently, this process can promote students in a good way of patient, saving, responsibility, generosity, punctuality and critical problem solving. In terms of the using reason into solving problems, there were many activities that support students to have critical thinking and apply in their life style such as case studies and dairy. For patient attribute, not only classroom activity can offer patient feature for students, but fasting during the month "Ramadan" can challenge students to be more patient.

The behavior of integrity, courteousness of students was not increased significantly because the results of assessors' evaluation for students before and after were the same high level of behavior that was an appropriate behavior.

Student behavior of courage and dedication was not different significantly between before and after using the method to improve ethical behavior of students. This maybe the aims of activities were not clearly supported the ethical behavior, but courage and dedication behavior was often integrated into almost all activities, as the result, the next study should indicate clearly the aims and guidelines in order to develop students' behavior obviously.

## **8. Recommendations**

### **8.1 Recommendation for further use.**

Other curriculums in the college could apply these following activities to develop the students moral behavior considering real situation, timing, and geographic location.

### **8.2 Recommendation for further studies.**

8.2.1 The next study should monitor the students' behavior for long term

8.2.2 Educational institute and family should collaborate together to set out how to develop students' ethical behavior and continually participate the activities.

Queensland University of Technology, Australia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

In a study aimed at better understanding how students adapt to new blended studio learning environments, all undergraduate and masters of architecture students at a large school of architecture in Australia, learned a semester of architectural design in newly renovated, technology embedded, design studio environments. The renovations addressed the lessons learned from a 2011 pilot study of a second year architectural design studio learned in a high technology embedded prototype digital laboratory. The new design studios were purpose designed for the architecture students and adapted Student-Centred Active Learning Environment for Undergraduate Programs design principles.

At the end of the semester, the students completed a questionnaire about their experiences of learning in the new design studio environments. Using a dual method qualitative approach, the questionnaire data were coded and extrapolated using both thematic analysis and grounded theory methodology. The results from these two approaches were compared, contrasted and finally merged, to reveal five distinct emerging themes, which were instrumental in offering resistance or influencing adaptation to, the new blended studio learning environments.

This paper reports on the study, discusses the major contributors to resistance and adaptation, and proposes points for consideration when renovating or designing new blended studio learning environments. This research extends the 2011 pilot study by the same authors: 'Dichotomy in the design studio: Adapting to new blended learning environments'.

## Abstract

In a study aimed at better understanding how students adapt to new blended studio learning environments, all undergraduate and masters of architecture students at a large school of architecture in Australia, learned a semester of architectural design in newly renovated, technology embedded, design studio environments. The renovations addressed the lessons learned from a 2011 pilot study of a second year architectural design studio learned in a high technology embedded prototype digital laboratory. The new design studios were purpose designed for the architecture students and adapted Student-Centred Active Learning Environment for Undergraduate Programs design principles.

At the end of the semester, the students completed a questionnaire about their experiences of learning in the new design studio environments. Using a dual method qualitative approach, the questionnaire data were coded and extrapolated using both thematic analysis and grounded theory methodology. The results from these two approaches were compared, contrasted and finally merged, to reveal five distinct emerging themes, which were instrumental in offering resistance or influencing adaptation to, the new blended studio learning environments.

This paper reports on the study, discusses the major contributors to resistance and adaptation, and proposes points for consideration when renovating or designing new blended studio learning environments. This research extends the 2011 pilot study by the same authors: 'Dichotomy in the design studio: Adapting to new blended learning environments'.

**Keywords:** *Architectural education, blended studio learning environments, adaptation*

## 1 INTRODUCTION

Diversification and expansion of global higher education in the 21st century, has resulted in learning landscapes for architectural education that can no longer be sustained by the traditional model. Recent modifications have resulted in learning landscapes that cannot be defined by a solitary model. Changes have resulted because of surging student numbers, extensions to traditional curricula, unconventional/new teaching and learning practice and modified geographical and pedagogical boundaries (Neary et al., 2010).

The influx of available new technology has helped to democratise knowledge, transforming when, where and how learning takes place, and changing perceptions of traditional learning landscapes (JISC, 2006; Neary et al., 2010). Mobile computers combined with wireless technology, have completely transformed the educational world; students have turned nomad[ic], engaging in conversations and thinking across traditional campus spaces (Alexander, 2004; Fisher, 2005b). Corporate clients and industry benefactors now share the campus with full-fee paying local students, international students and postgraduate students, in an environment that has grown to be a lot more commercially orientated (McLaughlin & Mills, 2008). Growing pressure to provide flexible learning strategies whilst also providing quality research and superior teaching, has accompanied these changes. In many of Australia's larger universities, the acquisition of research funding and publication output is considered to be the major priority, leaving academics with reduced time to focus on developing innovative learning curricula, which respond to these contextual changes.

Core research in this field is emerging from the UK and the USA, however little research has explored this in depth within an Australian context, and more specifically, within a defined individual academic discipline. While facing comparable changes and pressures, architecture continues to be taught in similar environments, using similar pedagogical approaches, to those first developed when it moved from an apprenticeship model to national higher education system's in the early nineteenth century at the École des Beaux Arts (Kostof, 1977).

The purpose of this paper is to investigate how architecture students adapt to new blended studio learning environments, and how these, in turn, could be designed or renovated, considering some of these external contextual issues. Active architectural learning environments generally support dynamic project based and collaborative learning models, which have recently become a lot more common in disciplines outside of design and the arts. It is anticipated that the implications for this study, therefore, may well have a positive impact beyond the architectural studio learning environment.

## 2 REVIEW OF BACKGROUND LITERATURE

### 2.1 Space

Research shows that 50% of commencing students consider the facilities and appearance of buildings on campus, when deciding which university to enroll in (McLaughlin & Mills, 2008). Winston Churchill's observation during the debate on rebuilding the House of Commons after the war applies to university buildings as well: "We shape our buildings and afterwards our buildings shape us" (Churchill, 1943). Physical learning environments are, therefore, still important to students.

The most successful new university buildings are those that allow students to take responsibility for managing and supervising their own learning environments; and in addition to this, where they can help to reinforce the learning of their peers (Neary et al., 2010). These environments should be flexible, technologically rich, open 24/7 and with a sufficient occupation capacity to allow different disciplines to connect - in essence, a fusion between a library and a common

room. A modified spatial arrangement can assist to break down the pedagogical barriers which exist between students and teachers, and allows students to immerse themselves within their academic environment, rather than only being consumers of dispensed knowledge (JISC, 2006; Neary et al., 2010).

Further investigations into the methods through which research or critical-thinking by students and teachers can help to shape the physical environment, needs to be undertaken (Fisher, 2005b). When questioned on how buildings/spaces should be realised, Neary references Virginia Woolf's 1938 book 'Three Guineas,' on how to build a university on a very tight budget. Woolf, a feminist and pacifist, believed that buildings needed to be freed from the traditions of competition and acquisition, which she believed to dominate research and teaching; and she believed that the design of institutional buildings should go back to basics. She asserts:

It is young and poor; let it therefore take advantage of those qualities and be founded on poverty and youth. Obviously, then, it must be an experimental college, an adventurous college. Let it be built on lines of its own. It must be built not of carved stone and stained glass, but of some cheap, easily combustible material which does not hoard dust and perpetrate traditions. Do not have chapels. Do not have museums and libraries with chained books and first editions under glass cases. Let the pictures and the books be new and always changing. Let it be decorated afresh by each generation with their own hands cheaply (Woolf, 2008, para. 46).

As Woolf proposes, new, innovative and academically challenging environments can be designed in a spirit of poverty (Woolf, 2008). Unfortunately many of the issues that Woolf detailed in 1938 are still not resolved today, over 70 years later.

## 2.2 Pedagogy: Active Learning

Research systematically shows us that traditional lecture methods, where lecturers stand at the front of the classroom and talk while students are expected to sit quietly and listen, continue to dominate higher education classrooms (Barr & Tagg, 1995; Bonwell & Eison, 1991; Jamieson, Fisher, Gilding, Taylor & Trevitt, 2000). This is notwithstanding an abundance of evidence in research which points to the success of, and student's preference to engage in, active learning approaches. Active learning simply requires students to be actively involved in their learning while engaging in higher-order thinking tasks such as analysis, synthesis, and evaluation. Bonwell and Eison argue that in order to promote successful active learning, instructional activities must be aligned to support students to learn through doing [or observing], followed by thinking about what they are doing [or observing] through dialogue with self or others (1991). Dale argues that when actively learning, students generally remember 90% of what they do and 70% of what they say and write, but conversely when passively learning, student only remember 30% of what they see, 20% of what they hear and 10% of what they read (1969).

In most Australian universities, traditional face-to-face teaching takes place in large, tiered lecture theatres, generic flat-roomed tutorial rooms and in some specialised discipline specific classrooms or laboratories. The size, form, technology and furniture within these spaces tends to dictate limited pedagogical approaches which can be applied within them (Jamieson et al., 2000). These environments are generally designed to support traditional Mode 1 teacher-focused presentations, making active learning experimentations difficult to both achieve and sustain. The learning environment plays a very important role in supporting the pedagogical activities contained within it.

In order to be effective, teachers of today need to consider both methodology and context. Firstly methodology; Teachers have to learn to communicate in the language and style of their students, less step-by-step, but going faster, more in parallel and with more random access (Prensky, 2001). Secondly content: This should ideally be a fusion of legacy content [traditional

curriculum] and future content [digital and technological] (Prensky, 2001). Teaching both legacy and future content in the language of digital natives, requires a complete overhaul of traditional teaching approach and curriculum content.

### 2.3 Pedagogy: Blended Learning

Considering the emerging phenomena of interactive web 2.0 tools and on-line social media now available, Behling and Klingner (2010) seek to understand which of these tools could be successfully incorporated into the classroom, and what this technology will allow educators and students to achieve in the future. They explore the pedagogical approaches that support the blending of new technologies with traditional face-to-face learning. A key issue is teaching students to be critical thinkers and evaluators of information found in an online environment. While most students of today do have computer and technological skills, many of them do not have the ability to apply these skills for deeper thinking and learning. The careful selection and use of web 2.0 tools such as social networking sites, YouTube and course management systems, where matched appropriately to course content, can allow students and educators to balance professional standards, accreditation requirements and mandated learning landscapes (Behling & Klingner, 2010).

Blended learning effectively engages students with their learning, by providing them with highly interactive learning experiences (Garrison & Vaughan, 2008). If educators take advantage of the online skills that most students already have, they can develop blended learning techniques to engage students with active participation, interaction and deeper learning (Behling & Klingner, 2010). Inclusive educators therefore need to be well adept at amalgamating their discipline expertise with suitable applied interactive technologies, within which students can learn to confidently interact within a user-generated context. Not only does the integration of technological tools into the classroom serve to motivate and engage students, it also helps to develop information literacy, critical thinking and communication skills (Behling & Klingner, 2010); all key factors for professional and personal success.

### 2.4 Learning Landscapes

'Learning landscapes' refers to the spatial, technological, social, psychological and pedagogical contexts within which learning occurs, and which have an impact on student engagement, achievement and attitude. Physical learning environments are included, as are blended and virtual environments, spaces and places, formal and informal environments, both on-campus and off-campus.

A critical factor in the design of successful learning landscapes is the exploration of the linkages between space and pedagogy (Fisher, 2005a, 2005b, 2007; Neary et al., 2010). While learning and teaching should be the key drivers behind learning landscape design, there appears to be a disconnect between these two in actual practice (Barnett & Temple, 2006), where financial and programmatic drivers usually take priority. Research has shown that space planners and managers tend to become preoccupied with the availability and serviceability of furniture, finishes and technology selections, to the detriment of spontaneity, comfort and pedagogy, which are considered less important (Neary et al., 2010). As a result, learning landscapes are usually designed around technological, architectural and operational imperatives (Radcliffe, Wilson, Powell & Tibbetts, 2008).

While research into the design of learning landscapes for higher education has been gaining momentum over the last decade [most of these studies using a systematic case-study approach], the linkages between pedagogy and space are still not well understood (Temple, 2008). Research has generally been limited to how space supports the development of a university community, the needs of specialist spaces, the impact of technology on space use, the connections between built and virtual space and investigations into the future of education; and the learning landscapes

investigated, have generally been of a generic nature. Space design is central to effective learning and teaching, and further research is needed to investigate the relationships between built/virtual/informal space and pedagogy in the design of future learning landscapes.

## 2.5 Implications for Architectural Education

The design studio has always been, and is likely to continue being, the cornerstone of architectural education (Goldschmidt, Hochman & Dafni, 2010; Lackney, 1999; Salama & Wilkinson, 2007). Key properties for the architectural design studio include project-based pedagogy, rapid iteration of design solutions within set constraints, the critique, consideration of precedent, and the importance of visual presentation (Kuhn, 2001). The one-on-one/face-to-face desk critique [crit], allows the student to discuss their design progress on a regular and informal basis with their lecturer, thus acquiring design skills and knowledge through this process (Soep, 2006; Swaffield, 2006). The studio has developed historically as a learning-by-doing environment, where the lecturer mentors their students in the design process, and students are challenged to observe design processes - their own, and those of their colleagues and lecturers (Carlhian, 1979; Frey, Birmingham & Dym, 2010; Gournay, 1986).

## 2.6 Conclusion

A review of the academic literature has indicated that while there is some literature on physical, blended and virtual learning environments, there is limited research which specifically addresses architectural learning environments. Similarly, while there is much literature on new and experimental pedagogical approaches to support active learning, very little of this focuses specifically on architectural design studio pedagogy. Core research in this field is emerging from the UK and the USA, however little research has explored this in depth within an Australasian context, and more specifically, within the defined academic discipline of architecture. The purpose of this research is to begin to identify emerging trends in adapting to future learning landscapes for architectural education, in Australasia. It explores the important linkages between space, pedagogy, technology and furniture, using a multi methodological qualitative research approach.

# 3 METHODOLOGY

## 3.1 Context

In late 2011, the architectural design studios at a large university in Australia were redesigned and renovated. The redesign of these studio environments was developed, in part, based on the outcomes of an earlier study of a new digital learning laboratory at the same university, which adapted Student-Centred Active Learning Environment for Undergraduate Programs (SCALE-UP) design principles (Osborne, Franz, Savage & Crowther, 2011). This 2011 study identified six themes which were instrumental in offering resistance or influencing adaptation to, new blended learning environments: technical/technological proficiency; technological infrastructure support; human infrastructure support; pedagogy/technology compatibility; pedagogy/technology/environmental compatibility; and, pedagogy/environmental compatibility. These six themes responded to the resistance by highlighting the adaptive notions of proficiency, support and compatibility. The renovations were also required to respond to the heritage protected requirements of the building and a limited budget. The renovations included modifications to the spatial environment, the technologies provided within these spaces, and the addition of new furniture.

The spatial changes included the decision to merge smaller, separate studios, into larger combined studio spaces, through the demolition of internal dividing partitions. In addition to this, old carpets were removed, to reveal the original heritage listed timber floorboards below.

Technology renovations included the addition of data projectors and screens, mobile computers on wheels [MOCOWS], mobile pinboards and whiteboards. The new furniture selected included large white tables and chairs that were both mobile and stackable. An ongoing issue, which was not addressed in the 2011 renovations due to budgetary restraints, was provision of universal access to the floating mezzanine spaces, above the studios.

While not prescriptive, the space layout and arrangement of each designated studio space consisted of distinct group work zones, an open central space, one data projector and screen, and one MOCOW. Each group work zone included two mobile tables and nine mobile chairs, and each of these zones was orientated to the outside wall of the space. In addition to general WIFI internet access, the new MOCOWS hosted software to provide scaffolding to the collaborative learning environment including: Skype (free web application for video calling and instant messaging, with mobile integration for iPhone/android devices); Google Docs and Mindmeister (free web applications for collaborative 'real time' creation, editing and sharing of documents/mind-maps using web enabled devices); and Facebook and Twitter (free web social utilities that connect people with others around them).

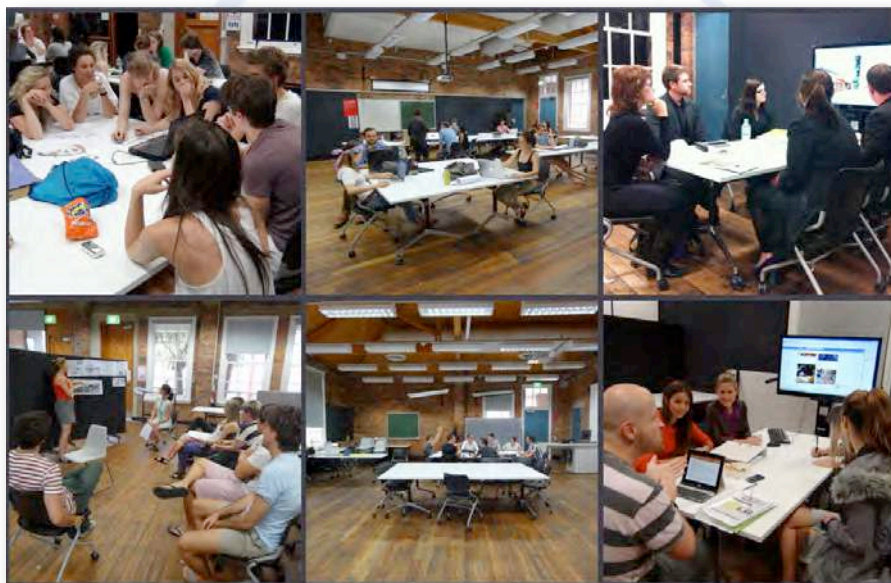

Figure 01. The renovated architectural design studio environments being used in various pedagogical modalities

### 3.2 Data Collection and Analysis

In the first semester of 2011, 79 second year architecture students completed a questionnaire about their learning experiences in the traditional architectural design studios - the response rate represented approximately 70% of second year students who has been allocated to learn in these spaces, that semester. In the first semester of 2012, the study was expanded to include responses from 356 students from all five years of the undergraduate and the masters of architecture degrees - the response rate represented approximately 40% of enrolled students.

Using a dual method qualitative approach, the questionnaire data were coded and extrapolated using both thematic analysis and grounded theory methodology. The results from these two different approaches across two consecutive years were compared, contrasted and finally merged, to reveal five distinct emerging thematic areas, which were instrumental in influencing adaptation

to the newly renovated architectural design studio learning environments, where adaptation creates a sense of person-environment fit: Learning Spaces, Social and Informal Learning, Traditional Technologies, New Technologies and Furniture. These five thematic areas highlight the important linkages between Space, Pedagogy and Technology, in supporting students' overall learning experience.

## 4 FINDINGS

### 4.1 Learning Spaces

While there was a very positive reaction to the improved aesthetic appearance and how it felt to be in the new large open-plan collaborative studio learning spaces, two items were identified as a potential barrier to effective learning in the new environments: Acoustics and Vision.

**Acoustics:** The 2011 study indicated that two-thirds of students could easily hear in class, however this was reduced to just over half, in the 2012 study. The contributing factors are most likely to be the elimination of the internal dividing partitions and the carpeted floor finish, both of which would have provided acoustic insulation properties, however increased student numbers in the same spaces, may well be a factor too.

**Vision:** Over three-quarters of students believed that they were able to easily see what was happening in class, in the 2011 study, however this percentage was reduced to just under two-thirds of the class in 2012. As the spaces were redesigned to no longer prescribe a 'front' and 'back' of the classroom but rather to support an equitable collaborative learning experience, this may be a contributing factor. In addition to this, more of a reliance on using the MOCOWS for researching and explaining concepts, as well as presenting student work is likely to be contributing to a problem that did not exist prior to the addition of this new technology. Research from the 2011 study indicated that the use of MOCOWS was ideally limited to groups of 9 students, however budgetary limitations meant that one MOCOW was provided for over double this number of students in the renovation.

It could well be that some of these items have arisen from years of cultural conditioning that effective learning can only happen in a quiet and small, enclosed space; our current research in this area is addressing some of these pre-conceptions, and will allow us to better understand the contributing factors.

### 4.2 Social and Informal Learning

An interesting outcome of the 2012 study was the very positive reaction of students to social and informal learning environments.

**Favourite Place to Work:** While the architectural design studios remain the most popular environment to work in, students also nominated a high percentage of social and informal learning environments. These included the collaborative and informal breakout spaces in the campus library, coffee shops and other similar social external environments on campus, and the unstructured design student common rooms. A small percentage of students favoured the computer labs; this small number can most probably be attributed to the fact that many students now carry their own mobile learning devices to campus with them, allowing them to work anywhere and anytime, and reducing the need for formal computer enhanced facilities. Finally very small percentage of students choose to hide in another faculty building where they can work anonymously, or off-campus altogether. Figure 2 illustrates the students' favourite places to work in these seven broad categories.

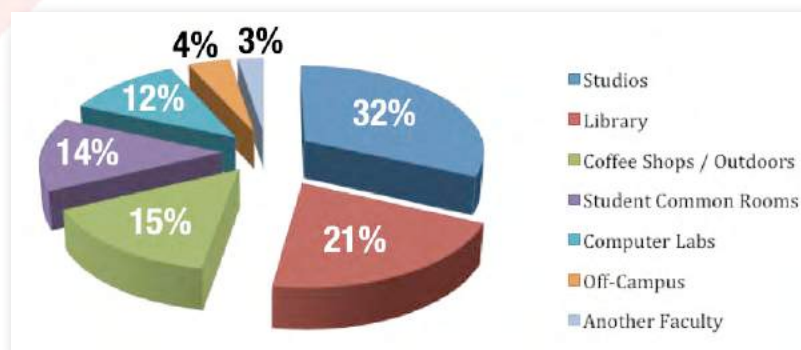

Figure 02. Students' favourite places to work in

**Social/Informal Learning Spaces:** Over 90% of students agreed that they definitely wanted to see more social/informal learning environments on campus, which validates the very positive light in which students view these types of learning spaces, and highlights the importance of providing both more of these and blended spaces, on university campuses. If students are happy and feel comfortable in, a learning environment, they are likely to remain there longer; this hopefully has a positive impact on learning.

#### 4.3 Traditional Technologies

The 2012 study highlighted the changes in technologies used in class, over a one-year period. A clear trend emerged in the move away from the traditional pinboards and whiteboards, to new high technologies including laptops, tablets/iPads, smart phones and MOCOWS. The strong and fairly quick move away from the reliance on pinboards and whiteboards was surprising, considering the results of the 2011 study, which demonstrated that students wanted more of these elements in the design studio environments.

The 2012 study indicated a 10% increase in students bringing their own laptops to class, in the space of one year. There was a further 10% increase in students bringing tablets/iPads, and finally, there was also a 10% increase in the number of students bringing in and utilising their smart phones to class, for learning. These increases were offset by a very clear reduction in the use of pinboards and whiteboards by one third of the students. This clear trend towards the use of new digital technologies and away from traditional technologies is notwithstanding the addition of the new MOCOWS, which saw an immediate uptake of over one third of the student cohort in the first year of their utilisation.

**Pinboards:** Traditionally, architecture students have had a strong reliance on the use of pinboards in the design studio learning environment. Their principle use has been to allow students to pin up their design work at regular intervals throughout the semester, to allow lecturers and student

peers to review their design progress and provide feedback on their design proposition. This pedagogical approach is most usually hosted in a 'crit' environment. When questioned about whether the use of pinboards improved their learning, the data indicated a definite trend of over 20% of students, away from the reliance on pinboards to support learning.

Whiteboards: Whiteboards were introduced to the design studios, based on the outcomes of the 2011 study which demonstrated a student desire for these in the studio environment, however similar to the pinboards, the introduction of these traditional technologies was met with mediocre acceptance; only 15% of students believed that whiteboards improved their learning.

#### 4.4 New Technologies

A significant change to the architectural design studio learning environments was the introduction of new technologies, which, with the exception of WIFI access and data projectors in some of the studios, were largely non-existent prior to the renovations. The data showed a positive introduction of new technologies to the architectural design studio learning environments, but some concerns around confidence and competence, with regards to technology utilisation. The data showed a notable increase in student's perceptions that technology improves their learning; just over one third of students believing this in 2011, the data shifted to nearly two thirds believing this after having access to technologies, in 2012.

Data Projectors: When asked whether data projectors improved their learning, the response rates were similar in both the 2011 and 2012 studies, with just under a third of the class agreeing to this statement. The most likely reason for this, is that data projectors are typically used in a lecture-style pedagogical mode, which is largely un-utilised in the design studio learning environment; rather, one-on-one lecturer/student mentoring, peer-to-peer learning and small group collaborative learning are the most utilised pedagogical modes in a design studio. However, there are key times during the semester when the studio transforms into a presentation or critique environment, and the data projector is a popular technology to support this pedagogical approach.

MOCOWS: The introduction of MOCOWS to the studios in 2012 was both positive and successful. Over half the students agreed that the MOCOWS were responsible for improving their learning and less than 10% of students disagreed with this notion.

Groupwork/Collaboration: Another significant trend was an increase in student perceptions that the introduction of new technologies had a positive impact on and assisted with, groupwork, collaboration, and sharing and communication of ideas. The 2011 study showed that less than half of students believed that technology assisted them, but this was increased to nearly three quarters of the student cohort, in 2012

Student Confidence: Students were also questioned about their confidence with regards to using new technologies. While it was pleasing to see an increase in confidence of roughly 20% from 2011 to 2012, what is probably more of a concern is that a quarter of students reported that they do not feel confident using technology. This is an important and timely reminder that lecturers need to scaffold students' learning to use technologies; we cannot just assume that they, as 'digital natives' or 'millennials', have all the skills that they need at their disposal.

Lecturer Competence: When questioned about how well their lecturers' utilised technologies, student positive perceptions decreased and their negative perceptions increased, between the 2011 and 2012 studies. This is most likely attributable to the increased use of technologies, exposing lecturers who do not have high skill levels, or at the very least, confidence to use the technology. As with the student confidence item, this is a timely reminder that institutions need to privately scaffold lecturer's learning to use technologies, prior to placing them publicly into the learning environment.

#### 4.5 Furniture

A significant part of the renovation budget was allocated to the provision of new furniture. Based on the outcomes of the 2011 study and budgetary restraints, new furniture was selected for the design studio learning environments. All furniture was required to be both mobile and stackable, to allow students and lecturers to take ownership of the space, and to rearrange or transform it, to suit the pedagogical tasks being performed rather than merely relying on the arrangements left behind by the previous class. Another requirement was to provide large tables with white surfaces, to accommodate for drawing on and display of, large-scale architectural drawings.

**Learning:** Over half the students believed that the introduction of the new mobile and stackable furniture had a positive impact on their learning. This result was significantly up from the 2011 study, where only a quarter of students believed the furniture had supported their learning.

**Groupwork/Collaboration:** Another significant trend was the positive impact of the new furniture, on supporting groupwork; 80% of students agreed with this and less than five percent disagreed. These results are encouraging, since pedagogically, much of the architectural design studio learning environment centres around collaborative groupwork.

### 5 CONCLUSION

When designing or renovating learning spaces to allow for the provision of open-plan and collaborative blended learning studio environments, careful consideration must be given to the implications that this has on the students' ability to hear and see effectively. While some of these issues may be simply attributed to cultural conditioning when adapting to a new environment, if a student cannot hear or see effectively, learning may well be diminished.

Student's desire for more social and informal learning environments is clearly evident. While it is not appropriate to simply abandon all traditional teacher-centred learning environments, which definitely do have their place in university education, there are some components of informal or social learning that may well be introduced in learner-centred collaborative blended learning environments. This is an area that the research team are continuing to work in and trying to better understand.

While there is still a strong romantic yearning for the placement of old technologies in architecture design studio learning environments, there is an evident swing away from these, and towards the use of new, digital technologies. It is also evident, however, that the new can not simply replace the old, and that the provision of blended old and new technologies appears to be most successful solution at this stage, while student and lecturer confidence/competence, is built.

The selection of appropriate furniture is critical when designing or renovating learning spaces, particularly if varying pedagogical modes of learning may take place, in the same space. Where time allows, it is most beneficial to trial different types of furniture and collate feedback from the users, prior to expending large amounts of funds on what may well become redundant selections.

While the results of this study are somewhat varied and indicate both areas in need of improvement and areas which have been improved, arguably the most important results from this study indicated that students believed that their overall learning experience had been positively enhanced, as a result of the renovations into the blended architectural design studio learning environment. With three quarters of students agreeing to a positive overall learning experience in the renovated studios, this provides a strong argument to support the importance of the design of the physical environment, in supporting blended student learning.

## 1. Introduction

The subject of aesthetic research usually focus on art traditionally. Some aesthetics begin to develop a new approach called “aesthetics of nature” which inquires issues about natural beauty. A. Carlson, A. Berleant, R. Hepburn, E. Brady, R. Moore, S. Godlovitch, N. Carroll and H. Rolston III(1932 ~ )are famous scholars in this research field.

Carlson, the renowned aesthetics of nature scholar, believes that although Rolston is famous for environmental ethics, his reflections on aesthetic experiences of nature constitutes a profound natural environmental aesthetics and become a pivotal figure in the development of this field. Rolston’s works promote our aesthetic appreciation for nature and help us find the value and beauty of nature (Carlson, 2010: 103, 118).

Because Rolston has extensive knowledge in many disciplines, his aesthetics of nature interlinked with philosophy, science, and theology, which includes biology, ecology, botany, geology, theology, and philosophy. In the two approaches of cognitive(science)-based and non-cognitive-based, Carlson classifies Rolston’s belief as former. In fact, Rolston’s belief does not only speak on science. Maybe Rolston is affected by his own religious background of being a pastor. He also directs aesthetics to religion. His sense of sublime, in particular, is close to religious experience. Although there are some disputes about Rolston’s aesthetics of nature, particularly in religion, his comments on the deep properties of natural beauty give us some valuable educational implications.

## 2. Scientific Aesthetics of Nature

As N. Hettinger(2010: 63) indicates, no environmental philosophy understands natural sciences better than does Rolston. His writings full of scientific description and sciences are the basis for interpreting every fields. Rolston “scientizes his aesthetics, ethics and religion of nature” (Hettinger, 2010: 75). Accordingly, Rolston’s aesthetics of nature is “science-based landscape aesthetics”. He rejects to limit aesthetics as beauty perceptible to the senses, and expand it to include beauty sensed by the reasoning mind. For Rolston, aesthetics of nature should stress concepts as well as percepts(Rolston, 1995: 384; 2011: 274).

What kind of natural beauty can science help us appreciate? According to Rolston, there are all kinds of beauty in nature. People cannot appreciate the beauty because they do not understand it. Thus, science provides profound knowledge to help us appreciate nature and find various aesthetic properties.

### 2.1. The Beauty of Diversity and Abundance of Creatures

People often think some places to be barren, when they are actually not. Take swamps for example, they are in fact places with the most variety of living things or “biological diversity”. Every continent has swamps, except for the Antarctica. Six percent of the earth’s surface is wetland and 11% of the Arctic is wetland. A swamp can be as small as a pond to as large as tens of thousands of hectares. It can be either

freshwater or saltwater. Scientists use various classifying schemes and terminology to show abundance of wetlands, such as bogs, marshes, mires, muskegs, peatlands, palsa bogs, fens, swamps, wetland moors, wetland prairies, tidal salt marshes, mangrove wetlands, river floodplains, deltas. Wetlands are rich with living things, from micro-organisms, insects, plants to animals (Rolston, 2000: 585-586).

The diversity of living things in forests is even richer. Before human came into existence, forests took up about 60% of the earth's surface. There were vast taigas or polar forests in Canada, Siberia, and northern Europe. Temperate forests covered much of the United States, Europe, and China. There were tropical rainforests, tropical deciduous, as well as thorn forests. Forests showed greater exuberant vitality and its biomass was greater than that on grasslands. The tropical rain forest is the most complex and diverse ecological community on earth. There are up to 300 different species of trees in one hectare in a tropical rain forest (Rolston, 1998: 158-159). We can know more than before and feel an aesthetic sense of biological diversity from perspectives of biology and ecology.

## 2.2. Aesthetic Sense of Ancient Time and Space

The forest, the sky, and the sea are the archetype of the world with ancient deep time and sense of space. Forests take time by the decades and centuries, compared to the way human take time by the days, months, and years. Forests go back three to four hundred million years. Land plants first appeared in the Silurian Period and remained close to the ground, like mosses and liverworts, until the Devonian Period, when we found the first fossil wood. Large, erect plants need the strength of cellulose and vascular columns to pump water and nutrients, which require a very long time to evolve. No one knows when forests started to exist, but the evolution is still in progress. A pristine forest is like a living historical museum (Rolston, 1998: 157-158). The ferns, lycopodium, equisetum, and mosses in swamps are very ancient plants. Equisetum species can be traced back to 400 millions years ago. These ancient living things make us marvel and experience a deep sense of time, dynamism and antiquity, and thus stimulate our aesthetics. The migration of birds makes us ponder their start and destination, and elicits the aesthetics of time and distance (Rolston, 2000: 588, 592-593).

## 2.3. The Beauty of Subtlety and Delicacy

Science also helps us appreciate the indistinct. Amazing things are going on in dead wood, underground, or in the dark. Seen with a magnifying glass, the stellate pubescence on the underside of a Shepherdia leaf is quite remarkable. The weird green luminescence of *Panus stypticus*, a kind of mushroom that is discovered at night, is hard to forget. As for indistinct and intricate natural objects, we can only appreciate them with the help of science. Trees push toward the sky, and this sense of pressing upward is vital in beauty. Given photosynthesis, there is competition for sunlight, and plants that place their leaves higher as struggle for survival. The tree needs to have structural materials, cellulose, to maintain the heights, and also to lift necessary nutrients and water. As for grasslands, water resource is limited. There are alpine and tundra ecosystems where the wind and the cold limit the growth of living things. Only

when moving through science to the deeper aesthetic experiences that are enriched by science can the forest be most adequately known. Rolston knows that aestheticians are often uncomfortable with this because they don't seem to believe science helps the appreciation of nature. However, science can indeed enrich and deepen our aesthetic experience (Rolston, 1998: 160-161).

Living things often develop exquisite skills in order to survive. For example, the Venus flytrap (*Dionaea muscipula* Ellis) is probably the most effective prey-trapping land plant. The leaves are hinged, fringed with stiff long bristles, and exude sweet nectar. There are trigger hairs on the midrib. When an insect touches the trigger hairs twice, the hinged leaf are released to quickly snap shut. The marvelous fringes, like eyelashes, interlock and form a cage where the insect is held and digested. The capture takes only one or two seconds. Then the leaf secretes, over several days, digest enzymes that break down the insect protein into amino acids and peptides. If a twig or a windblown pebble falls on the leaves, they will reopen in a few minutes. These exquisite skills are often marvelous and cause deep sense of aesthetics (Rolston, 2000: 590-591).

#### 2.4. The Beauty of Struggle for Survival and Regeneration

From scientific knowledge of ecology, we can understand the phenomenon of continuing struggle for survival and conflicts with the environment. It is a feeling for vitality (Rolston, 2002: 134-135). Struggling for life is also a kind of natural beauty. Animals have to struggle for survival. They either eat or be eaten. The impalas run for their lives to escape the wild dogs' hunt. The pasqueflower develops all kinds of mechanisms to fight the bitter winter. All of these are a kind of beauty. In addition, "life persisting in the midst of its perceptual perishing". Death is the beginning of regeneration. Life and death interchange with each other. Seasons come and go. The dialectic of life is a kind of life beauty. Existence is the deepest kind of beauty (Rolston, 1998: 134-136; 2000: 597).

During winter time in the Rocky Mountains in North America, it snows and blows fierce winds. Everything is quiet and lifeless, except for pasqueflower. The flower exhibits surprising endurance for cold and dryness and blossom in the bad weather. It has a brave and persevering beauty, which is also called the Easter and Passover flower, representing the coming of spring. It symbolizes vitality, hope, struggle against adversity, and resurrection. "The way of nature is the Way of the Cross" (Rolston, 1986: 261). Rolston lets us feel the truth behind life and religion.

#### 3. The Aesthetics of Nature: From Science to Religion

Rolston (1995: 374) suggests that the sense of sublime is a massive power. It touches heights and depths beyond normal experience and transcends us. There is vertigo before vastness, magnitude, antiquity, power, and fierce forces beyond our limits. For example, at an overlook in the mountains, with trees all around, the ground runs right up to your feet and disappears over the horizon. In the unexplored forest, the boundary of space is even more indefinite. No one knows the origins of forests. The trees point upward along the mountain slope, which rises to join the sky, and the scene soars off to unknown heights. The aesthetic situation has gotten out of control

because the limits have vanished. In addition, the aforementioned life struggle and regeneration make us feel a sense of sublime (Rolston, 1998: 163-164). Nature has positive aesthetic properties for us to respect and appreciate.

The sense of sublime ultimately elevates into the religious sacredness. Take forests for instance, Rolston uses quotes from the Bible such as “Break forth into singing, O mountains, O forest, and every tree in it!” (Isaiah 44.23), “The trees of the Lord are watered abundantly; the cedars of Lebanon which he planted” (Psalms 104.16), and “The groves were God’s first temples” (William Cullen Bryant). The forest like a kind of church. Trees pierce the sky, like cathedral spires. Light filters down, like through stained glass. The forest canopy is lofty, far above our heads. Being deep in the woods, with the ground under one’s feet and trees roof over one’s head, it generates religious experience. The line between aesthetic respect and reverence for nature is crossed. Photosynthesis is not only a chemical reaction, but more of a spirited behavior and creates the miracle of life. Forests arouse our senses of exclamation, miracle, admiration, modesty, and reverence. It makes us think about the universe. There are no forests on Mars or Saturn and nowhere else in the solar system, perhaps none in the galaxy; but Earth’s forests are indisputably here. There is operational organization and genetic history in a handful of forest humus. This creativity is the most sacred property of Earth. Our home is a rare planet, and all the elements work appropriately with one another (Rolston, 1998: 164-166; 2011: 282). Isn’t this God’s masterpiece? When science cannot explain the question, we can only leave it to God because He is the source and answer to all enigmas and mysteries.

According to Rolston, all appreciation for nature leads to religion whether it is the nature’s subtlety, complexity, infinity, sublimity, miracle, sanctity, and mystery. People who appreciate the natural phenomenon have to exclaim at the Creator’s amazing power. The light filtering through trees in the forests and clouds in the sky makes us feel the appearance of gods and a sense of aesthetics. It makes us think of how unbelievable God is. The aesthetics of nature and religion merge with each other. Although the intrinsic value of environmental ethics and aesthetic experience of nature are based on science, they finally enter religion. However, one would wonder if this kind of natural aesthetic experience is over-deified?

Rolston steps into religion from science and causes some criticism. The earth and everything are indeed a miraculous existence. However, the aesthetic experience can stay with the exclamation of earth. It is not necessary to conclude everything to God’s grace. The subtlety of life is admirable and respectable, but one cannot prove that everything is created by God. Rolston’s “theological aesthetics” have been questioned by some scholars. But if we leave the argument of God’s existence alone, religion may also be a foundation for appreciation of nature. It is not illogical that the life’s miracle will cause the thought and affirmation of gods

#### 4. Rolston's Revelation of the Aesthetics of Nature for Education

According to the aforementioned, Rolston's aesthetics of nature is still disputable regarding religious questions. However, he still leaves some meaningful implications for education. Actually, as for educational practice, science, religion, philosophy, and mythology can be the foundation for appreciation of nature. The following discusses Rolston's revelation of aesthetics of nature from the three aspects of aesthetic education, environmental education, and life education.

##### 4.1. Aesthetic Education

The aesthetic education in Taiwan is almost the same as art education, but lacks the nature appreciation education. The nature provides rich materials to stimulate people's aesthetic experience which is something the aesthetic education should not overlook. Education can make people feel deeply touched and enrich our life and life's beauty. According to Rolston, aesthetics of nature education should be more than the superficial appreciation of colors and shapes or emotional expression, but rather strengthen scientific knowledge. The momentary ugliness is only a still shot in an ongoing ecologic motion. We have to learn to beyond human subject for appreciation in nature. If students can understand more about science, it can help them better appreciate nature.

However, the problem is, even though our science course offers a lot of scientific knowledge, students still cannot appreciate nature. Scientific education is necessary, but it should not be only cognitive lectures. Teachers should guide students to appreciate beauty through knowledge. Are the teachers capable of doing so? Apparently, the teachers should have more related professional on-the-job training. The aforementioned four scientific and religious beauty suggested by Rolston can be the basis of courses and lectures. Further unit-based "nature appreciation" supplementary courses can be designed. In addition, we can combine science and geography courses, or design a school-based curriculum according to the school's special features.

##### 4.2. Environmental Education

Nowadays, we are facing environmental crisis. Each of us should care about the environment. Environmental or ecological education is even more important. As for environmental protection, Leopold believes that the public should develop exquisite tastes for natural things, which is an aesthetic representation for the whole society and culture. The land utilization policy is also very influential. When we promote understanding and appreciation for the beauty of nature, we should focus on strengthening people's awareness of nature, instead of opening up more roads leading to the countryside (Leopold, 1969).

Rolston's aesthetics of nature suggests a view point for appreciating the ecosystem and offers many ways to appreciate nature. Thus, he promotes the intrinsic value of nature appreciation. If students can appreciate the beauty of ecology's diversity,

subtlety, and struggle for life, and experience nature's sublimity and sanctity, it should be helpful to stimulate the motive and actions for environmental protection.

#### 4.3. Life Education

Appreciating life's subtlety makes us realize that life's existence is very precious. We should cherish and make good use of our life because it is as precious as nature. The beauty of struggle for life can motivate people and encourage us to move forward and face positively all kinds of challenge in life, just like pasqueflower's amazing endurance and perseverance of life. If a tiny flower can show beauty in the bitter winter, there is nothing unattainable in life.

Life is human's best instructor. If we immerse ourselves in nature, we can probably feel the greatness and power of nature, as well as the insignificance of human. Thus, we can be humble and respect nature, no longer conceitedly conquering and destroying nature. The nature appreciation can enlighten people. If school education can make good use of natural beauty as life education materials, it will help students to appreciate nature and thus reflect their lives, and respect themselves, others and nature. Overall, it will help people to have healthy mind and enhance their quality of life.

Abstracts

Cambodia's future presents a bleak scenario. It is currently among the poorest nations on the globe. Ravaged by war, genocide and corruption, its civic infrastructure is in shambles. Compounding the problem, 50% of Cambodian society is under the age of twenty. Youth, which should be an asset, is not because adequate societal role models are few, the system of education is flawed, and thousands of children are not attending school. Both governmental and non-governmental organizations are finding the problem intractable.

Children do not attend school because they either have no family or their families exploit them for economic reasons. In cities, the children become street hustlers, engaging in prostitution and other vices. In rural areas, the children must work in menial subsistence farming.

The educational system is geared more toward developing tradesmen than it is to creating an intellectual, professional or entrepreneurial class. Young people do not appreciate the value of such an education when compared to the short-term benefit of what can be earned on the street or the farm.

Our paper suggests a counter-intuitive solution: Place greater emphasis on teaching art and music. Studies have shown that such studies correlate with higher achievement in math and science and have a positive effect on truancy. A developing society needs engineers and other professionals who have a solid background in math and science. Creating a new class of better educated citizens will be the first step toward Cambodia becoming a useful member of the world community.

## **Abstract**

Cambodia's future presents a bleak scenario. It is currently among the poorest nations on the globe. Ravaged by war, genocide and corruption, its civic infrastructure is in shambles. Compounding the problem, 50% of Cambodian society is under the age of twenty. Youth, which should be an asset, is not because adequate societal role models are few, the system of education is flawed, and thousands of children are not attending school. Both governmental and non-governmental organizations are finding the problem intractable.

Children do not attend school because they either have no family or their families exploit them for economic reasons. In cities, the children become street hustlers, engaging in prostitution and other vices. In rural areas, the children must work in menial subsistence farming.

The educational system is geared more toward developing tradesmen than it is to creating an intellectual, professional or entrepreneurial class. Young people do not appreciate the value of such an education when compared to the short-term benefit of what can be earned on the street or the farm.

Our paper suggests a counter-intuitive solution: Place greater emphasis on teaching art and music. Studies have shown that such studies correlate with higher achievement in math and science and have a positive effect on truancy. A developing society needs engineers and other professionals who have a solid background in math and science.

Creating a new class of better educated citizens will be the first step toward Cambodia becoming a useful member of the world community.

## **Cambodia's Problem**

Cambodia is one of the new nations of the twentieth century—those formed out of the chaos of colonization, imperialism, ideological differences, and nationalism. By the end of World War II, more than 140 nations gained independence.<sup>1</sup> Cambodia, as one of those newly independent countries, is still developing. It currently suffers from inadequate economic and social infrastructure. Per capita GDP is only \$830, which is lower than most of Cambodia's neighboring countries.<sup>2</sup> The children of Cambodia, both in rural and urban environments, are suffering from severe poverty and lack of education. In the cities more than 24,000 street children beg for money and food, either for themselves or for their families; they roam at night, exposed to drug abuse, sexual assaults, and human trafficking.<sup>3</sup> In rural areas, children cannot attend schools because their families need them to help with the farming.

Education of high caliber is crucial to the development of Cambodia. The younger generation of Cambodia composes the majority of the population due to an oppressive regime that had massacred nearly a quarter of its people. However, there is no efficient education system that has a long-term vision to guide the younger generation so that it can develop creative, reformative solutions that will make the country more independent and stable. Both the public school system and nongovernmental organizations' educational programs do not focus on the quality of the education that can produce long-term effects and benefit the nation as a whole.

## **The Genesis of the Problem**

When Cambodia gained independence in 1954, it was emerging from centuries of domination by colonial overlords from Vietnam, Japan and France. In the nearly sixty years since independence, Cambodia has had to deal with war, genocide, civil and political turmoil—in addition to its being a developing nation without a modern infrastructure.

After independence, Cambodia struggled to find stable government. The civil war in neighboring Vietnam and the related conflict with the United States had a devastating impact on Cambodia. The chaos of the government of the constitutional monarchy under King Sihanouk, followed by the military junta under General Lon Nol, ultimately gave way to the genocidal policies of Pol Pot and the infamous Khmer Rouge.

The advent of the Khmer Rouge began a reign of terror to establish an “idealistic” communist society. Pol Pot envisioned a utopian agrarian society, and so forced an evacuation of all cities and towns, including the capital city of Phnom Penh. His idea was to relocate citizens to rural farms. However, during the attempted relocation thousands died as a result of lack of food, agricultural equipment, and medical care.

To eliminate opposition to his regime, Pol Pot killed former military and government officials, affluent people, and every intellectual who had formal education<sup>4</sup>. The Khmer Rouge's goal of building a “pure” agricultural communist nation exterminated all foreign-educated experts, physicians, teachers, journalists, and engineers.<sup>5</sup> This was to prevent possible opposition from intellectuals, who might gather international and domestic support, and to eliminate those who would “contaminate Cambodia with foreign influence.” As a result, more than a quarter of the Cambodian population of 8 million died due to starvation, forced labor, disease, and execution.<sup>6</sup> Education ceased because all intellectuals and experts

were either executed or forced to flee to other countries.<sup>7</sup> The regime also established torture centers; to stimulate fear, public executions were common. The so-called “Killing Fields”—20,000 mass graves—are estimated to contain the bodies of more than 1,386,000 victims.<sup>8</sup>

Since the collapse of Pol Pot’s regime, Cambodia has been struggling to rebuild its social and economic system. The restored constitutional monarchy is stable compared to previous regimes, but power struggles in the political arena continue to be problematic.

The aftermath of these sixty years of turmoil, destruction and death is that Cambodia is left with a majority of young people and a dearth of educated adults to serve as leaders and role models.

### **Current Social and Economic Status of Cambodia**

Although Cambodia’s economy has been steadily expanding since the turn of the twenty-first century, it suffers from an imbalance, relying almost exclusively on agriculture and tourism. This leaves Cambodia vulnerable to fluctuation of demand. The global economic downturn of 2008 and 2009 devastated Cambodia because tourism and international investment decreased, creating 60,000 unemployed workers.

Cambodia has attempted to diversify by developing textile and rubber exports, but has been thwarted by direct competition from nearby countries, China, India, Vietnam, and Bangladesh, who offer lower prices.<sup>9</sup> This is partially due to the Cambodian government’s inability to protect domestic business by forming sophisticated economic contracts with other nations. The Cambodian government has not entered into a single international economic agreement since the WTO Agreement on Textile and Clothing expired in January 2005. The expiration of that agreement initiated direct competition against Cambodian textile exporters.

The Cambodian economy is dependent upon foreign assistance. About half of the central government’s budget depends on international donors, indicating the need for reform of Cambodia’s economic infrastructure.

Cambodia’s agriculture industry also needs reform. The vast majority of Cambodians are farmers; agriculture comprises 33.4% of the country’s gross domestic product (GDP).<sup>10</sup> However, Cambodian farming techniques have not kept paced with modern innovations, so the farmers remain poor. Many farmers still use half-starved cows to plow rice fields, and many who cannot afford cows plow without assistance. The farms lack modern irrigation equipment, using communal pumps that often malfunction, if they are even available. The farmers suffer especially during dry seasons. The Cambodians’ outdated methods of farming, including a lack of understanding of the importance of fallowing, exhausts the soil and limit the types of products that can be obtained from the land. Sometimes the poor agricultural technique causes the land to be permanently infertile.

The obsolete method of farming hinders the progress of raising the national standard of living.

Although agricultural reform is desperately necessary, there are few experts who understand Cambodian climate, soil, and culture well enough to develop efficient farming techniques and teach farmers what they need to do. The lack of Cambodian farming experts and organized

governmental programs to assist agriculture is evident in Cambodian Ministry of Agriculture, Forestry and Fishery; only one ministry serves three different sectors. In its website under “Agricultural Technology” and “Laws and Regulations,” there is not a single word, let alone detailed records and documented programs.<sup>11</sup>

### **The Adverse Effects on Cambodian Children**

Every day, there are from 14,000 to 24,000 children working and living on streets of Cambodia. The street children mostly work in big cities and tourist sites of Phnom Penh, Angkor Watt, and the beaches of Sihanoukville where they beg or sell CDs, books, and souvenirs. The increasing tourism to Cambodia, with about one million tourists visiting per year, paradoxically contributes to the problem because tourists who give money or food help the children sustain a destructive life on the streets. Sex tourism is increasing despite strict laws and the efforts of various organizations to deter it.

A common problem for street children is drug addiction. Most children who live on streets sniff glue. With money they earn during the day, they buy glue, which is readily available and inexpensive. Unfortunately, glue peddlers also sell more dangerous substances such as methamphetamine. Street gangs, whose members come from the ranks of the street children, sell drugs to the children, enslaving them with addiction so that they can take money the children have earned. Physical abuse such as beating often accompanies this kind of economic exploitation.

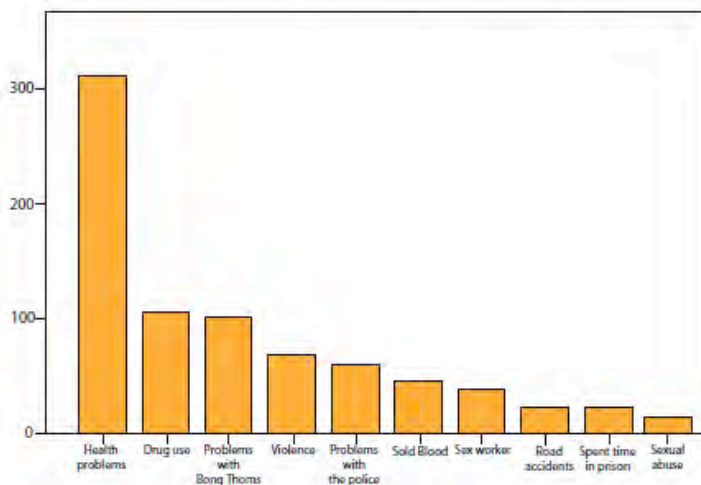

The girls are also susceptible to sexual abuse. There are more males than females on the streets because the girls do not survive. Many families view their daughters as simply a means to obtain money. The girls are sometimes sold into indentured servitude working to pay off the loans of their parents. These girls usually end up as prostitutes either for their families or for their owners. If the girls escape to the streets, human traffickers find them and force them into brothels. To whom does such a girl turn? She cannot seek refuge from her family that sold her.

Thus, a family’s lack of money is the reason these children end up on the streets. Poor families permit their children to be abused for money. Child advocacy groups refer to most street children as “Street Working Children.” They are not orphans; they have parents, but work on the streets to support their families. Some of the parents are disabled as a result of torture at the hands of the Khmer Rouge; some have HIV/AIDS; some are simply unemployable because of lack of education.

Figure 1 breaks down the incidence of problems faced by Cambodian children living on the streets.

### **Figure 1**

### Main problems faced on the street in Phnom Penh

Most problems mentioned by street children and youth were related to their health and to violence.

39% of the Children and Youth registered in 2007 have had health problems and more than 13% said they have been using drugs. This last figure is probably very much underestimated, but many children would not disclose this sensitive information at the time of their arrival. A snapshot survey conducted by Mith Samlanh in 2007 revealed that 58% of the street children and youth were actually drug users.

Graph from *Street Children Profile*

2008

Non-governmental organizations—NGOs—are private charities that make shelters available to street children, but the children do not stay. The children are used to the freedom and drug usage on streets. The children also need to earn money for their parents; so many of the parents disapprove of the children staying in NGO shelters or education/training centers. One of the most prominent NGO for street children in Cambodia, Friends International network, is only utilized by the children as a temporary place to receive a meal or take a shower before leaving, despite the various educational opportunities and counseling it offers. When a representative of Friends International was asked what percentage of children slip back into the night, he answered, “100%.”

### Deficiencies in Cambodia’s Educational System

The genocide during the Khmer Rouge regime, and the other adversities previously discussed decimated an entire generation of Cambodian citizenry. Those who were lost were the best and the brightest, compounding the problem through a dearth of admirable adult role models. Today, fifty percent of the population is under 20 years of age.<sup>12</sup> The population growth of Cambodia is 1.54% higher than that of Southeast Asia as a whole, increasing the disproportionate number of young people.<sup>13</sup> These young people are the future; educating them must be a key component in improving the inefficient and ineffective social and economic infrastructure of Cambodia.

Cambodia’s inability to create enough jobs in recognized economic sectors for the large number of job seekers who will soon enter the work force will inevitably bring economic

problems. It is crucial for the nation's future to educate the young so that they can independently find a way to earn money and make social change that will help the society improve. Reforms in agriculture and business will require educated people. A competent educational system that can raise young adults into intellectuals with critical thinking and specialized skills is necessary for Cambodia's development.

Cambodian children are seemingly interested in the idea of attending school, but they cannot control the forces that place them on the streets or on the farm. They enjoy the freedom of the streets and are not informed about the detrimental effects of living as street children. They are not aware of the detrimental cultural effect of adhering to a strict family hierarchy that allows parents to sell children. The children permit their parents who come to NGO's shelter to resell them to brothels. Their families will not permit them to remain in schools or NGO's shelters where they would be protected and educated. A practical system that informs the children about their health, various benefits of high education, and the importance of independent thinking and self discipline is crucial to help children participate in productive activities that will make them capable members of society.

The current public school administration focuses on addressing the pressing problems of today—lack of supplies and facilities—but does not address reforming the structure of the programs themselves. A significant portion of the government's budget for education is allotted to classrooms and textbooks, but very little thought or money is devoted to long-term strategic planning. The Ministry of Education is concerned with the dropouts and repeats—always including the statistics in its annual *Education Statistics and Indicators* reports—but seems little concerned with the quality of the education. Improving the curriculum, which is necessary to foster independent, capable intellectuals who can reform the country, receives much less attention compared to providing basic needs.

Although the Cambodia Ministry of Education has created the “Enhancing Education Quality Project,” it does help to develop new teachers. The program primarily concentrates on establishing a stable flow of students, not on organizing and supplementing curricula. Moreover, this project is heavily dependent on international aid from the Asian Development Bank, which grants 27.1 million dollars out of the total budget of 33.38 million.

The problems with the public school system begin with the lack of qualified teachers. Cambodia has very few specialized educators, like musicians, artists, scientists, and historians because of the ethnic cleansing by the Khmer Rouge that extirpated educated intellectuals; not only do teachers not have professional degrees, their average qualifications do not satisfy international standards. More than half of the primary school teachers in the country did not graduate high school. This lack of qualified teachers limits the quality of education and the variety of disciplines that public schools can provide. The report of the Ministry of Education states that Elective Vocational Education Program that public schools provide to eleventh and twelfth grades for vocational training depends on teacher and resource availability. This is a fancy way of saying that electives are non-existent.

The report, *Policy for Curriculum Development 2005-2009*, issued by the Cambodian Ministry of Education, Youth and Sports, demonstrates the government's short-sighted policy on education. The program emphasizes vocational preparation for the students instead of providing well-rounded disciplines to teach the students to be independent and creative. The public education system prioritizes education of foreign language because this will help

the students get employed; English or French is mandatory for every student above fifth grade. No one sees the value in teaching applied science, let alone art or music.

The Ministry of Education does play lip service to the needs identified in this paper. Every school is required to offer a course called “Local Life Skills Program”—LLSP. However, the course is given the smallest time slot during the educational week. The ministry vaguely defines LLSP as “intellectual, personal, interpersonal and vocational skills that enable informed decision making.”<sup>14</sup> In practice, LLSP is a jumble of vocational training mixed in with history and the arts—music, dance, and visual arts, all expected to be taught in the equivalent of one class hour per week. Science courses receive even less emphasis; for lower grades, science is taught as part of Social Studies and for eleventh and twelfth grades they are offered as optional.

### **Inadequacies of Current NGOs**

An NGO is a “non-profit, voluntary citizens' group which is organized on a local, national or international level. Task-oriented and driven by people with a common interest, NGOs perform a variety of service and humanitarian functions”<sup>15</sup>. They typically try to stay separate from the country’s government that they operate in, although they do accept government funding. NGOs typically try to solve problems that government does not address.<sup>16</sup>

NGOs attempt to fill the gaps in the public school curriculum. Most, however, also focus on education that provides job skills. Friends International Network and SOLS 24/7 program in association with Grassroots Development Institute, two more prominent NGOs, do work closely with the families of children to convince them to let the children stay in shelters so that they may receive medical care and vocational training such as cooking, sewing, conversational English and basic computer skills. The programs are somewhat successful in transforming children’s attitudes and helping them find jobs.

However, the NGOs’ programs are also short-sighted; they operate to help the desperate, they do not have the luxury of considering a long-term vision of the country’s overall development. They concentrate on “rescuing” the children so that they can be employed, not “reforming” the system so that Cambodia can be autonomous both socially and economically

The NGOs should be supplementing deficiencies in public education. Sebastian Marot, the Friends International coordinator in Phnom Penh,” points out that sewing classes provide young women with the opportunity to sew in a dark factory for hours on end, which will provide only slightly more money than begging or working on the streets in freedom.<sup>17</sup> Working as a prostitute she will earn more. Friends International therefore provides more diverse options such as motorcycle repair, hairdressing, and welding. Regardless: job training does not provide organized, insightful education that will teach children to be creative and independent.

The principal problem with relying on NGOs to provide educational services is that they cannot force children to follow their rules or even to attend. They cannot imprison children in their shelters or prevent parents from removing them. Children themselves also voluntarily run away—at a rate of 100%—according to Sebastian Marot of Friends International. They either understand that they must earn money for their families or are used to freedom and drug addiction on the streets that they will not confine themselves to an

institution. Establishing regulations that require attendance would cause accusation of imprisonment and kidnapping. Most NGOs have their foundations outside of Cambodia in western nations; criticism about imposing western values, moral, and religion might brew. These cultural considerations prevent NGOs from countering parents who wish to limit the participation of their children in programs, because strict family hierarchy is part of the Cambodian culture.

There are myriad of nongovernmental organizations operating in Cambodia. However, they do not communicate or coordinate with each other or with the government. As a result there are both overlaps and gaps in the available services. There is no established method to connect NGOs and the public education system to achieve more effective results. Cambodian Street Children Network, a coalition of seven NGOs for street children including Cambodian Children against Starvation and Violence Association, two divisions of the Friends International network, and World Vision, did produce a report, the *Cambodian Street Children Profile* in 2008 which effectively compiled data of street children's background information. However, there are no active interactions between NGOs to seek coordination to increase the effectiveness of their projects.

An obvious relationship exists between a country's educational system and its prospects for future economic development. This is especially true in a country like Cambodia, where over fifty percent of the population is under the age of twenty. Yet the Cambodian educational system is inadequate: competent teachers are in short supply and students lack motivation to attend school. Change is necessary—the educational system has to place greater emphasis on achievement in studies necessary to succeed in a technology oriented world—math and science; it must also encourage students to attend school.

### **How to transform the Cambodian Educational System**

Our proposed solution may seem counterintuitive. We do not merely propose the obvious remedies of more instructors or the direct injection of money, although we recognize that these are important. We propose greater emphasis on art and music instruction because cultivating these areas directly correlates with increased achievement in math and science, not only because the study of art and music is fun—thus encouraging students to attend school—but also because the study of art and music has been shown to increase cognitive ability in math and science.

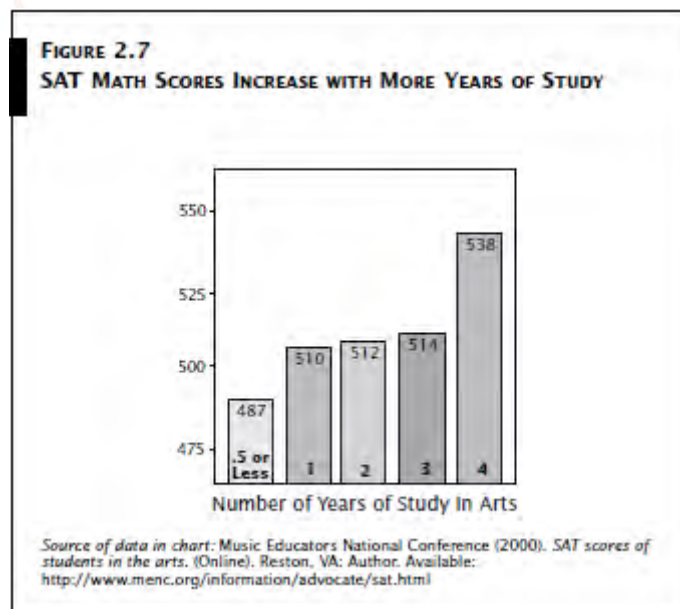

## Testing the theory through experiments

Art and music have long been hypothesized to have positive effects on the academic potential of children. The results of research published in 1993 by Professors Gordon Shaw, Frances H. Rauscher, and Katherine Ky dealt with the effects of listening to Mozart's Sonata in D Major for Two Pianos, K488: one group of college age students listened to the piece, another group to a "relaxation tape," and a third did not listen to music. A test designed to determine spatial IQ was administered to each group; the one that listened to Mozart eight to nine points higher.<sup>18</sup>

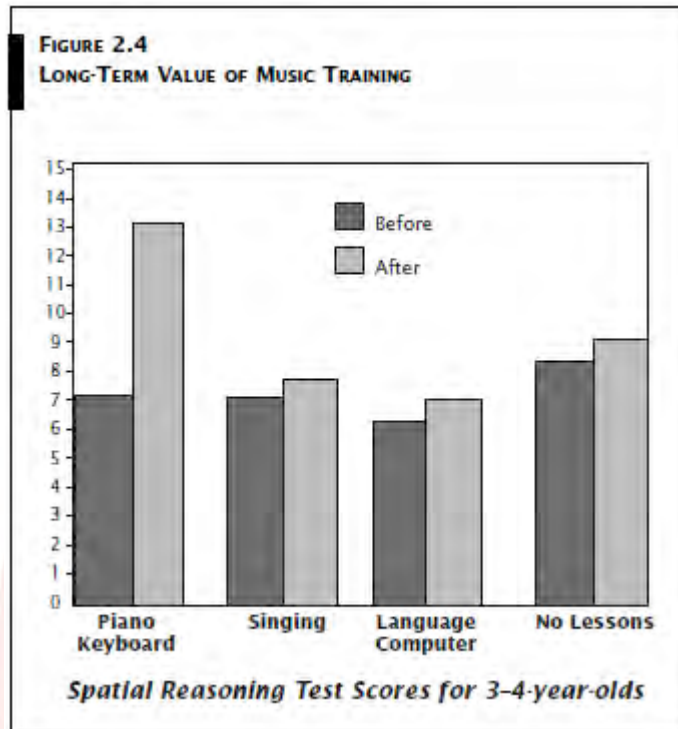

Eric P. Jensen, a noted educator, has devoted a book, *Arts with the Brain in Mind*, to the correlation between the study of art and the development of the brain's capacity to learn. His thesis is

"The arts are not only fundamental to success in our demanding, highly technical, fast-moving world, but they are what makes us most human, most complete as people. Arts contribute to our growth as human beings. The time has come to take the arts seriously."<sup>19</sup>

Jensen documents that MRI experimentation and neural experiments demonstrates that music activates and synchronizes neural firing patterns in the brain and therefore has an effect on the connections between neurons. The correlation between art instruction and spatial reasoning, creativity, and mathematical abilities is also suggested by the data in Figure 2.4 from page 24 of Jensen's book, which charts the relationship between the time spent studying art and the average math score on the SAT reasoning test. There is a difference of approximately fifty points between the averages of those who studied the arts for four years and those who studied the arts for half a year or less.<sup>20</sup> Jensen's chart is reproduced below:

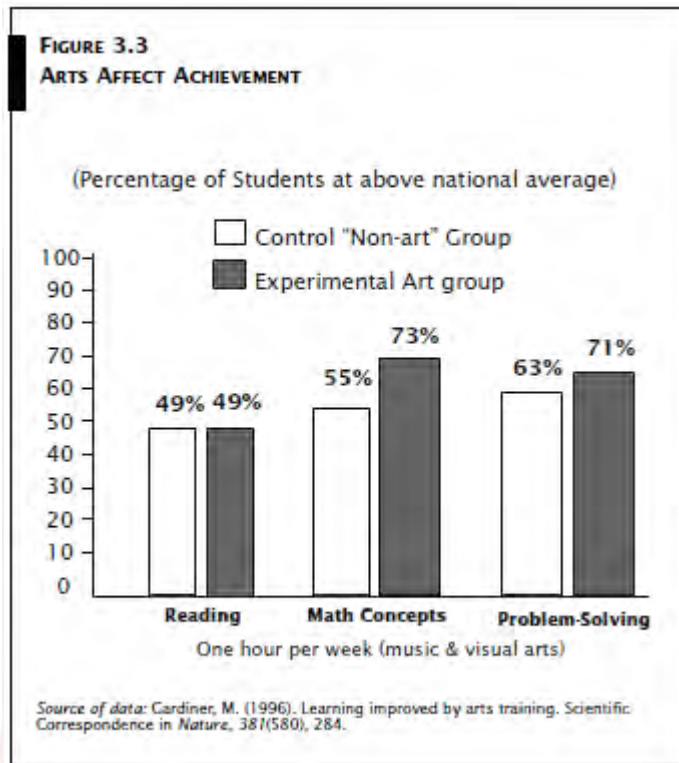

Another study, reported by Jensen, was conducted on three to four year-olds to test their spatial reasoning after exposure to different forms of music study. It shows that those who received intensive piano lessons improved their scores the most.<sup>21</sup> Jensen's chart of the findings is reproduced here:

The visual arts also have a significant impact on academic achievement, having the capacity, when used appropriately, to enhance concentration and improve focus. They can foster self-motivation and hence, decrease the sense of helplessness that deters under-achieving students. Studies by Jerrold Ross indicate not only that the integration of aesthetics, skill, history and theory—higher-order intellectual skills—are required in the study of art can be applied to learning about the arts, but also that acquiring these skills, knowledge and attitudes can help young people achieve at a higher level in more traditional academic areas, such as math and science.<sup>22</sup>

The effects that exposure to visual arts has on cognitive abilities are not as well documented as those of music, but there are biological implications that suggest a relationship between visual arts and neural development. In his book, Eric Jensen mentions two developmental periods during which it is crucial to maintain proper optical development. Research on feline visual acuity has demonstrated that impaired vision at early stages of development has long lasting effects on the ability to learn edges, contrast, and lines.<sup>23</sup>

Additional research has been conducted on children and their abilities prior to and after experience in dealing with the visual arts. This is represented in figure 3.3:

### Testing the theory in practice: El Sistema

El Sistema, originated in Venezuela in 1975, uses school based orchestras performing Western classical composition, to increase student interest, participation, and achievement. So successful has it been, that El Sistema-type programs have been introduced in twenty-five other nations with positive results. Outside of Venezuela, El Sistema has had the most influence in the United States and Scotland.<sup>24</sup>

In the United States, the most convincing evidence of El Sistema's impact comes from Los Angeles, California and Juneau, Alaska. All of the high school students of El Sistema USA in Los Angeles graduated from the program and attended college; each student was the first in his family to do so. In Juneau, the positive effects were observed in Glacier Valley kindergartners. Over the period of three months, from September to December of 2010, their reading scores skyrocketed from 11% to 55%. Then, from winter to spring, their scores continued to increase, as they raised their scores from 55% to 71% in reading, which was 10% higher than the district average, and 69% in math, 8% higher than the district average.<sup>25</sup>

The use of El Sistema has had other positive effects. In a survey in Scotland, 100% of parents replied 'yes' to a question regarding a positive change in their children's confidence. In the same survey, 93% of parents also noted that their children were happier overall. In Baltimore, 55% of students, up from 15% the previous year, envisioned themselves completing high school and attending college; over 80% of students indicated an improvement in grades, self-confidence, and behavior.<sup>26</sup>

### Applying these theories and experiences Cambodia

It is evident that there is a correlation between exposure to art and music and intellectual vitality.<sup>27</sup> Just as El Sistema revolutionized Venezuelan education, and has had the same positive effect in other countries in which it has been introduced, increasing emphasis on art and music instruction will improve Cambodian education and increase the prospects for a new generation of Cambodians ready to take their place in the world community.

### **How international volunteers can help**

We propose to create a new NGO—The Cambodia Project—modeled on the U.S. Peace Corps, to provide art and music instruction through the service of young adult volunteers.<sup>28</sup>

Staffing for the new art and music curriculum will come from two pools of candidates: international volunteers and local graduates. Instructors will live among the people for months so that they may develop relationships vital to the success of the program. In recruiting volunteers, The Cambodia Project will seek graduate or post-graduate candidates studying art and music in their native countries.

The ultimate goal is for the program to become perpetual. The ideal situation is for the former students of the Cambodia Project to become instructors and mentors for the subsequent generations. This is the method by which El Sistema sustains itself.

For practical working models, the Cambodia Project has many successful examples to look at. Both the Peace Corps and El Sistema are excellent models of what the Cambodia Project could aspire to be. As an NGO, the Project will have to face the hurdle of obtaining funding. Both the Corps and El Sistema are at least partially integrated with and funded by their national governments. The Cambodia Project will have to receive most of its resources from donations and volunteers. Nevertheless, the value of the Project is well worth the obstacles it will have to overcome.

### **Conclusion**

World Wars, Cold War, and dictatorship left lasting damage to Cambodia. Cambodia is still trying to rebuild. The availability of a well-rounded, high caliber education is crucial to the development of the country. However, both the public education system and foreign NGOs are only addressing the immediate problems of unemployment and low public school participation. Cambodia must also pay attention to raising the quality of education so that Cambodian youth can be independent, creative intellectual who can reform Cambodian socioeconomic structure.

The first step is to encourage students to attend school. The second step is to imbue them with the high morals and ethics that a healthy society values, and to instill in each student a commitment to working as a team for a goal that is more important than the individual. El Sistema is an example of an art/music program that has succeeded in helping nations achieve these goals by improving educational systems and outcomes.

Abstracts

The Research Lesson entitled “ICT-Enhanced TfU Research Lessons to construct concepts in Newton's Laws” was conducted with the objective of using ICT-infused lessons to promote self-directed learning (SDL), collaborative learning (CoL), and critical thinking skill (CTS).

This ICT-enhanced lesson surfaced students' concepts and misconceptions in dynamics and at the same time promotes self-directed learning, collaborative learning and critical thinking skills. With simulation where all forces acting on the object are shown, the students who are visual learners could be greatly helped in learning about forces. The use of videos and images further add to the visualizations to help students concretize something as abstract as forces as well as relate to real life scenarios which they see and experience around them. The kinesthetic learners get to be engaged and learn by exploration. The self-directed and self-motivated learner gains some control over his learning through the guided-inquiry.

## **1. Introduction**

The purpose of this study was to see if the use of ICT-infused lessons helped to raise engagement levels of students, provided students with the opportunity for collaborative learning (CoL), and gave students more autonomy in self-directed learning (SDL). It is also hoped that the use of applets in this series of ICT-infused lessons would promote the use of critical thinking skills (CTS) in problem solving.

## **2. Abstract**

The Research Lesson entitled “ICT-Enhanced TfU Research Lessons to construct concepts in Newton’s Laws” was conducted with the objective of using ICT-infused lessons to promote self-directed learning (SDL), collaborative learning (CoL), and critical thinking skill (CTS).

This ICT-enhanced lesson surfaced students’ concepts and misconceptions in dynamics and is found to promote self-directed learning, collaborative learning and critical thinking skills. With simulation where all forces acting on the object are shown, the students who are visual learners could be greatly helped in learning about forces. The use of videos and images further add to the visualizations to help students concretize something as abstract as forces as well as relate to real life scenarios which they see and experience around them. The kinesthetic learners get to be engaged and learn by exploration. The self-directed and self-motivated learner gains some control over his learning through the guided-inquiry.

## **3. Rationale**

The rationale of the Research Lesson in using ICT to enhance an Inquiry-Approach is that student learns collaboratively and constructs knowledge together. In using Guided Inquiry, we build pre-cognitive levels which students do not have through either experiments conducted by students, or use of simulation and multiple representations to enable students to make multiple connections to arrive at the concepts. The topic Dynamics has always been difficult for students to grasp as students cannot see forces although they could see the effects of forces. With simulation where forces are represented with arrows for direction and length for magnitude and all forces acting on the object shown on the simulation, the students who are a visual, kinesthetic learners could be motivated in learning about forces, their interactions and effects as it matches their learning styles

The lessons that follow will be for the teacher to draw from these pre-cognitive levels which the students now possess to further their learning. The use of videos and images further add to the visualizations to help students concretize and make connections with something as abstract as forces as well as relate to real life scenarios which they see and experience around them.

## 4. Literature Research

### 4.1. Meaningful learning with technology to construct concepts in Newton's Laws

In this Research Paper we are trying to address students' difficulty to conceptualise with the help of technology. We look first at the common misconceptions students have in Newton's First and Second Law. We crafted our Research Lesson using the Teaching for Understanding Framework with use of Technology to address these misconceptions. We were also trying to look at how students collaborate, use critical thinking skills and do self-directed learning in constructing these concepts with use of technology available.

Muller had researched misconceptions around Newton's First and Second Laws, and these are the most common ones (Muller, 2008):

- believing an unbalanced force is required to keep an object moving with constant velocity;
- confusing velocity and acceleration;
- confusing position and velocity;
- confusing momentum with force; and
- believing that an increasing force is required to achieve constant acceleration

In order to equip the students with knowledge and skills that will prepare them to keep up with the changing environments and requirements in the future, there is a need to respond to the 21st century competencies framework by shifting part of our curriculum from teacher-centred to student-centred, with a greater emphasis on critical thinking, collaborative learning and self-directed learning.

The use of technologies can help to prepare students with the necessary skills by engaging students in the following:

- knowledge construction, not reproduction
- conversation, not reception
- articulation, not repetition
- collaboration, not competition
- reflection, not prescription

(Jonassen, Howland, Marra, Crismond, 1999)

Technologies are learning tools that support students' productive thinking and meaning-making. They are used to foster meaningful learning and should be used as engagers and facilitators of thinking.

Technology can be integrated to engage and enhance the learning experience of each student.

- Technology can be used as critical thinking tools to support knowledge construction to represent learners' ideas, and understandings.
- Technology engages students in self-directed learning by acting as information vehicle for exploring knowledge, accessing needed information and comparing perspectives, beliefs, and worldviews.
- Technology as social medium to support learning by collaborating with others.
- Technology as intellectual partner to support learning by reflecting, a skill needed for critical thinking, self-directed learning and collaboration. It supports learners' internal negotiations, meaning making and mindful thinking.

Students can use ICT tools to combine their ideas, compose, analyze and evaluate writing, all within one space. This engagement is transformational in that it takes various elements of the writing process and combines them into one experience, allowing the process to become collaborative, rather than just an individual experience. This we tried doing using google form for worksheets as students work on their ideas together to construct knowledge. They also collaborate to demonstrate their understanding using Edugloster where multimedia is use collaboratively to demonstrate their understanding of concepts.

Inquiry-based, collaborative approaches to learning benefit both individual and collective knowledge growth. Students engaged in inquiry-based learning develop content knowledge and learn increasingly important twenty-first century skills, such as the ability to work in teams, solve complex problems, and to apply knowledge gained through one lesson or task to other circumstances.

As schools explore and implement strategies to engage and prepare students for the complex and ever-changing world, inquiry-based learning provides a research-proven approach which has the potential to transform teaching and learning. Students develop critical academic, interpersonal, and life skills in new and powerful ways.

Hence in our ICT lesson, we had factored in components to help our students think and reason through the activities in the lesson. Through this ICT lessons, our students had to identify all the causal connections, understand and apply causal relationships, quantify attributes of causal relationships (direction, strength, probability, and duration) as well as explain the underlying mechanisms describing the relationship between the acceleration of an object when the mass, force, and friction is varied. Furthermore, students had to use technology to represent their understanding and are consistently required to engage in the comparison-contrast reasoning required to structurally map the attributes of one or more idea to others, and draw an analogy between what they see on the computer screen with what they understand in real life. ICT also allows students to express their understanding using a variety of tools, such as databases, spreadsheets, graphs, etc. Our lessons are also modelled around data collection and problem solving, allowing students to think deeply and engage in meaningful learning. Hence, what they learn while doing so will be better understood and remembered than being passively fed concepts in a didactic lesson.

(Meaningful Learning With Technology, by D. Jonassen, J. Howland, R.M. Marra, D. Crismond, 2008 edition, p. 5-10)

## 4.2. Teaching for Understanding (TfU)

Teaching for Understanding is an educational pedagogy that uses the following four questions as a foundation for its framework: What topics are worth understanding? What about these topics needs to be understood? How can we foster understanding? How can we tell what students understand? These four questions are structured into four key framework parts: generative topics, understanding goals, performances of understanding, and ongoing assessment to assess students' understanding. "Understanding" is defined as being able to carry out a variety of actions or "performances" that show one's grasp of a topic and at the same time advance it. It is being able to take knowledge and use it in new ways.

Teaching for Understanding framework is intended to do—guide and allow room for personal expression and it includes much more active and interactive learning than traditional 'transmission' kinds of classroom practices. The traditional method of teaching would be to introduce the concepts to students first before letting our students try out some problems to solve using those concepts taught. In our lesson, we had used use ICT to engage our students and provide them a platform to learn new concepts through simulation with computer software and interaction with peers before any mention the physics concepts.

The students derived the concepts and the teachers will follow-up with consolidation or reinforcement of the concepts in the lessons that follows.

## 4.3. What is Self-Directed Learning ?

**Gibbons** stated that "SDL is any increase in knowledge, skill, accomplishment, or personal development that an individual selects and brings about by his or her own efforts using any method in any circumstances at any time" (Gibbons, 2002, p.2).

**Knowles** describe Self-Directed learning (SDL) in broadest meaning as "a process in which individual take the initiative, with or without the help of other, to diagnose their learning needs, formulate learning goals, identify resources for learning, select and implement learning strategies, and evaluate learning outcomes" (Knowles, 1975, p.18) while other describe this process as self-planned learning, inquiry method, independent learning, self-education, self-instruction, self-teaching, self-study, and autonomous learning. These labels seem to imply learning in isolation, whereas Knowles pointed that SDL usually takes place in association with various types of helpers. For example, teachers, tutors, mentors, and peers. In addition, there is a lot of mutuality among a group of self-directed learners.

Meanwhile, **Abdullah (2001)**, describes the slight variations in how different educators define SDL in his review of literature show as the following:

- SDL views learners as responsible owners and managers of their own learning process. SDL integrates self-management with self-monitoring.

- SDL recognizes the significant role of motivation and volition in initiating and maintaining learners' effort.
- In SDL, control shifts from teachers to learners.
- Teachers scaffold learning by making learning visible.
- SDL develops domain-specific knowledge as well as the ability to transfer conceptual knowledge to new situations

#### **4.4. What is collaborative Learning ?**

Wikipedia defines Collaborative learning as a situation in which two or more people learn or attempt to learn something together. Unlike individual learning, people engaged in collaborative learning capitalize on one another's resources and skills (asking one another for information, evaluating one another's ideas, monitoring one another's work, etc.). Collaborative learning is heavily rooted in Vygotsky's views that there exists an inherent social nature of learning which is shown through his theory of zone of proximal development.

#### **4.5. What is Critical Thinking Skills?**

A statement by Michael Scriven & Richard Paul, presented at the 8th Annual International Conference on Critical Thinking and Education Reform, Summer 1987 defines Critical thinking as the intellectually disciplined process of actively and skilfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action. In its exemplary form, it is based on universal intellectual values that transcend subject matter divisions: clarity, accuracy, precision, consistency, relevance, sound evidence, good reasons, depth, breadth, and fairness.

### **5. Methodology**

The Research Lesson was undertaken by 4 Physics Teachers in the Science department. The title of the research is "ICT-Enhanced TfU Research Lessons to construct concepts in Newton's Laws" and the Research Question is "ICT enhanced Research Lesson promotes SDL, CoL and CTS in students". The title and Research questions were so chosen as it was decided that the whole research project be aided by ICT from the google site embedded with video, google form with PHET simulation for students to answer 3 worksheets online using google form to collecting quantitative and qualitative data on how students' are learning collaboratively, inter-dependently and whether they are making use of Critical Thinking Skills. Google forms were used to conduct a Quiz, students' survey and then teachers' feedback on the lesson. Teachers observed the Critical Thinking skill aspect to see if students were able to make multiple connections between Free-Body Diagrams to represent forces, quantitative data given on Forces and graphs on acceleration, velocity and displacement against time to arrive at the concepts in dynamics and make connections with the earlier concepts on kinematics.

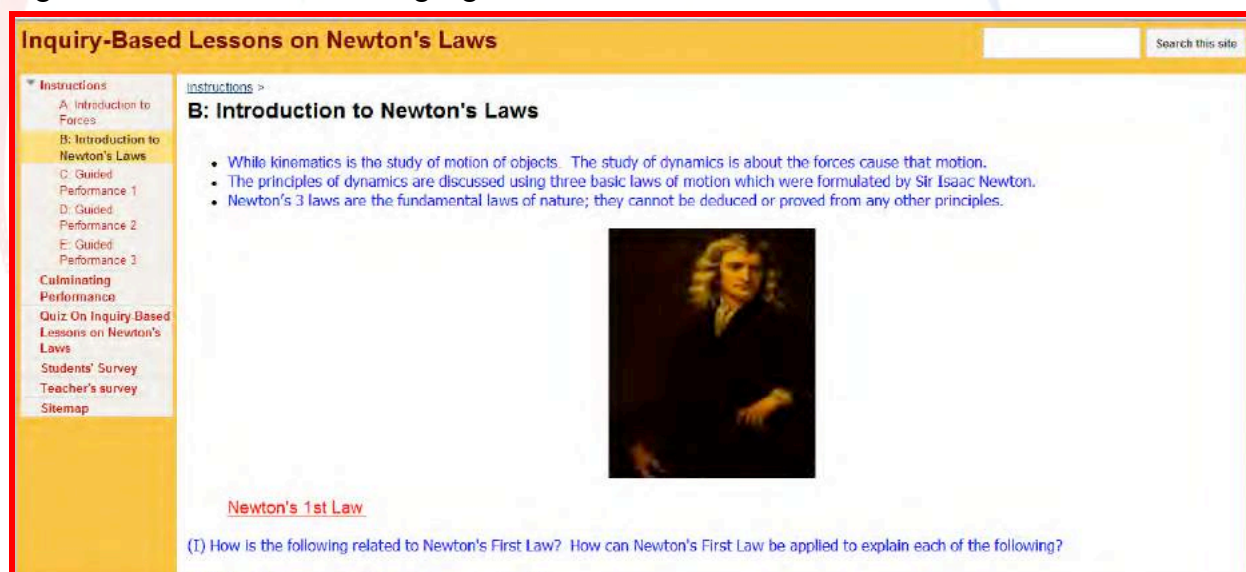

A google site was created and the activity and google/form/worksheets were crafted based on the TfU framework in the form of Performances of Understanding, namely Introductory Performance

of Understanding (IPU), Guided Performance of Understanding (GPoU) and Culminating Performance of Understanding (CPU). All Performances of Understanding were completed in groups of 2 or 3 to ensure there is self-directed and collaborative learning taking place throughout.

3 Classes of students were involved in this project. The classes chosen were two from High Ability Group, 2 from Mid Ability group due to the constraints in timetable which does not allow the teachers to observe the other classes in the level. All 4 teachers were in these classes during the online lesson to observe students' engagement, collaboration with one another, used of critical thinking skills to make multiple connections and to understand Newton's Laws through multiple visual representations. On top of these students answer a google form survey to assess themselves in these areas. Teachers also answered a survey form that assesses students in these key areas of engagement, collaboration and use of critical thinking skills after the lesson observations was conducted.

The Research project began in early April and was completed by May 2012. The Culminating Performances reflecting students understanding using Eduglogster were submitted by 23 May and the report was completed by end of October 2012.

Fig. 5.1 is a Print Screen of the google site

### 5.1.Introductory Performances of Understanding

In the Introductory Performances of Understanding, students were introduced to concepts of forces-from big picture of forces classified under 4 main categories to forces at work in Newton's Laws of Motion. Big guiding questions were asked to enable students to see some illustrations of Newton's 3 Laws in the form of images and videos from Youtube links in the site.

Fig. 5.1 Introduction to Forces

The screenshot shows a website with a yellow header titled "Inquiry-Based Lessons on Newton's Laws". On the left is a navigation menu with links like "Instructions", "A: Introduction to Forces", "B: Introduction to Newton's Laws", "C: Guided Performance 1", "D: Guided Performance 2", "E: Guided Performance 3", "Culminating Performance", "Quiz On Inquiry-Based Lessons on Newton's Laws", "Students' Survey", "Teacher's survey", and "Sitemap". The main content area is titled "A: Introduction to Forces" and "The Four Fundamental Forces". It explains that particles are acted upon by four fundamental forces: gravity, electromagnetism, the strong force, and the weak force. It then details each force: (A) Electromagnetism causes like-charged objects to repel and oppositely charged objects to attract; (B) The strong force binds quarks together; (C) Gravity is the phenomenon by which massive bodies are attracted to one another; (D) The weak force is responsible for different types of particle decays. At the bottom, there is a "YouTube Video" player.

Fig. 5.1(a) Sample of Introductory Performance of Understanding

The screenshot shows a website titled "Newton's 1st Law". It includes a heading "(I) How is the following related to Newton's First Law? How can Newton's First Law be applied to explain each of the following?" and a prompt "Click the following to watch the 2 Demonstration videos". Below this are two video players. The left player shows a ball on a stand with a circular path, and the right player shows a ball on a stand with a horizontal path. Below the videos are two URLs: <http://www.youtube.com/watch?v=8zsE3mpZ6Hw&feature=related> and <http://www.youtube.com/watch?v=uOSBC0SXVR4>.

Video and animations were used to help students relate to real life scenarios and formulate an initial understanding of the concepts in Newtons' Laws through what is observed.

How does the crumple zone of the car reduced injury to the passengers in the car?

## 5.2. Guided Performances of Understanding

Under the Guided Performances of Understanding, students had to make sense of Newton's 3 Laws through answering the 3 google forms which helped them focus on the 3 Laws as was

demonstrated by the PHET simulation. Students work in groups of 2 or 3 on the simulation exercises, putting in values of forces to simulate its effect as well the motion of objects as represented by graphs of displacement-time, velocity-time and acceleration-time to arrive at the concepts. Quantitative and Qualitative data collected surface students' concepts and misconceptions and allows for these misconceptions to be addressed by the teachers in the team during the time of consolidation of concepts in the lessons that follows.

**Fig 5.2 (a) Sample Guided Performance of Understanding with Google form Worksheet**

**Fig. 5.2 (b) Sample of Guided Performance of Understanding (POU 1)**

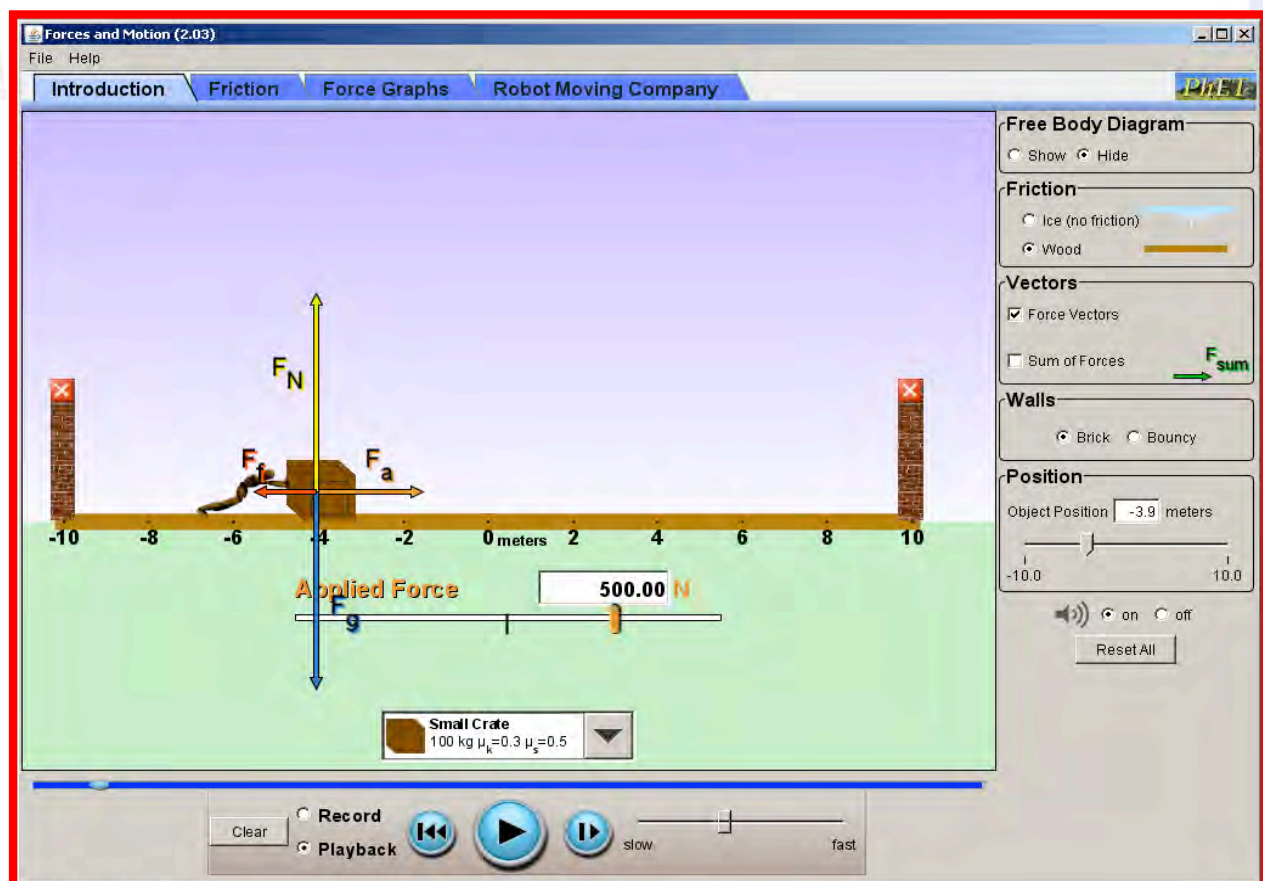

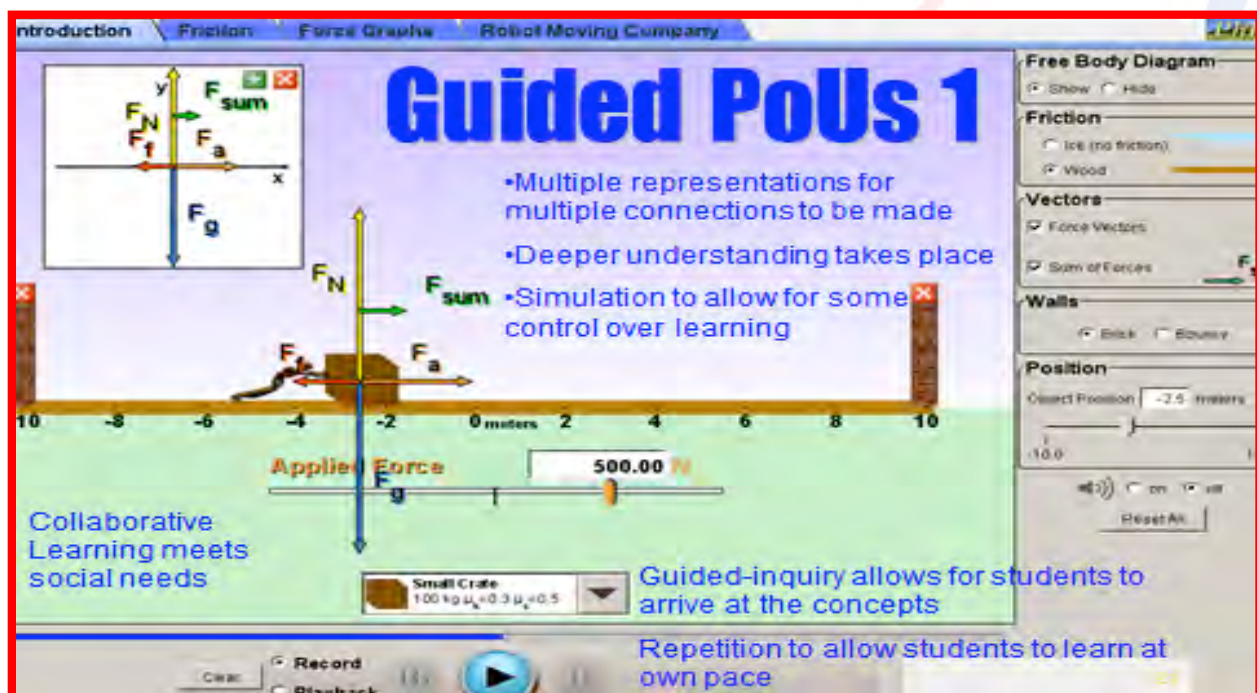

Fig.5.2 (b) shows how a force that is fixed or varying can be applied to the object to observe its effects on Friction and other interacting force like weight of object and the Normal Reaction Force. Students are able to observe the magnitude of the force and the vector sum of forces as they vary the applied force.

Fig. 5.2 (b) shows how students can look at the effects of application of fixed or varying forces from the free-body diagram in terms of sum of forces, the magnitude of the friction as related to the applied force before objects starts moving and after the object starts its motion. Students can be drawn to observe that

- the friction is equal to the applied force before motion begins and application of the force does not immediately move the object unless the force applied is equal or larger than the frictional force.
- the horizontal forces applied do not affect the magnitude of the vertical forces.
- when the object is not moving it does not mean that there are no forces acting on the object.
- when the surface is frictionless, the object can continue to move even when the applied force is totally removed and vector sum of forces in the horizontal direction equals to zero- hereby deducing Newton's First Law.
- the vector sum of forces is zero when applied force equals to the force of friction

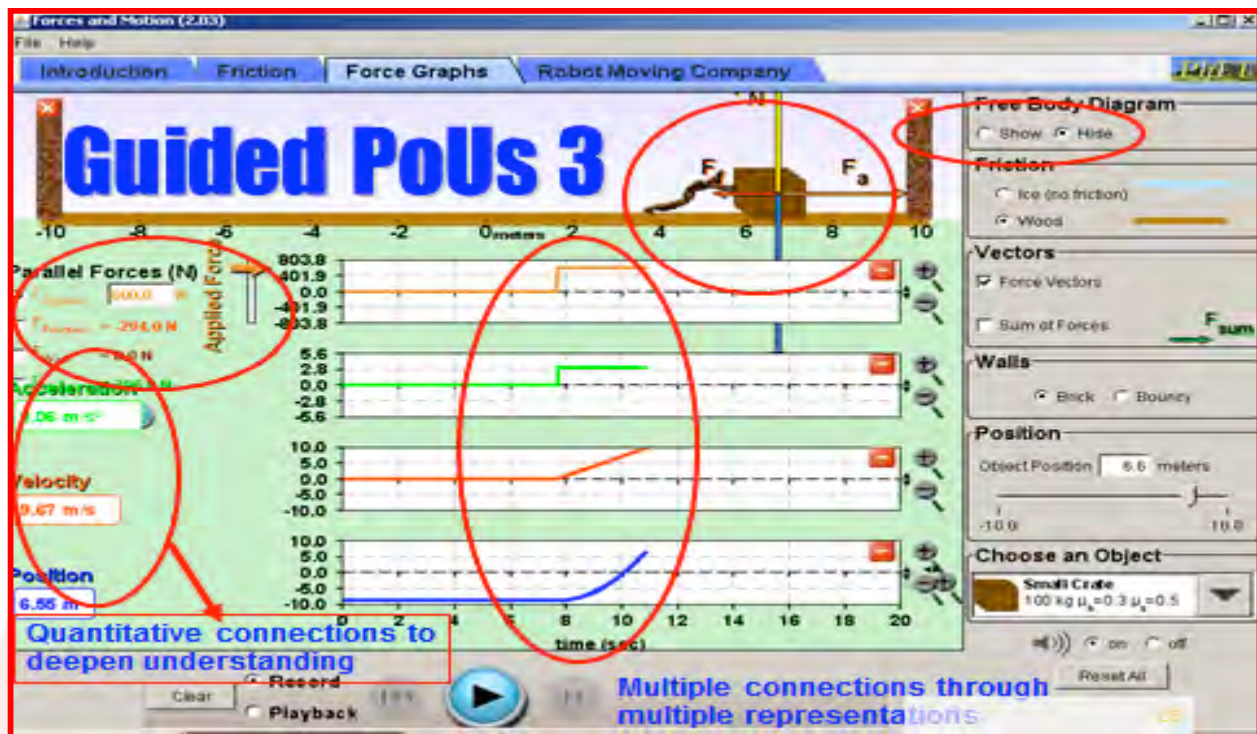

From these initial interactions with visible forces, concepts and questions will be formulated and students will gain initial understanding of concept of resultant force and deduce for themselves Newton's First Law of Motion: that when the resultant force acting on an object is zero, an object at rest will remain at rest and an object in motion will continue in constant velocity when the resultant force is reduced to zero. With the forces made visible, students can be drawn to deduce from the quantitative data the law before it is introduced in a didactic form in a formal classroom.

**Fig. 5.2(c) Sample of Guided Performance of Understanding (PoU 1)**

Students can explore force applied on frictionless surface and surfaces with friction and observe the different effects.

**Fig. 5.2(d) Sample Guided Performance of Understanding**

In this guided performance of understanding students can explore application of varying or fixed force and its effect on motion as observed in graphical forms. From this students will have to make multiple connections with the force applied deduce Newton's 2<sup>nd</sup> Law of motion, observe the effect of force and the relationship to motion as seen by the displacement-time graph, the velocity-time graph and finally the acceleration-time graph. This serves to build upon their prior knowledge in kinematics and reinforce their learning.

### 5.3. Culminating Performances of Understanding

The students then completed a Culminating Performance of Understanding by working in groups of 2 to 3 to demonstrate their understanding of the 3 Laws of Motion using 2 examples of each to explain how those examples demonstrate each of the 3 Laws of Motion. They completed the Culminating Performance of Understanding using Eduglogster as illustrated below. Again students had to collaborate online in groups of 2 or 3 to demonstrate their understanding. The deadline was for the work to be submitted by the end of the term in which the research project started.

[Mrs. Lee](#)

**Egg Drop Experiment**

Newton's 1st Law of Motion

Friction from leaning into the wall will cause the egg to accelerate. However, the egg has inertia. The inertia will overcome the friction from the egg and cause the egg to not accelerate with the table and fall into the water.

**Tablecloth pulling trick experiment**

As the tablecloth is pulled from it will cause the utensils to accelerate. However, the utensils have inertia. The inertia is greater than the friction thus it is overcome and the utensils will not accelerate along with the tablecloth.

**Newton's 2nd Law of Motion**

In the first example, the red car had a greater mass than the yellow one being bigger in size. According to Newton's 2nd law,  $F=ma$ , the greater the mass, the lesser the acceleration with the same force applied. Thus, the red car accelerated lesser than the yellow one had it had a greater mass.

**Experiment: Two cars with different mass**

**Newton's 3rd Law of Motion**

In this example, the bowling ball had a greater mass than the foam ball. According to Newton's 2nd law,  $F=ma$ . The greater the mass, the lesser the acceleration with constant mass. Thus, the bowling ball accelerated less than the foam ball as it had a greater mass.

**Experiment: Two balls with different mass**

**Newton's 3rd Law of Motion**

As the ball exerts a force on the wall, the wall exerts an equal and opposite force on the ball.

**Example: Ball against**

**Example: Bicycles leaning on tree**

As the bicycles lean against the tree and exerts a force on the tree, the tree exerts an equal and opposite force on the bicycle. This is why the tree will not fall over from the force exerted by the bicycle, nor will the bicycle fall from the force exerted by the tree.

The culminating performance of understanding allows students the free expression to choose how they want to represent their learning. They demonstrate their understanding through use of multi-media, videos and text explaining and relating to the concepts they have learnt earlier to give expression to what they have learnt. There is differentiation here in the way they choose the video to represent the concepts they have learnt and the way they would demonstrate their understanding.

Fig. 5.3 (b) Sample of Culminating Performance of Understanding

## 6. Students' Survey

Students' survey allows the students to give feedback on how they feel about the lesson in terms of engagement level, collaboration, confidence in Self-directed, Collaborative learning with use of Critical Thinking skills.

## 8. Qualitative Analysis of Students' Work

### 8.1 Concepts and Misconceptions from Worksheet 1

For the first part of the worksheet, students were first guided using an applet and google form to name the forces acting on an object at rest and observe the magnitudes and directions of the force, then deduced Newton's 1<sup>st</sup> Law for an object at rest.

The second part of the worksheet required the students to apply a force on an object, observe and deduce Newton's 1<sup>st</sup> Law for an object in motion. Subsequently, the students were guided to observe and explain the motion of the moving object after the applied force was removed.

The last part of the worksheet guided the students to evaluate the effect of resultant force by bringing in friction on a stationary object and a moving object.

Fig. 8.1 (a) Analysis of students answers to worksheet 1

(a) When the file cabinet was at rest, name the forces acting on it.

Gravitational force and Normal reaction force. Gravitational Field Strength, Normal Reaction Force from the floor. Normal force and gravitational force. Gravitational Force

Normal Reaction Force. gravitational force normal reaction force. 1)Gravitational Force 2)Normal Reaction Force 3)Frictional Force. Normal Reaction Force and Weight. Gravitational Force Normal Reaction Force. Downward gravitational force and normal reaction force. The forces acting on the file cabinet are gravitational force and normal contact force. Normal reaction force and Gravitational force. Normal Reaction force and Weight. Gravity.

(b) With the file cabinet at rest, set the vectors to sum of forces, what is the magnitude of the vector sum of forces acting on the file cabinet (represented by green arrow)?

The magnitude of vector sum of forces is zero. Zero, the object is at rest. 0N. 0. 0. 0 Newton. Positive magnitude. 0Newton. 0. The magnitude of the vector sum of forces acting on the file cabinet is zero. 0 N. 0. the same. 0. 0. 0 N. 0. Vector sum of forces while file cabinet is at rest magnitude = 0.0N. 0. 0N. 0N. 0. 0. N. 0. 0. 0. 0. no magnitude. 0. 0N. the magnitude of the file cabinet is 0. 0. 0. 0. 0. There is no magnitude. 0N. 0. 0. 0. 0N. 0N. 0. 0N. (-10) +10=0. 0. 0. 0N. ZERO. 0N. 0.00N. 0N. zero. 0N. Zero. 0. 0. 0. 0. Magnitude: 0N. Magnitude = 0. 0.0N. 0N. 0.0N. No direction. 0N. 0. The magnitude of the vector sum of the forces acting on the file cabinet is zero. 0. no magnitude. 0N. 0. 0. 0N. 0. 0. 0. 0N. 0. 0N. 0N. 0N. 0. ...

Students' answers showed that they were able to name the pair of forces acting on a stationary object and deduced that they are equal in magnitude which resulted in zero resultant force.

Fig. 8.1 (b) Sample of students' answers on Worksheet 1

(b) State what happened to the file cabinet after letting go of it.

constant velocity motion   It continues to move at constant velocity.   It continues moving at constant speed.   It moves at constant velocity.   It starts to accelerate.   It travelled at constant velocity and with ...

(c) Repeat the observation in step (2) with a larger force applied. How is the motion of the file cabinet different when a larger force is applied to it and then let go?

larger constant velocity   It moves at a greater constant velocity.   It moved at a faster, constant speed   It moves at a constant but higher velocity   It accelerates at a faster rate   It has a greater final c ...

(d) Complete the following for Newton's 1st Law for an object in motion. When no resultant force acts on an object, an object in motion

continues with its current motion   When no resultant force acts on an object, an object in motion moves at a constant velocity.   continues moving at constant speed.   It will continue moving at constant velocity (with friction being negligible).   moves with constant velocity   moves with constant velocity with zero acceleration   When no resultant force acts on an object, an object in motion will continue to travel in a constant velocity in a straight line.   when no resultant force acts on an object, an object in motion will continue to move in the same direction at constant velocity.   continues in its state   ...

From the results, the students were able to describe the motion of a moving object on a frictionless ground without applied force as object moves with constant velocity.

Fig. 8.1 (c) Sample of students' answers on Worksheet 1

[illegible]

The results reflected the students' ability to

- (a) state that the applied force is equal in magnitude to the frictional force for an object at rest.

- (b) When the resultant force equal zero Fig. 8.1 (b) the object move with constant velocity
- (c) state that the applied force is more than the frictional force for a moving object.
- (d) deduce that a positive resultant force will accelerate the moving object.

Students gave varied answers for a constant resultant positive force applied on the object. Answers include :

- (a) acceleration
- (b) deceleration
- (c) constant velocity

The reasons for this could be students did not know how to control the setting to bring about a constant positive force as it involves holding the force steady or setting a constant applied force that is larger than friction.

## 8.2. Concepts and Misconceptions from Worksheet 2

In the first part of this worksheet, students applied a constant force on an object at rest and deduced the magnitude of the different forces acting on the object (Gravitational force, Normal Reaction Force, Friction and applied force). The students were also asked to deduce the vector sum of horizontal forces and the vector sum of the vertical forces for this stationary object.

Fig. 8.2 (a) Sample of Students' answers to Worksheet 2

N	200N	153	0N	0N	250N	-200	0N																								

From the students' answers, most were able to deduce that since this object is stationary, the gravitational force and the normal reaction force are equal in magnitude; hence the vector sum of the vertical forces is zero. Their answers also show understanding that the applied force and frictional force must be equal and the vector sum of horizontal forces must be zero for an object that is not moving.

Being able to answer the first part of worksheet 2 correctly shows that students have understood the concepts from worksheet 1 and are able to apply Newton's first Law: If there is no resultant force for a stationary object, it will continue to remain at rest (i.e. no change to its state of motion). Conversely, if a stationary object remains at rest, it would mean that there is no resultant force on the object.

In the second part of this worksheet, students were instructed to apply a force greater than the frictional force, hence causing the object to move. Since there are no changes in the forces in the vertical direction, the answers to the gravitational force, normal reaction force and vector sum of vertical forces remains unchanged as in part 1.

Most students were unable to arrive at the correct answer to the frictional force because they were unsure of the equation as the subscripts were unclear in the Googleform. The disadvantage of the googleform as a ICT tool was that no superscript or subscript could be used to represent physical quantities in Physics and that created hurdles to student understanding how to derive the value of both kinetic and static friction. The limitations can be overcome if this tool included some mathematical functions and symbols as well as allows diagrams to be included into the form to aid understanding of the questions posed.

Fig. 8.2 (c) Answers to Worksheet 2

In part 3 of the worksheet, we wanted students to relate the applied force and the acceleration. Students were told to observe the motion of the object and deduce how the motion differs with a larger applied force. All students were able to reach the intended conclusion, that is, the object has greater acceleration, or that it moves faster with a larger applied force. Students were also able to explain for this observation by applying to Newton's second Law. In

their answers, students correctly pointed out that it is the “unbalanced force”, or the “resultant force” that leads to the acceleration and not the “applied force”.

### Summary of concepts learnt

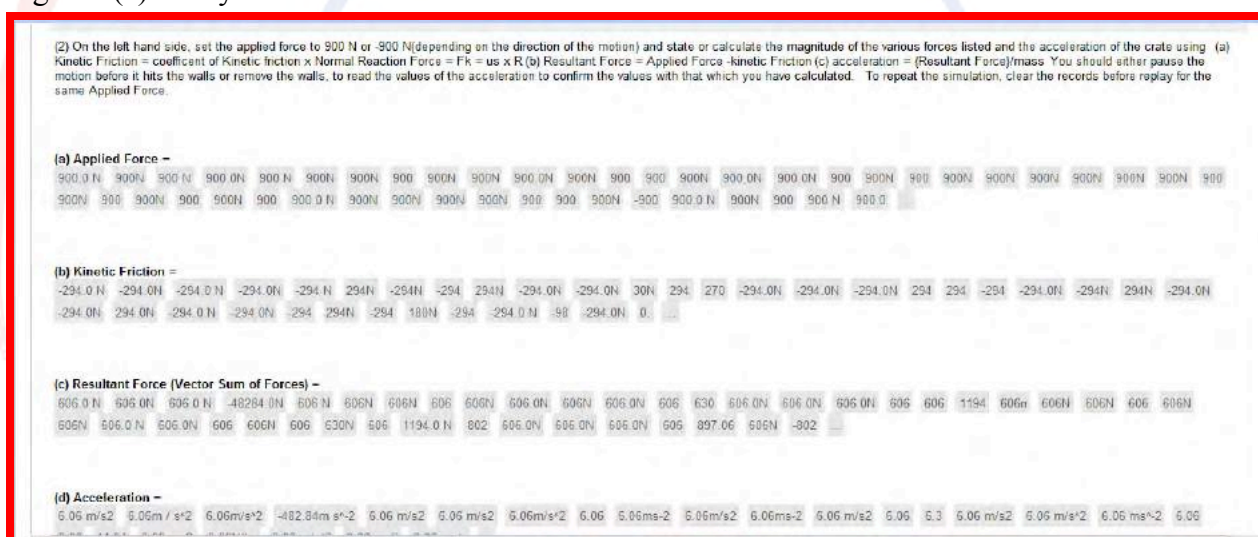

Students are able to understand better the concepts of

- (a) unbalanced/ resultant force
- (b) relationship between the resultant force and the acceleration

### 8.3. Concepts and Misconceptions from Worksheet 3

In this worksheet, students were guided to calculate the resultant force as a vector sum of applied force and kinetic friction. From this, students calculated the value of acceleration and observed the graph of displacement-time graph as a parabola, velocity-time graph as a constant rate of increase in velocity and constant acceleration as a graph parallel to the x-axis. This reinforces the earlier concepts of kinematics and helps them to deduce Newton’s Second Law by deducing that the Resultant force is a product of mass and acceleration.

Fig. 8.3 (a) Analysis of students answers to worksheet 3

Students’ answers reveal that they did not have problem with arriving at the resultant force or the calculation of the acceleration.

Fig.8.3(b) Sample of students' answers on Worksheet 3

**PART 6**  
The relationship between an object's mass m, its acceleration a, and the applied force F is F = ma. Acceleration and force are vectors (as indicated by their symbols being displayed in slant bold font), in this law the direction of the force vector is the same as the direction of the acceleration vector.  
The acceleration of an object as produced by a net force is directly proportional to the magnitude of the net force, in the same direction as the net force, and inversely proportional to the mass of the object.  
When a resultant force acts on an object of constant mass, the object will accelera

From the students' answer it was clear that students were able to derive the relationship between resultant force, mass and acceleration with no difficulty.

**Fig.8.3(d) Sample of students answer to worksheet 3**

**PART 7**

**(7)(a) Predict the motion of the file cabinet with mass 50.0 kg,  $\mu_k = 0.2$  and  $\mu_s = 0.5$ , if a force of 600 N is first applied for 2.0 s, after which the applied force is decreased to 245 N for the next 2.0 s.**

From 0 s to 2.0 s, the file cabinet moves at an increasing velocity with a constant rate of acceleration. At 2.0 s, the acceleration of the file cabinet decreases. From 2.0 s to 4.0 s, the file cabinet continues to move at an increasing velocity but with a lower constant rate of acceleration.

The file cabinet will accelerate at a constant rate for the first 2.0 s, then, at 2.0 s, it will continue to accelerate at a constant rate, but at a slower rate.

The file cabinet would accelerate in the direction of the resultant force for the first 2.0 s, causing the velocity of the file cabinet to increase.

**7(b) Explain the motion in PART 7(a) using Newton's Laws of Motion.**

The applied force, the mass of the file cabinet and the acceleration is related through the equation  $F=ma$ . Therefore, when the force applied decreases, the acceleration will decrease as well since the mass of the object is constant.

For the first 2.0 s, the acceleration is constant as the same net force is exerted on the object throughout the 2.0 s, but at 2.0 s onward, the acceleration is still constant due to a constant net force, but at a slower rate since the acceleration is directly proportional to the net force.

According to Newton's second law, the formula of the acceleration would equal to  $a = F/m$ .

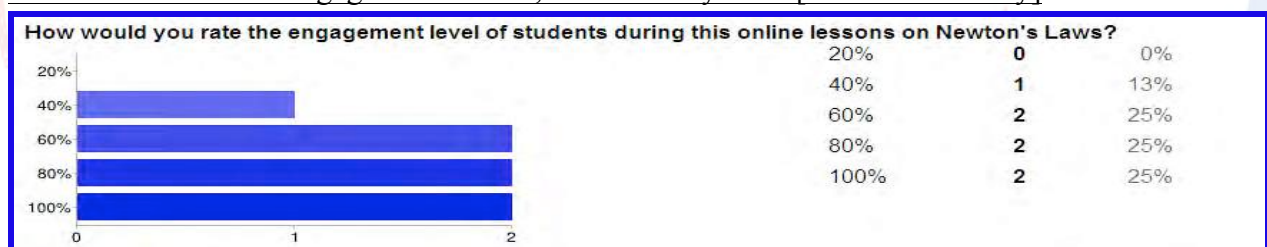

The above shows the extension to learning where students had to predict the effect of a reduced resultant force on motion. Answers revealed students ability to arrive at the concept of the reduced acceleration with a reduced resultant force and the right explanation with it of acceleration being proportional to the resultant force acting on the object.

## 9. Analysis of Teachers' Survey

For the teachers' survey, 3 teachers submitted their feedback according to their observations for each of the classes, 3A, 3B, and 3F. Students' survey was collected from 57 students after the series of 3 ICT lessons on Newton's Laws.

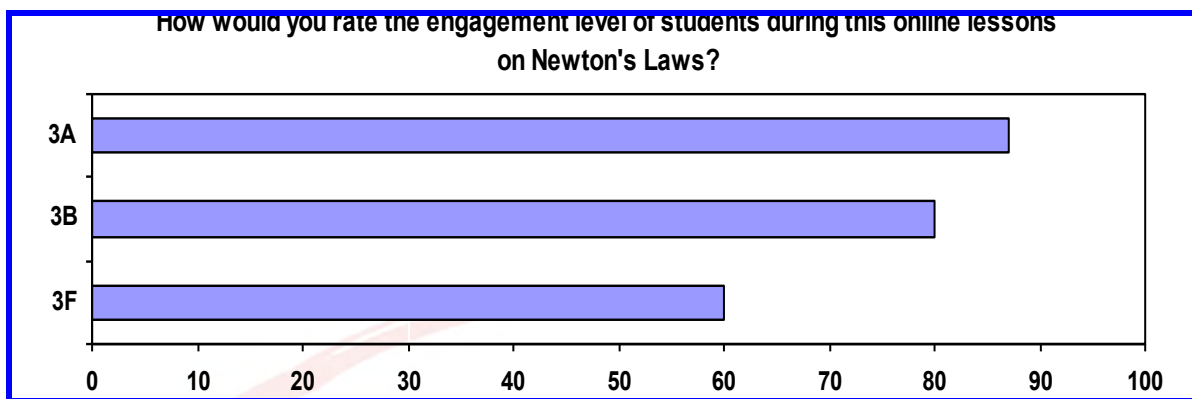

### 9.1. Students' Engagement Level

**Chart 9. 1: Students' Engagement Levels, not sorted by class [Teachers' Survey]**

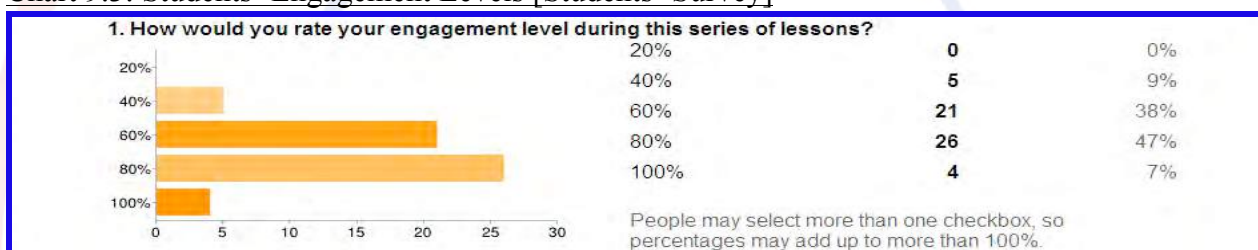

We noticed that students' engagement level during this activity varies from class to class. As there is no objective and measurable yardstick for scoring the engagement level of students, the average of teachers' scoring for each class is taken as teachers' perceived engagement level of the class. We can see from the survey [Chart 9.1] that there is a range of engagement levels from 40% to 100% for the different classes. 75% of the teachers rate the engagement level of the students at more than 60 %. The use of percentages scaled at 20 %, 40 %, 60 %, 80 % and 100 % does not accurately reflect what is observed as the scale is too discrete and better measures have to be designed to overcome this.

Chart 9. 2: Average Students' Engagement Levels by class [Teachers' Survey]

According to teachers' responses [Chart 9.2], teachers observed that the students' engagement level in the activity is high for classes 3A and 3B. However, teachers felt that students in class 3F have a slightly lower engagement level even then it is at least 60%. The limitation comes in that the engagement level comes in discrete steps of 20 % and teachers could only estimate their perception represented by these percentages. A better designed survey question could measure the engagement level on a scale of 10 perhaps.

Chart 9.3: Students' Engagement Levels [Students' Survey]

From the students' survey [Chart 9.3], students also reported engagement levels of about 40% to 100% during the lesson, and this corresponds to our Teachers' Survey in Diagram 1. 92 % of Students however, reflected an engagement level of more than 60 % and 7 % reflected that they are totally engaged in the lesson. Students therefore perceived themselves as more engaged than the observation by the teachers. The difference could have been due to differing understanding of what engagement meant to students and how it meant to teachers. Probably the high percentage more accurately reflected students being actively involved in the learning whereas the teachers were looking at students who got distracted by other options on the simulation bar and were less focused on the worksheet at hand and thus deemed as less on-task during the lesson.

## 9.2. Students involvement in Activities

Chart 9.4: Activities Involved in during the lesson [Teachers' Survey]

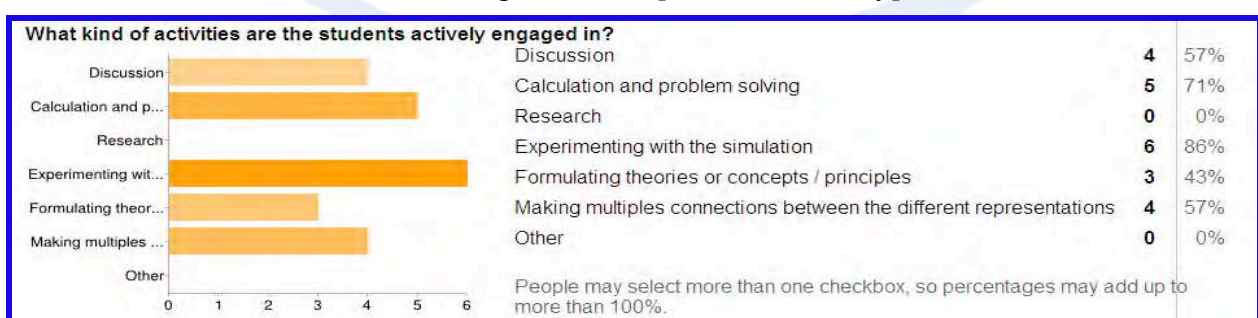

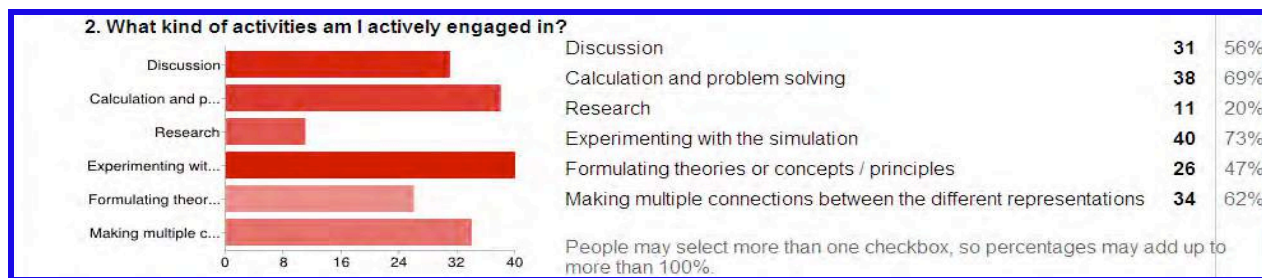

Chart 9.5: Activities Involved in during the lesson [Students' Survey]

From the teachers' observations [Chart 9.4], the activities that the students are engaged in are mainly discussion, calculation and problem solving, experimenting with the simulation, formulating theories or concepts, making multiple connections between the different representations. However, a small percentage of the students [Chart 9.5] reported that they were also engaged in research during the lesson.

This was surprising as we had not build in questions or activities that require any form of research into this lesson. However, as there was availability of use of internet, some students tried to use Google to search for the Newton's Laws of motion to aid them in this exercise instead of coming up with their own understanding of what Newton's laws, which might explain why they considered research part of this exercise.

We are hearten also to know that students recognized that knowledge is at their fingertip and with the pressing of a few keys on the computer key boards they can easily search for answers to give understanding of something that they do not understanding or is trying to figure out.

Chart 9.6: Content Coverage [Teachers' Survey]

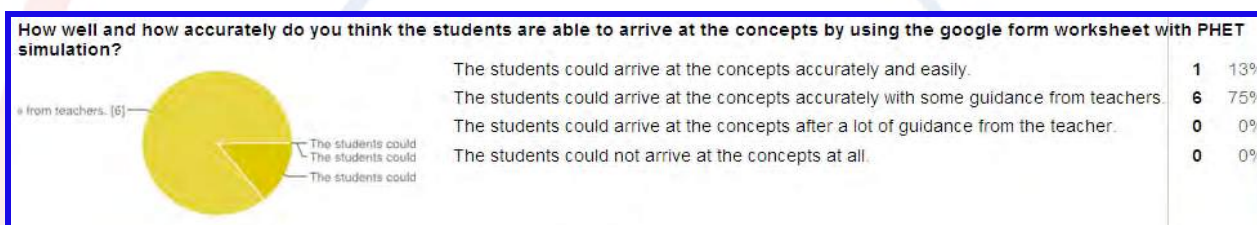

Teachers agreed that more than 60% of the syllabus [Chart 9.6] for the topic of Newton's Law could be covered through the use of the simulation and guided questions on the Google worksheet. The topics covered in this series of ICT lessons are: Free-body diagrams, resultant force, balanced and unbalanced forces, Newton's laws, kinetic and static friction, and the calculation of acceleration using **Newton's Second Law**.

However, there were certain key concepts that could not be adequately covered in this series of lessons. They are: explanation of Newton's 3 laws, the applications of Newton's 3 laws in other situations, and problem solving using Newton's Law. This would become our addition to the future Research Lessons when we use Youtube videos and guide students in arriving at the explanation to the concepts found in Newton's 3 Laws of Motions. We also have to acknowledge that there are multiple pedagogies that have to be used to engage students to arrive at the understanding of concepts and ICT tools is one but not the only way.

### 9.3. Student Understanding and Teacher Involvement

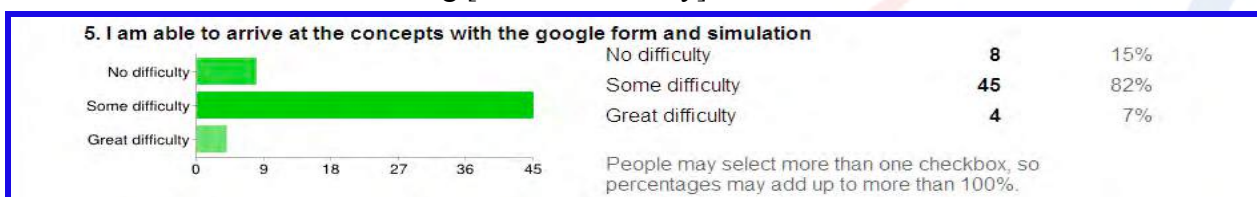

Most teachers noted that students were able to arrive at the desired concepts accurately with some guidance from the teachers [Chart 9.7]. Some students expressed that they faced some difficulty [chart 9. 8] with the use of the simulation (how to use it) and understanding the questions. And all teachers agreed unanimously that only about 20% of the lesson is spent focusing and paying attention to the teacher [chart 9. 9]. This 20% of the lesson spent on paying attention to the teacher was for the purpose of conducting a briefing for the students before they start experimenting with the simulation. Again this 20 % could be lower if we have given the teacher the freedom to fill in a number rather than be guided to click on what was provided. The advantage of this is analysis is made easier with a quantitative rather than a qualitative representation of the teachers' answer. The disadvantage of this is that the answers are too discrete and there are no values possible in between for a more accurate representation to be given. In future research, we have to bear this in mind and attempt to strike a better balance in getting more accurate responses with the ease of analysis of results with discrete numbers which compromises on the accuracy.

Chart 9. 7: Students' Understanding [Teachers' Survey]

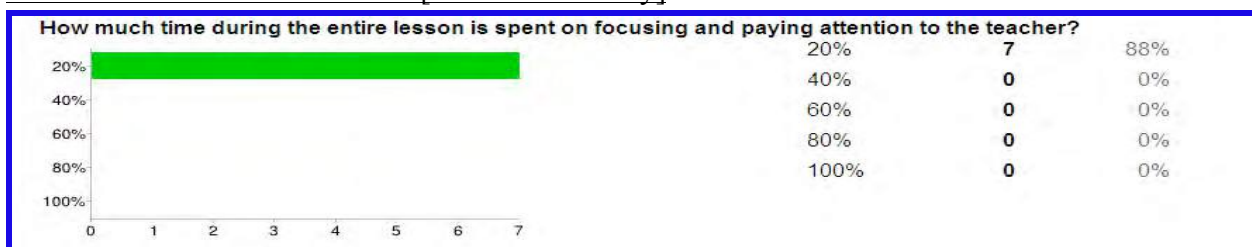

All the teachers are confident that the students were able to arrive at the concepts accurately with some guidance from the teachers. This guidance were usually technical in nature dealing with either the software or it could be the way the questions were phrased and students needed some clarification to aid them in understanding what was being asked.

Chart 9.8: Students' Understanding [Students' Survey]

97 % of the students reflected that with some help they were able to arrive at the concepts. When the students indicated some difficulty, it was usually related to the way the questions were phrased and some getting used to maneuvering the stimulation. They were not necessary related to the difficulty in arriving at the concepts per se as was reflected in the answers collected from the 3 worksheets which reflected a high percentage of students deducing the correct concepts at the end of the simulation exercise. To determine what this difficulty is, we could have clarified by following up with a question requiring students to elaborate on the difficulty faced.

Chart 9.9: Teacher-Centredness [Teachers' Survey]

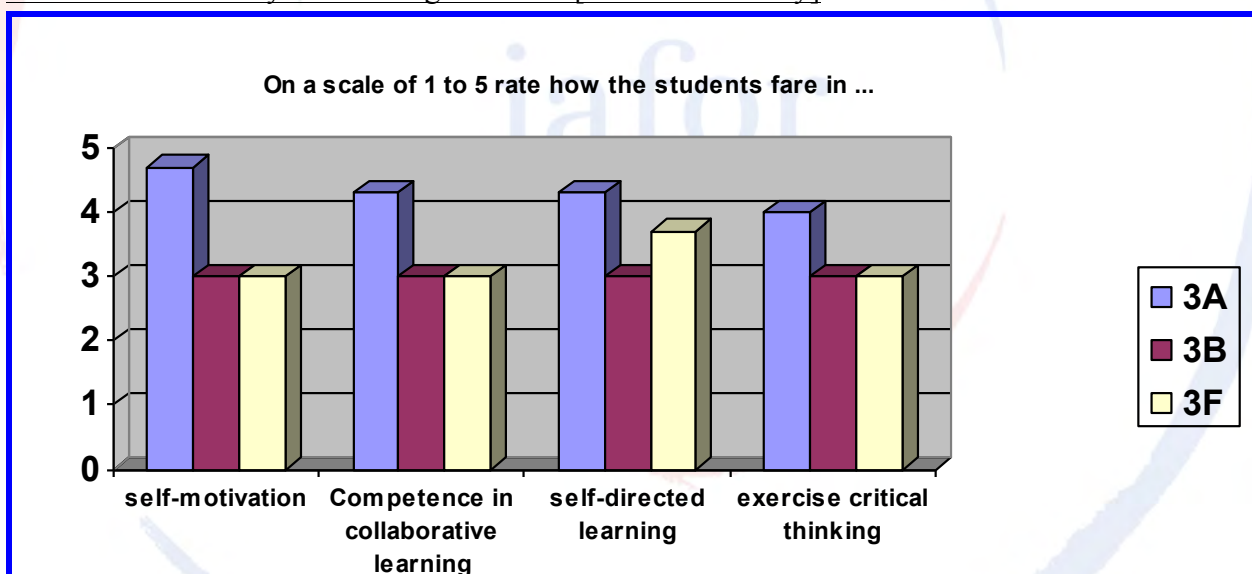

Without the teacher doing didactic teaching in front of the class for the 80% of the time, the role of the teacher during this lesson is mainly to interpret and to clarify questions in the worksheet and to provide technical support on how to use the simulation during the lesson itself. No teaching of the concept was done before the research lesson or during the implementation of the research lesson. Students were left to explore the simulation with the guided worksheet and to derive their own understanding after discussion with their peers.

#### 9.4. Learning Attitudes and Behaviours

Teachers scored students with respect to our observations on how students fared in terms of self-motivation, competence in collaborative learning, self-directed learning and critical thinking during this lesson, and the observations are as follows:

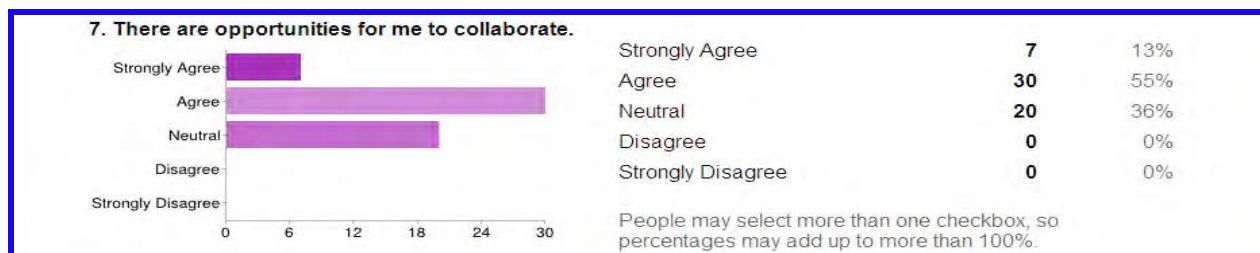

Chart 9.10: Summary of Learning Attitudes [Teachers' Survey]

Feedback from students showed that there were opportunities for collaborative learning, self-directed learning and critical thinking during the lessons [Charts 10.1,10.2 and 10.3].

## 10. Analysis of Students' Survey

Chart 10.1: Students' Feedback on Lesson – Collaborative Learning [Students' Survey]

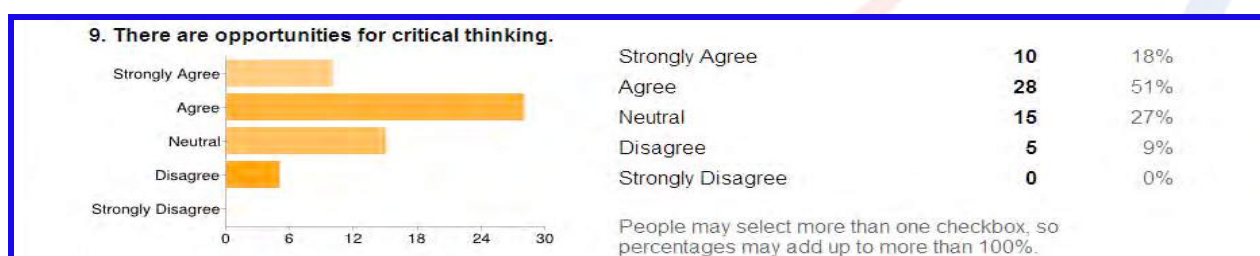

68 % of the students responded that they had opportunities to collaborate in this research lesson with 0 % disagreeing. This reflected that students' were generally positive to the collaboration opportunities provided through the way the lesson was conducted. As usual with a choice for a "neutral" answer, respondents who are less expressive has tendency to be non-committal and so we have the disadvantage of having 36 % who chose to sit on the fence.

Chart 10.2: Students' Feedback on Lesson – Self-Directed Learning [Students' Survey]

88 % of students indicated they had opportunity for self-directed learning. One student disagreed. Question is raised as to why this student disagreed to having the opportunity for self-directed learning. The single student who disagreed could either be not used to this method of learning or is not incline or willing to adopt a new way of learning or there may be other reasons.

Chart 10.3: Students' Feedback on Lesson – Critical Thinking [Students' Survey]

Students showed more confidence in Collaborative Learning and Self-directed learning after this lesson [Chart 10.4 and 10.5]. About 70 % to 88 % agreed that there were opportunities to collaborate, opportunities for Self-Directed Learning as well as exercising of Critical Thinking Skills. Though there are still a handful of students who felt insecure and would like to have more hand-holding from the teacher. This might be because one of students' more comfortable modes of learning is didactic teaching [Chart 10.6], as we can see from the Students' Survey, and not having a teacher to teach directly in front of the class could have made them insecure about their ability to learning. Students are still not exposed enough to independently learning and therefore feel that they can learn only when a teacher teaches well.

Chart 10.4: Students' Confidence in Collaborative Learning [Students' Survey]

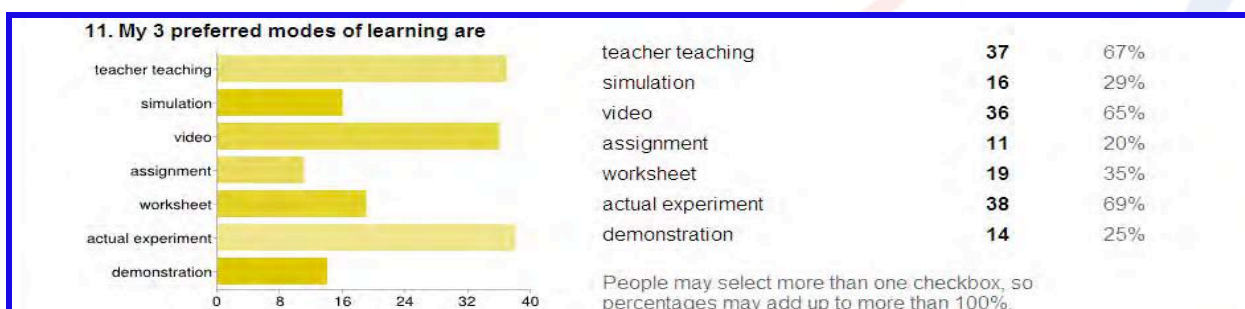

In general students scored high on the level confidence in CoL-82 % [Chart 10.4], SDL-88% [Chart 10.2]. Results show that students of high calibre would benefit greatly with well-designed lessons that includes these component of collaborative learning and self-directed learning. However, this need not necessarily be confined to students of high ability as the simulation used for experiential learning should also benefit students of any ability group. However, this is area of research can be undertaken at another platform perhaps across schools with students of different ability.

Chart 10.5: Students' Confidence in Self-Directed Learning [Students' Survey]

We also scored students based on their self-managing, self-monitoring and self-modifying behaviours. 89 % indicated they were more than 60% confident in self-directed learning.

Chart 10.6: Preferred modes of Learning [Students' Survey]

As can be seen from the above chart, students preferred mode of learning are in this order, actual experiment, teacher teaching and video, as compared to their ability to do SDL and CoL. This indicated that there are still a group of students who have not moved away from teacher teaching and learning to learn by themselves even though they have the capacity to do so. It is important for the school to realize the capacity of the students through assigning work which increasingly move away from direct teaching so as to allow students with the capacity to become the independent learners who will be the ready workforce of tomorrow. This has to be a more school-wide practice so that it becomes a school culture and students come to expect this to be

the way to learn.

Chart 10.7 shows how the teachers' rate the students in the 3 classes in terms of their ability to self-manage, self-monitor and self-modify. As the teachers have no clear rubrics to meaningfully measure these qualities, with different teachers having different perceptions of what these could mean, the scoring by different teachers therefore differs. However, from perceptions the high ability group scores best in self-managing, self-monitoring and self-modifying compared to the other two classes that are classified as students with mid-abilities. In future, we have to have a rubrics to assess students in this area so as to be able to rate the students in this area meaningfully.

Chart 10.7: Teachers' Scoring on Students Learning Behaviours [Teachers' Survey]

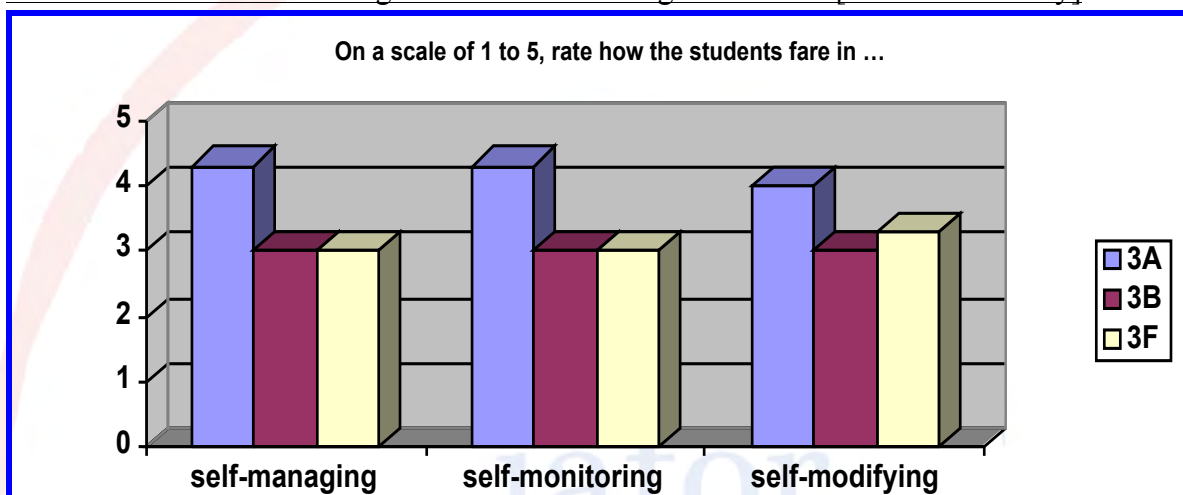

Chart 10.8: Pace of Lessons [Students' Survey]

About 40 % of the students felt the lessons were satisfactory with about another 41 % expressing that it was good. Here the answers could have been scaled so as to them less probability of picking the neutral answer or satisfactory when they are not too sure how they feel towards the lesson. To the students, satisfactory could mean that they are as the term suggests, satisfied with the lesson.

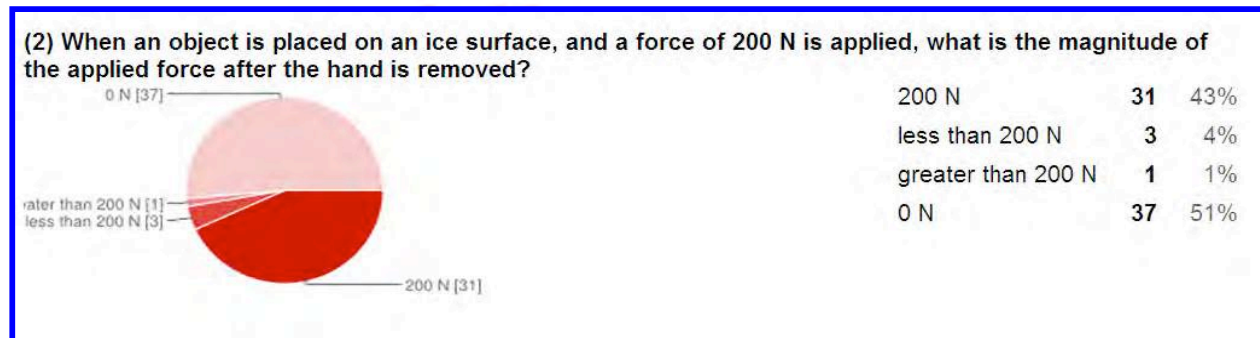

Charts 10.9: Overall rating of lesson [Students' Survey]

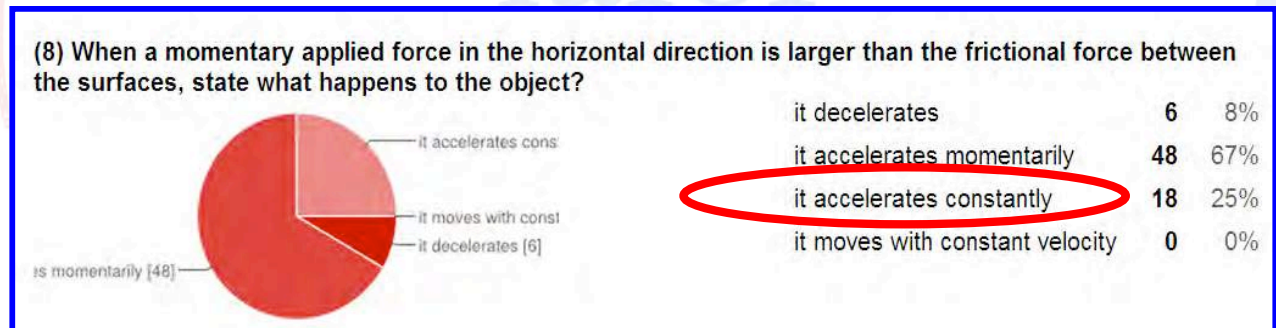

Overall, 79% of students found the pace of lessons suitably well-paced [Chart 10.8]. This series of ICT-based lessons also received positive feedback [Chart 10.9] from the students, though there are about 20% of the students who do not take to this method of learning. We do agree with the 18 % of the students that the lesson can certainly be improved.

## 11. Analysis of Quiz

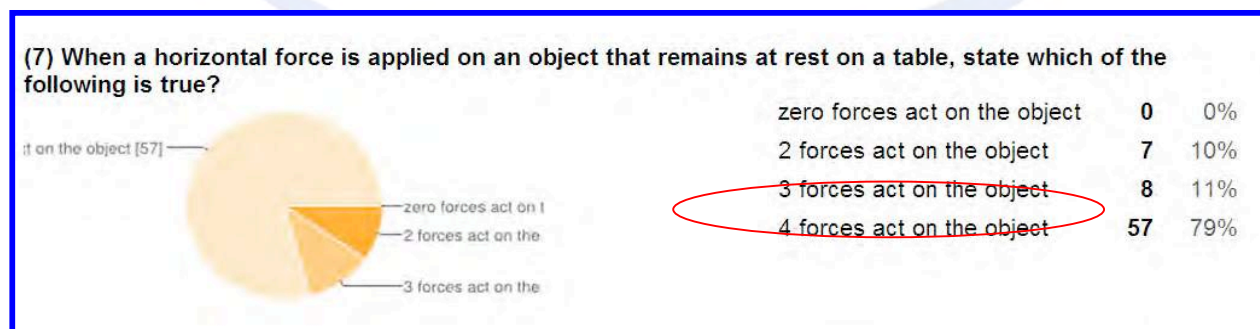

### Concepts and Misconceptions from Quiz

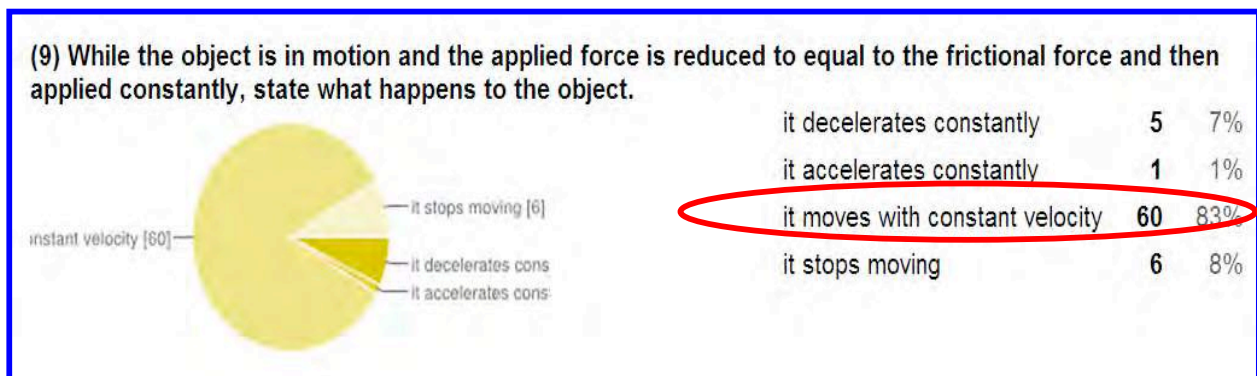

The answer to the above questions indicated that students have misconceptions that after the hand was removed, the applied force is of 200 N is still present. There were 43 % who had this misconception which also surfaced in the test that followed although the number with the same misconception had reduced. A small percentage still had the misconceptions that after the object was thrown it will continue to accelerate under the action of the momentary applied force.

This same misconception is reflected in question (8) where students indicated that the momentary applied force is able to accelerate the object constantly.

Question (7) indicates students demonstrating understanding of the concepts of object at rest may not mean no force acting on it. 79% understood that there could be 4 forces acting on it even though it is at rest.

Question (9) indicates students understanding of the concept that when forces are balanced an object in motion moves with constant velocity with a small number still having the misconception that it will stop moving and another small percentage of 5% having the misconception that it will decelerate.

## 12. Teachers' Post-Lesson Reflections

- (1) Time to be given for students to complete the three worksheets instead of one in class. This is because being able to see their partners face to face in a discussion promotes more exchange of ideas.
- (2) Teachers could also make the instructions on worksheet and questions clearer by getting other teachers teaching the same subjects to try out the questions and surface any questions/instructions that are unclear.
- (3) We can also try to assign pairing between the better students with the weaker students instead of leaving it open to student instructions.
- (4) The guided inquiry can include not just PHET simulation but also Youtube videos that demonstrate Newton's Laws of Motion and so that students learn with real life examples and are able to explain them on their own. That will take the learning to another level as they learn using multimedia.
- (5) The 20 multiple choice questions to be administered to a control group as well to check for the difference with the intervention measures using ICT and that taught by the traditional method.
- (6) The questions to gather both teachers and students feedback on Self-directed learning, ability to collaborate and opportunities for use of Critical Thinking Skills should not be in discrete steps of percentages of 20% if it is to more accurately measure and reflect the abilities and confidence of the students for SDL, CoL and CTS. Suggestion for the next project to be collecting data which allows easy analysis of data yet allows for a wider range of responses to accurately reflect the situation.
- (7) To gather qualitative data on student's response to engagement level, activities engaged in, ability to collaborate, self-directed and ability to engage in critical thinking, it is recommended that teachers craft a rubrics or checklists to observe this grade these abilities.

- (8) The same rubrics could be used for students to grade themselves so that both teachers and students taking part in the Research have the same understanding of what each of these terms collaborative, self-directed and critical thinking skills mean.
- (9) Answers like neutral or satisfactory are usually selected by students who choose to be non-committal and hinder us from getting accurate data and therefore some modifications may have to be done to the responses provided to avoid it.
- (10) When we asked students the level of the difficulty they encounter in deducing the concepts, clarification could be made as to the nature and type of difficulty they encounter.

### **13. Conclusion**

The use of ICT-enhanced lessons has proven to be engaging for most students. It provided students with the opportunity for collaborative learning (CoL), self-directed learning (SDL) and to use critical thinking skills (CTS) in problem solving. Using Teaching for Understanding framework to guide our crafting the inquiry-based and by applying technology has enabled us to see students collaborating, doing self-directed learning with use of critical thinking skills and thus preparing a generation of students who will be the workforce of the future.

A parting word is that ICT-enhanced TfU lessons will have to be done as a school so that it becomes a culture and then we can altogether build the workforce of tomorrow.

Rajamangala University of Technology Lanna, Thailand

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

The objective of this research was to find out the effect of studying of computer assisted instruction program in the course of Educational Psychology in 2 units: Intelligence quotient Emotional quotient and Aptitude and Learning and transfer of learning for students in the division of Industrial Education, Faculty of Engineer, University of Technology Lanna Chiangmai Campus who took class in Educational Psychology in semester 2/2011, and to compare the learning achievement of students between the use of computer assisted instruction program and usual instruction. The samples were selected by using a purposive sampling method. There were 35 students in the experimental group studied with computer assisted instruction program and 35 students in the control group studied with usual instruction. An achievement test was administered to both groups after completion of the experiment. The efficiency was analyzed by using KW-CAI formulas. The learning achievement between the two groups was compared by using a t-test independent statistic with SPSS program. Results of the study found that:

1. The efficiency of the computer assisted instruction program was 81.20 percent in which it was at a fair level.
2. The learning achievement of the experimental group was significantly higher than that of the control group at the level of .05.
3. The satisfaction of the computer assisted instruction program was good.

Key-Words: - computer assisted instruction/ educational psychology

## Introduction

RMUTL aims to enhance students' professional development in language, science and technology. Instructors play an important role in creating teaching strategies according to their students' needs. Learning and teaching today is necessary to develop and apply advanced technologies used in conjunction with the teaching and learning in order to optimize the learner. Student-centered learning is an approach to education focusing on the needs of the students, rather than those of others involved in the educational process, such as teachers and administrators. It seeks to empower and enable students to take autonomy for their own learning, thus relying less and less on the teacher. A certain university sought to promote student-centred learning across the entire university by employing many methods such as analysis of good practice by award-winning teachers in all faculties to show that they made use of active forms of student learning, subsequent use the analysis to promote wider use of good practice, a compulsory teacher training course for new junior teachers, which encouraged student-centred learning etc. (Kember, 2009). CAI is one of several student-centered approach which used multimedia program to encourage students to learn and retain greater interest. It assists students to learn by themselves without restrictions of time or place.

**Objectives of the research** are as follow:

1. To study the result of using CAI in the course of educational psychology
2. To compare students' achievement between using CAI and normal classroom methods
3. To study the students' satisfaction towards CAI in the course of educational psychology

### Research hypothesis

This study seeks to find out:

1. The CAI is effective more than 80%
2. The difference in students' achievement between CAI and normal classroom is statistically significant.

### Benefits of the research

CAI brings with it several potential benefits as a teaching/learning medium. These include self-paced learning, self-directed learning, the exercising of various senses and the ability to represent content in a variety of media. With self-paced learning, learners can move as slowly or as quickly as they like through a program. If they want to repeat some task or review some material again, they can do so as many times as they choose. The program will not tire or complain about repetitions. Learners can skip over a topic if information is already known, making the learning process more efficient. With self-directed learning, learners can decide what they want to learn and in what order. Various studies (Entwistle, 1981; Schmeck 1988; Ford and Chen, 2001) have shown that when

learners can learn in a way that suits them, improvements in the effectiveness of the learning process normally ensue. However the benefits of this study are as follow:

1. To study the results from using CAI in the course of educational psychology in unit of Intelligence and Learning
2. To be a guideline in developing CAI in other subjects
3. Students have positive attitude towards self access learning.

## **Literature search**

What is 'Computer Assisted Instruction' (CAI)?

Since technology has been used to streamline many educational tasks. There are different types of educational computer use. The educational uses of computers that are considered to be computer-assisted instruction (CAI) or computer-based instruction (CBI) are those cases in which either instruction is presented through a computer program to a passive student, or the computer is the platform for an interactive and personalized learning environment. CAI can be used either in isolation, bearing the whole responsibility for conveying instruction to students, or face-to-face teaching methods. Lots of researches have shown that the combination of conventional and CAI instruction has been most effective in raising student achievement scores.

## **Types of CAI**

CAI falls into two basic types which are tutor or tool (Levy, 1997), although the term CAI often refers to computer tutors. In the tutor classification, the computer has the information to be learnt and controls the learning environment. A CAI tool enhances the teaching process, usually by focusing on one particular learning task and aiming to improve it. Within the tutor classification, there are four modes: drill and practice, tutorials, simulations and games (Gloor, 1990). Drill and practice is suited to the behaviourist model, with repeated practice on lower-level cognitive skills. Although often frowned upon, it can be useful in certain contexts. The tutorial mode is probably one of the most common ones within CAI. In this mode, the computer presents the information, guides the learner through the system, allows the learner to practice and then assesses the learner. This research was working in this mode.

## **The efficiency of media**

In order to find the efficiency of learning media, learners have to achieve the objectives at the minimum level from the pre-test, assignments or post-test. Generally, the benchmark comes from the average of assignments and testing which refer to  $E1$  and  $E2 = 90/90$ ,  $85/85$  or  $80/80$

For instance, Suraporn Gaikhan has developed a computer assisted instruction for website programming II class. The study revealed that the package was developed more effectively as  $84.03/83.56$ , which perform better than the criteria set  $80/80$ . The criteria of the effectiveness

of learning are assessed from performance before learning was 19.61 and efficient post learning was 83.56, so computer assisted instruction developed allows the students effectively increase learning 63.94, which met the criteria set is 60. The satisfaction of samples are an average 4.37 which is high satisfaction. Moreover, Duangnapa pitathanang has developed computer assisted instruction for computer instruction class. The result of the study showed that effectiveness of the lesson was at 84.33/86.92 higher than the criteria set at 80/80. The performance after learning is equal to 86.92, compare with performance before learning, which is equal to 84.33 show that the performance during the study is better.

### **Testing the effectiveness of CAI**

There is a research about teaching and learning using computer assisted instruction (CAI), which found that achievement and perform better than students taught by traditional instruction. Tests to evaluate the effectiveness of CAI usually follow the psychometric tradition. This involves using standardized proficiency tests to measure the effects of instructional programs or methods on student learning outcomes and comparing the results. There will be two groups of students. The group that use a CAI program was called experimental group another group was the control group which will be taught in the traditional classroom setting. Sometimes a pre-test is carried out whereby each group is examined on knowledge before partaking in the learning process. At the end of the instruction period, the two groups undertake a test to determine what has been learnt. This type of evaluation of the CAI process is the most common because it follows traditional methods and is easiest and least labour intensive to perform.

### **Related theories**

Connor et al. (1999) report that CAI should be based on educational theory, otherwise the learning is left to chance. Although there are no clearly defined boundaries between the various different educational psychologies, there are four basic groups. Behavioural psychology (Skinner, 1968) focuses only on objectively observable behaviours and discounts mental activities. The cognitive model (Merrill, 1991) holds the view that knowledge is constructed and is not simply a learned response. This model considers the active mental processing that occurs and the setting (individual, group and environment) when acquiring knowledge. The constructivist approach (Jonassen, 1991) considers the nature of knowledge, the mental activities of learners and how knowledge develops in learning. In this model, learners use their intuitions to link prior understanding and new knowledge, which can be acquired by new experiences and interaction with the physical world. The humanist psychology of Maslow (1954) and Rogers (1969) is complex and based on personality. It is founded on generally accepted principles of human nature (Merriam and Caffarella, 1991) and argues that learning occurs as a result of intrinsic motivation and reflection on personal experience. Thus, as more experience is gained with CAI and better technology becomes available, CAI applications based on more advanced educational psychologies have been developed.

## Research Methodology

The research methodology of this study are as follows:

1. Create the CAI in the course of Educational Psychology
2. Study the result of analyzation of the test group of student's performance using CAI
3. Analyze the test group of students' and their satisfactions' towards using the CAI method

## Steps for creating CAI

There are 6 steps for creating CAI in this research.

1. Analyzing the content from the topics of Intelligence quotient, Emotional quotient, Aptitude, Learning and transfer of learning. All contents should be divided in a series of short lessons. Each lesson consists of images, text labels, video clips and sound waves. We call these simplified objects as 'templates'
2. Setting the behavioral objectives of those topics.
3. Presenting to content experts
4. Writing the script or the story board. Hence the name implies; what goes in, what comes out and what point of time as stated 'CAI' is a form of interactivity which also means real time scripts for each and every object(s) coming in and out to interact with the user.
5. Studying the programs for creating CAI. Choosing the preferred program/utility for creating each 'object template' is also an important factor. Such as when working with high quality 'Images' (ie. JPG/JPEG) retouching them; we would use the practical software 'Adobe Photoshop', but if we were to aim for a lower quality or a rather small sized animated image such as a 'GIF' file (a type of pre-packed animation sequence images) we would rather use 'GIF animator studio' or the like, Choosing the right software for the job can save much time and effort.
6. Presenting multimedia production to the experts. For the final part, professional production experts such as animation studios can help render both, in and out the necessary parts of the final script making the final impact to the user more practical.

## Software used

The researcher used many types of software in order to create CAI:

1. Macromedia Author ware (the main software)
2. Macromedia Dreamweaver
3. Macromedia Flash
4. and Adobe Photoshop

## Research instruments

The instruments used in this study are as follow:

1. Computer assisted instruction in the course of educational psychology
2. CAI's experts evaluation form
3. Achievement tests
4. Satisfaction questionnaires

Researchers create questionnaires for content experts, questionnaire for multimedia production experts, and questionnaire for students' satisfaction. Each questionnaire consisted of 23 statements in 4 sections : 5 items in content and use, 4 items in figure and semantics, 5 items in font and color, 4 items in testing and 5 items in management lessons. Each section presented in 5 point Likert scale : excellent, good, average, fair, and poor.

## Data analysis and statistics used

In order to find out the effectiveness of the CAI, researcher applied these statistics.

1. Determination of compliance between the test and the objectives using these formula

$$IOC = \frac{\sum R}{N}$$

$IOC$  = Item objective congruence index  
 $\sum R$  = Total of experts' opinions  
 $N$  = number of experts

Formula for finding level of difficulty

$$p = \frac{R_H + R_L}{N_H + N_L}$$

$p$  = the difficulty of the selected items  
 $R_H$  = number of students selected the high scores group  
 $R_L$  = number of students selected the low scores group  
 $N_H$  = number of students in the high scores group  
 $N_L$  = number of students in the low scores group

Formula for finding level of discrimination Power

$$r = \frac{R_H - R_L}{N_H} : (N_H = N_L)$$

$r$  = discrimination power of the items  
 $R_H$  = The number of students who have correct answers in the high scores group.  
 $R_L$  = The number of students who have correct answers in the low scores group.  
 $N_H$  = Total of the students in high scores group

$N_L$  = Total of the students in low scores group

Formula for finding level of reliability by Kuder and Richardson

$$KR-20 = \frac{K}{K-1} \left[ 1 - \frac{\sum pq}{\sigma^2} \right]$$

KR-20 = Reliability of the test

K = Number of items in the high score group.

P = The ratio of the students who did correct answers in each item

q = The ratio of the students who did incorrect answers in each item

item

$\sigma^2$  = Variance of the scores

$$= \frac{N \sum X^2 - (\sum X)^2}{N^2}$$

X = Scores of each students

N = Number of students who take the test

Formula for finding the mean of the experts' opinions

$$\text{สูตร} \quad \bar{X} = \frac{\sum X}{n}$$

$\bar{X}$  = Mean of the sample group

$\sum X$  = Sum of the score in all group

X = individual score

## 2. Determining the effectiveness of CAI

The researcher used KW-CAI : Qualitative analysis of the efficiency of the lesson for finding the effectiveness of CAI

$\bar{E}_b$  = Average of the students who do right answers on the assignments

$\bar{E}_a$  = Average of the students who do right answers on the tests

$$\frac{\sum \left( \frac{x}{A} \right)}{n} = F$$

$$\bar{E}_b = \sum_{i=1}^n \left( \frac{x}{B} \right)_i$$

$$KW-CAI = \frac{\bar{E}_a + \bar{E}_b}{2} \times 100$$

Evaluation as a percentage follows :

95-100 = Excellent

90-94 = Good

80-89 = Fair

Below 80 = Poor

## Sample group

The sample groups are third year students from industrial engineering and second year students from electronics engineering who enrolled in Educational Psychology. Respondents were selected by purposive sampling

## Research Results

### 1. The result from CAI's expert evaluation

Topic	n	$\bar{X}$	S.D.	Meaning
Content	2	4.78	0.10	Excellent
Multimedia production Technique	3	4.75	0.41	Excellent
<b>Total</b>	<b>5</b>	<b>4.76</b>	<b>0.25</b>	Excellent

### 2. The result of students' achievement

Achievement test	n	Total score	Means	Effective
Assignments (40 cores)	35	18.35	0.53	81.20
Tests (60 scores)	35	29.00	0.83	

### 3. The result of students' achievement analysis

Experimental group	n	$\bar{X}$	S.D.	t
CAI classroom	35	51.08	4.728	3.364*
Normal classroom	35	45.31	4.694	

## Conclusions

Conclusions from The effect of computer assisted instruction in the course of educational psychology for students of faculty of engineer, the division of industrial education, Rajamangala University of Technology Lanna, Chiang Mai Campus are as follows: Learner-centered approach did change and develop the students' behavior. The CAI has been effective at 81.20% which is higher than 80% the research hypothesis and the achievement test compared between CAI classroom and normal classroom is statistically significant at .05

## Suggestions

The suggestions from this study are: CAI is a teaching instrument which should be designed cooperatively by the instructors, the curriculum developers and the technicians and CAI in other subjects should be developed and evaluated for the effectiveness, and should be easily accessed by students.

Nanyang Polytechnic, Singapore

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

Teaching human anatomy and pathophysiology involves memorizing names, visualizing pictures and also understanding difficult Latin and Greek terminology. This paper provides an insight in the use of the Computer Based Teaching (CBT) as a pedagogical approach to create e-learning material which can be integrated and used across different courses for better learning outcomes. This study focuses on three CBTs that were developed in-house by the biological sciences department, namely Bone Box, Coronary Artery Disease (CAD) and Histobox. The survey result on students learning using CBTs showed significant improvements in their learning behaviour and test grades. The students preferred choice of learning is e-Learning with Histobox compared with traditional lecture and practical using microscopy,  $Z=13.107$ ,  $p<0.001$ . Our student survey revealed that 98% of the students agreed that the CBTs helped them to understand and learn the subjects better. The survey results also revealed that 94% of the students agreed that the CBTs can help to replace traditional teaching by practical sessions. About 89% of the students also agreed that the CBTs helped them to improve in their assessment grades. Thus the student learning outcome of better knowledge and test grades were achieved. The case-scenarios and assessment quizzes used in the CBT improved the higher order critical thinking. One interesting finding of the survey showed that student preferred interactive quizzes and assessment tools more than game based learning activity. These CBTs are used seamlessly as an integrated e-Learning tool to teach across the seven different courses for Health Sciences and Engineering students.

## **Introduction**

E-Learning includes the use of electronic devices such as computer for a network enabled transfer of skills and knowledge to the learner. Pedagogy is the art and science of education. There are numerous pedagogical approaches that can be used for e-Learning. Such as use of quizzes, interdisciplinary learning, teaching through games, problem based learning, team teaching, case study. A recent study involving 227 courses in 31 educational institutes in Ireland for mental health professionals showed benefits of interprofessional pedagogical approach for health science education (McCann et al, 2012).

Generally, students in vocational schools are expected to spend much more time and effort in learning a variety of technological skills as compared to those in academic universities (Shen et al, 2008). If one of the primary goals of e-Learning is to promote active involvement, then the teachers and instructional designers need to better understand the design of learning tasks in stimulating and sustaining learner engagement (Hedberg, 2003). The combination of problem based learning and self-regulated learning can improve student involvement in the vocational course from beginning to end (Lee et al, 2008).

Integration of e-Learning technologies in an interprofessional health science course enhances student's perception of their learning without compromising pedagogy (Mike et al, 2008). Many health sciences information technology initiatives were designed to use asynchronous technology to replace face-to-face classroom teaching in health disciplines like medicine, nursing, occupational therapy, pathology and dentistry (Ricciardone et al, 2003; Spinello & Fischbach 2004; Mash et al, 2005; Upton, 2006). Research provided evidence of broad acceptance of the existing model with practioners, but indicated that teachers would take this tool and remodel in for their own contexts of learning to make it meaningful, relevant and useful to their level of skill and knowledge (Freitas et al, 2007).

In this paper, we describe how different instructional designs were used to develop three biological science CBTs for an integrated e-learning. The pedagogical instructional approach is also varied to suit the content and the expected student learning outcome. Our current model of CBT is based on customized content to cater to the needs of our multidisciplinary teaching of biological sciences topics across different courses and specialties. We believe that this approach of e-learning in health sciences education will increase student involvement and motivation to learn with their own pace when compared with face-to-face learning. A survey on the student learning outcome and preference of content delivery will be done. This will clarify if our current practice of using custom made CBTs will have a positive implication for our integrated e-Learning approach in the School of Health Sciences, Nanyang Polytechnic.

## **Methodology (Pedagogy)**

The School of Health Sciences ventured into e-learning by continually expanding its e-Learning curriculum by developing new multimedia packages. Currently there are more than 40 computer based e-Learning packages providing learning experiences that lead to students' comprehension and mastery of new skills and knowledge in diverse areas. The use of integrated teaching is a new pedagogic approach used to maximise the effectiveness of health sciences teaching and learning, especially in the field of nursing and allied health topics which is highly integrated and multi-disciplinary in nature. Here, we describe three CBTs with different instructional designs and pedagogical approach.

*HistoBox*: Histology is studied under Anatomy as “Microscopic Anatomy”. The HistoBox is designed as an integrated e-Learning platform for students to learn basic histology. It is customized for the learning needs of students in the School of Health Sciences (SHS) and School of Engineering (SEG), Nanyang Polytechnic (NYP). Users should begin learning with “*Learn*” to read theory then “*Practice*” with slides followed by assessment of their learning through the interactive “*Play*” and finally use “*Think*” to apply their learning to some clinical conditions. The lecture, tutorial, practice and assessment of various tissues are integrated into a single package using e-learning as an enabling technology.

*BoneBox*: Traditionally skeletal system and bones are the first topic to be taught for all SHS and also SEG modules. Students had difficulty coping with the subject content, while our lecturers found it challenging to teach. They had difficulty learning bones and needed several rounds of tutorial and practical sessions. With the limited bone specimens and increased student intake, the students were thronging the bioscience resource center to learn bones. They had to scramble to get hold of the bones to revise for the practical test. Through a seamless collaboration between the subject expert and multimedia developers, we produced a highly integrated interactive e-learning package for studying bones. The design and development of the bone box is based on the *famous dictum of Confucius*,

**“Tell me**, and I will forget.

**Show me**, and I may remember.

**Involve me**, and I will understand.”

*Coronary Artery Disease (CAD)*: This CBT provides a basic understanding of the heart and its common disorder “myocardial infarction”. Myocardial infarction is regarded as a single top killer disease in Singapore and other developed countries. The design and development is based on the “*step by step*” approach in learning and understanding the topics from basic “Anatomy of heart” to ultimately managing a patient with “myocardial infarction”. It will help in understanding the topics at following levels.

- 1: Knowledge
- 2: Comprehension
- 3: Application (quiz)
- 4: Critical thinking and above (Case scenario)

## Results

All the three CBTs were uploaded into the NYP “Course Management System” (CMS) as a digital media repository (DMR). They are then tagged into any individual modules offered by the biological sciences department to the SHS and SEG course modules. A detailed survey was carried out to assess the effectiveness of learning and assessment outcomes. A Wilcoxon test (Table 1) was conducted to evaluate students’ preference for the Histobox or the microscope method in terms of ease of operation. The results indicated a significant difference ‘ $Z=12.99$ ,  $p<0.001$ . The students also found the content for the HistoBox to be more interesting than for the microscopy session,  $Z=13.23$ ,  $p<0.001$ . The students preferred choice of learning is HistoBox compared with microscopy,  $Z=13.107$ ,  $p<0.001$ . The figure 1 shows the screen capture of the four segments of HistoBox. The “Learn” segment of the CBT gives information and figures similar to the lecture concept. The “Practice” segment gives information similar to a practical lab set up. The case studies

in the “Think” segment in the CBT help to bring about higher order critical thinking and apply their knowledge learned in a clinical setting. The “Play” segment is mainly used as an assessment tool to learn in a fun way, like answering MCQs in an SMS format using an iPhone interface. The HistoBox is an integrated package to teach histology for students across various modules, courses and schools in NYP. The survey results indicate that the students preferred it over the actual face-to-face practical lessons. They can zoom in and zoom out their slides as viewed using microscope.

**Table 1. Wilcoxon Signed Ranks Test for HistoBox (E-histo) survey (n=242)**

		Ranks			
		N	Mean Rank	Sum of Ranks	
Ease of use for E-histo - Ease of use for microscopy	Negative Ranks	1 <sup>a</sup>	33.00	33.00	a. Ease of use for E-histo < Ease of use for microscopy
	Positive Ranks	218 <sup>b</sup>	110.35	24057.00	b. Ease of use for E-histo > Ease of use for microscopy

# NYP e-Bone Box

**Pelvic girdle**

The pelvic girdle consists of a pair of hipbones.

**Show & Tell**

**Cranium**

The skull consists of 22 bones. It is formed by two groups of bones.

- A. Cranium is formed by 8 bones.
- B. Face is formed by 14 bones.

The cranium consists of 8 bones:

- 1 frontal bone
- 2 parietal bones
- 2 temporal bones
- 1 occipital bone
- 1 sphenoid bone
- and 1 ethmoid bone

**Practice**

1. Skull  
2. Bones  
3. Build a skeleton  
4. Identify the bone

**The design and development of the "NYP e-Bone Box" is based on the famous dictum of Confucius:**

**Tell me, and I will forget.**

**Show me, and I may remember.**

**Practice, and I will understand.**

**Student learning is active and integrated.**

**The Bone Box is also integrated to teach across various modules, courses and schools.**

**Table 2. Summary of sample survey questions for BoneBox**

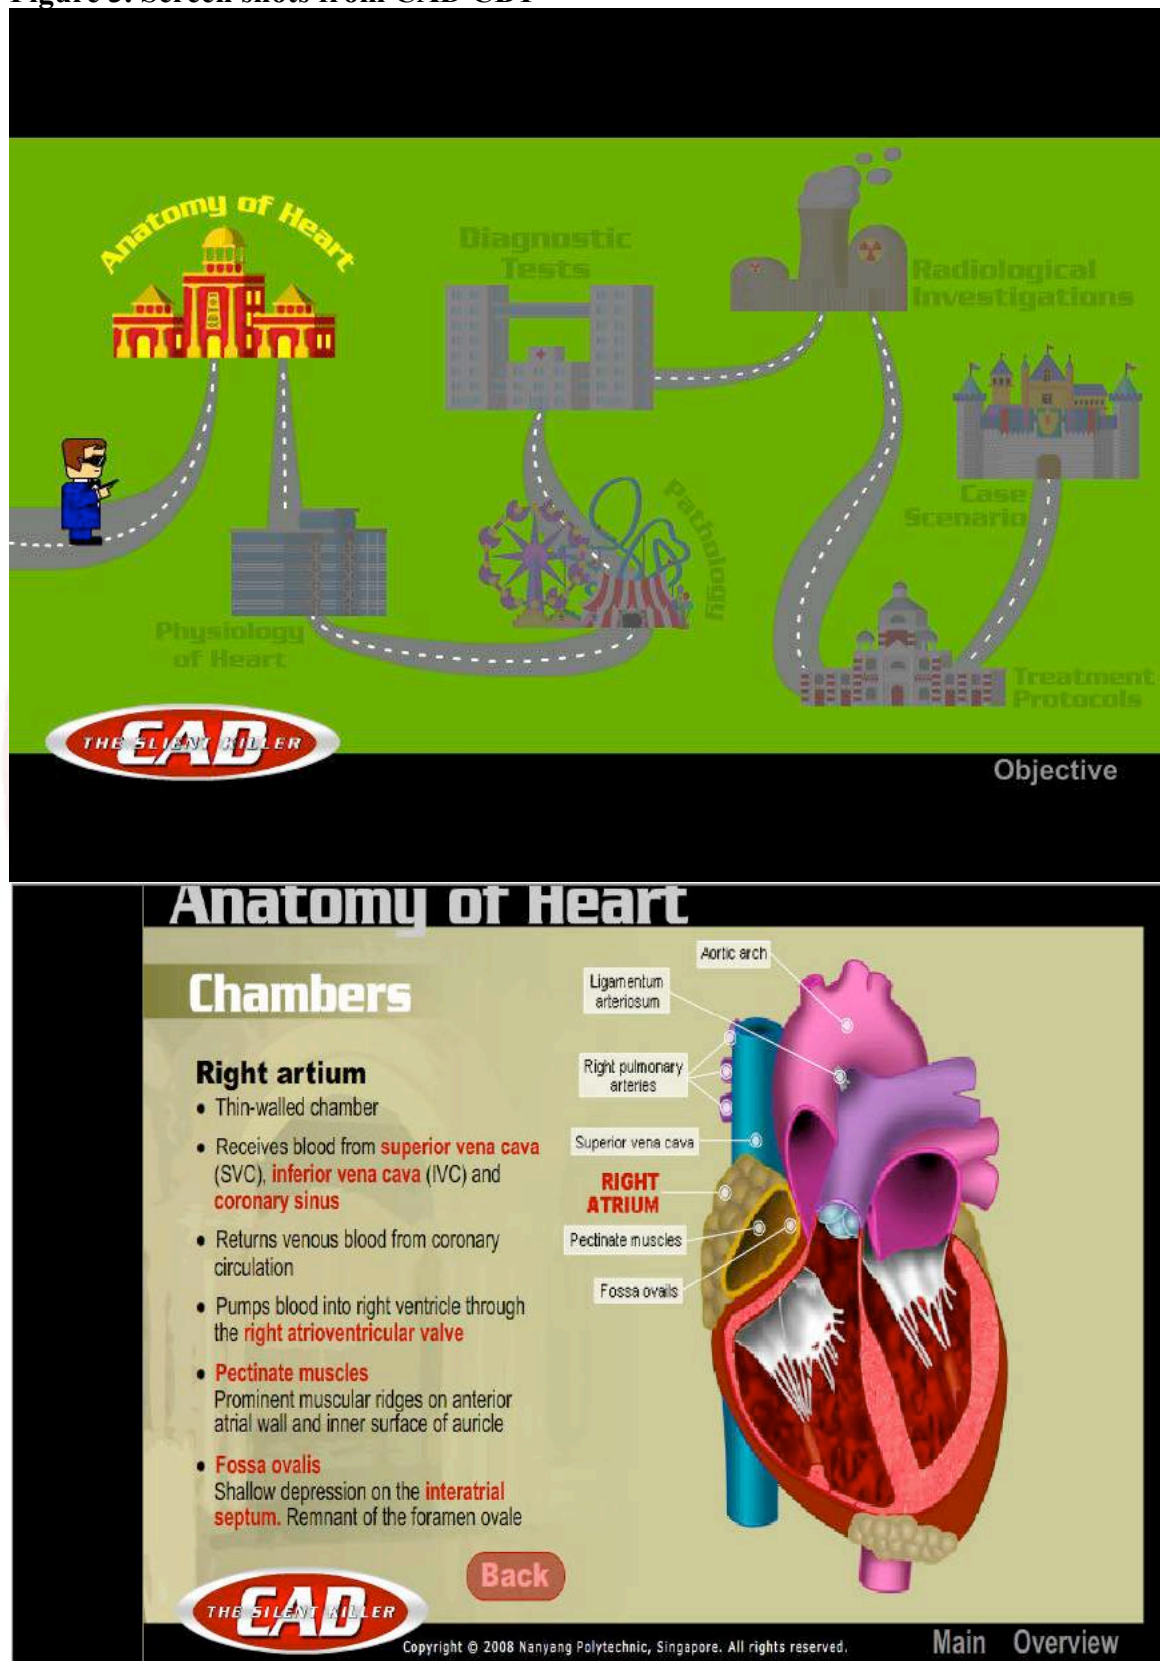

Survey Questions for BoneBox		% options selected (n=100)			
		Strongly disagree	Disagree	Agree	Strongly Agree
Q1	Learning the new terminology on bones is difficulty.	11	27	55	6
Q2	Learning bones without practical is difficult.	6	3	23	68
Q3	Bones are better learned with pictures and models.	5	2	19	74
Q4	The current external web sites on bones are either simple or complex with too many details.	3	45	48	3
Q5	<b>The NYP bone box is designed to our learning needs.</b>	<b>42</b>	<b>53</b>	<b>0</b>	<b>5</b>
Q6	<b>The design of NYP bone box is simple and interactive.</b>	<b>3</b>	<b>2</b>	<b>60</b>	<b>35</b>
Q7	The NYP bone box helped me to understand and learn the bones better.	5	2	74	19
Q8	The NYP bone box can be used as an e-Learning tool to enhance our practical lesson on bones.	2	3	56	39
Q9	The NYP bone box can be used to replace our practical on bones.	43	51	5	2
Q10	<b>The NYP bone box has helped me score better grade for my practical test.</b>	<b>2</b>	<b>10</b>	<b>68</b>	<b>21</b>
Q11	<b>The feature that I liked most in the NYP bone box is/are (You may select more than one options)</b>	<b>66</b>	<b>66</b>	<b>79</b>	<b>60</b>
		<b>(Picture)</b>	<b>(Text)</b>	<b>(Quiz)</b>	<b>(Game)</b>
Q12	I enjoyed doing the skeleton building game and it helped in my understanding on the orientation of bones.	3	2	76	19
Q13	My overall rating on the interactive features in the NYP bone box is	0	2	62	36
Q14	<b>My overall rating of the "NYP bone box" computer based learning aid pedagogy is</b>	<b>0</b>	<b>2</b>	<b>68</b>	<b>31</b>
		<b>(Poor)</b>	<b>(Satisfactory)</b>	<b>(Good)</b>	<b>(Excellent)</b>

The BoneBox is user friendly and interactive. It also injected an element of fun by including a skeleton building game. The "BoneBox" was developed as a "3-in-1" educational tool that can be used for: (i) **e-Learning** (including e-Learning reusable objects), (ii) **m-Learning** (the file size is small and it can be loaded into mobile devices), (iii) **i-Learning** (integrated to teach multiple modules across different courses and schools). The "e-Bone Box" is an effective "borderless educational package" and can be used for over 10 modules in various courses and schools (SHS, SEG and SCL). The contents were pitched to student's needs. Students can learn and revise at their own pace and convenience. The practice quiz and other interactive tools can translate to better understanding of the subject content and better test grade for the practical component of their individual course module.

The coronary artery disease CBT is designed with the student acting as an agent trying to explore "step by step" the different learning segments, starting from basic anatomy of the heart, followed by pathophysiology, diagnostic lab tests (including radiology for our radiography students), followed by treatment protocols and nursing management of a myocardial infarction patients. The final segment is on case scenarios where the students are given different patients scenarios and area asked to do the nursing and physiotherapy management for these patients. If students fail to understand the cases and answer the quizzes wrong they go back to the basic topics and redo the learning and come back again to redo the final critical thinking segment. This enables the student to

integrate different concepts learnt and understand interprofessional care management protocols a doctor, nurse, radiology and physiotherapist.

**Figure 3. Screen shots from CAD CBT**

### **Some descriptive feedback from students:**

“Great effort and creativity. Please keep up the effort and good work.”

“Even though I did not go through all the elements in the bone box, I find it really useful. It is a fun way of learning! I had a good laugh building the skeleton and watching it collapse before me! It is a good complement to the practical lab, practical test. More practice definitely helps us learn better. Thank you so much for the effort!”

“It is hard to grasp so many bone terminologies within such a short period of time, but with the help of the NYP bone box and also our lecturer, Dr Ponraj, it definitely makes my learning easier.”

“It is really fun and enjoyable using the NYP bone box.” “I like the skeleton game! So cutie!”

“Learning histology became more interesting and fun with the help of e-learning materials, specifically the NYP HistoBox.”

“Retain learning bones with practical lab. It enhances my understanding better than the computer-based learning. The "NYP bone box" can be mind-boggling one. I see it as another useful tool for topic (theory) learning when practical lab isn't available.”

“Very entertaining experience for learning coronary artery disease using CAD.”

### **Discussion**

Previous studies have highlighted the importance of using technologies to help in student learning (Connolly et al, 2007; Liu & Tsai 2008). Computer Based Teaching is synonymous to e-Learning in the School of Health Sciences, Nanyang Polytechnic. The CBT are mainly used for teaching biological sciences and nursing skills and allow greater flexibility to learn and to maintain their own pace. The CBT pedagogy is one of the effective approaches to deliver up to 30% of e-Learning in our student curriculum where face-to-face class time is reduced but not eliminated. It complemented and increased our student confidence to reach out to real world clinical situation.

The CAD CBT in particular is an excellent tool for an integrated e-learning across various allied health course students and nursing students and enables them to understand inter-professional team work. The CBTs help to create better understanding of the contents, improve team work and to understand the roles of doctors, nurses, radiographers, physiotherapist and biomedical engineers in integrating different tasks of various health care professionals. One of the unexpected out-come of our survey results is that students value the text content and quizzes over games. This is a clear indication that our student learning appetite is focused on assessment as the key element of learning. Although game based pedagogy can be a part of e-Learning, it should not be the main focus e-Learning CBTs. The current study shows CBTs are our student's preferred choice of e-Learning pedagogy than the third party websites and soft wares.

The various segments of our CBTs can be used as reusable learning object where small chunks of learning material are stored digitally and reused or can be referenced for a new module. For example the myocardial infarction and radiological investigation part of the CBT can be used in Radiological pathology module. This concept was promoted by Hodgins (2005) using a lego metaphor. A new CBT can thus be assembled just like a child can combine lego blocks to create a

new object. These Learning objects (LOs) offer a quicker and more effective means of creating a new course material to achieve a new learning outcome. The biological sciences team also used this strategy to develop a new CBT on “Basic Medical Terminology” using the multimedia and learning objects of our existing CBTs.

Recent study showed that the new generation of e-Learners is more demanding and the early enthusiasm has waned and current approach needs a more humane touch (Harden et al 2011). It can be likened to having a tutor constantly available for the student as they work through the CBT, thus a need for a “personal learning assistant”. A commentary or a personal teaching assistant can be used when a learning object is complex, as with some anatomical diagrams or body radiology image tracings. This commentary can be linked to the LOs, like a story as told by the teacher or an animated character. This can complement the student learning and make it as efficient and effective as possible and to contextualize the LOs in the local setting (Harden et al, 2011). Finally, the future direction of our CBTs should focus on developing inbuilt LOs with a humane touch and emotional elements. Such an addition of emotional elements will help learner to have a more personal learning experience as being taught by a private tutor at their own pace and time. A recent unpublished survey on all our CBTs and the student’s preference of mobile educational apps for e-Learning will also be presented at the conference.

## **Conclusion**

The CBT based e-Learning pedagogy has achieved our student learning outcomes as evidenced by the improvement in our students assessment grades. Our studies highlighted the importance of using an assessment-based approach to the instruction design, so that the learners’ outcomes are one of the key rationales for the pedagogical approach, rather than the provision of content. The case-scenarios and other assessment components in our CBTs have improved our student critical thinking skills. The study concludes that the bioscience and health science content is best learned by using customized CBTs to suit our local student needs.

## **Acknowledgements**

The author is grateful to the Directors, School of Health Sciences (AH & N) for the support to develop the CBTs and to conduct the survey. He would like to thank the multimedia technologists Ms Grace Pheang and Ms Melissa Tan for their technical support in the development of these CBTs. The author is grateful to the staff of School of Health Sciences for embarking and promoting the use of CBTs for e-Learning.

Ganesha University of Education (UNDIKSHA), Indonesia

The Asian Conference on Education 2012

Official Conference Proceedings 2012

**Abstract:**

Mastering and developing science and technology that are growing from time to time bring out positive effects on human prosperity, such as the less time and space needed for doing the same activity and more practical techniques used to accomplish a complex task. Beside the many such positive effects, there is a concern about the negative effects of the development of science and technology (which if cannot be brought under control) will be able to destroy this life. Dantes (2009) developed a perspective on the integration of character values into the development of science and technology applied in education called techno-humanistic-based character education.

The above concept was followed up with a study by Dantes (2010) with the focus: techno-humanistic-based character education at formal schools in Indonesia. The study found out that the character aspects (humanistic values) that have to be developed together with the development of science and technology consist of moral awareness, knowledge of moral values, ability to give a moral view and consideration, recognition/ understanding of oneself, work (a perspective on work), conscience, self esteem, empathy, love for virtues, self control, humbleness, compassion, honesty, discipline, responsibility, friendship, courage, perseverance, and decision making.

As a consequence, science and technology development has to be based on the character value aspects that are consonant with humanity, since life in the future will be hard and competitive. References on the change in time has been done by various scholars such as Rossabeth Moss Kanter (1994), Niesbet (1997), Rowan Gibson (1997), Peter Senge (2004), etc who gave a description that in the future there will be a need for education which, in addition to the mastery of science and high technology it should be based on the understanding and mastery of noble character values.

Then, based on techno-humanistic-based character education and the results of the need assessment above, Dantes (2012) develops an initial prototype of techno-humanistic-based character education at formal schools in Indonesia that consists three dimensions, namely (1) mastery of science and technology, (2) mastery of moral values (knowledge, feelings and moral behavior) as well as (3) application of wisdom. The science and technology dimension, moral values (knowledge, feelings and moral behavior) can be transformed through the pillars of learning how to know, learning to do, and learning to be, while the values of wisdom can be transformed through learning to live together and learning to live sustainably. The transformation of the first and second dimensions are at the stage of forming and developing the character values until they are mastered by the student (that is concerned with the aspects found by Dantes (2010), while the third dimension is the implementation of the values themselves in life.

The next stage in the study is to find the techno-humanistic-based character education process to create a school as a caring community.

## 1.Introduction

Education is a process of humanization of humans, in terms of the optimizing of the development of human dignity ( Dantes, 2010). It implies that basically, education has to occur within the human community, and it is in this process that the human cultural transformation occurs from one generation to the next.

The development of the human community is more and more advanced with the finding of science and technology by human-beings in order to overcome problems that they face in addition to the development for the sake of the development of science and technology themselves. In that context, science has three dimensions, namely, ontology, epistemology, and axiology. The ontology of science deals with the object of science itself, which in its development is based on scientific procedure that adopts an open , objective and honest verification in the science epistemological framework, that is expected to offer prosperity to human-beings as the axiological dimension. That is the basis that the development of science on human values ( Jujun Suryasumantri, 2000).

The more advanced the human community, the more differentiated and specialized the needs and demands of life in such a way that makes it possible to create a life that tends to be individualistic that is based on material needs that gradually but surely will cause the life of the community that tends to stress extreme egoism and cronyism.

The community life in today's world is becoming more obsessed with the material needs which are becoming more urgent so that the development of science and technology is also becoming more oriented toward the fulfillment of the material aspects of life and tends to lead to the dwindling of human values as the basis of the development. The domination of material needs in the communities in various parts of the world brings out various non-normative behaviors such as violence, human right violation, murder, etc. such events are happening in Europe, Arab world, United States, and symptomatically in Indonesia. The form of such behaviors as ethnic , racial, religious, and group conflicts are seen in Sambas conflict (2000), that was an interethnic fight between Madura and Dayak ethnic groups. Sampang Madura conflict (2012) or inter-religion sect conflict, Lampung conflict (2012) or an attack of Balinese, Jakarta conflict (2012) or a fight between SMAN 6 and SMAN 70 students, and also the fight between the students of Universitas Negeri Makasar or between the students of the Art Faculty and those of the Faculty of Engineering (2012) and many other events , all of which with casualties. These events are suspected to have been caused by the tendency to giving more priority to the development of science and technology to meet the material needs by neglecting the transformation of human values of the young generation both in the formal and the non-formal education.

In relation to this, Dantes (2010) describes that human activities in mastering science and technology becomes more intensive, especially in the formal education. Almost all activities in

education ( schooling) are oriented toward the development of science and technology alone that all activities are dominated by the reasoning activity only. This occurs very fast and in uniform that with the same speed we feel the dryness of life based on the basic value of togetherness. This condition is strengthened more intensively by the symptoms of global life that every person and nation have to be ready all the time for living a borderless life. Globalization is a logical implication of the advance of science and technology. Related to this, to live in a global community, every nation is required to be ready all the time for competitions to be able to exist in the dynamic life constellation. Information and communication revolution as the direct effect of the advance of science and technology has eliminated regional and territorial borders so that for a particular community this condition has to be addressed quickly and comprehensively in order it does not lose its characteristics ( Schement, 2002; Jannes, 2001). For education, this condition is of course a reality that has to be faced, especially when there is the tendency in education to focus on the mastery of science and technology alone.

In the real life which has become more complex and more globalized, there are more evidence that shows the shallow understanding, the mastery and application of life values in social interactions. The mastery of science and technology which is not based on human values, is thus used as a weapon to master and violate other human dignities. The very low mastery of the human values causes the various human conflicts. Thus, our education should not only be based on the mastery of science and education but should be based on also on human values. The combination of the two dimensions has to be orchestrated in an integrative way in the education of our generation. It is in this relation that education must be able to meet the challenges. Education should provide opportunities to every student to obtain knowledge, skill, and values as his or her preparation to enter global competitions that have become tougher and tougher. Beside the provision of the most ample opportunities, one thing that is also important is offering meaningful learning, since only by meaningful learning the student can be provided with life-skill, while meaningless learning will only become a burden in life.

## **II. Theoretical Background**

### **2.1 Education and Nation Character Building**

Since 1920s Indonesia's educator, Ki Hajar Dewantara has launched an idea that education is basically humanizing humans. To achieve this aim, the condition that is needed in education is the condition that is based on the principle of family relationship, kindheartedness, empathy, love, and respect for every member, *there is no education without love*. Thus, education should help the student to develop free personality, physical health, mental health, intelligence and to make him or her a useful member of the community. A free human being is a person with the ability to develop wholly and harmoniously in all aspects of his or her humanity and the ability to appreciate and respect the humanity of everybody; to achieve this aim, Indonesia with its multiculturalism should adopt the method of education with *among* system, since the

application of this method is based on the principles of *asah*, *asih* and *asuh*. While, the principle in administering the education needs to be based on “*Ing ngarso sung tulodho, Ing madyo mangun karso. Tut wuri handayani.*”

Indonesia as the society with most of whose members belong to the traditional typology. To be able to live harmoniously and happily in the new global environment the society needs a new traditional norm, namely, new values that are rooted in traditional (original/native) values and in the process of development and change, the values can change according to dynamic integrated norm which implies that the change of values is always originated and integrated with the original values that may take the form of the nation's noble values and the values that are originated from local genius.

When we examine some references in relation to the issue above, it is clear that there is a picture of very fast changes of times. Nisbet (1997) offered *ten global megatrends* which will occur in the future and which are known as global millennium megatrends. While Rowan Gibson (1997) stated three things in relation to life in the future, namely, *first, the road stops here*, which, essentially, states that the future will be very different from the past, and that is why there is a need to be able to understand the future well. *Second, new time calls for new organizations*, which, basically, states that with different challenges there is a need a new form of organizations/institutions with the characteristics of high efficiency and the speed of motions. *Third, where do we go next*, which, basically, says that with various changes that will happen, every organization, institution, needs to formulate the right direction of the desired destination. Peter Senge (1994) also stated that in the future there would be changes in the detail complexity to the dynamic complexity that would make an interpolation difficult. The changes that will occur will occur suddenly and unpredictably. While Rossabeth Moss Kanter (1994) stated that the future would be dominated by cosmopolitan values and ideas and every actor in every field, including education is required to have 4Cs, namely, **Concept, Competence, Connection and Confidence**. Thus, in the future there is a need for education that, in addition to the mastery of science and high technology there should be a basis for understanding and mastery of values and strong morality, which the writer calls ***techno-humanistic education***.

Material prosperity that has been achieved by the human being in life is the result of reasoning in science and technology with a direct effect on the prosperity of life. Various findings in science and technology have been obtained, such as the ability to shorten time, various kinds of diseases can be cured, Information Technology grows very fast, etc. have caused the quality of life is getting higher and higher. The facilities that have been obtained will have no meaning if they are not based on values, ethics and strong morality of the users. This can become a boomerang for the human beings themselves. The findings in science and technology can destroy them or even the . Thus there is a need for a basis of a deep understanding of human values. The touch of education is must, since education is *a process of humanizing humans*.

Thus, education is a means of transformation of culture, and education itself is *intangible social culture*. It is also and at the same time supports the culture system, so that advances in the civilization of a society can be measured the level of the quality of its educational institutions. In relation to this, education is required to play a role as an agent in developing the nation's civilization. It is required to be able to form modern values remain Indonesian in their characteristics with various local geniuses, and in many nations, including the developed ones, formal education is an important process for the *nation and character building*. Martin Luther King Jr. said “ *Intelligence plus character, that is the true goal of education*”.

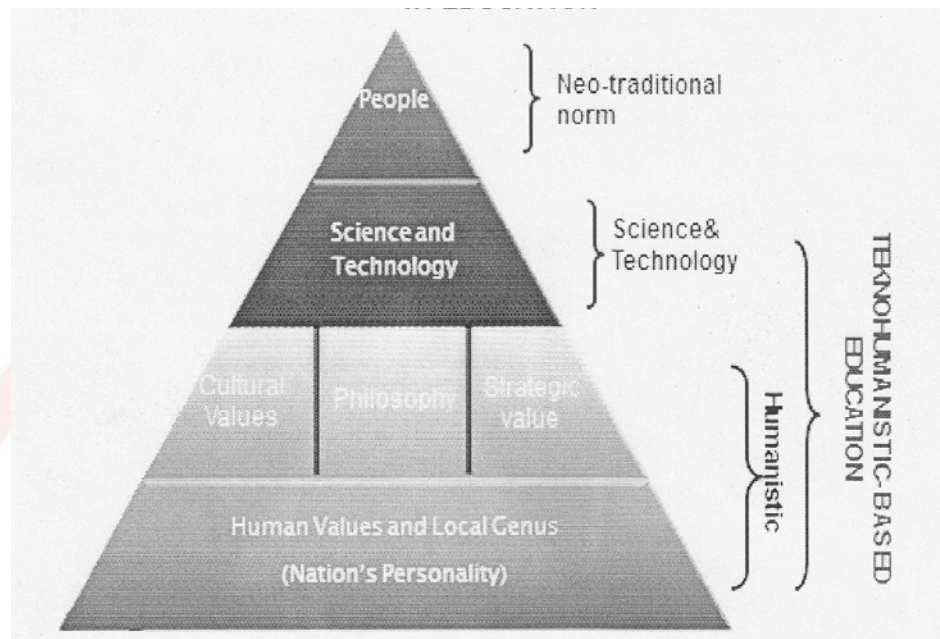

## 2.2 The Paradigm of Education in the Future

Future oriented education is an education that can meet the future challenges, namely, a process that can produce individuals who are equipped with knowledge, skill and values that are needed for the life in the global era.

The International Commission for the 21<sup>st</sup> Century Education that was formed by UNESCO reported that in this globalization era education is administered on the basis of four pillars of education, namely, learning to know, learning to do, learning to be and , learning to live together (Delor, 1996), and Dantes (2010) added one more pillar, that is, learning to live sustainably, which means that the student has to understand the meaning of life, and the sustainability of life in this , so that the sustainability of human life and the support from nature that are harmonious and sustainable can be realized. In this way, through the pillars of the education it is hoped that the student grows into a whole individual, who is aware of all of his or her rights and responsibilities, and who masters science and technology for preparing and sustaining his or her life and for preserving the natural environment where he or she lives.

The learning paradigm that has been used for a long time puts more emphasis on the role of teacher in transferring knowledge to the student. As has been mentioned at the beginning of this paper, today this paradigm has shifted to the one that gives more role to the student to develop the skill he or she , the society, the nation and the country need. Therefore, a model of education that is capable of transforming the intellectual provision with the strong basis of culture is needed, the one that has been called Techno-humanistic Education model. The concept of techno-humanistic education can be shown in the following figure.

## THE CONSTELLATION OF VALUE-SCIENCE-TECHNOLOGY IN EDUCATION

As the implication of globalization and reform, there occurs a change in the paradigm of education. The change is concerned with, *first*, the paradigm of process of education that is oriented toward teaching in which teacher is the center of information is shifted to the learning in which the student becomes the source ( student centered ). With the abundance of alternative learning resources that can replace the function and role of the teacher, the teacher's role has changed into that of facilitator. *Second*, the traditional paradigm of the process of education that is oriented toward classical approach and format in the classroom shifts to the more flexible learning model, such as distance education. *Third*, the quality of education becomes the priority ( which means that quality becomes international quality). *Forth*, the growing popularity of life-long education and the diminishing border between in-school education and out of school education. *Fifth*, with the growing development of science and technology education, and for the sake of human prosperity and good environment, the development of science and technology has to be based on the human values.

### 2.3 Principles of Techno-humanistic Education

Techno-humanistic education is the education that transforms science and culture values that are based on the principle of human dignity. In its administration the techno-humanistic education refers to an effective character education, with the following principles:

1. Techno-humanistic education should develop “ Core Ethical Values” as the basis of good human characters. The basis of the administration of the techno-humanistic education starts from the philosophical principles, that objectively regard pure ethical

- values or core ethical values, such as care, honesty, openness, responsibility, and respect of oneself and others as the basis of good character, that is the basis of the mastery of science and technology that are becoming more complex.
2. Character and techno-humanistic education has to be defined comprehensively, including in them ratio, feeling, and behavior. In the character education program as the core of the techno-humanistic education that generally touches on the cognitive, affective and psychomotor and metacognitive domains contain a broader meaning, and finally can be concerned with behavior aspect in moral life. The techno-humanistic education is based on the mastery of science and technology that is strongly based on understanding and care of basic ethical values, and actions on the basis of the core ethical values.
  3. In relation to formal education, the effective techno-humanistic education requires serious intention, proactivity and comprehensive approach that can stimulate the core values in all stages of school life. It would be better if the school in administering the techno-humanistic education is seen from the moral lens and from this perspective one can see how everything affects the values in the school and the character of the students.
  4. School has to be “a caring community.” The school itself has to show itself as an educational institution that has a good character.

#### 2.4 Comprehensive Approach in Techno-humanistic Education

There are three dimensions of the goal that are covered in the techno-humanistic education, namely, the mastery of science – technology, wisdom and virtues. Education for mastering science and technology has to be based on the axiology of knowledge, namely, for the sake of welfare and prosperity of human beings. School (formal) education that matches the application in various fields/sectors is a strategic endeavor to achieve the objective. Education about virtues is the basis of democracy. Education about values in the framework of student character building needs to be made effective since there are various negative effects that can influence the student’s behavior such as the tendency to deviate from the norm. considering such negative symptoms, what values need to be taught? Two major moral values are “ respect and responsibility”. In addition, there are some values that need to be taught, which include honesty, fairness, tolerance, prudence, self discipline, helpfulness, compassion, cooperation, courage and host of democratic values” (Lickona, 1991;43-45), which will at the end simultaneously build the character of the student.

The character is related to moral knowing, moral feeling, and moral behaving. A good character consists of knowledge about virtues, desire to do something good, and doing something good, or the habit of thinking, the habit of feeling in one’s heart, and the habit of behaving well. In the “moral knowing” component there are six aspects, namely, (1) conscience, (2) knowing moral values, that consists of showing respect to life and liberty, responsibility for others, honesty, openness, tolerance, politeness, self-discipline, integrity, virtues, love, and commitment., (3)

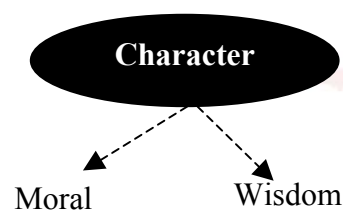

Perspective-taking ( ability to give one's view to other , looking at the situation as it is, thinking about how other should think, react, and feel). (4) moral reasoning is an understanding of what is meant by having morality and why we have to have morality. (5) Decision-making is the ability to make a decision in facing moral problems. (6) self-knowledge ( ability to recognize or understand oneself), and this is the most difficult to achieve, but this is needed for moral development.

In the “moral feeling” component, there are six important aspects, namely, (1) conscience, that has two sides, cognitive ( knowledge about what is right) and emotional side ( feeling that one is obliged to do something good). (2) self-esteem and if we measure our self-esteem, it means that we evaluate ourselves; if we identify ourselves it means that we evaluate ourselves; if we evaluate ourselves it means we respect ourselves. (3) empathy ( ability to identify oneself with other, or as if one is experiencing what is being experienced by other and what other is doing. (4) loving the good. . This is the highest form of character, including becoming interested in the actual virtue. If one loves the good, then he or she will do the good thing and has morality. (5) self-control, and this functions to control one's pleasure. (6) humility, that is the moral virtue that is sometimes forgotten or neglected, although it is the essence of a good character.

In the “moral action : component, there are three important aspects, (1) competence ( moral competence), that is the ability to use moral considerations in an effective moral behavior; (2) will, that is the correct choice in a particular moral situation, which is usually difficult; (3) habit, that is a habit to act correctly and appropriately.

### III. Concept

On the basis of the theoretical review above, character education and development is classified into two dimensions, that is, moral and wisdom, that can be shown as follows.

The mastery and development of science and technology which from time to time is on the increase, brings positive effects on human prosperity, such as the shortening of time and time needed for doing the same thing, the more practical ways of accomplishing complex tasks. Beside the many positive things, there is a concern about the negative effects when the development of science and technology is not controlled. This will destroy this life. Dantes (2009) developed a perspective about integrating character values with the development of science and technology that are implemented in education, which is called character education in the techno-humanistic perspective.

The above concept was followed up with a study by Dantes (2010) with the focus, techno-humanistic-based education at formal schools in Indonesia and found out that the character aspects (humanistic aspects) that have to be developed simultaneously with the development of science and technology cover: *moral awareness, knowledge of moral values, ability to give perspective and moral consideration, recognizing/understanding oneself, work( one's view about work), conscience, self-esteem, empathy, loving the good, self-control, humility, compassion, honesty, loyalty, faith, moral competence, will, habit, self discipline, responsibility, friendship, courage, perseverance, and decision making.*

As the consequence, it is very important to develop science and technology based on the value aspects of character that are consonant with human culture, since life in the future is very hard and competitive. The review of references on the change of time has been done by various scholars such as Rossabeth Moss Kanter (1994), Niesbet (1997), Rowan Gibson (1997), Peter Sange (2004) and others who give a description that in the future there is a need for education that, in addition of focusing on the mastery of science and high technology, it should be based on understanding and mastery of noble character values.

Then, based on the perspective of techno-humanistic-base character education and the result of need assessment above, there is a need to develop an initial prototype of techno-humanistic-based character education at the formal education in Indonesia that consists of three dimensions that are covered in it, namely (1) mastery of science and technology, (2) mastery of moral values ( moral knowledge, feeling and behavior ), and (3) application of wisdom. The science-technology dimension, the mastery of moral values ( moral knowledge, feeling and behavior) can be transformed through the education pillar of learning to know, learning to do and learning to be; while wisdom values are transformed through learning to live together and learning to live sustainably. The first and second dimensions transformation are at the stage of formation and development of the character values until they are acquired by the student ( that concerns the aspects that have been found out by Dantes (2012), while the third dimension is the implementation of the values in life.

#### **IV Research Methodology**

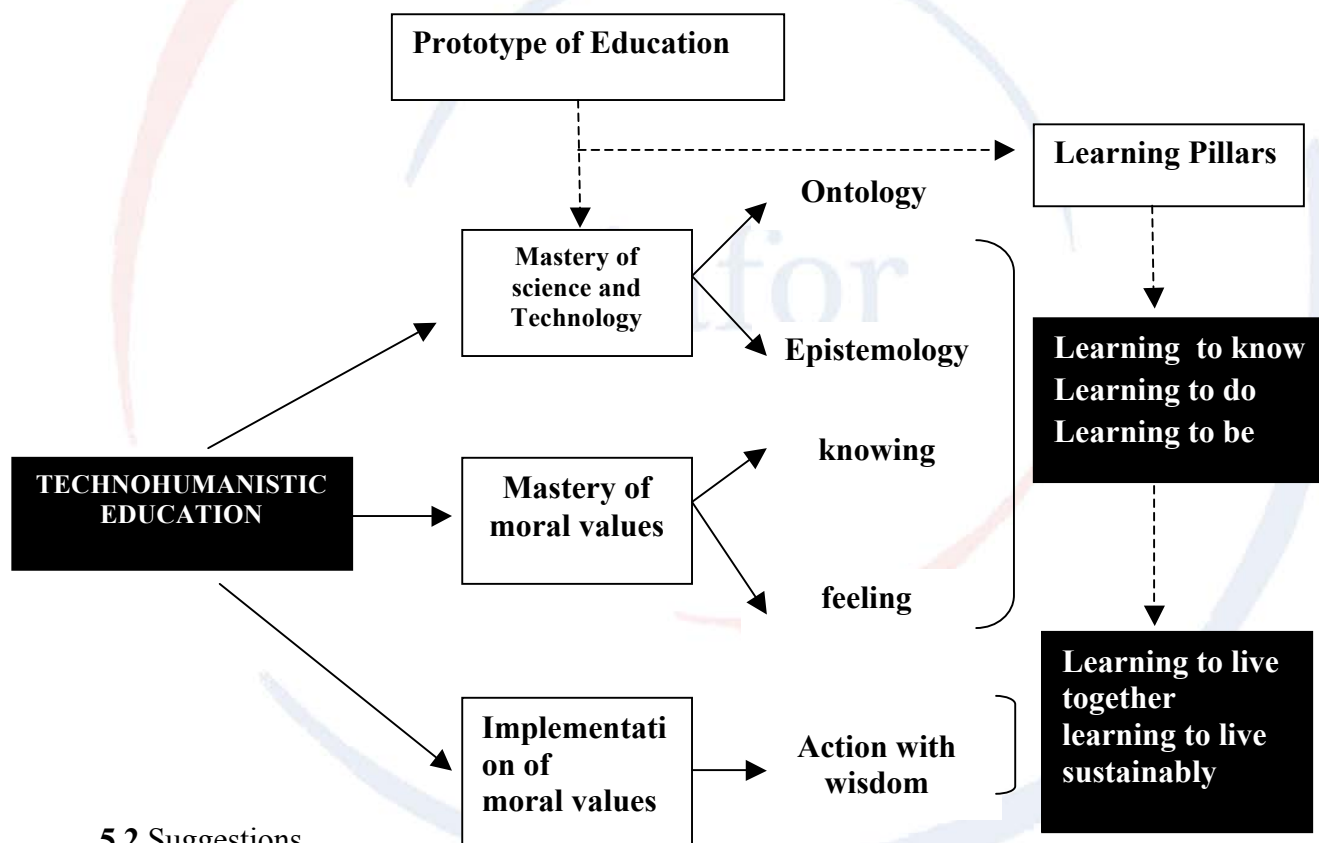

The population of this study was the students of secondary schools in the province of Bali. The sample was selected by cluster random sampling. The sample consisted of 214 secondary school students, 50 teachers, and 50 parents. The data were collected by Delphi pattern questionnaire. Selected interview, and focus group discussion. The methods of data analysis used were trend analysis and qualitative analysis.

## V. Conclusion and Suggestions

### 5.1 Conclusion

Based on the analysis of the data it was found out that the dimensions and indicators of the character education are (1) moral dimension, that covers the indicators: moral awareness, knowledge of moral values, ability to give moral perspective and moral development, understanding of self, perspective about work, self-esteem, empathy, love to goodness, self-control modesty, compassion, honesty, loyalty, faith. (2) wisdom dimension that covers the indicators: moral competency, willingness, habit, self-discipline, responsibility, friendship, courage, perseverance, decision making.

The implementation of the techno-humanistic-based character education found from trend analysis and qualitative analysis as follows:

### 5.2 Suggestions

Suggestions or recommendations are given to (1) formal educators, nonformal and informal educators to try to implement this in the education task domain, in order to achieve optimal level of students' character development. This can give an effect on the social conducive behavior that in its turn has an effect on the comfort in the social interaction of the people in our nation; (2) the government to seriously support the implementation of the proposed prototype. With the participation of the government it is hoped that this will have a positive impact on the life of people in our nation.

*Turning Adversity at Home into Advantage at Destination: Malaysian Chinese Students  
in Taiwan*

Ai-hsuan Sandra Ma

0310

National Chengchi University, Taiwan

The Asian Conference on Education 2012

Official Conference Proceedings 2012

Abstracts

This paper examines how Malaysian Chinese students turned their ethnic minority status into their advantage in pursuing higher education in Taiwan. Taiwan started actively recruiting overseas Chinese students since 1950 mainly as a soft power policy. Faced with the deprived access to local higher education under the racial quota system, some Malaysian Chinese students, especially those from local Chinese high schools, chose to study abroad. Owing to the benefits granted by the Taiwanese government based on their Chinese lineage, the marginal ethnic status of Malaysian Chinese at home is transformed into a privileged right to in Taiwan's higher education system. Despite their localized ethnic identity, many young Malaysian Chinese take advantage of their ethnic heritage in order to seek higher education in Taiwan, a strategy to both overcome the deprived opportunity to have access to local higher education as well as to fulfill the dreams of getting higher education and studying abroad. In this process, the dense ethnically-based transnational student migration networks are especially crucial in directing and facilitating such migration decisions and movements.

## ***Introduction***

Owing to its rapid growth in volume and scope, international student mobility has attracted increasing attention in research and policy-making. Much attention has been paid to the economic, political, social-cultural and academic dimensions of this phenomenon (Adams, Banks, and Olsen, 2011). From the economic perspective, the force of the market has become increasingly dominant. Driven by privatization, decreased public funding for higher education and the need of HEIs' to generate revenue, the increasingly expanded international market of higher education mobilizes large numbers of students to study overseas (Healey, 2008; Meadows, 2011). Moreover, overseas credentials can be valuable "position goods" for students themselves to enhance their chances in upward social mobility (Hirsch, 1976; Marginson, 2006). From the political perspective, recruiting international students can be employed as an important strategy to exercise a country's soft power (Nye, 2005; Watanabe and McConnell, 2008). From the social-cultural and academic perspectives, countries send students abroad to enrich mutual understandings, and institutions recruit international students to enhance their international competitiveness and reputation. For international students, while study abroad often implies cultural clashes and adjustments, they gain degrees, quality education, language training by studying overseas (OECD, 2004). Moreover, the direction and magnitude of international student mobility as well the practices of internationalization of HEIs worldwide often manifest the way linguistic hegemony (such as the dominance of English) operates in the international higher education market (e.g., Brock-Utne, 2007; Kerklaan, Moreira, and Boersma, 2008).

Nevertheless, little has been said about the role of ethnicity in transnational student mobility. Based on the observations of ethnicity as a significant factor in affecting social interactions and mobility, it is hardly convincing that student transnational mobility can be ethnically-blind. To fill in this mission piece, the objective of this paper is to examine how ethnicity plays a role in international students' migration decisions and movements. This paper is based on recent research on transnational student mobility and the internationalization of higher education in Taiwan. The materials discussed in this paper were generated in 2008 and 2009 through semi-structured in-depth interviews with eight Malaysian Chinese students studying at four leading universities (two public and two private) in Taiwan. The average length of the interviews was approximately two hours. The interviews were digitally recorded with the permission of the interviewees and transcribed for analysis.

### ***Taiwan's Overseas Chinese Recruitment Policy***

International students in Taiwan consist of “overseas Chinese students” (*chiaosheng*) and “foreign students” (*waichisheng*). These two groups are recruited through distinct channels and administered by different government agencies, despite the fact that all but a few overseas Chinese students in Taiwan are either foreign nationals or have dual citizenships. According to the Taiwanese government regulations, the term “overseas Chinese student” is reserved for those of Chinese ancestry who were born and raised overseas (except Hong Kong, Macau and PRC<sup>1</sup>) until the time of school application, or Taiwanese citizens residing overseas for at least six consecutive years and acquired visas for studying abroad (OCAC, 2011a). The term “foreign student” refers to a student of foreign nationality who is not a citizen of Taiwan and does not possess an overseas Chinese student status (Ministry of Education, 2011). According to these regulations, ethnic Chinese overseas generally fall into the category of “overseas Chinese students” when they come to study in Taiwan.

The recruitment of overseas Chinese students in Taiwan began in 1950. Owing to the fact that approximately 80 percent of overseas Chinese residing in Southeast Asia, the recruitment focused specifically on this region. This effort was in part a continuation of preceding policies on overseas Chinese affairs instituted by the KMT government in the 1930s due to the strong support received from overseas Chinese communities in founding the Republic of China (ROC) (Chang, 1991; Chu, 1973). Soon after the retreat of the KMT government to Taiwan in 1949, overseas Chinese affairs were resumed with added purposes. Faced with its most threatening enemy, the People's Republic of China (PRC) led by the Chinese Communist government, Taiwan were in need of international alliances. Overseas Chinese communities were considered by the KMT government in Taiwan to be a plausible source of support based on years of cultivation in overseas Chinese affairs. However, since the ethnic Chinese overseas were generally migrants or descendants of early migrants from China, establishing bonds with overseas Chinese communities and redirecting their loyalty became a tricky mission for the Taiwanese government. In this context, providing education for overseas Chinese students became a constructive means of developing ties with overseas Chinese communities and an important soft-power policy. With the aid from the United States (US) from 1954 to 1965 and the efforts made by the Taiwanese

---

<sup>1</sup> Students from Hong Kong and Macau belong to a distinct category called “Hong Kong and Macau students” and are governed by a tailored recruitment policy. Nevertheless, they enjoy the same benefits granted to overseas Chinese students and are included in the Taiwanese government's statistics of overseas Chinese students (MOE, n.d.). The recruitment of Mainland Chinese degree-seeking students to Taiwan started in 2011, and Mainland Chinese students are categorized into yet another category called “Mainland students” and are governed by a discrete policy.

<sup>2</sup> The Sijil Pelajaran Malaysia (SPM), or the Malaysian Certificate of Education, is a national

government and universities, the number of overseas Chinese enrollments in Taiwan's higher education institutions soared from sixty in 1951 to its first peak of 11,582 in 1989 (Yu, 2001). The decline in overseas Chinese student enrollment figures in the 1990s might be related to the rapid economic developments in Southeast Asian countries, the rise of China and its "Open Door" policy, and the Taiwanese government's cut in benefits originally granted to overseas Chinese students in response to the mounting cry from the local population for greater access to higher education (Lee, 1991; Ma, 2012). After 2000 the enrollments of overseas Chinese students increased again. In 2011, there were 13,334 overseas Chinese students studying in Taiwan's higher education institutions. They came mainly from Asia, of which Malaysia sends the largest numbers (OCAC, 2011b).

### ***Ethnic Chinese in Malaysia***

Ethnic Chinese formed a significant minority group in Malaysia, constituting approximately 30 percent of the total population over the past decades (Suryadinata, 2004). Mass Chinese immigration to the Straits Settlements (Penang, Malacca, and Singapore) began in the nineteenth century as a result of both voluntary and forced migration. Since then the Chinese started to establish their own schools, business and cultural clubs, and dialect-based associations to safeguard their culture and commercial interests. By the 1920s, a Chinese community emerged in British Malaysia, and the source of its strength in maintaining Chineseness was the ties among the local ethnic Chinese, with other Chinese groups in Southeast Asia, and with those in Mainland China (Shamsul, 2004).

Wang (1970, 2001) suggested that the Chinese overseas can be divided into three groups (not including the fourth group of those who did not identify themselves as ethnic Chinese), and these three groups represented three stages of changing identities: *huaqiao* (overseas Chinese), *huaren* (ethnic Chinese), and *huayi* (Chinese descent). In the past, most Chinese overseas considered themselves *huaqiao*. They maintained links with the politics of China and identified with the destiny of China. Moreover, since both the Chinese and the British colonial government claimed Malaysian Chinese as their subjects, these Chinese often possessed dual citizenship (Shamsul, 2004). After World War II, the independent Malaysia and its subsequent nation-building challenged the local Chinese to choose their citizenship. The majority of the Malaysian Chinese took on the new Malaysian national identity, and faced the prospect of transforming their culture-based community into one that was required to pledge its loyalty to the new nation-state (Wang, 2004). Nevertheless, the drive to

preserve a strong communal Chinese identity remained very strong. Consequently, the Chinese in post-war Malaysia were gradually transformed into *huaren* or *huayi* (Suryadinata, 2004). Post-war Chinese identity and Chineseness of Malaysia Chinese is in effect based on their ethnic language and culture imparted mainly through education, and the Chinese schools are perceived as the custodian of Chinese language and culture in Malaysia (Shamsul, 2004; Tan, 1997). Although Malay is the main teaching medium and that no access to higher learning was possible without it, students can choose to attend government-approved Chinese-language primary schools (Wang, 2001).

It is noted that the growing preference of Chinese schools is based not only on communal sentiments but also on these schools' education quality, discipline, and the acquiesce of additional language skills (Mandarin Chinese). It is estimated that some 70 percent of Chinese parents (including a significant number of English-educated Chinese) send their children to Chinese schools (Hing, 2004).

In addition to primary schools, there are sixty Chinese privately-funded "independent" high schools in Malaysia. The United Chinese School Committees Association of Malaysia (UCSCAM, better known as "*Dong Jiao Zong*") coordinates the curriculum adopted by these schools and organizes the annual Unified Examination Certificate (UEC) standardized test (UCSCAM website: <http://www.djz.edu.my/v2/school.php>). Although the certificates of independent schools are not recognized by the Malaysian government, non-government sectors and foreign institutions generally recognize these certificates.

It is noted that for the past forty years, Malaysia has been the only Asian country that officially discriminate against a division of its population in regards to higher education. As an act for affirmative action, a racial quota system for university admissions was set through the National Economic Policy and National Education Policy to assist the ethnic Malays (Hing, 2004). By allocating generous admission opportunities to ethnic Malay students, the policy has essentially been geared toward improving the social mobility of the country's majority Malays over their financially dominant Chinese counterparts, an imbalance created during the British colonial period. As a result, though Chinese Malaysians account for approximately 30 percent of the country's overall population, by some estimates they constitute less than 10 percent of the students at national universities (Cohen, 2001).

## ***Data Analysis***

### **Studying abroad as a pre-programmed decision**

Although no statistical figures are available, field data indicate that all international students from Malaysia are ethnic Chinese. All but a few came to Taiwan as overseas Chinese students, and a vast majority of them had attended government-approved Chinese-language primary schools and graduated from Malaysian independent high schools before they came to Taiwan. From the life storied told by informants, it is clear that their decision to choose Taiwan for higher education had been pre-programmed in their upbringing and schooling back home.

These ethnic Chinese grew up mostly from middle-class or lower middle-class families. They were sent by parents to public Chinese-language primary schools in order to “learn Chinese” and “learn to be Chinese.” After they finished primary schools, they often faced the decision to study in either public Malay high schools or private independent Chinese high schools, and sometimes private English high schools as well. Their decision to study in independent Chinese high schools was often based on the well-received high quality of independent schools, family’s financial capacity, and the influence from social networks within the Chinese community to “maintain Chineseness”:

Many *huaren* (ethnic Chinese) do not attend private schools mainly because of financial concerns; their parents are not willing to pay for high tuitions. (BB007)

[The reason for me to get into the independent high school system] was first because my relatives’ children all studied in independent high schools. In addition, the independent high school in Malacca was a prestigious school and its students were perceived as top students. Second, because it’s a private school and students have to pay tuitions, so you get a feeling that these students must be good and come from well-off backgrounds. (BB005)

Because independent high schools do not follow the national curriculum and adopt the curriculum coordinated by UCSCAM, their students often face the difficulty in passing the national examinations Sijil Pelajaran Malaysia (SPM) and Sijil Tinggi

Persekolahan Malaysia (STPM), both are prerequisites to enter local universities.<sup>2</sup> Although independent high schools use three languages – Mandarin Chinese, English, and Malay – in their curriculum, Mandarin Chinese is the main teaching language. In addition, ethnic Chinese normally speak Chinese (either Mandarin or other Chinese dialects) at home and use minimum Malay in daily life. The Chinese language and cultural identity thus is effectively imparted not only at home but more importantly through Chinese schools. However, the independent high school students' strong Mandarin Chinese language ability is often coupled with their relative weakness in Malay and English. This creates barriers for them to pursue local higher education in which Malay is the only language and that both SPM and STIP are conducted in Malay. Some independent high schools join only the Unified Examination Certificate (UEC) standardized test organized by UCSCAM and do not encourage students to take the national SPM or STPM examinations. Moreover, they may be less confident in pursuing higher education in Western countries with their English language ability.

Independent high schools emphasize three languages; that is, you have to learn Chinese, Malay and English. However, I feel that we do not excel in any of these three languages. (Q: What do you mean?) You may be better than others in Chinese, but your Malay and English would be weaker in comparison with students from public high schools. (BB007)

[One of the reasons] for me to come to Taiwan was because of my English ability. My English is terrible, at that time it was terrible. I would face the pressure if I go to the Western countries. If I come to a Chinese environment, it would be very easy for me. This is an opportunistic attitude. (AB001)

Aside from language issues, the costly education in the Western countries often prevent these students, mostly from middle- to lower-middle class families, from pursuing higher education in major destinations such as the United States, the United Kingdom, or Australia. Singapore and China sometimes are possible options; the former for its high-quality education and geographic proximity and the latter for its Chinese environment. However, many of the informants mentioned the

---

<sup>2</sup> The Sijil Pelajaran Malaysia (SPM), or the Malaysian Certificate of Education, is a national examination taken by all fifth-year secondary schools in Malaysia. SPM is equivalent to the O-Level and is the second last public examination at the secondary school level before the entry into a first bachelor degree course at a Malaysian university. The Sijil Tinggi Persekolahan Malaysia (STPM), being a pre-university study and equivalent to the A-Level, is the last public examination at the second school level.

competitiveness of scholarships from and admissions to Singaporean universities as well as the costly tuition paid by international students in China prevented them from considering these two countries as possible destinations. Moreover, those who long for a “real” overseas experience would see the close proximity between Malaysia and Singapore as a downside for choosing Singapore. Taiwan, by providing low-priced education, academic freedom and a resourceful Chinese learning environment at a reasonable distance, become an attractive option:

Many of my classmates went to the United States or Australia...their families are wealthier. Generally speaking, those who choose to come to Taiwan are because of its much cheaper tuition. (BB007)

The majority of those studying in independent high schools normally would either come to Taiwan or go to Western countries...I didn't hear much about going to China, because China is more expensive. If we come here, it's New Taiwan Dollars. If we go to China, it's US Dollars. It's a big difference. (DB008)

Furthermore, the cultural influence from Taiwan on the local Chinese community, manifested through popular culture and the independent high school system, can also explain why these students chose Taiwan as their destination:

I felt that I would go to Taiwan, I did not consider going elsewhere...because we watch Taiwanese TV programs and receive information from Taiwan. My brother and sister also went there to study. My own Chinese ability is better [than other language abilities], and my parents respected my decision. Some of my friends also came to Taiwan to study, so I took for granted of my decision to study in Taiwan. (AB009)

I read some books published in Taiwan back in high school, and many of them I still read, such as [the ones written by] Lung Yingtai, Bo Yang. Maybe not many in the younger generation in Taiwan would read their books, but many in Malaysia still read their books. That's because our social situation is like the old days with martial law in Taiwan, and these books can fit our needs. (AB001)

### **Double-edged sword of ethnicity**

To the Chinese in Malaysia, their ethnic minority status put them at a disadvantage in getting access to local higher education. Many informants indicated that because their certificates from independent high schools are not recognized by the Malaysian government, and the racial quota system in Malaysian higher education further barred many qualified Chinese from entering local universities, many were pushed overseas to study:

I studied in an independent high school. Many students from Malaysia in Taiwan are independent high school graduates. Because our country does not recognize our certificates, so once we graduate we would study in some local private colleges or study abroad. (BB005)

It is very difficult to study in a local university in Malaysia...although maybe it is not good for me to say this; there are some racial issues involved. As you know, there are three major races in Malaysia: Malay, Chinese, and Indian. Malay stands as the largest racial group, and it is easier for Malays to enter local universities. There was news before reporting things like Chinese students had very high scores but could not enter local universities. (DB009)

Our government set the quota system in Malaysian universities...many seats are reserved for Malays, and we feel like, why is this? We are also Malaysian citizens! We are very furious about it... the government does not recognize us [independent high schools], and we don't want to stay in Malaysia even if we have good examination scores. In fact, the quality of independent high schools is better, and the government says that we only want to run outside and study overseas and blame us for not helping our home country. I think that's because you don't recognize us that we run away. (BB005)

Faced with the deprived access to local higher education under the racial quota system, some Malaysian Chinese students, especially those from independent Chinese high schools, chose to study abroad. Owing to the benefits granted by the Taiwanese

government (such as scholarships and assistantships, subsidies, privileged admission policy) based on their Chinese lineage and advantages given by universities (such as guaranteed school accommodation, priority part-time employment opportunity on campus) due to their status as overseas Chinese students, the marginal ethnic status of Malaysian Chinese at home is transformed into a privileged right to in Taiwan's higher education system.

### **Transnational ethnic social network at work**

The Taiwanese government's recruitment policy and programs on overseas Chinese students initiated in 1950 successfully generated significant student migration streams from Malaysia. The efforts exerted by the Taiwanese government and universities, together with high returns of Malaysian Chinese students, dense social networks within the Chinese community, and the operation of independent Chinese high schools in Malaysia, created a self-sustained transnational student migration system between Malaysia and Taiwan based on Chinese ethnicity.

At home, the influence from family members, especially parents, can be significant in influencing students' migration decisions. Many informants indicated that their parents, relatives, and/or siblings had studied in Taiwan, and these people set the example for them to follow:

My father graduated from Taiwan's Chung Hsing University...my brother will come in this September to study at the National Central University...[The reason for me to choose Taiwan to study] was because of its low tuition, and also because my uncle is here...He graduated from National Taiwan University and got married [to a local Taiwanese] and stayed here [in Taiwan] since... I originally wanted to study in China, but my father had studied in Taiwan and he supported me to come here; also my uncle was here. (CB001)

For these Chinese students, the independent Chinese schools they attended and their school cohorts often put forth a more powerful influence on their decision to study in Taiwan. First, the significant number of Malaysian Chinese students studying in Taiwan over the last few decades, mostly from independent Chinese high schools, created a large base for a homogeneous hierarchical system of student and alumni associations based not only on nationality and ethnicity but also on origins of high school and region. The Malaysia Students Association in Taiwan (MSAIT, also

known as Da Ma Tzung Huei) is the top student incorporating and coordinating all Malaysian student associations in Taiwan. Under MSAIT there are two sub-divisions of Malaysian student associations, one based on the members' high school alma maters and the other based on the universities that members attend. The high-school based student associations play a critical role in transmitting information of Taiwan to independent high schools and ushering the independent high school graduates in getting to Taiwan and to their respective universities. The university-based Malaysian student associations later take over, helping these Malaysian Chinese students to adjust to campus life, mediating between these students and the university administrative system, and forming a safety net for these students in their daily life: :

We have a regional student association back in Malaysia. Every summer the *shueijie* (the female senior students) and *shueijang* (the male senior students) would come back and arrange the affairs such as visa and airport pick-up for incoming students. The student association will also hold an orientation seminar and welcoming activity for incoming students and take these students to the respective universities they will attend once they arrive. If a school does not have a large number of students going to Taiwan to study, the independent schools in that region will organize a united student association together. There are four independent high schools in my region, and together they formed the Selangor [Independent High School] Student Association. (CB001)

The teachers in independent Chinese high schools, many of them received higher education in Taiwan, can be very influential in these students' choices of destination. In addition, some of the independent Chinese schools also encourage students to study overseas, including Taiwan:

It was mainly my high school to do the coordination (to help students to go to Taiwan). Teachers would be responsible for taking students' names [in joining the travel group to Taiwan], and the school would take charge in contacting students, the [high school] alumni association [in Taiwan], and the UECOS...My school is very serious about this and is very happy to help... Our teacher would bring the whole group [of all incoming students from my high school] to Taiwan. (AB009)

At that time of my application [of admission to Taiwanese universities], I did not know how to fill out the priority form<sup>3</sup>, so I went back to my high school to ask my teacher. He suggested that I should first identify the programs I wanted to study, find out the schools that have these programs, then priority them by putting the national ones first and the private ones second. I did just that, very simple. At that time I did not think if this school is good or bad. (Q: So you just totally trusted your teacher?) Yes. (Q: You weren't afraid that maybe the teacher would lie to you? (laugh)) Oh no. All of them came back from Taiwan, so they couldn't be wrong. (DB009)

In short, this dense ethnically-based transnational student migration network plays a critical role in directing these Malaysian Chinese students' migration decisions to come to Taiwan and facilitating their movements.

### ***Conclusion***

The case study of Malaysian Chinese students in Taiwan demonstrates an important finding: ethnicity can be an critical factor in mobilizing international student mobility. Despite their localized ethnic identity, many young Malaysian Chinese take advantage of their ethnic heritage in order to seek higher education in Taiwan, a strategy to both overcome the deprived opportunity to have access to local higher education and to fulfill the dreams of getting higher education and studying abroad.

---

<sup>3</sup> For overseas Chinese students to apply for admission to universities in Taiwan, they need to fill out a priority form with the prioritized choices of university programs. The University Entrance Committee for Overseas Chinese Student (UECOCS), an agency organized by universities and coordinates recruitment and admissions of overseas Chinese students, is responsible for assessing these students' applications and distributing these students to respective universities and programs based on their qualifications (such as the UEC test scores or high school records) and the priority forms they submit.
