OFFICIAL CONFERENCE PROCEEDINGS

The Asian Conference on Education (ACE2024)

November 25-29, 2024 | Tokyo, Japan, and Online

ISSN: 2186-5892

Organised by the International Academic Forum (IAFOR) in partnership with the IAFOR Research Centre at the Osaka School of International Public Policy (OSIPP) at Osaka University, Japan, and IAFOR's Global Partners.

iafor

"To Open Minds, To Educate Intelligence, To Inform Decisions"

The International Academic Forum provides new perspectives to the thought-leaders and decision-makers of today and tomorrow by offering constructive environments for dialogue and interchange at the intersections of nation, culture, and discipline. Headquartered in Nagoya, Japan, and registered as a Non-Profit Organization (一般社団法人) , IAFOR is an independent think tank committed to the deeper understanding of contemporary geo-political transformation, particularly in the Asia Pacific Region.

INTERNATIONAL

INTERCULTURAL

INTERDISCIPLINARY

iafor

International Academic Board

Dr Joseph Haldane, IAFOR and Osaka University, Japan, & University College London, United Kingdom
Professor Jun Arima, President, IAFOR & University of Tokyo, Japan
Professor Anne Boddington, Executive Vice-President and Provost, IAFOR & Middlesex University, United Kingdom
Professor Barbara Lockee, Virginia Tech, United States
Professor Donald E. Hall, Binghamton University, United States
Dr James W. McNally, University of Michigan, United States & NACDA Program on Aging
Professor Grant Black, Chuo University, Japan
Professor Dexter Da Silva, Keisen University, Japan
Professor Baden Offord, Centre for Human Rights Education, Curtin University, Australia & Cultural Studies Association of Australasia
Professor Frank S. Ravitch, Michigan State University College of Law, United States
Professor William Baber, Kyoto University, Japan
Dr Virgil Hawkins, Osaka University, Japan

ACE2024 Conference Programme Committee

Distinguished Professor Tien-Hui Chiang, Zhengzhou University, China
Dr Joseph Haldane, IAFOR and Osaka University, Japan, & University College London, United Kingdom (Conference Co-chair)
Susie Kung, Manukau Institute of Technology, New Zealand
Professor May Sok Mui Lim, Singapore Institute of Technology, Singapore
Dr Tzu-Bin Lin, National Taiwan Normal University, Taiwan
Professor Barbara Lockee, Virginia Tech, United States
Dr Leandro Loyola, Conestoga College Institute of Technology and Applied Learning, Canada
Professor José McClanahan, Creighton University, United States
Dr Sean McMinn, Hong Kong University of Science and Technology, Hong Kong
Dr Murielle El Hajj Nahas, Lusail University, Qatar
Dr Justin Sanders, Woven by Toyota, Japan
Dr Tati D. Wardi, Universitas Islam Internasional Indonesia (UIII), Indonesia
Dr Aki Yamada, Tamagawa University, Japan

Table of Contents

The Use of Digital Media in Empowering Students Digital Literacy and Critical Thinking in Biology Learning
M. Imam Fauzi
Mimien Henie Irawati Al Muhdhar
Hendra Susanto pp. 1 - 6

Illiteracy Eradication Strategies in Indonesian Rural Schools Using the I Love Reading (SSM) Curriculum
Astina Hotnauli Marpaung
Hiryanto pp. 7 - 14

Facilitator's Perception of Module Effectiveness: A Qualitative Review in Ministry of Religious Affairs Teacher CPD Training
Muliyani Olvah
Muhammad Alfan
Toto Nusantara
Shirly Rizki Kusumaningrum
Radeni Sukma Indra Dewi pp. 15 - 26

Moral Disengagement as a Predictor of Bullying Behavior of Adolescent Students
Chrisanta Kezia Yemima
Diana Septi Purnama pp. 27 - 38

Analysis of Student Difficulties in Determining the Main Idea and Supporting Ideas of Paragraphs
Umi Nahdhiah
Sri Untari
Ratna Ekawati
Shirly Rizki Kusumaningrum
Radeni Sukma Indra Dewi pp. 39 - 48

International Projects: Tracing the Journey From Design to Community Use
Inês Araújo
Célio Gonçalo Marques
Hélder Pestana pp. 49 - 57

Arab EFL Learners' Collocational Competence: Errors, Challenges, and Teaching Implications
Pakenam Shiha
Nadine Emirey Lacsina pp. 59 - 74

Tangled Timelines: A Qualitative Exploration of ESL Challenges in Acquiring the English Past Tense
Ewana Mohamad Yusop
Nur Qistin Mohd Harunthmarin pp. 75 - 82

Environmental Empathy Through the Paradigm of Postmodernism Based on Indigenous Peoples' Local Wisdom
Piki Setri Pernantah
Nana Supriatna
Kokom Komalasari
Siti Nurbayani K pp. 83 - 97

Higher Order Thinking Skills (HOTS) of Elementary School Teacher Education Students in Indonesia: A Systematic Literature Review
Iyoh Maspiroh
Zuhdan Kun Prasetyo
Hermanto Hermanto pp. 99 - 110

Self-Efficacy and Self-Regulation in Mathematics Learning: Validity and Reliability of Instruments in Private Junior High School Students
Ovan
Yusuf Fuad
Mega Teguh Budiarto pp. 111 - 127

Improving Nutrition Education and Physical Fitness in High School Through a Community-Based Haheho Apps Intervention
Ropik Hidayat
Syahrizal Islam
Heny Setiawaty
Siti Baitul Mukarromah
Hermawan Pamot Rahardjo pp. 129 - 140

Performance Measurements of Community-Friendly Schools in Hong Kong
Kwun-hang Lau pp. 141 - 158

Using Case Studies to Develop Policymaking Competencies in Continuing Education: Integrating Practice and Experience
June Gwee pp. 159 - 172

Virtual Linguistic Landscape of Saudi Arabia's Language Policy in Higher Educational Institutions' Websites
Nadine Emirey Lacsina pp. 173 - 191

Promoting Workplace Comprehension Through Situated Interactive Simulation of Recruitment Mobile Game
Pei-Ching Ngu
Mei-Chiung Fu
Chih-Chung Chien
Huei-Tse Hou pp. 193 - 198

Development of Print Media for Learning Motivation Using Creative Designs in Printing, Decorating, and Book Making
Tanapon Tangpanyavareekul
Suchapa Netpradit
Wannarat Wirachkul pp. 199 - 205

PRIMM Model Towards Malaysian Matriculation Students' Motivation in Learning Programming
Tevya Letchumanan pp. 207 - 224

National-Level Cross-Cluster Rotation Training in Obstetrics and Gynaecology: Through the Looking Glass of Residents
Chun Phoy Cheng Rachel
Manisha Mathur
Citra Mattar
Yang Liying
Jill Lee Cheng Sim pp. 225 - 231

A Generative AI Puzzle Educational Game for Decision Making Skill Training With a Clue Exploration Mechanism
Hung-Yu Chan
Yu-Chi Chen
Chih-Chung Chien
Huei-Tse Hou pp. 233 - 239

Literature Review of the Impact of Strength Training and Plyometric Training on Basketball Performance
Jun Wan pp. 241 - 250

An Alternative Reality Museum Tour Game Integrating Realistic Historical Storyline and Role-Playing for Learning Cultural Heritage
Shen-Yang Ni
Chih-Chen Kuo
Hung-Yu Chan
Huei-Tse Hou pp. 251 - 256

Combining Realistic Story Situations and GPT-Based NPC Framework for Historical Knowledge Problem-Solving Games
Cheng-Yuan Wei
Yu-Chi Chen
Chih-Chung Chien
Huei-Tse Hou pp. 257 - 262

Implementation of EMI in Taiwan's Higher Education: Exploring Students' Perspective on the Challenges and Their Needs
Chen-An Chang
Shan-Yun Huang
I-Jan Peng pp. 263 - 284

Evaluation of a Financial Education Board Game Integrating Historical Contextual Events and Simulated Trading Mechanisms
Zheng-Hong Pan
Shen-Yang Ni
Huei-Tse Hou pp. 285 - 290

One Program, Two Pathways: The Transformative Learning Journeys of 2 Adult Learners in Graduate School
Jennifer Poh Sim Tan pp. 291 - 296

Challenges and Opportunities of AI in Revitalizing and Preserving Endangered Languages in Kenya
Hesborn Ondiba pp. 297 - 308

e-Training With AI Prompts on Preparing Articles for International Academic Conferences and Publication in International Journals
Theerapong Maneepen
Narong Mungkung
Suchapa Netpradit pp. 309 - 319

Soft Skills in a Multicultural Society Context: A Case Study of Teaching Profession Students in the Southern Border Provinces of Thailand
Maithai Chaiyapan
Jirasuk Suksawat
Purimpratch Khaninphasut
Putcharee Junpeng pp. 321 - 332

Development of the Multimedia Modules for Interactive Online Learning to Enhance Understanding of Principles of Graphic Design on Packaging
Suchapa Netpradit
Tanatorn Tongsumrith
Worawimon Bunlungsup pp. 333 - 340

Effect of Developing Multimedia for Three Phase Induction Motor Rewinding Using ADDIE Model
Nantarak Reungruk
Chamnan Ratsamee
Pakpoom Chansri pp. 341 - 351

Development of Training Curricula to Improve Engineers' Learning Capacity in Manufacturing Facilities Using the Production Support System Based on DAPOA
Chamnan Ratsame
Pakpoom Chansri pp. 353 - 367

ChatGPT's Impact on Education: Increasing Student's Learning Interest
Evaristus Didik Madyatmadja
Debri Pristinella
Edbert Kurniawan
Dharmawan Elmadya
Priscillia Utama Christy
Rolando Krisnanto pp. 369 - 381

Challenges of Language Learning in a Multicultural Context: International Students Learning BIPA (Bahasa Indonesia bagi Penutur Asing) in University Level
Aldian Idris Febrianto
Joko Priyana pp. 383 - 393

Exploring the Effects of Automatic Speech Recognition Technology in EFL Students' Speaking Performance
Hui-Wen Liu
Pei-Shan Tsai pp. 395 - 400

Profiling English Language Learning Anxiety of Selected Rural Area Secondary School Students in Kedah: A Case Study
Aini Syahira Jamaluddin
Aina Yasmin Mohd Amin
Nurul Huda Hassan Bakri
Asri Karolina pp. 401 - 411

The Foreign Language Writing Anxiety of Japanese University Students
Lidija Elliott pp. 413 - 423

Development of a Learning Model Integrating Service-Learning and Experiential Learning in the Educational Communication Technology Curriculum
Punsa Ekpornprasit pp. 425 - 436

Integrating Generative AI and Progressive Guided Scaffolding Mechanisms in Educational Games to Facilitate Research Design and Statistical Learning
Yu-Kai Chu
Huei-Tse Hou pp. 437 - 442

Emotional Responses of Taiwanese English Major Students to EMI Courses Taught by Native English-Speaking Teachers
Chin-Hui Chen
Zih-Ying Chen
Shu-Wen Lan pp. 443 - 459

The Use of Career Awareness Comic Book to Enhance English Language Learning for Primary School Students in the People's Republic of China
Li Yunchun
Metee Pigultong pp. 461 - 468

Using Problem-Based Learning Activities to Enhance Systematic Thinking in Electrical Power Engineering Students
Priyaporn Ratsame
Pakpoom Chansri
Chamnan Ratsame pp. 469 - 480

The Impact of Information Graphics on Fire Evacuation of Chinese Students: A Case Study of Sichuan University of Light Industry and Chemical Technology
Zhang Xia
Metee Pigultong pp. 481 - 490

Documentaries as a Tool for Collecting and Disseminating Memories of Self-Initiated Community Practices: The Case of Workshop School
Mateus Carvalho
Daniel Brandão
Nuno Martins
Bruno Silva pp. 491 - 498

Development of the 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program
Saruit Wongdontri
Naphatsanan Suwannawong pp. 499 - 509

Can Individuality Be Taught? The Paradox of Self-Identity and Autonomy in a Pragmatic Society
Venus Ke Xin Pei
Xin Er Lin pp. 511 - 518

Development of Online Video Learning Media on Paper Box Packaging Production Process
Ratsamee Narktaptim
Sasita Thakerngsri
Sirinuch Khaebamrung
Yathana Pakawattanakoson
Suchapa Netpradit pp. 519 - 526

Gap Analysis Between Program Expectations and Competency Outcomes of Students in Industrial Education of Electrical Engineering for Curriculum Improvement
Wannarat Kaewthong
Komkrit Chomsuwan
Suchapa Netpradit pp. 527 - 535

Needs Analysis of English Skills Development for Agripreneur of Thai Students in Higher Education
Alisa Injan pp. 537 - 547

Computational Thinking in Agricultural STEM-Based Project: A Case Study on the Impact of the Magnetcode Application Among Zambian Educators
Sanura Jaya
Phiri Cornelius
Parvinder Singh Amar Singh
Azman Jusoh pp. 549 - 561

Analysis of the Readability of Health Education Texts for Elderly Readers: An Eye-Tracking Experiment
Hui-Xin Chen
Hou-Chiang Tseng
Yao-Ting Sung pp. 563 - 582

Transforming Education: Using the Pedagogy, Spaces and Technology (oPSTi) Framework to Teach Project Based Learning Among Southeast Asia Educators
Sanura Jaya
Parvinder Singh Amar Singh
Azman Jusoh pp. 583 - 594

The Role Played by the Student-Centred Approach in the Acquisition and Development of 4Cs of 21st Century Skills Through a Project-Based STEM Curriculum
Vidujith Vithanage
Nicola Nakashima pp. 595 - 610

Envisioning Possible Post-PhD Careers Outside Academia: An Exploratory Study of Two Chinese Doctoral Graduates' Differentiated Experiences
Sangge Qi pp. 611 - 621

Charting Sustainable Pathways: Understanding Private and Public State Universities' Role in Generation Z's Study Abroad Choices Through MCDA and SEM-ANN
Charmine Sheena Saflor
Klint Allen Mariñas
Jazel Monterola
Reina Krizzia Pranada
Macrein Acosta
Arnelyn Labao pp. 623 - 631

Research on the Key Success Factors of Literacy-Oriented Courses Using DANP Method
Chia Wei Wang pp. 633 - 640

The Efficacy of Pre-editing as a Means of Improving NMT Output
Kayo Tsuji
Benjamin Neil Smith
Kiyo Okamoto pp. 641 - 650

Factors Influencing University Selection and Future Educational Trends: A Survey of Thai High School Students Applying to Study at KMUTT
Somsri Binraman
Suchapa Netpradit
Chanin Tungpantong pp. 651 - 660

Examining Vocational Education in Indo-Pacific Countries and Implications for Taiwan's Vocational Education
Jen-Chia Chang
Po-Ching Lu pp. 661 - 670

Professional Identity Development of Multi-role Teachers in Technical High Schools
Chia-Hao Liu
Hsiao-Fen Liu pp. 671 - 681

Exploring the Effects of Gender, Technology, and Economic Status Towards Indonesian Students' Science Performance in PISA 2022
Wawan Kurniawan pp. 683 - 697

Cultural Affective Factors and Group Dynamics in COIL Projects: How Much Autonomy Is Too Much Autonomy?
Brian Bachman
Michael David Barr
Yi-hung Cathy Liao pp. 699 - 712

Beyond Content: Exploring the Impact of Team Characteristics in Effective Project-Based Learning
Low Bee Lee
Desmond Ng
Heng Jun Jie
Low Kang Min pp. 713 - 725

A Hybrid SEM-Artificial Neural Network Study on Students' Usage and Perceptions of ChatGPT: Exploring Academic Work Engagement
Klint Allen Mariñas
Charmine Sheena Saflor
Jasper Von Chico
Hannah Maureen Manzano
Monica Shane Tanglao pp. 727 - 735

The Impact of Skill Test on Technical High Schools in Taiwan
Jen-Chia Chang
Shao-Chen Chou pp. 737 - 747

Use Eye Movement Features to Explore the Impact of Language Features on Text Difficulty
Yi Ju Chan
Hou-Chiang Tseng
Yao-Ting Sung pp. 749 - 767

"Students Have Been Cheating With or Without AI!": Doing What Matters Most – Designing Authentic, Critical and Meaningful Learning With AIEd
HG Retno Harsanti pp. 769 - 779

Learning to Labor? Reconsider Schooling and Capitalism in the 21st Century From a Post-marxist Perspective
Autthapon Prapasanobol pp. 781 - 791

Exploring the Effects of Integrating SVVR Into High School History on Students' Self-Efficacy, Learning Behavior, and Learning Performance
Chia-Ling Wu
Hui-Xin Chen
Shuo-Jung Hsu pp. 793 - 811

The Results of the Development of a Science Instructional Kit to Improve Teachers' Students' Memory and Understanding in Biology Courses
Phatcharida Inthama
Suwicha Wansudon
Sompong Jaideechoey
Trai Unyapoti pp. 813 - 818

Development of Behavior Regarding Socially Responsible Entrepreneurship Skills for Undergraduate Students in Bachelor of Education According to the Concept of Sustainable Corporate Development (ESG)
Suwicha Wansudon
Trai Unyapoti
Phatcharida Inthama
Ponpeera Wongpornpratheep pp. 819 - 828

Problem-Based Learning Integrated With Augmented Reality: Development and Teacher Perspective
Risma Nurul Auliya
Jirarat Sitthiworachart
Thanin Ratanaolarn pp. 829 - 835

Design and Evaluation of the Educational Board Game for Teaching Conservation of Momentum
Trai Unyapoti
Suwicha Wansudon
Krirk Saksuparb
Arunee Eambaipreuk
Thanida Sujarittham pp. 837 - 842

Ensure Inclusive and Equitable Education: Who's Left Behind?
Freshy Windy Rosmala Dewi
Azka Muthia pp. 843 - 856

Exploring Inclusive Evolution in Music Academia: Experimental Practices in Contemporary Music
Raushan Jumaniyazova
Zhanel Safiyeva pp. 857 - 867

Changing Students by Osmosis: A Literature Review of Nudge Theory in Educational Technology
Chengze Zeng pp. 869 - 883

The Juggling Life: Investigating Work-School Conflict Among Thai Graduate Students
Siripreeya Chaiboonma
Kanit Sriklaub
Siwachoat Srisuttiyakorn pp. 885 - 898

Using Flipped Classroom to Improve the Korean Reading Ability and Learning Motivation of First-Year Korean Students
Jun Wang
Jirarat Sitthiworachart pp. 899 - 905

A Comparison of Visual Representations of Integer Operations in Middle School Mathematics Textbooks in the Turkish and United States
Ali Sabri İpek pp. 907 - 916

Leveraging AI for MOOC Course Preparation: A Reflection From Online Instructors
Y. T. Chow pp. 917 - 928

Designing an Educational Board Game Combined With Spherical Video Virtual Reality Scaffolding Mechanism for Learning Inhaled Drug Therapy
Tzu-Pei Wang
Huei-Tse Hou pp. 929 - 935

Using Experiential Learning Activities in Simulation Games to Predict Students' Scores
Nang Laik Ma
Ivy Sook May Chia pp. 937 - 946

Comparative Analysis of Educational Concepts and Outcomes Between Public High Schools in Heilongjiang County Town and New First-Tier Cities in Zhejiang Province, China
Jiwen Yang pp. 947 - 952

Pre-service Teachers Undergoing a Second Teaching Practicum: Thoughts, Perceptions and Impacts on Future Careers as Early Childhood Educators
Menn Sze Chua pp. 953 - 963

The Authenticity of EFL Summative Test-Task Items at a Senior High School in West Seram, Maluku Province, Indonesia
Hardianto Hitimala
Susi Septaviana Rahkmawati pp. 965 - 980

Development of Infographics on Mental Health and Nutrition to Promote Health and Wellness for Secondary School Students
Ailin Chen
Naruemon Thepnuan pp. 981 - 991

Effects of Perceived Teachers' Autonomy Support on Motivation of Japanese Undergraduate With Mild Difficulties in Learning
Ryo Okada pp. 993 - 1004

Development of Learning Innovation on Digital Learning Ecosystem to Promote Entrepreneurial Intent and Entrepreneur's Professional Skills
Sirimonpak Suwannakhun
Sakesun Yampinij
Naphatsanan Suwannawong
Jiruth Patanachan
Apichaya Panicnok
Wallapa Wassanasompong pp. 1005 - 1025

Designing a SVVR Educational Game to Cultivate Environmental Behavior Decision-Making Skills: A Case Study on Tropical Rainforest and Indigenous Issues
Kang-Miao Cheng
Huei-Tse Hou pp. 1027 - 1034

Teachers' Perspectives in Promoting English Listening Skills Among Young Learners in Indonesia
Munirotul Fatimah
Jamilah pp. 1035 - 1043

The Impact of AI Writing Tools on Academic Writing: The Perspective of Higher Education Students in Indonesia
Noviyanti
Dwiyani Pratiwi
Suci Apriani pp. 1045 - 1058

An Empirical Analysis of Islamic Leadership: Mediating Role of Teacher Well-being
Rita Pusvitasari
Chantana Viriyavejakul
Piyapong Sumettikoon pp. 1059 - 1070

Academic Writing Across Traditions: How Doctoral Candidates Navigate Local and International Research Paradigms in Kazakhstan
Askat Tleuov pp. 1071 - 1085

Exploring Parent's Perceptions of Comprehensive Sexuality Education Among Early Childhood Students in Indonesia
Debri Pristinella
Gabriela Brenda Nathania Sukmana pp. 1087 - 1094

The Impact of the Affective Filter in the Acquisition of English Among College Students in Kuwait
Eidah Al-Mutairi pp. 1095 - 1106

Learning Innovation in the 3T Area: The Effectiveness of Moodle-Based Blended Learning on Critical Thinking Skills
Desak Made Anggraeni
Binar Kurnia Prahani
Suyatno
Budi Jatmiko pp. 1107 - 1130

Evaluating Western Cultural Content in Chinese Middle School English Textbooks Using the Zone of Proximal Development
Peihan Ji
Yujie Su
Vivian Ngan-Lin Lei
Xiaoshu Xu
Yuqing Dai pp. 1131 - 1147

Using Emotional and Multiple Intelligences to Predict Graduate Online Students Connectedness
Loren B. Naffziger pp. 1149 - 1153

Analysis of the Need for the Development of Research-Based History Learning Models in Higher Education With the TPACK Approach
Asyrul Fikri
Suarman
Isjoni
Sumarno pp. 1155 - 1173

Perception of History Education Students on the Use of Virtual Reality Tour 3D Media of the Wings Palace in Pelalawan
Bunari
Muhammad Afrillyan Dwi Syahputra
Ria Rafianti
Chandra Perwira Negara
Asyrul Fikri pp. 1175 - 1182

Analyzing Gender-Based Perceptions of Corruption and Equity Among Engineering Students: Insights From a Multidisciplinary Data Mining Approach
Gloria Martínez
Nashielly Yarzabal
Juan Sabas pp. 1183 - 1192

Tolerance for Uncertainty as a Mediation Role in the Relationship Between Professional Identity and Career Choice Among Early Childhood Student Teachers in China
Jie Pan
Mohammad Ismath Ramzy Mohammad Ismail pp. 1193 - 1213

Nurturing Early Childhood's Character in Indonesia
Siti Aisyah
Nina Mariani Noor pp. 1215 - 1229

Individuals' Motivations for Selecting a Liberal Arts Major: Evidence From a Transnational University in China
Shan He pp. 1231 - 1244

Do You Re(meme)ber: Reconstructing Memes as a Summary for Recall and Comprehension in Mapua University
Marian Ingrid A. Sauco
Marvin B. De Leon pp. 1245 - 1256

Cultivating Intuition for Mathematical Modelling in an Interdisciplinary STEM Lesson: A Case Study in Singapore
Lim Kim Yong
Ng Mei Ting pp. 1257 - 1269

Development of Augmented Reality on Mathematics for Grade 2 Students at Zigong Vocational and Technical School in China
Lai Yuhong
Mathuros Panmuang pp. 1271 - 1280

A Conceptual Framework for Self-Regulated Learning and Assessment in Pre-service Teacher Education
Apichaya Khwankaew
Jirarat Sitthiworachart pp. 1281 - 1289

Development of a Recognizing Digital Skills Model to Promote Community Business Learning and Creative Tourism in the Mekong Riverside Area, Nakhon Phanom Municipality, Thailand
Suwisa Jarutkamolpong
Kantapop Buathong
Parama Khangmuang
Athirhat NunKuntee
Kanlaya Mikhama pp. 1291 - 1308

A Comparison of Online Learning Engagement Across Cultural Backgrounds: A Study of Students at Two International Campuses Sharing the Same Curriculum
Suzanne Mary Caliph
Chooi Yeng Lee pp. 1309 - 1316

Exploring Authentic English Learning Tasks in the EFL Classroom With KIVA
Michael Johnson pp. 1317 - 1325

Transforming Teaching and Learning at the Royal University of Bhutan Through Targeted Needs Assessment
Gembo Tshering pp. 1327 - 1345

Detection of Particles With a Fog Chamber: Experiential Learning With IPN High School Students
Guillermina Ávila García pp. 1347 - 1359

Enhancing English Language Proficiency for Primary School Students Through the Implementation of Online Interactive Multimedia Learning
BoMing Yang
Piyanan Pannim Vipahasna pp. 1361 - 1365

Podcasting in Teacher Education Can Enhance Critical Discourse and Collaborative Learning: Reflections From Researcher-Practitioners
Delecia Davids
Elzahn Rinquest pp. 1367 - 1382

Artificial Intelligence in Art and Design Education: A Bibliometric Study of Emerging Trends
Jirarat Sitthiworachart
Zhaodi Li
Thanin Ratanaolarn pp. 1383 - 1397

Development of Video With Microlearning on Soil Research to Enhance Learning Achievement of Students at Sichuan University of Science and Engineering
Ming Dong
Thidarat Kulnattarawong pp. 1399 - 1409

Structural Equation Model of Causal Factors Affecting Achievement in Calculus 1 for Engineering and Architecture Students
Anek Putthidech
Amnaj Sookjam
Sangtong Boonying
Suwit Somsupaprungyot pp. 1411 - 1422

Application of Teachable Machine Program for Developing Volleyball Skills
Amnaj Sookjam
Anek Putthidech
Sangtong Boonying
Parinya Natho pp. 1423 - 1434

How Are New Metaphors Created? Evidence From Chinese English Learners
Ying He pp. 1435 - 1446

Proper Modalities of Input Facilitate Incidental Vocabulary Acquisition: Evidence From Advanced Chinese EFL Learners
Ying He
Siyu Wu pp. 1447 - 1462

Factors Related to Entrepreneurial Intention Among Engineering and Technology Undergraduates in Thailand: A Confirmatory Factor Analysis
Piyanan Wongtaweelat
Tanes Tanitteerapan
Mongkhon Narmluk
Sirimonpak Suwannakhun pp. 1463 - 1475

Effect of Dance Learning Experience on Audiovisual Information and Body Synchrony
Mizuki Nakajima
Takeshi Sato
Hiroyuki Morikawa
Kimie Nakajima pp. 1477 - 1483

Future of Civil Engineering Education: Trends and Challenges
Yasser E. Ibrahim Mansour pp. 1485 - 1492

A Design Framework for Illustrating Malay Proverbs: Shaping Learning Modalities for Generation Alpha
Neesa Ameera Mohamed Salim
Mohd Nor Shahizan Ali
Syahrini Shawalludin
Nurul ‘Ayn Ahmad Sayuti
Azhar Abd Jamil pp. 1493 - 1502

Reshaping Visual Learning Through the Design Thinking Model: Board Games and Dyslexic Children’s Mastery of Malay Proverbs
Mohd Nor Shahizan Ali
Neesa Ameera Mohamed Salim
Noor Alaudin Abdul Wahab
Karim Harun
Norashikin Hamzah pp. 1503 - 1515

Development of a Digital Embroidery Museum Integrated With VR for the Preservation of Intangible Cultural Heritage
Ran Shao
Juntao Li
Thoriq Tri Prabowo
Atit Tippichai pp. 1517 - 1525

Effectiveness of Game Based Teaching in Topic of Human Resource Management for Vocational College Students
Tan Qiulan
Tiamyod Pasawano pp. 1527 - 1537

Navigating Challenges and Strategies: Malaysian ESL Secondary School Teachers in Differentiated Reading Instruction
Aimi Liana Ahmad pp. 1539 - 1549

Curriculum Reform in Data Science Education: Enhancing Learning Outcomes With Scaffolding Learning Through Data Storytelling (SLDS)
Yiyun Fan
Kah Loon Ng
Wan Mei Amanda Soon pp. 1551 - 1564

Preparing Organizations for the Digital and AI-Driven Economy: Building Dynamic Capabilities Through Continuing Education
Siw M. Fosstenløkken
Annita Fjuk pp. 1565 - 1574

A Theoretical Framework for Ubiquitous Learning in Creative Music Arrangement: Enhancing Skills Development for Thai Youth
Nattaphob Aoonlamai pp. 1575 - 1587

Exploring Students' Experiences and Attitudes Toward Text-Generating AI in Foreign Language Learning: A Study of Japanese University Students
Harumi Kashiwagi
Min Kang pp. 1589 - 1600

Structural Validity of the Career Decision-Making Self-Efficacy Scale for Thai Vocational Students: A Confirmatory Factor Analysis for Career Guidance Development
Chanchai Yothasoot
Surapon Boonlue
Saranya Chuathong
Sutiwat Supaluk pp. 1601 - 1611

Who's on First? Who's on Second? Getting Our Students to Home Today
Denese Wolff-Hilliard
Tia Caster pp. 1613 - 1620

The Development of an Automated Response System Using AI Chatbot to Support and Resolving Network-Related Problems at Thai University
Sangtong Boonying
Suwit Somsuphaprungyot
Anek Putthidech
Amnaj Sookjam
Parinya Natho pp. 1621 - 1633

Learning Process in Learning Community as Paulo Freire's Learning Approach
Nur Ilma
Hiryanto
Naila Intania pp. 1635 - 1646

Development of a Digital Camera-Based Attendance System for University Students
Suwit Somsuphaprungyos
Anek Putthidech
Amnaj Sookjam
Sangtong Boonying
Nutthawat Mudpetch pp. 1647 - 1655

Aesthetic Education Through Teaching Japanese Literature and Cinema at the Ho Chi Minh City University of Education in Vietnam
Thu Vân Phan pp. 1657 - 1665

A Comprehensive Synthesis and Administrative Implementation Framework for Universal Design for Learning
Rapeephan Phaengsopha
Saowanee Sirisooksilp pp. 1667 - 1687

Moderating Effects of Cognitive Load and Learning Engagement on Self-Regulated Learning Motivation and Academic Achievement
Wen-Liang Chang
Ming-Hsiu Tsai
Cheng-Hung Weng
Hung-Che Cheng pp. 1689 - 1707

Preserving Modern Local Skills: A Case Study of Embroiderers in Chiang Mai, Thailand
Pathitta Nirunpornputta pp. 1709 - 1721

Enhancing Critical Thinking Through Reading in a Controlled Environment: A Study Using the BookRoll Tool
Panadda Jaiboonlue
Wasan Na Chai
Nattapol Kritsutikul pp. 1723 - 1732

Enhancing Interdisciplinary Critical Thinking Skills in Higher Education With Improved Content Selection and Syllabus Sequencing Presented by Relationship Mapping
Zhaotong Li
Bohao Ma
Seng Chee Tan
Seyed Mehdi Zahraei
Chee Chong Teo pp. 1733 - 1747

Perception of Pre-service Teachers Towards Practicing Value-Based Techno-Pedagogical Content Knowledge (VTPCK Model)
Suprita Kumari Sinha
V. K. Shanwal pp. 1749 - 1756

A Comparative Study on Enhancing the Accuracy of Chinese Speech-to-Text in Instructional Videos Using Large Language Models
Chih Chang Yang
Tzren-Ru Chou
Shu Wei Liu pp. 1757 - 1761

Integrating Innovative Technologies in Mechanical Engineering Education: Case Study of an Arduino-Powered Robotic Arm for Quality Assurance in Automotive Manufacturing
Suzilawati Muhamud-Kayat
Mohd Hazri Mohd Rusli
Danish Afdal Azman
Joshua Goh pp. 1763 - 1769

Official Conference Proceedings

Abstract
This research is qualitative and aims to find out how digital media is used to empower students' digital literacy and critical thinking in biology learning. The methods used were filling out questionnaires and conducting interviews. Seventy-six eleventh grade students of SMA Negeri 1 Kesesi, Indonesia, and two biology teachers were selected as the research sample in this study. The research results showed the following aspects: Firstly, the student's digital literacy questionnaire is 71%, which is classified as moderate in digital literacy indicators including finding, using sources, selecting, evaluating, considering sources, message effects, and using data to produce work; secondly, students critical thinking skills is 65% which is classified as relatively low, not yet able to assess evidence, compare and contrast various objects with actual conditions and cannot examine them objectively; thirdly, some of the things that teachers do to train these two skills are by inviting students to search for information via Google/search engines and video searches to support the teacher's explanations, using Canva to make some presentation and using Google Lens to image any plants around the school. Unfortunately, teachers do not train them on how to search using appropriate keywords and trusted sources. Finally, teachers must be more active and innovative in maximizing the wise use of digital media to improve students' digital literacy and critical thinking skills.

Introduction

Education in the 21st century has challenges in the form of VUCA (Volatility, Uncertainty, Complexity, and Ambiguity), a condition that indicates very dynamic and rapid changes, is difficult to predict, difficult to understand the causes and effects of something, and has a variety of results that cannot be explained clearly (Mohanta et al., 2020). These challenges mean that education in the 21st century needs to continuously survive and innovate in the current competitive era. Efforts that can be made are to equip and train students with appropriate skills, such as digital literacy and critical thinking.

In education, especially in biology, digital literacy needs to be trained and studied to form a digitally literate generation of the nation's young people. Increasing digital literacy is able to form self-control as a solution to prevent cases of the circulation of false information (hoaxes) from recurring and increasing in number (Sabrina, 2019). Hoaxes usually contain inaccurate information and hate speech that can incite, corner, and even provoke religious, ideological, and other figures. Hoaxes occurs when non-face-to-face interactions between people on social media encourage courage to express opinions or statements that involve insults, hate speech, and bullying (Jusnita & Ali, 2022).

Critical thinking skills are cognitive activities that are connected to the use of the mind (Cotrell, 2005), or the process of solving problems carefully and thinking clearly. A person with thinking skills will be able to question something appropriately, as well as gather relevant information, obtain logical reasons, and think critically based on existing information to draw a conclusion (Reichenbach, 2002). Critical thinking skills are defined by Greenstain (2012) as a way of thinking about any subject, content, or problem in which a thinker skillfully uses the quality of his thinking and forces his intellectual standards to increase. Thinking skills include cognitive abilities and emotional aspects (disposition). Critical thinking skills include interpretation, inference, explanation, evaluation, self-regulation, analysis, and induction and deduction processes in finding reasons (Profetto-McGrath, 2003). Critical thinking skills require cognitive abilities, a habit of deep inquiry, and a desire to think through different problems. The application of this ability causes a person to feel the need to achieve knowledge in the real world.

Based on the background above, the researcher studied how the use of digital media in high school empowering students' digital literacy and critical thinking skills in biology learning.

Method

The research method is qualitative used mix both quistionaire and interview. The data has taken on 9-10 Oktober 2023 in SMA Negeri 1 Kesesi, Pekalongan, Central Java, Indonesia. Qualitative research is a term with varying meanings in educational research. In example, Borg and Gall (1989) suggest that the term is often used interchangeably with terms such as naturalistic, etnograpic, subjective and pospositivistic. A quistionnaire used to measure students perception about digital literacy and crical thinking skill was used in this research. The initial item bank contained 26 items based on digital literacy and critical thinking skills by Arends (2003). All items were scored on a 5-point Likert Scale. A total 76 eleventh grade students of SMA Negeri 1 Kesesi, Indonesia, completed the quistionnaire. Only those students who completed the full quistionnaire were included in the analyses.

Polit and Beck (2006) defined the interview as a methode of data collection in which one person ask question of another person: interviews are conducted either face to face or by telephone. Two biology teacher of SMA Negeri 1 Kesesi participated in interviews. On average, each interview lasted 40 minutes. All interviews were semi-structured and focused on the three topics included digital literacy, critical thinking skill and digital media. The research questions in this study are following:

- What they know about digital literacy and critical thinking skill?
- What kinds of technolgy do they use before classes?
- What kinds of digital media do they use before classes?
- Do students show digital literacy during classes?
- What kinds method do they use to train digital literacy and critical thinking skill?

Results and Discussion

This study aimed to find out how digital media is used to empower students' digital literacy and critical thinking in biology learning. Student questionnaire results shows that the digital literacy of class XI students at SMA Negeri 1 Kesesi classified as medium with an average yield of 71%, with details of the average for each indicator as follows: The first indicator of digital literacy is skills found that getting a score of 74% was moderate. These results show that students are able to sort through choices and independently find information related to or relevant to the problem.

The second indicator Digital literacy, namely the skill of using sources, gets a score of 69% relatively low, so students are able to access some information, but usually misses the problem keyword. The third indicator of digital literacy, namely chose to get a score of 69%, which is low, indicating that students not yet able to select and make exceptions to the source of information and not being able to make the right choice from a wide range of options. The fourth indicator for digital literacy, namely evaluating, getting a score of 77%, which is classified as moderate, shows that students are able to complete source and author verification but are not yet aware of the bias in the information. The fifth indicator of literacy digital, namely considering the source and effect of the message, gets a score of 77%, classified as moderate, indicating that students are aware that there is persuasive or invitation to the information obtained but unable to explain method used. The sixth indicator of digital literacy is using data to produces work that gets a score of 72%, which is classified as medium, showing that students are skilled at creating new works from the information obtained, however has not used strong analysis and evaluation.

Those result is in line with the results of teacher interviews stated that there were still many students who did not consider the message effect of the information they obtain or use and the information validation process is still minimal, so there are tendencies. Students are easily exposed to biased information and hoaxes.

The student questionnaire shows that the critical thinking skills of the class The indicator of using data to develop critical insight is choosing to get a score of 74%, which is classified as moderate, meaning that students are able to use the selected data to draw conclusions that are in accordance with the facts but are not completely accurate. The analysing indicator gets a score of 53.4%, which is low, meaning that students are able to explain the main problem inaccurately and cannot examine it objectively. The synthesising indicator gets a score of 75%, which is considered moderate, indicating that students are able to identify and compare

the components of an argument but are not yet skilled at combining the components of an argument into one complete piece of new information.

Students' thinking skills are low due to the cognitive training that students are given only around the ability to remember and understand (Saparuddin et al., 2021; Shafira et al., 2023). If critical thinking skills are not trained or developed, a person will continue to be in their initial condition and have an impact on their digital literacy (Delima et al., 2023; Indah et al., 2022).

One of the efforts made by teachers is by creating or using multimedia in learning. Digital multimedia have been proven to be able to increase student motivation and learning outcomes (Nofitasari, 2012; Leow, 2014), as well as improve students' critical thinking skills in science learning (Syawaludin, 2019).

The interview results show that teachers have used digital media in biology learning, for example the use of search engines to add information about the topic being studied, the use of Google Lens to help students naming and classifying plants at school and the use of Canva to make presentations. Unfortunately, this process still lacks teacher supervision, especially in determining reliable sources of information and applying keywords when searching, giving rise to bias and the possibility of misinformation.

Conclusion

Based on the results and discussion of this research, the following conclusions were obtained.

1. Digital media can be use by teacher in biology class to empowering students digital literacy and critical thinking skill.
2. Teacher should choose some leaning model when they use digital media.

Illiteracy Eradication Strategies in Indonesian Rural Schools Using the I Love Reading (SSM) Curriculum

Astina Hotnauli Marpaung, Yogyakarta State University, Indonesia
Hiryanto, Yogyakarta State University, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study examines the implementation of the SSM curriculum in eradicating illiteracy in rural Indonesian schools and identifies contributing factors to illiteracy in these areas. Using a qualitative case study approach, data were collected through in-depth interviews with teachers, school principals, parents, and students, alongside direct observations and document analysis. The findings highlight challenges such as children dropping out to assist with family livelihoods, inadequate teacher training, and the lack of a specialized curriculum. Implementation of the SSM curriculum has shown promising results in enhancing both student and teacher engagement by employing phonics, local wisdom-based media, and adaptable teaching resources. This study underscores the significance of contextually relevant curricula in addressing illiteracy in rural areas and aims to contribute to strategies for improving education quality in similar contexts.

Keywords: Illiteracy Eradication, SSM Curriculum, Rural Education, Indonesia

iafor
The International Academic Forum
www.iafor.org

Introduction

Education plays a pivotal role in improving the quality of human resources and life. However, in rural Indonesia, education quality remains alarmingly low, hindered by factors such as difficult geographical conditions, lack of educational infrastructure, low teacher quality and welfare, and minimal government attention. These issues contribute to high illiteracy rates, particularly in remote areas.

As of 2021, 9.24% of Indonesians aged 45 and above were illiterate, while 1.50% of those aged 15–59 years remained illiterate in 2022 (BPS, 2022). The productive age group (15–19 years) exhibited the highest illiteracy rates, indicating a missed opportunity for human resource development. Poor literacy and numeracy exacerbate social exclusion and alienation, particularly in disadvantaged communities (Hajaj, 2002).

Factors Contributing to Illiteracy in Rural Indonesia

Various factors contribute to this issue, including lack of motivation, varying intelligence levels, and external influences from family, school, and community environments (Sartina et al., 2020). Economic constraints and limited access to education historically have also played a role (Waziroh, 2021). To address this problem, government and non-formal institutions have implemented literacy programs, though these often face challenges such as inadequate learning hours and low student motivation. Successful interventions have included involving religious leaders to increase learner motivation (Anto, 2020), optimizing literacy activities in early childhood education and elementary schools, and providing reading materials (Sudarwita, 2022).

Implementation of the SSM Curriculum in Rural Schools

Several recent studies have explored innovative approaches to eradicate illiteracy in remote areas of Indonesia. The use of flashcards has shown promising results in improving basic reading and writing skills in Sorong district, West Papua (Kasri et al., 2023). Integrating local culture and activities into literacy instructional design has been effective in improving adult reading skills in disadvantaged areas (Hadianto et al., 2022). In Papua, utilizing folklore and mother tongue materials has been proposed as a culturally appropriate strategy to strengthen literacy programs and preserve local languages (Yektiningtyas-Modouw & Karna, 2013). Environment-based literacy programs have also been implemented, as seen in Owata Village, Gorontalo Province, where the surrounding environment became a learning resource for vocabulary and sentence acquisition, resulting in reduced illiteracy rates and increased awareness of environmental conservation (Supriyadi & Kadir, 2020).

Over three years of living and working in 3T areas (Outermost, Frontier, and Disadvantaged), including Nias (North Sumatra), East Nusa Tenggara, and the Mentawai Islands (West Sumatra), the author observed a persistent issue of illiteracy in rural Indonesian schools, where many students in grades 3–5 still cannot read, write, or perform basic arithmetic. These students are often promoted despite lacking foundational skills, as formal schools struggle to address their needs due to limited teacher resources, inadequate teaching materials, and the absence of a special curriculum. Factors such as students missing school to help their families, the blending of illiterate and literate students in one classroom without differentiated instruction, and teachers focusing only on academically capable students exacerbate the problem. Furthermore, the lack of teacher training, low teacher welfare, and insufficient

learning media contribute to the ongoing challenge of illiteracy eradication in these rural areas.

To address the problem of illiteracy in rural areas, it is necessary to develop an effective literacy curriculum that suits local needs. The SSM (Saya Suka Membaca) curriculum offers a step-by-step approach to teaching children to read, utilising learning media based on local wisdom. Research shows that local context-based approaches can increase participation and success of literacy programmes. For example, research by (Hiryanto, 2009) on the illiteracy eradication programme through Kuliah Kerja Nyata (KKN) in Bantul showed success because it integrated local themes and relevant learning resources. In addition, the social context-based education theory proposed by Freire, (2017) emphasises the importance of education that is relevant to students' life experiences and cultural backgrounds, which can increase their motivation and participation in learning.

The functional curriculum theory described by Kress (2003) is also relevant in this context, where literacy is not only about the ability to read and write, but also about the ability to use these skills in practical situations. The active learning approach proposed by John Dewey (1938), which involves direct experience and active interaction of students with learning materials, has been shown to be effective in improving literacy skills. That literacy curriculum interventions that focus on local needs can reduce illiteracy rates in different community groups, emphasising the importance of curriculum development that is appropriate to students' social and cultural contexts (Dewey, 2022).

The SSM (Saya Suka Membaca) curriculum offers a potential answer. Designed to foster literacy through phonics, interactive media, and local wisdom, the curriculum has demonstrated success in improving literacy rates in diverse contexts across Indonesia. This study explores its implementation in rural schools to identify its impact and potential as a model for addressing illiteracy nationwide. In 2018, SSM Curriculum materials were used in the teaching process for more than 4,500 children in 12 Indonesian provinces, ranging from North Sumatra (Nias) to Papua (Merauke), more than doubling the number compared to the previous year, where we served 1,800 children in 2017. The SSM curriculum has provided more than 6000 reading books to partners, including UNICEF and Room to Read. Therefore, researchers are interested in examining how the strategy of eradicating illiteracy in Indonesian rural schools using the SSM curriculum.

Conclusion

The research method used is qualitative research with a case study approach. According to Creswell, in Sugiyono (2023: 45) a case study is a type of qualitative research, where the author conducts in-depth exploration of programs, events, processes, activities for individuals related to time and activities. Case studies aim to study intensively the background of the problem of the current situation and position of an event, as well as the interaction of certain social environments that are as they are. Data were collected through in-depth interviews with rural teachers (20 people), local teachers (4 people), principals in rural schools (3 people), parents (5 people) and students in grades 3-5 who were still illiterate (25 people) who were the subjects of this study. In addition, direct observation and analysis of related documents were also conducted. All information obtained from the field was verified for accuracy through a data triangulation process.

Based on the results of the analysis conducted by the researcher, several factors were found to influence the presence of illiterate high school students in Indonesian rural schools.

a. Factors Influencing Illiteracy Among High School Students in Rural Indonesia

1. Many students leave school because they have to follow their parents to the plantation or to the forest to harvest or hunt, causing them to miss many lessons and even drop out of school but they can return to the same class or even age-appropriate class whenever they come down from the mountain or return from the forest. This indecisive system creates an imbalance of literacy learning needs in one classroom.
2. Illiterate students and students with good academic abilities are combined in one class and there is no special attention or learning for illiterate children so that illiterate students are only present in the class without being able to participate in learning.
3. Teachers in Indonesia's rural schools have no guidelines, teaching materials, modules and no skills training on how they should eradicate illiteracy in the rural schools where they serve.
4. Teachers' unemployment and students' backgrounds from underprivileged families mean that there is limited access to reading resources and effective learning media for children who cannot read.
5. There are still many teachers who focus only on students whose academic abilities are considered good and ignore students who are difficult to teach calistung since the lower grades.

b. The Stages Undertaken by Rural Teachers in Carrying Out Illiteracy Eradication Strategies Using the SSM Curriculum Are As Follows:

1. Identifying students' reading ability and then grouping students based on SSM curriculum levels, namely letter sound class, syllable class, word and sentence class and independent reading class. So that students in one class can vary in age but almost the same learning needs in literacy.
2. Teaching letter sounds (lL, Kk, Mm, Pp consonant letters and vowels until 26 letters are completed). At this level or stage, letters are not introduced or taught in order A-Z but randomly to prevent students from recognizing letters by memorizing but should remember because of understanding not because of memorization. This stage also learns both lowercase and capital letters at the same time and avoids learning similar letters in close proximity such as nN and Mm. Before starting the lesson, the teacher explains to the students what letters they will learn today. The teacher explains and pronounces several names of objects beginning with the letter L. The teacher invites students to look at several different pictures drawn on the blackboard or pasted on the classroom wall (can be printouts, results drawn by the teacher or can be cutouts from used snack wrappers and then leads students to say together all these objects whether the sound of the initial name of the object is the same or different. For the student activity sheet, there are several activities such as finding and then circling the letter being studied that day among many other letters, collaging letters using origami or other used paper according to the teacher's creativity, sticking letters on dry wooden twigs provided by the teacher (letter trees), games to find letters behind friends' chairs and learning to recognize letters written on leaves. For the letter sound stage, students are invited to sing a letter sound song with the same tone for each letter, only changing the name of the object according to the initial letter being studied at that time. The lyrics of the song are as follows: lL flies flies flies Flies start with L L L L L L That's the letter L.

Figure 1: Origami Letter Collage

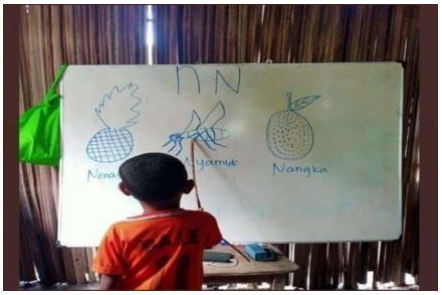

Figure 2: Learning the Letter nN

3. Syllables. At this stage, all students from the letter sound class are expected to recognize and be able to write letters. The teacher teaches students to combine two syllables combining consonant letters and vocal letters such as Sa-Pu. In addition to reading aloud combining 2-3 syllables in front of the blackboard, teachers can also provide learning media in the form of letter cards. Letter cards do not have to be purchased but can also be made by yourself with cardboard written with letters using markers.

Figure 3: Reading Two-Syllable Picture Story Words

4. Words and sentences. The learning objectives at this level are for children to: a. Assemble simple syllables to form new words. b. Explore new varieties of syllables (for example, words ending in the syllable "h", or containing "ng"). c. Follow the reading of simple stories. d. Read simple stories together in class and afterwards individually. e. Read simple questions about the stories they read and write the answers. f. Read stories together in class and afterwards individually.

Figure 4: The Child Reads the Sentence Written on the Leaf

5. Independent reading. This is the final level and the goal of all levels of the SSM curriculum. At this level, the learning objectives are for children to achieve several things, including: a. Practice reading independently to improve their ability to read fluently and understand the content. b. Demonstrate their understanding of the reading

material by writing responses to questions about books they have not read before. c. Understand the proper use of capitalization, as well as punctuation marks such as periods, question marks, and exclamation marks. d. Develop an interest and enjoyment in reading as well as the overall learning process.

The conclusion from the results of this study is that there is an increase in the willingness or participation of high grade students (3-5) to take part in learning because the learning process is adjusted to the agreement with students in the afternoon or evening for students who have to go to the forest to hunt or hunt. Students are also happy in the learning process because in one class all have the same learning objectives so that there are no passive students. The enthusiasm of illiterate students to immediately be able to go to the next stage or level is very high because the motivation is to show everyone that they can read and learning to read is fun. Teachers also feel a positive impact when preparing activity sheets or learning media plans for each level of the SSM curriculum because they can be created with materials provided by nature so that teachers are more happy to be able to teach for good without feeling burdened. Teachers who implemented the SSM Curriculum stated that they benefited from a better understanding of reading teaching methods, felt re-inspired, had a more defined vision for the teaching process, and became more efficient in lesson preparation. They also noted that the children they taught progressed in learning to read more quickly and showed greater interest in reading independently.

Related to the above conclusions, some suggestions for rural schools and the government are that schools need to collaborate with the Tuna Aksara Foundation and the local government or Education Office to provide training on the practice-based SSM curriculum to rural teachers so that in the future classroom teachers for low grades are able to cope with student literacy learning from grade 1 and there are no more illiterate students in high grades (3-5). The SSM curriculum demonstrates significant potential in addressing illiteracy in rural Indonesia by leveraging phonics-based instruction, local wisdom, and adaptable teaching methods. This study highlights the urgent need for targeted literacy programs and specialized teacher training in rural areas. By adopting contextually relevant curricula, Indonesia can make substantial progress toward eradicating illiteracy and improving educational equity.

Future research should explore the long-term impact of the SSM curriculum and its scalability to other rural contexts. Collaborative efforts between policymakers, educators, and communities are essential to ensure sustainable and impactful literacy interventions.

Acknowledgments

The author expresses heartfelt gratitude to **LPDP (Lembaga Pengelola Dana Pendidikan)** for their generous financial support in attending this international conference. The author greatly appreciates the opportunity provided by LPDP and its continued commitment to supporting the author's academic and professional development. Sincere thanks for this invaluable opportunity.

Official Conference Proceedings

Abstract
The MEQR Component 3 Project is an activity to strengthen and develop the capacity of supervisors, madrasah heads, teachers, librarians, and laboratory workers through tiered training. Modules are an integral part of this training activity. This qualitative research aims to obtain information on the effectiveness of training modules in CPD Teacher activities. This study involved 6 facilitators who were determined using a simple random sampling technique. Data was taken using interview techniques and document analysis and then analyzed descriptively. The results showed that in the aspect of module readability, facilitators have a good perception. Most of the interview results showed that the modules used had a language that was easy to understand. From the aspect of the module content, most facilitators argue that the content of the CPD Teacher module is still not optimal and requires improvement in the form of curriculum adjustments and clarifying learning stages. Furthermore, in terms of the utilization of modules by participants, facilitators have the opinion that their utilization is still not optimal because most participants still like to read information and materials from PPT compared to modules. Following up on the results of this study, it is recommended that the module revision be made in the form of curriculum adjustments and module design, and further research is needed related to participants' interest in reading the CPD Teacher module.

Introduction

Education is the main foundation for shaping a superior future generation (Presidential Regulation of the Republic of Indonesia Number 87 on Strengthening Character Education, 2017). The quality of education is influenced by various factors, one of which is the success of delivering material to educators. In this context, teacher skills in designing fun learning are indispensable (Sudrajat, 2020). Teachers are expected to participate in professional development activities regularly to improve their professionalism and support their careers. Therefore, the Ministry of Religious Affairs, through the program Madrasah Education Quality Reform (MEQR), initiated Project Component 3: Policy and Continuous Professional Development for Teachers and Education Personnel in Madrasah (Kementerian Agama, 2021).

Project Component 3: Policy and Continuous Professional Development for Teachers, Education Personnel in Madrasah, commonly called CPD Project for Teachers and Educators, is an activity to provide strengthening and capacity building of supervisors, madrasah heads, teachers, librarians, and laboratories through tiered training. This activity involves Working Groups such as KKG, MGMP, MGBK, and KKM as part of its training facilities (Kementerian Agama, 2021). Strengthening and development activities are carried out in stages, starting with module writers, National Instructors, Provincial Facilitators, Regional Facilitators, and teachers.

Facilitators have a crucial role as mediators between training materials and participants in teacher competency-strengthening training (CPD) (Waluyo, 2021). They are not only teachers but also facilitators of learning who connect theory with practice in the field (Imtihanah & Gumati, 2022). CPD Guru facilitators are responsible for ensuring that the material presented is not only understood but also effectively applied by the participants (Milaini et al., 2023). They play an important role in creating an inclusive learning environment, facilitating enriching discussions, and providing in-depth guidance in the learning process (Burhamzah et al., 2023).

CPD facilitators are responsible for understanding the individual needs of participants as companions in teacher professional development (Holiah, 2022). They must be able to adapt the learning approach according to the participants' characteristics and facilitate a results-oriented learning process (Giu, 2021). More than just providing information, CPD facilitators are expected to build teacher skills in applying new knowledge to their teaching context (Adia, 2022). With a responsive and interactive approach, CPD Guru facilitators are not only introducers to information but also mentors who encourage reflection and ongoing professional development for participants (Sugiyono & Setiawati, 2020).

Teacher training modules are teaching materials that are systematically designed and presented to assist teachers in improving their competencies. In the context of education, teacher training modules can serve as operational guidance for education and training institutions (Kementrian Pekerjaan Umum dan Perumahan Rakyat, 2019). The concept of the CPD Teacher module in the MEQR Component 3 Project is designed to contain several Learning Units (UP), with each learning unit having 3 stages, namely In Service Learning 1, On Service Learning, and In-Service Learning *2* (Hairunisah et al., 2020). This module not only contains information but also presents learning materials with an approach that facilitates an interactive, fun, and easy-to-understand teaching-learning process (Putri Kumalasani & Eilmelda, 2022). This teacher's CPD module can also function as a teaching

module because each UP contains examples of learning designs that teachers can apply in madrasah.

Apart from being a guide for participants in attending training, the CPD Guru module also aims to be a reference source that can be reaccessed after completing the training. Good modules are comprehensively designed to include a variety of learning methods, case examples, and activities that support the understanding and application of training materials in the field (Maulinda, 2022). An effective CPD Teacher module can also arouse participants' interest in learning and facilitate the process of reflection and improvement of teacher professionalism (Nadeak et al., 2023).

Unfortunately, no research has examined how effective the CPD Master module is in the MEQR Component 3 Project until now. Information about the effectiveness of modules in this activity is needed, especially by policymakers and module authors, so that they can be input and produce even better teacher training modules.

Various studies regarding module development have been carried out before (Sulistiyono, 2022; Wulandari & Iriani, 2018). Some papers also lead to research to evaluate modules (Firdaus et al., 2023). However, the variables of the study are all teaching modules for students. In line with this information, research examining the effectiveness of training modules has never been conducted. This research needs to be done because it can provide information about how efficiently the use of modules in the CPD Teacher training activities of the MEQR Component 3 Project. In addition, this research can also be the basis for research on the development of teacher training modules. Therefore, the purpose of this study is to see an overview of the effectiveness of the CPD Teacher training module from the perspective of the facilitator.

Method

This research uses a qualitative descriptive approach with data collection methods through interviews and document analysis. The study was conducted from October to December 2023 using interview techniques with several facilitators in data collection. The facilitators selected to be interviewed in this study were 6 people.

In the data collection process, researchers involved Provincial Facilitators and Regional Facilitators as resource persons. Researchers conducted observations and interviews through *WhatsApp media*. Researchers also conduct regulatory analysis and training technical guidelines for CPD Teachers and write modules to gain a deeper understanding of the implementation of teacher CPD and module writing. The instrument used here is an interview guide sheet that contains aspects that want to be researched in general related to the extent of the effectiveness of using the CPD Teacher training module in training activities using general guidelines (Patton, 1990). The leading information to be obtained through interviews included the shortcomings of the training module, its readability, construction, and use by participants during the training. This study used the Miles and Huberman Model for data analysis (Sugiyono, 2022). With data reduction analysis steps, data display, and conclusion drawing/verification.

Result and Discussion

MEQR Component 3 Project Teacher CPD Training Module

The Teacher CPD Training Module Component 3 of the MEQR Project of the Ministry of Religious Affairs is part of the efforts to strengthen the ministry's policies and programs related to Continuing Professional Development (CPD) for Teachers and Education Personnel in Madrasahs. This module is designed to provide strengthening and development through working groups, tiered training, and preparation of prospective madrasah heads and supervisors (Kementerian Agama, 2021). This module is teaching material packaged systematically. It contains a set of planned learning experiences and can be used as an operational guide for institutions that organize education and training (Decree of the Director General of Islamic Education Number 4447 of 2020 Concerning Guidelines for the Preparation of Madrasah Teacher Continuing Professional Development Modules, 2020).

The Component 3 project is one part of the Madrasah Education Quality Reform program initiated by the Ministry of Religious Affairs. This program consists of 4 components, namely: Implementation of the e-RKAM (Electronic-based Madrasah Work and Budget Plan) System Nationally and Provision of Assistance Funds for Madrasahs, Implementation of Learning Outcome Assessment System at Madrasah Ibtidaiyah (MI) level for All Grade 4 Learners Nationally Lack of Training Modules, Policies and Continuous Professional Development for Teachers, Education Personnel in Madrasahs, and System Strengthening to Support Quality Development. (Kementerian Agama, 2020)This project aims to assist the government in achieving its Sustainable Development Goals (SDGs). It is funded by a 50 USD per year World Bank grant.

One of the components of the MEQR program is the Component 3 Policy and Continuing Professional Development Project for Teachers and Education Personnel in Madrasahs. This project aims to provide development and strengthening through working groups, training, learning resources for teachers, and Teacher Competency Assessments, as well as strengthening the capacity of supervisors, madrasah heads, librarians, and laboratorians through tiered training (Kementerian Agama, 2021). This project runs from 2020 to 2024.

The main reasons for teachers' CPD activities are individual teacher needs, government needs, learner needs, madrasah needs, and the needs of educational institutions or foundations. The needs of individual teachers are reflected in the results of teacher assessments through the Teacher Needs Assessment (AKG) and Teacher Performance Assessment (PKG). Furthermore, government needs are based on government program priorities. The needs of educational institutions or foundations are based on the priority programs of the educational institutions or foundations themselves, especially teachers in private schools. So based on these needs, it is necessary to determine the priority programs that must be implemented by teachers in implementing CPD. (Decree of the Director General of Islamic Education Number 6673 of 2019 Concerning Technical Guidelines for Implementing Madrasah Teachers' Continuing Professional Development, 2019).

In training activities organized by MEQR, training modules are required as one of the training teaching materials. A package of teaching materials or teaching materials that contains one learning unit that can be read and studied independently is called a module. Modules are also referred to as media for self-study because they are equipped with instructions for self-study. Modules are designed as a guide for facilitators to help

participants achieve their learning objectives. (Decree of the Director General of Islamic Education Number 4447 of 2020 Concerning Guidelines for the Preparation of Madrasah Teacher Continuing Professional Development Modules, 2020). In general, the module consists of 1) target competencies to be achieved; 2) materials and topics that will be the basis of the teaching and learning process; 3) tools and materials to be used; 4) activity steps; 5) worksheets; 6) additional information; 7) assessment; 8) glossary; and 9) bibliography. By using modules, learning objectives can be achieved effectively and efficiently. Modules also allow participants to learn according to their abilities, methods, and techniques (Najuah et al., 2020). Module characteristics, according to the Module Writing Book, include self-instructional, self-contained, stand-alone, adaptive, and user-friendly (Directorate of Education Personnel Ministry of National Education, 2008). Self-instructional means that trainees can learn by themselves through the module and do not depend on themselves. Self-contained means that the module must contain all the material as a whole so that participants can easily learn the module. Stand-alone means that the module is not connected to other media or does not have to be used together with other media. Adaptive means that the module must adjust to the development of science and technology so that it can adapt to the current conditions of the participants. User-friendly means that the module must be easy to understand and use and follow user needs. Based on these definitions and characteristics, it can be concluded that modules are indispensable and have an important role in the training process. The function of the module is as a substitute for facilitators, teaching materials, evaluation tools, and reference materials.

The structure of the MEQR Component 3 Project Teacher CPD module consists of a module introduction, introduction, learning objectives and outcomes, learning flow, learning activities, glossary, PowerPoint slides (PPT), and bibliography (Decree of the Director General of Islamic Education Number 4447 of 2020 Concerning Guidelines for the Preparation of Madrasah Teacher Continuing Professional Development Modules, 2020). The introductory section explains the module's background, summarizes it in several Units of Learning (UPs), explains the module's interrelationship between UPs, explains the training approach used and provides guidelines for using the module.

Furthermore, the introduction explains the content of the UP and the reason why the material is part of the module. The objectives and learning outcomes focus on the teacher competency targets that will be developed in the UP following Permendiknas No. 16 of 2007 concerning Teacher Qualification and Competency Standards. Teacher competency targets are coupled with student competency targets consisting of knowledge, skills, and attitudes, each of which includes KI and KD according to Permendikbud No. 37 of 2018 concerning Amendments to Regulation of the Minister of Education and Culture No. 24 of 2016 concerning Core Competencies and Basic Competencies in the 2013 Curriculum in Primary Education and Secondary Education. In addition, the learning flow section contains a summary in flowchart form of the training process and time allocation through the stages of In-Service Learning 1 (IN1), On Job Learning (ON), and In-Service Learning 2 (IN2).

Learning Activities are the most crucial part of this module. This section contains the activity steps as well as the methods, approaches, materials sources, and techniques used to achieve the competencies expected in the module. In each activity step, there are Worksheets (LK) in the form of assignments or assessments and Additional Information (IT) which aims to expand knowledge of the concepts given or as a reference for further assignments. The learning activities consist of three main activities, namely the In-Service Learning (IN1) activity step, where in this activity participants will get material from the facilitator, work on

tasks in groups, and then create a learning design to be applied at the On-Service Learning (ON) stage. Furthermore, in On Service Learning (ON) activities, participants return to their respective madrasahs to implement the learning designs they have made in IN1. Then, in In Service Learning 2 (IN2), participants return together with the facilitator to reflect on what they have done in the madrasah.

The Glossary section contains concepts and terms that are new to participants. The PowerPoint slides (PPT) section is displayed during the training. This section contains text, relevant images, diagrams, tables, graphs, and more. The last section is the Bibliography, which contains a list of reference sources used in the module.

Module Readability

Module readability refers to the ability of the module to be presented in a clear, understandable, and accessible manner by the reader or trainee. Readability is not only limited to the ease of reading the words but also to the ability of participants to understand the information presented without significant difficulty (McLaughlin, 1969). This includes using simple language, a structured layout, and supportive visual elements to clarify the concepts being taught.

The importance of readability in training modules is that trainees can access information easily and effectively, improve their understanding of the material, and minimize barriers or confusion when learning the content presented in the module. Thus, a module that has good readability will support the purpose of the training itself, which is to provide knowledge and skills to participants efficiently and effectively.

Based on the results of interviews with 6 facilitators regarding the readability of the Teacher ESC training module, the following data were obtained:

Table 1: Interview Transcript Related to Module Readability

Interviewer	Interview Transcript
1st Facilitator	For the student section of the module, the language is light and easy to understand by students.
2nd Facilitator	There is some language that is not neatly arranged, and the appearance of the module is not attractive.
3rd Facilitator	Overall, the module is easy to understand, especially in the learning design section.
4th Facilitator	The language used is clear and easy to understand, and the display is less colorful.
5th Facilitator	For the facilitator's part, the parts that must be done are clear. In terms of teachers, there are no clear steps, so teachers have to interpret their steps to the madrasah at the time of ON.
6th Facilitator	The module is good and easy to understand.

Based on the data in Table 1, the module's readability is generally good. Most (4 facilitators) said that the language is easy to understand so that the trainees easily accept the information. This is following McLaughlin's opinion that readability is not only limited to words but also to the ease of understanding the information in the module (McLaughlin, 1969). However, there is one facilitator who thinks that the readability is suitable or can be understood during

the learning stage by the facilitator. However, for the learning stages carried out by teachers to students, the readability is still lacking. In addition, 2 facilitators think that the appearance of the module is still not attractive. Therefore, it can be concluded that the perception of facilitators on the readability aspect of the module can be said to be good because, in terms of language, it is easy to understand with light language. As stated in the Technical Guidelines for Writing Teacher CPD Modules, the module must be user-friendly or easy to understand and use by trainees (Decree of the Director General of Islamic Education Number 4447 of 2020 Concerning Guidelines for the Preparation of Madrasah Teacher Continuing Professional Development Modules, 2020).

Module Content

Content in a module refers to information or learning materials that are systematically organized to be delivered to trainees (Sumardjo et al., 2020). The role of content is crucial as it forms the core of the entire module, providing the substance or information to be learned and understood by participants. Good content ensures that the material presented is not only relevant to the learning objectives but also delivered in a clear, structured, and easy-to-understand manner, enabling participants to achieve a deep understanding of the topics taught. Thus, understanding and selecting the right content is an important cornerstone in the construction of a module that is effective in supporting the learning process.

In addition to readability, facilitators were also interviewed to find out their perspectives on the content of the MEQR Component 3 Project Teacher CPD module. The following is a table of interview transcripts for the module construction section:

Table 2: Interview Transcript Related to Module Content

Interviewer	Interview Transcript
1st Facilitator	In the module, teachers seem to be dictated to conduct learning in the same way as the module. Regarding alternative energy materials, the solutions offered are even more expensive and inefficient.
2nd Facilitator	The content is still lacking and needs to be revised.
3rd Facilitator	In general, the content meets the learning needs of students in the classroom related to the material.
4th Facilitator	Not yet paying attention to the diversity of learning, feedback is good with the stimulus at the beginning.
5th Facilitator	The upper-grade module needs to be revised so that the content is more "applicable." The order of material delivery in some sections is still unclear, and it needs to adjust to the new curriculum.
6th Facilitator	For the low-grade module, the stages are less coherent and less clear.

Based on the interview results in Table 2 above, most of the 6 facilitators expressed dissatisfaction with the content of the module. In terms of learning stages, 3 of the 6 facilitators thought that the stages were not clear enough, and 1 facilitator thought that the learning stages were too rigid so that teachers could not innovate when implementing them in madrasah in ON sessions. Furthermore, there is 1 facilitator who believes that the module is not following the Merdeka Belajar curriculum and 1 facilitator who believes that the module content still does not pay attention to student diversity. This is following the Technical

Guidelines for Writing Teacher CPD Modules, that participant modules must be adaptive and self-contained so that participants can study and understand the module as a whole even though there is no facilitator (Decree of the Director General of Islamic Education Number 4447 of 2020 Concerning Guidelines for the Preparation of Madrasah Teacher Continuing Professional Development Modules, 2020). Thus, it can be concluded that the facilitators were dissatisfied with the content and needed improvement.

Module Utilization by Participants During Training

Module utilization by participants refers to the process by which participants use, understand, and apply the material presented in the module during the training process (Muhardini et al., 2023). It involves the way participants learn, understand, and integrate information from the module into their understanding of the subject being studied. Module utilization does not only include reading or accessing materials but also involves activities, discussions, and practical application of the information presented (Najuah et al., 2020). In other words, module utilization is about how participants use this tool to deepen knowledge, develop skills, and apply learned concepts to an authentic context.

Participant engagement is crucial as it has a direct impact on the effectiveness of learning. When participants are actively involved in utilizing the module, they have the opportunity to understand the material more deeply. (Maskur, 2023), strengthening skills, and applying learned concepts to practical situations. This engagement also allows participants to personalize the learning process according to their individual needs and learning styles, thus making the module not only a learning tool but also a resource they rely on to improve their knowledge and skills. Thus, participant engagement in utilizing the module is key to the success of effective training.

On the aspect of module utilization during training activities, the results of interviews with 6 facilitators are as follows:

Table 3: Interview Transcript related to Module Utilization by Participants During Training

Interviewer	Interview Transcript
1st Facilitator	Participants focused more on the PPT and less on the module. In addition, the practicum activities took too much time and did not allow participants to read the module.
2nd Facilitator	Module utilization was not maximized during the training.
3rd Facilitator	Most participants did not use the module during the training. More focus on PPT.
4th Facilitator	Participants did not utilize the module during the training. When asked to make a design, they did not utilize the module but instead searched the internet.
5th Facilitator	Participants preferred to read the PPT over the module because the PPT was simpler.
6th Facilitator	Participants pay more attention to PPT only, while the module is less used during training.

Based on the interview results in Table 3 above based on their experience, all facilitators agree that participants are less than optimal in utilizing the modules provided. This can be seen from the facilitators' answers, who stated that most and almost all participants preferred

to read the PPT rather than the module itself. So, it can be concluded that the aspect of module utilization by participants during training is still not optimal.

Conclusion

In this study, researchers examined the responses or perspectives of facilitators on three aspects of the module, namely readability, content, and module use by participants during training. The results of this study show that in the aspect of module readability, facilitators have a good perception. It can be seen from most of the interview results that the module used has a language that is easy to understand. Furthermore, in terms of module content, most facilitators believed that the content of the CPD Project Teacher Component 3 module is still not optimal and requires improvement. Both improvements in terms of curriculum adjustments, as well as stages must be clarified. Furthermore, in terms of module utilization by participants, facilitators also have the opinion that the utilization is still not optimal because most participants still like to read information and materials from PPTs rather than modules.

Recommendations

Through the findings obtained in this study, the perception of facilitators as teachers in the CPD Teacher Training Component 3 Project is an input that needs to be considered. Revisions and improvements to the CPD teacher training module should be made, especially regarding the learning stages, design, and adaptation to the current curriculum. In addition, further research needs to be conducted on why trainees prefer PPT to get information on training materials compared to reading the module itself.

Acknowledgements

The researcher would like to thank the Indonesia Endowment Fund for Education/Lembaga Pengelola Dana Pendidikan (LPDP) for the support in this research funding process.

Moral Disengagement as a Predictor of Bullying Behavior of Adolescent Students

Chrisanta Kezia Yemima, Universitas Negeri Yogyakarta, Indonesia
Diana Septi Purnama, Universitas Negeri Yogyakarta, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Moral development in adolescents is crucial for individuals to make behavioral decisions. Moral disengagement involves eight mechanisms considered a form of self-defense in violating ethical standards. The moral release mechanism that teenagers create makes them quickly engage in immoral behavior with peer groups, such as bullying. This research aims to determine whether moral disengagement can predict bullying behavior among teenage students in Surakarta. The method used in this research is quantitative, employing multiple linear regression analysis. The sample in this study consisted of 60 adolescent students aged 15 to 17 years. The results of this research indicate that the hypothesis using the F test shows that the-eight Moral Disengagement mechanisms have a value of F = 5.062 and a significance of 0.000. The coefficient of determination value R2 is 0.34, and the Adjusted R Square is 35.6%. The results of the multiple linear regression analysis show that the Moral Disengagement mechanisms of bullying behavior as predictors are the variables (X3) Advantageous comparison, (X5) Diffusion of responsibility, (X6) Distorting consequences, and (X8) Attribution of blame.

Keywords: Moral Disengagement, Bullying, Students, Teenager

Introduction

Morals originate from the etymological terms "mos," which means habit, and "ethos," which means habit or custom in behavior, expressing it with excellent and suitable expressions. According to (Wantah, 2005), morals are related to a person's ability to determine right or wrong, good or bad behavior, and make decisions. Good and bad behavior can be observed from early life when an individual is treated in an environment, which becomes part of the factors of moral formation. Moral values have specific benchmarks and roles in determining whether someone's behavior is right or wrong and what limits exist. Morals are a societal standard regarding what can be considered reasonable and healthy. Morality is an essential foundation in guiding human behavior. However, in some cases, individuals may disregard their moral principles to engage in unethical behavior, such as bullying. Humans should have moral principles in social life as guidelines to help them make decisions before acting and feeling. Morals consist of three essential parts: moral knowledge, feelings, and behavior. Feeling morals involves conscience, trust, empathy, self-control, and humility. Meanwhile, moral behavior is the intention, desire, and habit of doing something (Sarbini et al., 2019).

Individuals with strong moral values can be wise in responding to all events within them. Values in social morals contain goodness and healthy behavior to determine good and bad behavior in society. The guidelines that individuals adhere to will refrain from selfish behavior and prevent manipulation, cheating, stealing, and lying (Elliemiers, Toorn, Paunov & Leuwen, 2019). Morals play a significant role in a person's life in society. Still, several researchers discovered deviant behavior carried out by several individuals who were caught based on CNN data from the 19 December 2018 edition by carrying out a tier operation to see 28 cases with a total of 108 suspects. Based on data from the 2019 edition of the 14th edition of the Mind of the People, it is shown that the number of two-wheeled motorbike riders who violate traffic in Cimahi is 12,679, and 3,276 of them are students. This data shows quite a large number of immoral cases. For example, a child's experience at school with his friends over the years helps the student develop social skills, self-confidence, and experiences that strengthen his social life. On the other hand, students who fail to develop social competence will be rejected by their peers and potentially have problematic developmental impacts on their adult behavior (Parkier & Ashier, 1993). Moral disengagement is the ability to control behavior that allows someone to engage in unhealthy behavior. Bandura (2016) identified several ways individuals justify or rationalize their behavior that violates moral norms. These include dehumanization, where the victim is considered an object or non-human, and denial of personal responsibility. They blame situations or external factors for lousy behavior and reduce sensitivity to acts of violence or downplay their negative impacts. Bandura et al. (2006) Explain that there are eight mechanisms in moral disengagement to maintain behavior without intentionally looking at responsibility, namely Moral Justification, Euphemistic Labeling, Advantageous Comparison, Displacement of Responsibility, Diffusion of Responsibility, Distortion of Consequences, Dehumanization, and Attribution of Blame.

There are various mechanisms used to maintain unhealthy behavior, namely redefining a behavior and individuals taking responsibility beyond their abilities by behaving as if the behavior is considered correct with defense (Feist & Robert, 2017). The comparison is calming to benefit the behavior, which is justified by softening the reprehensible behavior to appear friendly and harmless. According to research (Siregar, 2020), it has been studied that the influence of moral disengagement plays a vital role in providing space for unhealthy adolescent behavior, such as bullying behavior. Malfunctioning self-regulation in the sense of moral disengagement in decision-making has an influence that tends to be unethical. A

student needs good standards or principles in their development to support excellent and wrong, a moral compass that can be used as a guide so that student development can run in a balanced manner. This means that cognitive development that is not running in balance has the potential to give rise to deviant behavior, hurtful actions, and involvement in unhealthy peer relationships, one of which is bullying.

Bullying is a phenomenon that often occurs in adolescence. This phenomenon has been proven to be prevalent among adolescents (Nansel et al., 2004). According to Due and colleagues (2005), 123,227 students aged 13-15 years in Western Europe were found to have a relationship with bullying, leading to psychological symptoms such as nervousness, low self-esteem, and loneliness. Research conducted on students aged 13-16 years in England Smith et al. (2004) revealed that the perpetrators of bullying were students who struggled to adjust well, had low self-understanding, and uncertain moral standards. The influence of unhealthy peer relationships becomes crucial during early adolescence, where developmental tasks, adjustment, and positive peer relationships take precedence over individualism (Hurlock, 1991). Adolescents may feel supported by the group when engaging in bullying behavior, disregarding morals for conformity, and unhealthy group behavior. Slonje (2013) discovered that there were more bullying perpetrators aged 15-18 years compared to those aged 20 years and older, indicating that individuals in this age group may feel emboldened by group relationships with friends at school, providing a sense of protection. Meter and Bauman (2018) explain that moral disengagement creates a space for individuals to engage in harmful actions, increasing hurtful behavior. Conversely, low moral disengagement suggests that individuals who can regulate themselves effectively are less likely to engage in bullying behavior.

Based on the explanation mentioned above, this research aims to determine whether bullying behavior carried out by teenagers affects the eight mechanisms of moral disengagement. This research seeks to combine empirical and recent evidence about bullying behavior towards adolescents, which is influenced by moral disengagement. This research hypothesizes that bullying behavior carried out by teenagers influences morals. It is important to note that moral disengagement is only one factor influencing bullying behavior. However, understanding this concept can provide valuable insight into efforts to prevent and intervene against bullying behavior among adolescent students.

Method

This research is quantitative research with a multiple linear regression model to find additional information or data for researchers. The sampling technique used by researchers for the targeted sample is purposive sampling. The researcher first determines the shape and characteristics of the sample. The characteristics of the sample in this study were teenagers aged between 15 and 17 years. This study included a total of 60 subjects aged 15-17 years. Analysis with more than one independent variable is called multiple linear regression. The multiple linear regression technique determines whether there is an influence between two or more independent variables (multicollinearity and normality test). The hypothesis in this research was carried out using the F and T-test.

The data results were obtained by distributing scale instruments to students, and the assessment used a Likert scale. Two scales are used: the Bullying Behavior Scale and the Moral Disengagement Scale. The Bullying Scale is based on the Olweus Bully/Victim Questionnaire (OBVQ) scale, which identifies bullying by perpetrators and has been adapted

into Indonesian. Bandura (2002) created a moral disengagement scale. This instrument was assessed using a Likert scale. The Cronbach Alpha (α) reliability test measures this scale. If the intercept value is reliable, the level is considered trustworthy.

Results and Discussion

1. Normality Test

The normality test results using the Kolmogorov Smirnov one sample statistical method are as follows.

Table 1: Normality Test Results

		Unstandardized Residuals
N		61
Normal Parameters [a, b]	Mean	.0000000
	Std. Deviation	7.30990264
Most Extreme Differences	Absolute	,070
	Positive	,065
	Negative	-.070
Statistical Tests		,070
Asymp. Sig. (2-tailed)		,200 [c,d]

a. Test distribution is Normal.
b. Calculated from data.

Table 1 shows that the output results have a significance value of 0.20. The data is standard because the significance is more than 0.05 (0.20>0.05). The regression model is suitable for use because it meets the normality assumption.

2. Simultaneous Test (F Test)

To determine the test by creating a hypothesis formula as follows:
H0: βi = means variable (X1) Moral Justification, (X2) Euphemistic language, (X3) Advantageous comparison, (X4) Displacement of responsibility, (X5) Diffusion of responsibility, (X6) Distorting consequences, (X7) Dehumanization and (X8) Attribution of blame. It does not have a joint significant influence on the Bullying variable (Y).

H0: βi ≠ means variable (X1) Moral Justification, (X2) Euphemistic language, (X3) Advantageous comparison, (X4) Displacement of responsibility, (X5) Diffusion of responsibility, (X6) Distorting consequences, (X7) Dehumanization and (X8) Attribution of blame. It has a significant influence on the bullying variable (Y).

In determining significance:
- The significance value (*PValue*)<0.05 means H0 is rejected and H1 is accepted
- The significance value (*Pvalue*)>0.05 means H0 is accepted and H1 is rejected

So it can be concluded if:
- (*Pvalue*)<0.05 then H0 is rejected and H1 is accepted. This means that the independent variables simultaneously influence the dependent variable.
- (*Pvalue*)>0.05 then H0 is accepted and H1 is rejected. This means that the independent variable simultaneously does not influence the dependent variable.

The F Test results in Table 2 are as follows:

Table 2: ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1024.066	8	128,008	5,062	,000 [b]
	Residual	1315.016	52	25,289		
	Total	2339.082	60			

a. Dependent Variable: Bullying
b. Predictors: (Constant), Attribution of blame, Diffusion of responsibility, Distorting consequences, Moral Justification, Advantageous comparison, Dehumanization, Displacement of responsibility, Euphemistic language

Based on the F-test results above, it can be seen that the calculated F-value is 5.062 with a significance level of 0.00. The significance level is 95% (α=0.05), 0.00<0.05 for this comparison. Therefore, H0 is rejected, which means the variables (X1) Moral Justification, (X2) Euphemistic language, (X3) Advantageous comparison, (X4) Displacement of responsibility, (X5) Diffusion of responsibility, (X6) Distorting consequences, (X7) Dehumanization, and (X8) Attribution of blame have a jointly significant influence on the Bullying variable (Y) with the equation:

$$Y= 35{,}130-0{,}391\ X_1- 0{,}203\ X_2- 0{,}706\ X_3- 0{,}447\ X_4+0{,}740\ X_5+ 1{,}132\ X_6+0{,}041\ X_7+ 1{,}482X_8$$

3. t-Test Results

Table 3. t-Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	35,130	4,685		7,499	,000
	Moral Justification	-.396	,346	-.152	-1,142	,259
	Euphemistic language	-.203	,387	-.072	-.524	,603
	Advantageous comparison	-.706	,324	-.272	-2,179	,034
	Displacement of responsibility	-.447	,354	-.162	-1,262	,213
	Diffusion of responsibility	,740	,332	,309	2,228	,030
	Distorting consequences	1,132	,359	,409	3,150	,003
	Dehumanization	.041	,388	.013	.105	,917
	Attribution of blame	1,482	,435	,501	3,407	,001

a. Dependent Variable: Bullying

Based on the results in Table 3, it can be explained from the t-test results:

1. Moral Justification (X1)
   The Moral Justification Hypothesis is:
   H0: βi = 0, meaning that the variable (X1) Moral Justification does not have a joint significant influence on Bullying behavior.
   H0: βi ≠ 0, meaning that variable (X1) Moral justification, has a significant influence on bullying behavior.

The test results obtained variable X1 with a calculated t value = 1.142 with a significance of 0.259 and a significance limit of 0.05, meaning that it is rejected that moral justification does not influence to be a predictor of bullying behavior.

2. Euphemistic language (X2)

   Hypothesis as follows:
   H0: βi = 0, meaning that the Euphemistic language variable (X2) does not have a joint significant influence on bullying behavior.
   H0: βi ≠ 0, meaning that the Euphemistic language variable (X2) has a significant influence on bullying behavior.

The test results obtained variable X2 had a calculated t value of 0.63 and a significance of 0.05, meaning that euphemistic language has no influence as a predictor of bullying behavior.

3. Advantageous comparison (X3)

   Hypothesis as follows:
   H0: βi = 0, meaning that the Advantageous comparison variable (X3) does not have a joint significant influence on Bullying behavior.
   H0: βi ≠ 0, meaning that the Advantageous comparison variable (X3) has a significant influence on Bullying behavior.

The test results obtained variable X3 with a calculated t value = 2.17 with a significance of 0.034, a significance limit of 0.05, meaning that H0 is rejected and H1 is accepted. Advantageous comparison has an influence to be a predictor of bullying behavior.

4. Displacement of responsibility (X4)

   Hypothesis as follows:
   H0: βi = 0, meaning that the Displacement of responsibility variable (X4) does not have a jointly significant influence on Bullying behavior.
   H0: βi ≠ 0, meaning that the Displacement of responsibility (X4) variable has a significant influence on bullying behavior.

The test results obtained variable X4 with a calculated t value = 1.26 with a significance of 0.21, a significance limit of 0.05, meaning that H0 is accepted and H1 is rejected. Displacement of responsibility has no influence as a predictor of bullying behavior.

5. Diffusion of responsibility (X5)

Hypothesis as follows:

H0: βi = 0, meaning that the Diffusion of responsibility variable (X5) does not have a joint significant influence on Bullying behavior.

H0: βi ≠ 0, meaning that the Diffusion of responsibility (X5) variable significantly influences Bullying behavior.

The test results obtained variable X5 with a calculated t value = 2.22 with a significance of 0.030, the significance limit is 0.05, meaning that H0 is rejected and H1 is accepted. Diffusion of responsibility has an influence to be a predictor of bullying behavior.

6. Distorting consequences (X6)

Hypothesis as follows:

H0: βi = 0, meaning that the Distorting consequences variable (X6) does not have a jointly significant influence on Bullying behavior.

H0: βi ≠ 0, meaning that the Distorting consequences (X6) variable significantly influences Bullying behavior.

The test results obtained variable X6 with a calculated t value = 3.15 with a significance of 0.003, a significance limit of 0.05, meaning that H0 is rejected and H1 is accepted. Distorting consequences have an influence to become a predictor of bullying behavior.

7. Dehumanization (X7)

Hypothesis as follows:

H0: βi = 0, meaning that the Dehumanization variable (X7) does not have a joint significant influence on bullying behavior.

H0: βi ≠ 0, meaning that the Dehumanization variable (X7) significantly influences bullying behavior.

The test results obtained variable X7 with a t-value of 0.10 with a significance of 0.91, a significance limit of 0.05, meaning that H0 is accepted and H1 is rejected. Dehumanization has no influence as a predictor of bullying behavior.

8. Attribution of blame (X8)

Hypothesis as follows:

H0: βi = 0, meaning that the Attribution of Blame (X8) variable does not have a joint significant influence on bullying behavior.

H0: βi ≠ 0, meaning that the Attribution of Blame (X8) variable significantly influences bullying behavior.

The test results obtained variable X6 with a calculated t value = 3.40 with a significance of 0.001, a significance limit of 0.05, meaning that H0 is rejected and H1 is accepted. Attribution of blame has an influence to become a predictor of bullying behavior.

4. Multiple Linear Regression Analysis

Based on the regression results with SPSS, the regression coefficient in Table 4 can be seen as follows:

Table 4: Regression Test Results (Regression Coefficient)

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	31,759	3,852		8,245	,000
	X3	.728	,320	.280	2,276	,027
	X5	,552	,263	,231	2,100	,040
	X6	1,017	,318	,368	3,198	,002
	X8	1,121	,374	,379	3,000	,004
a. Dependent Variable: Y						

Based on Table 4 In the SPSS results above, the multiple linear regression equation can be seen as follows:

$$Y = 31.759 + 0.728\ X_3 + 0.552\ X_5 + 1.017\ X_6 + 1.121 X_8$$

The results of the equation above are explained as follows:

1. If a student's Advantageous Comparison (X3) level increases by one, bullying will increase by 0.728.
2. If a student's Diffusion of responsibility (X5) increases by one, Bullying behavior will increase by 0.552.
3. If a student's Distorting Consequences (X6) increases by one, Bullying behavior will increase by 1.017.
4. If a student's Attribution of Blame (X8) increases by one, bullying behavior will increase by 1.121.

Meanwhile, the results of the coefficient of determination from the table equation above are:

Table 5: Coefficient of Determination Test Results

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.632 [a]	,399	,356	5.00892

a. Predictors: (Constant), X8, X5, X6, X3
b. Dependent Variable Y

The adjusted R Square value is 35.6% based on the data results above.

$$Y = 31.759 + 0.728\ X_3 + 0.552\ X_5 + 1.017\ X_6 + 1.121 X_8$$

Looking at the results of the statistical data analysis above, it can be concluded that the hypothesis in this research using the F test is that the variables (X1) Moral Justification, (X2) Euphemistic language, (X3) Advantageous comparison, (X4) Displacement of responsibility, (X5) Diffusion of responsibility, (X6) Distorting consequences, (X7) Dehumanization and (X8) Attribution of blame have a significant influence together on the Bullying variable (Y) with the equation. With a value of F = 5.062 and a significance figure of 0.000. The coefficient of determination value is 0.399, and the Adjusted R Square is 0.356 or 35.6%.

The results of the multiple linear regression analysis indicate that the variables that significantly predict bullying behavior are (X3) Advantageous Comparison, (X5) Diffusion of Responsibility, (X6) Distorting Consequences, and (X8) Attribution of Blame, with the following equation:

$$Y = 31.759 + 0.728\ X_3 + 0.552\ X_5 + 1.017\ X_6 + 1.121 X_8$$

The results of this research align with (Istiqomah & Madiun, 2023) that moral disengagement with its eight aspects can make an individual easily justify maladaptive behavior such as bullying as normal behavior. Bandura's social-cognitive theory regarding the concept of Moral disengagement leads to a psychological scheme regarding immoral behavior and bullying as detrimental behavior by changing the bullying behavior with self-defense mechanisms to justify bullying as acceptable behavior. This research has shown that eight moral disengagement mechanisms can predict bullying behavior: advantageous comparison, Diffusion of responsibility, distortion of consequences, and Attribution of blame.

Bandura (1997) describes the psychological concept that moral values can be separated from immoral behavior, making others feel disadvantaged by accepting harmful behavior and allowing aggressive and immoral behavior to be carried out. With the help of this process, a person can engage in self-serving behavior inconsistent with their moral principles. They can continue to use these defenses as principles without causing cognitive self-evaluation (such as cognitive dissonance) or emotional reactions (such as guilt and shame), which in their partners can help them avoid making mistakes. Understanding moral disengagement is essential for designing bullying prevention strategies. Intervening at the level at which individuals use these mechanisms can help reduce levels of bullying behavior. This can be done through strong moral education, anti-bullying programs that involve awareness of the consequences of these actions, and fostering a school environment that supports and encourages positive norms. The results of this research emphasize the importance of paying attention to the role of each mechanism of Moral disengagement in understanding and preventing bullying behavior. Using this mechanism is a strong indicator of a person's likelihood of being involved in bullying.

Based on the results of the data above show that moral disengagement, such as Advantageous comparison, Diffusion of responsibility, Distorting consequences, and Attribution of blame, tend to influence teenagers involved in bullying behavior significantly. This can be explained as:

a. Advantageous comparison: Bullies may compare their actions with actions considered worse to make their behavior more acceptable. For example, a student might think, "At least I didn't hit him, just made fun of him."
b. Diffusion of Responsibility: Bullies may feel less responsible if the actions are carried out in a group. They may think responsibility is distributed among all group members, so they feel less guilty. For example, students might think, "We're all in this together, so it's not just my fault."
c. Distorting Consequences: Bullies may minimize or ignore the negative impacts of their actions. They may assume that the victim was not truly hurt or that their actions were not as bad as they were. For example, a student might think, "It was just a joke, he wasn't hurt."
d. Attribution of Blame: Bullies may blame the victim for their actions, assuming that the victim deserves terrible treatment. They may think that the victim has provoked or

deserved the treatment. For example, a student might think, "He deserves it because he always acts weird."

Understanding these mechanisms can help in developing more effective interventions to prevent and address bullying among adolescent students. By identifying and addressing how bullies disable their moral constraints, educators and counselors can work to strengthen moral norms and empathy among students.

Conclusion

Based on the results of the statistical data analysis above, it can be concluded that the hypothesis in this research using the F-test is that the variables (X1) Moral Justification, (X2) Euphemistic language, (X3) Advantageous comparison, (X4) Displacement of responsibility, (X5) Diffusion of responsibility, (X6) Distorting consequences, (X7) Dehumanization, and (X8) Attribution of blame have a significant influence together on the Bullying variable (Y) with the equation. The F-value is 5.062, with a significance level of 0.000. The coefficient of determination value shows 0.34, and the Adjusted R Square is 0.356, representing 35.6% of multiple linear analysis. Regression analysis showed that the variable.

$$Y= 31.759 + 0.728\ X_3 + 0.552\ X_5 + 1.017\ X_6 + 1.121 X_8$$

It can be concluded that there are moral disengagement mechanisms, namely Advantageous comparison, Displacement of responsibility, Diffusion of responsibility, Distorted consequences, Dehumanization, and Attribution of Blame, which are predictors of student bullying behavior by as much as 35.6%. And 64.4% comes from other factors.

Acknowledgments

The author would like to thank Lembaga Pengelola Pendidikan Dana Pendidikan (LPDP) for providing support and funding assistance for the author to present the results of this research widely at the 16th Asian Conference on Education (ACE2024). The researcher also thanked Universitas Negeri Yogyakarta for recommending that researchers participate in this conference.

Abstract
This research was motivated by a problem about the learning difficulties of grade IV students of Sumbersari III Elementary School Malang, Indonesia in determining the main ideas and supporting ideas of paragraphs. This study aims to understand the process of student learning difficulties in identifying the main ideas and supporting ideas of a paragraph and find out the factors that cause students' learning difficulties. The research approach used is a qualitative approach. While the method used is a descriptive research method. The sample in this study was 26 grade IV students of Sumbersari III Elementary School Malang, Indonesia. Data in this study was collected through interviews, documentation, and observations related to the research problem studied. Interviews were conducted with four students and homeroom teachers of grade IV. The results of the analysis show that students have good abilities in determining the main sentence, but most students still have low abilities in the main idea, supporting ideas, and type of paragraph. Internal factors that causes students learning difficulties are low interest in reading, low learning motivation, limited reading ability, lack of confidence, and dislike of Indonesian subject. External factors that causes students learning difficulties are family environment factors and classroom management. It is hoped that these difficulties can be overcome by using appropriate and supportive learning strategies, and students' understanding of the structure and content of Indonesian text can be improved.

Keywords: Student Difficulty, Main Idea, Paragraph

Introduction

Learning difficulties refer to the hurdles or obstacles that individuals face in attaining knowledge or skills. Learning difficulties are conditions in learning when there are obstacles in obtaining learning outcomes (Cahyono, 2019). Students experience obstacles in receiving lessons from teachers (Nurhaliza et al., 2019). These difficulties can manifest in a variety of ways, such as difficulty completing tasks, difficulty in reading, writing, spelling, reasoning, or remembering information (Firdous et al., 2019). It is very important to pay special attention to children who face learning difficulties because they are the future human resources of the nation (Norman et al., 2021). One of the learning difficulties faced by students is the difficulty in determining the main idea of a paragraph.

The main idea material is one of the materials studied in subjects Indonesian elementary school. The main idea is the essence of a reading or paragraph to find out the point or essence of the reading (Oktafiani & Irawan, 2021). While supporting ideas are sentences in paragraphs that contain explanations of the main topic discussed. A paragraph consists of a series of sentences that support one main idea (Lo et al., 2013). The main idea can be found at the beginning, middle, or end of a paragraph and sometimes throughout a paragraph (Nasution, 2020). The main idea material will be learned by students again at the next level and become an important skill in life.

Students must read the reading first in order to find the main idea. The main idea is obtained through the main sentence and the developer's idea is in the supporting sentence (Irwan et al., 2021). The reader should take several steps to determine the main idea, including reading the passage carefully and understanding its content; formulate questions in the mind related to "what is this paragraph about?"; write down the main idea based on the conclusions that have been thought out; Pay attention to keywords to find key concepts (Hasana & Mukhlishina, 2020). Finding key ideas in Indonesian learning can be a challenging task for students. In this case students have difficulty in identifying key concepts and overarching themes in the text being read.

Based on the results of interviews with the homeroom teachers of grade IV students of Sumbersari III State Elementary School Malang City, it shows that grade IV students have difficulty identifying the main idea of a paragraph. Low interest in reading students make students unable to identify the main idea of the paragraph. This is in line with the results of observations and interviews that have been carried out by Hasana and Mukhlishina (2020) in the homeroom teacher of grade III of Al-Falah Islamic Elementary School, which shows that the ability to determine the main ideas of grade III students of Al-Falah Islamic Elementary School is categorized as low. The inability to determine the main idea can hinder students' understanding and critical thinking skills, because the ability to determine the main idea is essential to summarize and analyze information effectively.

Previous research relevant to this study was conducted by Shansabilah and colleagues (2023) entitled "Analysis of the Difficulty of Class V Students in Determining a Paragraph Main Idea in Subject Indonesian". The relevance of this research is the object of research, learning difficulties. Based on the results of the study shows that there are still many students who have low ability in finding the main idea. Further, research by Nurhaliza and colleagues (2019) entitled "Analysis of Student Difficulties in Determining the Main Idea of a Paragraph in Class V Indonesian Lesson SDN Pondok Jagung 01 Serpong Utara" reveals internal factors that cause students to have difficulty in determining the main idea of a paragraph

including psychological and motivational factors. External factors that cause students learning difficulties are inadequate classroom conditions, as well as monotonous teaching methods and strategies by teachers.

This study aims to understand the process of student learning difficulties in identifying the main ideas and supporting ideas of a paragraph, see the results of the analysis of student learning difficulties in identifying the main ideas and supporting ideas of paragraphs, and find out the factors that cause student learning difficulties in determining the main ideas and supporting ideas of a paragraph.

Method

The research method used in this study is qualitative descriptive. The implementation of in-depth research requires qualitative research (Gungor et al., 2023). Qualitative research can be interpreted as studies that use natural language data to understand variations in individual experiences and their meanings (Sevilla-liu, 2023).

Data in this study was collected through interviews, documentation, and observations related to the research problem studied. Data in descriptive qualitative research is analyzed through three stages, those are data reduction, data presentation, and conclusion drawing (Fithriyana, 2020). The sample in this study was 26 grade IV students of Sumbersari III State Elementary School Malang City. The interview sampling technique uses the technique purposive sampling, which is the technique of deciding on samples with certain considerations (Shintya et al., 2021). Interviews were conducted on four grade IV students and homeroom teacher of grade IV.

The research was conducted from October 12 to November 21, 2023. The research procedure includes the pre-field stage, the fieldwork stage, and the data analysis stage. This study used two data, primary and secondary data. Primary data are obtained internally, such as through direct observation, and so on (Siregar et al., 2022). The primary data in this study were obtained through observation, documentation, and interviews with grade IV students and grade IV teachers of Sumbersari III State Elementary School Malang City. Meanwhile, secondary data are obtained through references related to the variables studied.

Results and Discussion

Based on the findings of the study, researchers discussed the difficulties of students in determining the main ideas and supporting ideas more deeply, as well as the factors that cause student difficulties.

Students' Difficulties in Determining Main Ideas and Supporting Ideas

The results of the study were based on tests determining the main idea and supporting material—including the main sentence, paragraph type, and supporting ideas—which was carried out on grade IV students of Sumbersari III State Elementary School. Researchers gave seven questions to students, including six multiple-choice questions and one description question related to determining the main idea, determining the main sentence, determining the type of paragraph, and supporting ideas. Questions were given to 26 grade IV students. After the test was carried out, researchers found that the ability of grade IV students at Sumbersari III State Elementary School in finding the main idea was still low. This is

evidenced by the results obtained by the average percentage of students' ability to determine the main idea is only 36.5% or nine out of 26 students. In line with the results of observations and interviews by Tiyas and colleagues (2023) in grade IVA students of Sendangmulyo 02 State Elementary School Semarang, which shows that students' ability to distinguish between the main idea and the main sentence is still low. So does what is done by Najiyah et al. (2019) which shows that grade IV students at Polehan 4 State Elementary School Malang often experience confusion in identifying the main idea and main sentence.

Based on the results of the tests that have been conducted, in the first, fifth, and sixth questions related to the main idea, there are 12, one, and 10 out of 26 students who can answer correctly. While on the description questions related to the main idea, there were 15 out of 26 students who could answer correctly. So if presented, there are more than half of students who still have difficulty in finding the main idea. Furthermore, in the question related to determining the type of paragraph, 15 out of 26 or 58% of students can answer correctly the type of paragraph contained in the reading. While on questions related to determining the main sentence, 23 out of 26 students can answer correctly, or if the percentage is 88%. On the question related to determining supporting ideas, only 8 out of 26 students could answer correctly, or 30%. From the test results, the highest score was 71.4 and the lowest score was zero.

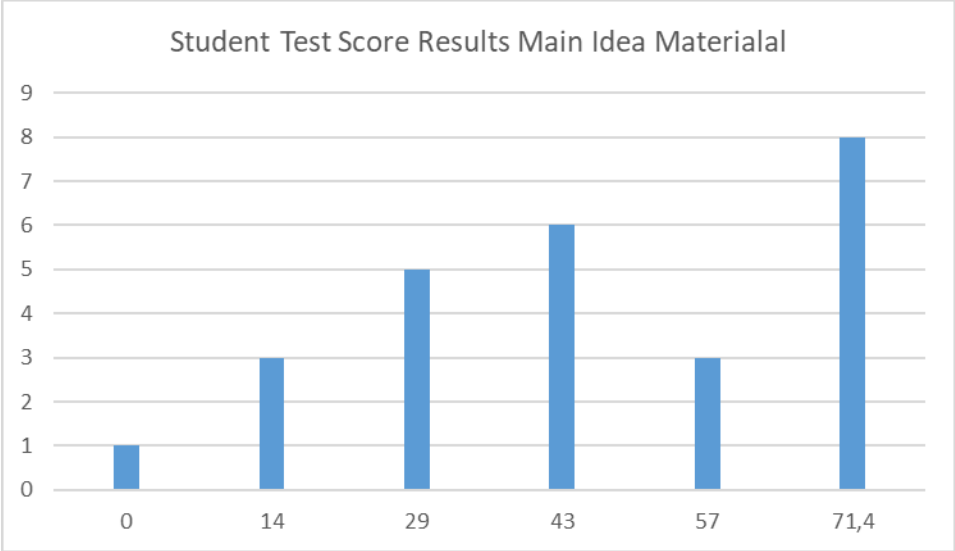

Figure 1: Student Test Score Results Main Idea Material

The average result of the students' test score is 44. This proves that students' ability to determine the main idea is still not good. The results of the analysis can be concluded that students have good abilities in determining the main sentence, but most students still have low abilities in determining the main idea and supporting ideas, and determining the type of paragraph. Interviews were conducted on four grade IV students and homeroom IV students to explore the factors that cause students' difficulties in learning the main idea material. Four of the 26 students were interviewed about their learning difficulties.

Factors Influencing Students' Difficulty in Determining Main and Supporting Ideas

Based on the results of interviews conducted on homeroom teachers and grade IV students of Sumbersari III State Elementary School showed that there are several factors causing students' learning difficulties in determining the main ideas and supporting ideas of

paragraph. These factors include internal factors and external factors. Internal factors refer to circumstances arising from within the student himself, while external factors include things or situations that come from outside the student.

Internal factors that cause student difficulties are that students have low interest in reading, so they tend to be lazy in reading. Low student enthusiasm in reading can be influenced by several factors, namely internal factors such as intelligence, age, gender, literacy skills, attitudes, and psychological needs, as well as external factors such as subject matter, level of complexity in the text, and material format which can also affect student reading motivation (Ningrum et al., 2023). Lack of interest in reading can make it difficult for students to understand the main and supporting ideas in the text, so students cannot understand the reading well. In line with research conducted by Nurhaliza and colleagues (2019) revealed that the difficulty of grade 5 students of Pondok Jagung 01 State Elementary School in determining the main idea was due to lack of interest in reading, resulting in an inability to understand the content and extract the main idea. Research conducted by Marlini et al., (2021) shows the factors that cause the difficulty of Grade IV students of 49 State Elementary School Banda Aceh in determining the main sentence are low interest in reading and learning motivation. This is in line with the research conducted Rahmadhani and Masfiah (2023) which shows that there is an influence of learning motivation on learning outcomes, which is 30.5%.

Based on the results of interviews with students, it was also found that there were still students who were not fluent in reading. The inability to read fluently can also be a major obstacle. Students who do not have good reading skills will have difficulty decoding texts, identifying important information, and understanding the relationship between main and supporting ideas. Research conducted by Safitri (2022) shows that one of the factors causing difficulty in finding the main idea is the factor of not being able to read well (dyslexia), which affects the brain's information processing (Safitri et al., 2022).

The next factor that causes student difficulties is that students have low self-confidence. Low self-confidence can prevent students from actively participating in Indonesian learning. Fear of making mistakes or inability to determine the main idea can affect students' ability to analyze the text effectively. This is in line with research conducted by Akbari & Sahibzada (2020) which explains that the level of self-confidence has a significant impact on the learning process of students, including their participation, achievement of goals, interest in the subject, level of anxiety, comfort with teachers and classmates, and sharing opinions in class. Research results by Septiani & Purwanto (2020) It also shows that there is a positive relationship between self-confidence and student learning outcomes.

Another internal factor that makes it difficult for students to determine the main idea and related material is that students do not like Indonesian subject. Students assume that Indonesian subject is a difficult subject. Lack of interest or disinterest in Indonesian subject can reduce the motivation of students to strive to understand the text fully. This can have an impact on students' level of attention and mental investment in learning the structure and content of the text. This is in harmony with what was revealed by Oktafiani and Irawan (2021), that the factor causing students' learning difficulties in paragraph material is psychological factors, spesigically their low interest or willingness to learn Indonesian. Students who have learning difficulties will Indonesian have difficulty understanding content related to the subject.

The results of interviews with grade IV homeroom teachers of Sumbersari III State Elementary School showed external factors behind students' difficulties is the family environment. Parents pay little attention to the development of the student's educational process. The educational process of a person is influenced not only by factors in school, but also by the family environment. Support from family is very important in supporting the learning process of students. There are several factors that contribute to low academic achievement, including the surrounding environment, peers, school, psychological disorders, and family problems (Al-Qadri et al., 2021). This is in line with research conducted by Oktafiani and Irawan (2021) which shows that external factors that affect students' difficulties in learning are environmental factors. Arumsari (2021) It also reveals external factors that influence is the family environment, especially the role of parents who have low concern for the development of their children. Recognition of students' academic achievement also plays an important role in increasing their confidence in identifying key ideas and supporting details.

Based on the results of observations and interviews, another external factor that causes students' difficulties in determining the main idea is suboptimal classroom management, spesifically the placement of inappropriate student seats. Students who have low ability in learning are placed near students who also have low ability. Research conducted by Mansur et al. (2023), stating that the placement of student seating is not appropriate in grade V 45 State Elementary School Ternate is one of the causes of students' learning difficulties in determining the main idea. Therefore, it is important to note that classroom management must be adjusted to consider many things related to the learning process.

Conclusion

Learning difficulties faced by students include difficulties in determining the main idea, supporting ideas, and paragraph types. Overall, the ability of grade IV students of Sumbersari III State Elementary School Malang City to determine the main idea, supporting ideas, and paragraph types is still relatively low. The difficulties students face in determining the main idea and supporting ideas in Indonesian texts can be influenced by internal factors and external factors. Internal factors, namely low interest in reading, low learning motivation, limited reading ability, lack of confidence, and dislike of Indonesian subject. The external factors that cause student difficulties in learning are family environment factors and classroom management management. By using appropriate and supportive learning strategies, it is hoped that these difficulties can be overcome, and students' understanding of the structure and content of Indonesian text can be improved.

Recommendations

Based on the conclusion above the researcher would like to offer some recommendations to be considered by primary teachers, students, and for the next researchers.

1. For primary teacher
Teachers can organize fun learning activities to increase student motivation and use a variety of learning media, so that students' understanding of the structure and content of Indonesian texts can be improved. Teachers are also expected to be able to manage classes in a balanced manner.

2. For the students
The results of this study are expected to increase student motivation in learning, so as to improve the ability to understand the structure and content of Indonesian text.

3. For next researcher
The researcher aims for this study's findings to serve as a valuable reference for future researchers interested in the Indonesian language and those seeking to explore the about the student difficulties in learning main idea of paragraph.

Acknowledgements

The researcher would like to thank the Indonesia Endowment Fund for Education/Lembaga Pengelola Dana Pendidikan (LPDP) for the support in this research funding process.

Abstract
Nowadays, we are witnessing a gender gap in ICT caused by stereotypes and misconceptions that need to be reversed. To this end, a group of European partners has developed a two-year project to involve girls aged between 14 and 16 in STEM subjects. Empower Girls Creativity Through Use of Digital Technologies (SparkDigiGirls) is an ERASMUS+ project that culminated in the creation of an online course. This course consists of 16 challenges spread across different types of technologies (Augmented Reality, Virtual Reality, Artificial Intelligence, Internet of Things, Robotics, Online Security). Students are challenged to learn about technology, apply it to real everyday situations or needs and present evidence. At a later stage, the course was converted into a MOOC for mentors and integrated into the Chair4Future platform, specifically designed to disseminate knowledge to IPT students and teachers, partner institutions and the community in general. This platform includes courses that can promote the main competences identified as lacking in the IPT's target population. As an institution with courses in the ICT area, capturing the interest of the female gender is increasingly important. In this article we will present how the work produced within the scope of SparkDigiGirls and its main results were integrated into the Chair4Future platform, in order to allow the community to access the knowledge developed. This resulted in the original materials being made available in Portuguese and English and a MOOC for mentors in Portuguese.

Introduction

Careers in technology and engineering are associated with gender stereotypes and misconceptions that persist and contribute to the gender gap in ICT. This is a reality experienced by companies in the sector but also by higher education institutions. It is believed that teachers and educators have a crucial role to play in redefining this perspective, providing guidance and opportunities for girls to make informed decisions (Marques et al., 2022; Marques et al., 2023).

The SparkDigiGirls project, co-funded by the Erasmus+ program, was developed between 2021 and 2023 to address the under-representation of girls in the digital technologies sector. It involved partners from four European countries: Lithuania, Portugal, Slovenia and Greece (Marques et. al., 2023). The aim was first to identify ways of reversing the current situation and then to produce digital content to help teachers and educators with this demand.

The SparkDigiGirls project produced content of relevance to the community, and the pilot study revealed very positive results with the students involved (Marques et al., 2024). It was considered imperative to find a solution that would allow it to continue beyond the project. Continuity in terms of maintaining the platform and open access to interested parties. To this end, a fourth phase was added to the project, which enabled the development of a Massive Open Online Course (MOOC) for mentors and the availability of the content produced on an open access platform.

In this paper, we will first recap the resources produced as part of SparkDigiGirls, followed by how they were integrated into the Chaire4Future platform through the fourth phase (community use), which was created after the end of the project. This will allow the content produced to be made available for use by students, as well as a version for mentors who wish to implement it.

SparkDigiGirls Project

SparkDigiGirls “Empower Girls Creativity Through the Use of Digital Technologies” is an international project that was born from the partnership of institutions from different EU countries Lithuania, Portugal, Slovenia and Greece. It lasted two years and was co-funded by the Erasmus+ strategic partnership in the field of youth. The main aim of the project was to create a way to inspire girls between the ages of 14 and 18 to explore digital technologies by generating new and innovative ideas, taking advantage of their newly acquired digital knowledge to contribute creatively to the traditionally male-dominated STEM industry (Marques et al., 2023).

The SparkDigiGirls initiative unfolded in three main phases: 1) Diagnostic and Curriculum Definition; 2) Content Development; and 3) Pilot Study and Dissemination (Marques, Araújo, et al., 2024).

The first phase involved identifying barriers to girls' participation in ICT and collecting insights through focus groups conducted in the participating countries. The analysis highlighted key factors, such as:

- Visible female leaders in ICT inspire girls to imagine themselves in similar roles.
- Providing practical exposure to digital tools and technologies fosters interest and confidence.

- Persistent biases dissuade girls from pursuing careers in STEM fields.
- Educators can play a critical role by actively encouraging girls to explore ICT.

These findings helped the definition of a curriculum to be designed to address these barriers through interactive and engaging methods.

During the second phase a course program, titled Unleash Your CreativITy with Technology, was developed. It consisted of 16 challenges delivered via a Moodle-based platform. These challenges covered various technologies, including Artificial Intelligence (AI), Augmented Reality (AR), Internet of Things (IoT), programming, 3D modeling, and blockchain. Each module (figure 1) included:

- Instructional videos explaining the technology and its applications.
- Tutorials with step-by-step guides for hands-on activities.
- Quizzes to test knowledge and reinforce learning.
- Tasks requiring evidence of completion, such as images, videos, or links.
- Participants earned certificates upon completing individual challenges. By completing challenges across six technology categories, they unlocked a Grand Certificate, symbolizing comprehensive mastery of the program.

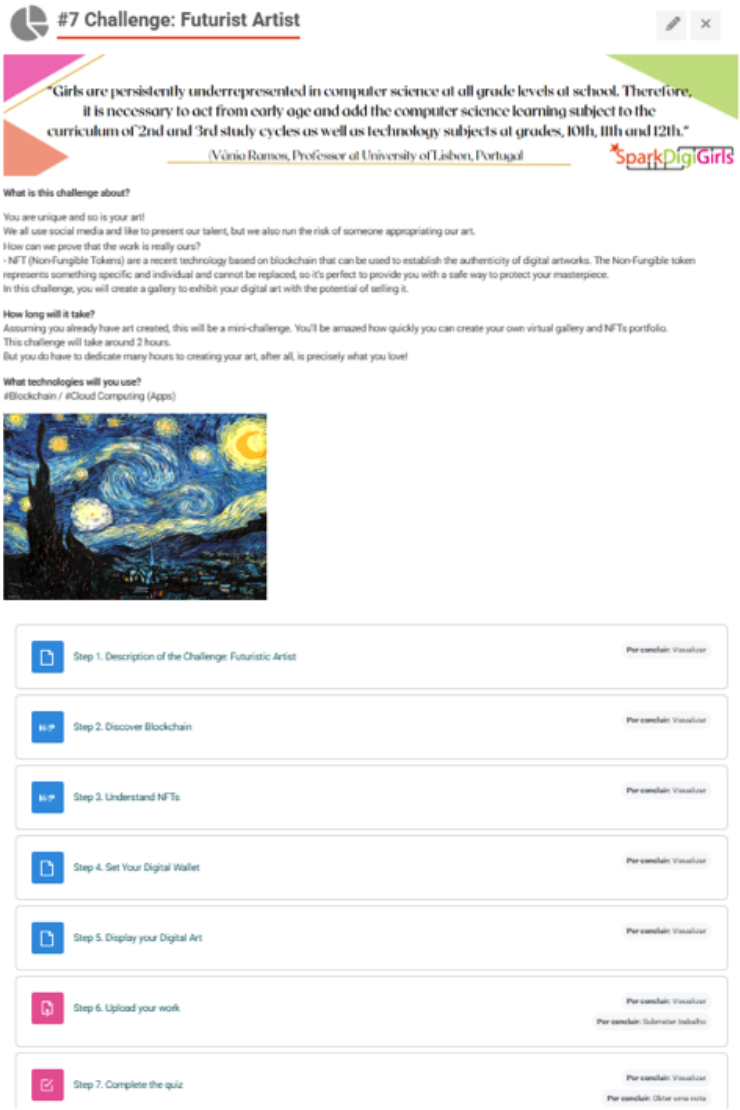

Figure 1: Challenge Example: Futurist Artist

To further inspire participants, the project incorporated testimonials from female ICT professionals and leaders, shared via the project's YouTube channel (Figure 2). These role models provided relatable examples of success in the tech industry, motivating girls to pursue similar paths.

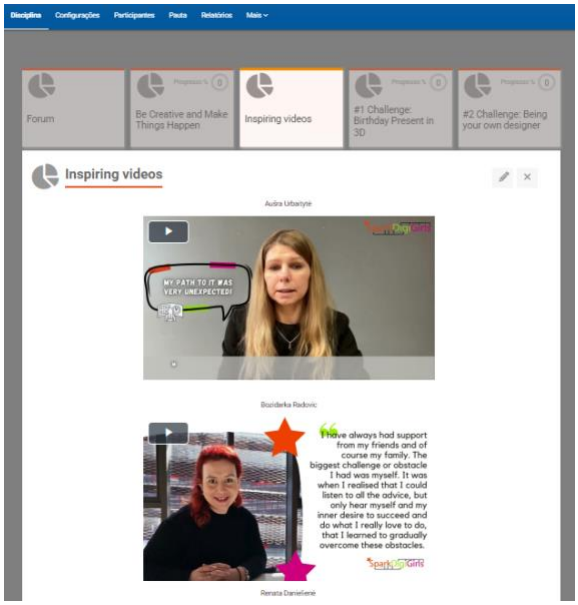

Figure 2: Inspiring Videos Module

The pilot phase involved 279 girls from the four partner countries participating in the program over two months (Marques, et. al., 2023). While initially designed for online delivery, some partners adapted the methodology to include face-to-face sessions, creating a blended learning experience. This approach proved effective in motivating participants and fostering collaboration. It verified that the program promoted high levels of engagement and enthusiasm among participants. The variability in challenge completion rates highlighted the areas for content refinement. Was verified that the blended learning formats combining online modules with in-person support was the most valuable approach.

Based on these findings, the project produced an e-guidebook to assist educators and youth workers in replicating and sustaining the program (Marques, Araújo, et al., 2024). The guidebook includes:

- Strategies for mentoring and empowering girls in digital technologies.
- Best practices from the pilot study.
- Resources and toolkits to enhance teaching and learning activities.
- Outcomes and Impact

The SparkDigiGirls project achieved success in its mission to empower girls through digital technologies, by enhancing interest in ICT, creating capacity building methodologies for educators and providing a sustainable model. The participants demonstrated increased curiosity and confidence in using digital tools, with many expressing a newfound interest in pursuing technology-related careers (Marques et al., 2023). The e-guidebook equips educators with practical tools and strategies to support girls' creativity and engagement in ICT (Marques, Araújo, et al., 2024). The project's resources and blended learning approach provide a scalable framework for future initiatives targeting gender diversity in STEM.

The need to promote the free use of content by the community after funding led to a fourth phase of the project (Community Use). In this way, we expect to attract more female students to the field of technology.

Methodology

Upon the completion of the SparkDigiGirls project, a fourth phase (Community Use) was introduced to ensure broader accessibility to the resources developed during its implementation. The primary goal of this phase was to facilitate community access to the content while also engaging potential mentors who could deliver the activities to groups of students. While the E-guidebook proved to be a valuable resource that sparked significant interest among educators and mentors, it became clear that creating a MOOC for mentors could provide an even more engaging and scalable solution.

The fourth phase of the project was meticulously designed and executed to achieve these objectives. First, a suitable platform was identified to host the MOOC, ensuring ease of access and user-friendliness for the target audience.

There is a process in place for the transformation of courses into MOOCs, which is in line with the Agile Methodology. This approach is increasingly being used in online education because of its emphasis on flexibility, collaboration and incremental progress. It is ideal for creating adaptable online courses that meet the evolving needs of students. (Salza et al., 2019). A five-phase process was designed for the creation and implementation of courses using Agile principles:

1. Analysis: A multidisciplinary team, including trainers, instructional designers, and content specialists, created video templates with institutional branding. These templates were validated by the coordinators responsible for digital content production.
2. Design: A course design workshop was conducted with teachers to support the preparation of MOOC content. The design model for all courses was developed and approved by the team.
3. Development: A media production workshop was held to assist teachers in creating multimedia content. Feedback was provided by instructional designers and content specialists.
4. Implementation: Pilot courses were tested with a student group to gather performance data and refine the content based on identified challenges. Final courses will then be launched.
5. Assessment: Final feedback and performance data will be collected to measure course success and ensure continuous improvement.

This structured approach ensures that the courses are responsive, effective, and tailored to students' needs.

Following this, a specialized module for mentors was developed using Agile Methodology. This iterative approach allowed for continuous refinement of the module, ensuring it met the needs of mentors effectively. The module content was tailored to equip mentors with the necessary skills and knowledge to implement the project activities confidently and successfully.

To validate the MOOC and identify areas for improvement, a pilot test was conducted with four carefully selected participants who met the project's requirements. These participants provided valuable feedback on the structure, content, and usability of the MOOC. Based on their input, further enhancements will be implemented to optimize the course's effectiveness and user experience.

The phase will culminate with the MOOC being made available online. This resource not only extends the reach of the SparkDigiGirls initiative but also empowers mentors to contribute to its mission of fostering student engagement and learning through innovative methodologies.

MOOC for mentors was developed in the second half of 2024 and a pilot test was carried out with a small group of trainees. The aim was to evaluate the content produced and detect possible improvements.

Results

The first step was to identify a platform with the necessary characteristics to facilitate widespread community use and engagement. After careful consideration, the Chair4Future platform (Figure 3) was selected. This platform was developed as part of the STRONG (Resilient Skills and Teachers Focused on the Next Generations) project, it is specifically designed to host digital resources and MOOCs that are accessible to the general community (Marques, Mateus & Araújo, 2024; Marques, Mateus, Araújo, Nata, et al., 2024). The creation of MOOCs on this platform follows the five-phase process using the agile principles mentioned above. By choosing this platform, we ensured that the SparkDigiGirls project aligned with a robust and user-friendly solution.

The Chair4Future platform is built on Moodle (Modular Object-Oriented Dynamic Learning Environment), an open-source learning management system (LMS) that is widely recognized and utilized for educational purposes. Moodle's reputation for flexibility and versatility made it an ideal choice for this initiative. Its core features allow for the creation, organization, and management of courses, providing a range of tools for developing interactive resources such as quizzes, forums, and assignments.

To further enhance the platform's functionality, it was integrated extensions such as H5P, a content creation tool that supports the development of interactive and visually appealing learning materials. Additionally, the medal gamification tool was activated to make the learning experience more dynamic and engaging. This gamification feature encourages user participation by allowing trainees to earn feedback and medals as they progress through their activities, fostering motivation and a sense of achievement.

By leveraging these features, the Chair4Future platform not only meets the project's technical requirements but also creates an interactive and supportive learning environment. This ensures that both mentors and students can benefit from an accessible, engaging, and effective educational experience, reinforcing the platform's role as a key enabler for the project's success.

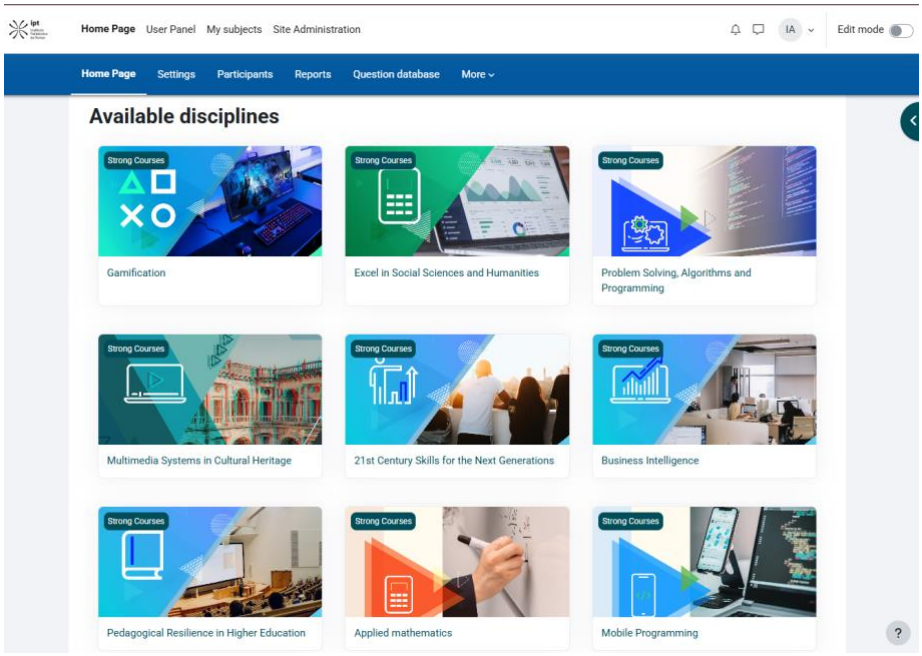

Figure 3: Chair4Future Platform

Three additional courses have been added to the set of MOOCs available on the Chair4Future platform as part of the ongoing process. The MOOCs included are:

1. Unleash Your CreativITy with Technology - Portuguese version;
2. Unleash Your CreativITy with Technology - Mentor Version (available only in Portuguese);
3. Unleash Your CreativITy with Technology - English version.

The Mentor's MOOC aims to provide educators with comprehensive explanatory content to help them better implement and present the challenges to groups of young learners. In addition to providing this content, our platform also serves as a tool for educators to effectively present the SparkDigiGirls challenges to students.

Unleash Your CreativITy With Technology – Mentor Version

In its original version, the set of challenges created as part of SparkDigiGirls only has material for young people who want to discover new technologies. As mentioned above, an e-guidebook has been created for educators who want to put this set of challenges into practice (Marques, Araújo, et al., 2024).

In the mentor version made available through Chair4Future, we decided to use the Agile methodology to create a specific module for educators, tutors or mentors who want to apply the proposed challenges with young people.

The module created to help the mentors is based on the e-guidebook created by the project and is subdivided into the following topics:

- Introduction to the project - explaining the origins of the project, the main results achieved and how the digital content created for the girls is structured. The participants have access to all content of the project, including the e-guidebook produced.

- The mentor/tutor role - where mentors are invited to better understand their role by presenting examples achieved during the project and some testimonies. This topic also describes the learning approaches tested during the project, so that the mentor can choose the one that best suits their context, though a final reflection.
- Digital resources - These include tutorials on how to use some of the tools available during the challenges, such as H5P. This is to enable mentors to adapt the resources if they detect any outdated content or want to adapt to a specific context.
- Final challenge - where mentors are invited to carry out the challenges created, and can see examples already created by participants in the project and ask the instructors any questions they may have.

After the pilot test at the end of 2024, we are still analyzing the information gathered. This will be followed by the implementation of improvements. In this way, we can make the content created available for the community to use. By having access to these resources, we expect that educators, tutors and mentors will be able to inspire and guide students through innovative and technological challenges, contributing to a more dynamic learning environment.

Conclusion

The SparkDigiGirls project represents a significant step toward bridging the gender gap in ICT by providing young girls with the skills, knowledge, and inspiration needed to explore their creative potential in the digital world. Through its innovative learning program, mentorship initiatives, and practical resources, the project empowers girls to become creators and innovators, not just consumers of technology. As a model for future efforts, SparkDigiGirls highlights the importance of inclusive education and diversity in shaping the future of technology (Marques, Araújo, et al., 2024).

Once the project's funding ended, it was considered important to include the resources created on a platform for the Portuguese community. To this end, the Portuguese team added a fourth phase to the initial project, by creating a MOOC for mentors that was made available through Chair4Future. This is an LMS platform based on Moodle for making content available to participants outside the institution. In this way, we have contributed to the development of courses that can be attended by students wishing to apply to the institution, but also by anyone else who is interested.

Thus, three versions of the original course were added, the original version in English and the one in Portuguese, as well a new version for mentors in Portuguese.

Through the Chair4Future platform it is possible for anyone who is interested to access the courses, without having to be an internal student of the institution. This provides the necessary conditions for the community to benefit from content created by the IPT.

With its strong emphasis on empowerment, collaboration, and creativity, SparkDigiGirls has set the stage for a more equitable and inclusive ICT industry, fostering a generation of talented young women ready to lead in the digital age. In this way, IPT aims to maintain its relationship with the community by promoting essential skills for the labour market. We believe that this case exemplifies this commitment to the community, promoting open access to content that can develop essential skills for the region's economic development.

Arab EFL Learners' Collocational Competence: Errors, Challenges, and Teaching Implications

Pakenam Shiha, Effat University, Saudi Arabia
Nadine Emirey Lacsina, Al Yamamah University, Saudi Arabia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study investigates the collocational competence of Arab foundation program students, addressing the lack of systematic analysis of ESL learners' lexical and collocation errors. Understanding how ESL learners construct fixed expressions is crucial for achieving native-like proficiency, a key goal of foundation programs. A cohort of 38 foundation learners took a 60-item collocation test focused on verb-noun and adjective-noun structures to assess their collocational competence and identify specific errors. Results indicated that students were more familiar with verb-noun combinations but struggled with adjective-noun collocations. A significant disparity in scores between these two structures was observed. The primary challenges stemmed from the influence of the learners' first language (L1), particularly in their selection of collocates, as many answers reflected their inability to differentiate between synonyms absent in their L1. Additionally, non-exposure to certain collocations and the degree of L1-L2 differences were highlighted in surveys. Instructor interviews corroborated these findings, emphasizing the students' limited exposure to collocations and insufficient English proficiency, alongside L1-L2 discrepancies. The thematic analysis revealed that enhancing students' exposure to collocations and addressing their linguistic challenges could improve their performance. Overall, the study's findings contribute valuable insights for language pedagogy, suggesting effective strategies for teaching collocations to ESL learners.

Introduction

Proficient use of collocations is seen as a defining characteristic of advanced English fluency and communicative competence for language learners. A student's collocational knowledge plays a pivotal role in determining their academic and professional success and acquiring vocabulary in phrasal units, rather than in isolation, may accelerate the second language learning process. Mastery of collocations is viewed as a critical indicator of overall language proficiency and a strong predictor of positive outcomes for students seeking to reach a higher level of English language skills (Hill, 2000; Howarth, 1998).

The investigation of EFL learners' interlanguage could greatly contribute to the teaching of English as a foreign language and the development of teaching materials. Despite the importance of collocations in language proficiency, collocational competence is one of the most neglected areas in language studies, especially second language teaching. Acquiring collocations is quite challenging and problematic to non-native English speakers. Nevertheless, it is widely noticed that collocations are still underestimated in different EFL contexts, which may hinder English learners' fluency in speaking and writing.

The present study aimed to raise awareness of the most common errors and challenges Arabs face when they learn collocations. In addition, this study investigated the collocational competence and knowledge of English learners with Arabic L1 backgrounds and different proficiency levels. The first part of the study deals with the types of collocations and the most common errors Arabs face while using collocations. The study then presents the challenges Arab students and EFL instructors face while teaching collocations. The last part includes a number of recommended activities that English language instructors can implement in their classroom. The paper is thus helpful to both researchers and language instructors as it sheds light on pertinent areas for research and recommends useful activities for teaching collocations.

Definition and Types of Collocations

The term collocation has been defined by different scholars. Collocation was first introduced by Firth (1957) to refer to a combination of words associated with each other. Meanwhile, Sinclair (1991) defines collocations as "items that occur physically together or have strong chances of being mentioned together". Furthermore, according to Lewis (1997), collocation was defined as "the readily observable phenomenon whereby certain words co-occur in natural text with greater than random frequency". In addition, collocation is defined as a predictable combination of two or more words which produce a specific meaning (Cowie, 1999; Hill, 2000). Benson, Benson, and Ilson (1997) categorized collocations into two types which are grammatical collocations and lexical collocations. Grammatical collocations consist of a dominant word and a grammatical word, whereas lexical collocations do not include function words. For this study, lexical collocations which are categorized into six types were used: adverb + adjective; adjective + noun; noun + noun; noun + verb; verb + noun; verb + adverb.

Although it may not be common to use these combinations of words, it will be highly effective in conveying messages in a more appropriate sense. Even though it is possible to use other word combinations, understanding collocations will definitely help English learners improve their fluency and communication skills (Hill, 2000).

Challenges in Using Collocations

Several past studies investigating second language acquisition of English collocations have shown that EFL learners' problems are due to different factors (Fan, 2009; Huang, 2001). One of the major reasons for collocational errors is the native language influence (Bahns, 1993; Koya, 2003; Nesselhauf, 2003). Learners' native language (L1) has an impact on their subsequent learning of L2 collocations (Nesselhauf, 2003, 2005). Learners' reliance upon their L1 collocational knowledge may represent their assumption that there is a one-to-one correspondence between L1 and L2 collocational choices. Fortunately, where there is an exactly identical match between collocations in both languages, transfer from learners' mother tongue could result in positive, satisfactory production (Ellis, 2008). For instance, the combination in reality appears to be possible in both Arabic and English. As a result, it is very likely that Arab learners will become successful in transferring this particular collocation from L1 Arabic to L2 English. On the other hand, some researchers have also found that learners depend on certain learning strategies, such as synonyms (Farghal & Obiedat, 1995; Mongkolchai, 2008), repetition and overgeneralization (Granger, 1998; Howarth, 1998).

Earlier Studies on Collocations

Mahmoud (2005), revealed in his study that EFL learners produce 'unnatural' word combinations. 61% of the incorrect combinations could be due to negative transfer from Arabic. The fact that post-intermediate and advanced students of EFL have a relatively large stock of vocabulary might have motivated interlingual transfer in the belief that it would be easy to find the EFL equivalents of the Arabic lexical items.

In a study conducted by Shammas (2013) on the assessment of comprehension and production of collocations of MA students from four Arab universities, the results of the study showed that the overall performance of the students was unsatisfactory and below what was expected from MA students. Four factors were mentioned that influenced students' weakness in understanding and using collocation which are: 1) the lack of knowledge of the collocations in question 2) shortage of dictionaries that include collocations 3) lack of consciousness of the role of collocations in expressing meaning as intended in context and 4) lack of concentration on collocations in EFL classes at Arab universities.

Another study by El Dakhs (2015) examined the collocational competence of Arab undergraduate students who study English in a foreign language (EFL) environment. The study focused on lexical collocations. The study showed that the collocational competence of learners was notably unsatisfactory despite the fact that English is the medium of instruction at the University. It was also found that collocational competence improves with increased language exposure but at a slow rate.

Likewise, Alsulayyi (2015) analyzed grammatical collocations through students' essays to examine their production of collocations. Examining the writing of 10 Saudi undergraduate students majoring in English, he found out that the learners studying in the United Kingdom produced fewer grammatical collocation errors than those studying in Saudi Arabia despite their similar IELTS score ranging between 5.5 and 6.

Consequently, Habtoor (2019) examined the familiarity of English as a Foreign Language (EFL) learners at Najran University with English collocations and the strategies being used when translating them into Arabic. The participants' familiarity with English collocations was

measured by means of a two-part test adopted from Gyllstad (2007). The study concluded that EFL learners' knowledge of collocations was unsatisfactory and below what was expected from them as English language major students. The results of the Pearson correlation test indicated a positive relationship between the learners' familiarity with English collocations and their ability to translate them into Arabic using different translation strategies.

Similarly, Osman (2019) investigated English language postgraduates' knowledge in using English collocations by examining M.A English language students' awareness of using English collocations in both lexical and grammatical forms. The descriptive analysis showed that M.A students were not sufficiently aware of using English collocations because university syllabi do not sufficiently cover English collocation. It was recommended that collocations should be integrated in university syllabus to raise students' awareness in using collocations and that students should practice collocations seriously to master the language.

Collocational Competence and English Proficiency

Several studies linked students' collocational competence with proficiency levels. Hua and Azmi's (2021) study supports this idea and exclaims that high language proficiency level can be reflected through collocational competence. In the same way, Bagherzadeh Hosseini and Akbarian (2007) whose study delved on language proficiency and collocational competence underscored that there is a correlation between a student's general proficiency and collocational competence. Furthermore, he mentioned that collocational knowledge is 25% of a person's general proficiency, exclaiming that rest include "vocabulary knowledge, grammatical knowledge, knowledge of discourse, an understanding of how texts are organized, skill in reading, writing, etc., and fluency" (p. 15).

Most of the previous research studies mentioned above focused on one single group of EFL learners, particularly those with high proficiency. Hardly do such studies reflect a true picture of how learners' collocational knowledge has been developed through time. To put it another way, there has been little research to date examining learners' errors in the total interlanguage system with respect to collocation learning. It is for this reason that the present study was undertaken to bridge the gap, i.e. to scrutinize the collocational competence of high-proficiency and low-proficiency Arab learners of English.

Statement of the Problem

Given the EFL context in Saudi Arabia and the importance of collocations in achieving native-like proficiency among students, this research aimed to investigate the overall collocational competence of Arab foundation students in Saudi Arabia. This objective was further explained and explored through the following questions:

1) What are the lexical errors that students make?
2) What are the challenges that students encounter when they form collocations?
3) What is the overall collocational competence of the students?
4) Does students' collocational competence progress with proficiency?

Significance of the Study

Results of this study shed light on the existing challenges that Arab ESL learners face as they use collocations. Furthermore, this study shall help instructors in designing activities that

help students strengthen their collocational competence, as having strong collocational competence is highly associated with native-like proficiency. In this way, students' oral and written skills using the target language may be improved (Alotaibi & Alotaibi, 2015). Lastly, this study will benefit syllabus designers because this research will guide them on the extent in which collocations have to be included in the syllabus and the frequency in which collocations have to be introduced in an English course.

Method

Research Design

This study utilized both quantitative and qualitative designs. For the qualitative end, this research used descriptive qualitative research as reflected through the thematic analysis that was used to get the recurring patterns from both the questionnaires and semi-structured interviews.

For the quantitative end of the research, statistical treatment was used to interpret the scores from the collocational test. Students were given a 60-item test in order to determine their overall collocational competence. Scores of the test underwent statistical treatment to identify whether the students' collocational thresholds are acceptable.

Participants

The participants of the study were a total of 38 foundation program students from the Effat English Academy. These students were chosen through purposive sampling. The criteria in choosing the students were based on the following: 1) students should be part of the foundation program 2) students should be studying collocations in their respective levels 3) students should be at least from the intermediate level. Students who are part of the foundation program undergo intensive English courses in order to improve their language skills prior to entering college. Of the 38 chosen students, 19 were upper intermediate level students, while 19 were intermediate level students. The students' levels were determined by the university's placement test, Cambridge's Linguaskill test.

Data Collection

The study used the triangulation method to collect data in order to cover many aspects, such as tests, interviews, and surveys to arrive at more grounded answers. The primary data for this study came from the Collex and Collmatch collocation tests which were adopted from Gyllstad (2005). A total of 60-items were administered to students, 20 items from the Collex test, while the other 20 items were taken from the Collmatch test. 12 items prompted students to combine words to form collocations, whereas the remaining 8 items were part of a fill-in-the blank test.

The test was administered once since the aim of this research was to know the collocational competence of students along with the challenges they face as they use collocations. The instructors who proctored the students during the administration of the test were the same instructors who were interviewed.

The secondary data came from the survey that was administered to students. The survey focused on the challenges that students face when dealing with collocations and the

frequency of their exposure to collocations which can serve as support to the results of their collocation test. The survey was administered a day after the test, so students can have ample time to reflect about their overall performance and feedback about the test.

Meanwhile, additional secondary data in the form semi-structured interview was administered to the instructors handling the students. Gathered data from the interview supported the findings of the test. In addition, instructors' perspective proved important in improving pedagogical practices and syllabus revisions that would benefit students in the future. The semi-structured interview was done two days after the administration of the test to give instructors time to gather their thoughts in terms of teaching collocations in the classroom context and their observations while proctoring the students during the administration of the test.

Data Analysis

To arrive at a more comprehensive answer to each of the research questions raised in the earlier section of this paper, the data analysis will comprise four stages as shown in Figure 1. The first stage of data analysis focused on the statistical treatment of the collocation test scores. Since the tests were administered to two different levels, B1 and B2 respectively, unpaired t-Test was utilized to compare the means from the two levels. Meanwhile, taking the average of both levels would prove sufficient to know the collocational competence of the students. The second stage deals with the identification of common errors made by the students when they took the collocation test. This proved effective in determining the words they chose to pair with a collocate. In addition, examining students' choice of collocates gave justification as to how their L1 influences their word choice in L2. The third stage centered on the analysis of the raw data from the survey guided by the Likert scale. Finally, in order to support the results of the test and students' answers from the survey, qualitative coding was used to get the common patterns or themes present in the interview transcripts of the instructors teaching these students.

Figure 1: Stages of Data Analysis

Results

1. What are the lexical collocation errors that students make?

Analysis of the collocation test revealed that students had difficulties with lexical collocations. For the specific collocation structures, students were only tested with verb+noun structure in the form of Collex and Collmatch tests, and adjective+noun structure in the form of a matching type test and fill-in-the-blank test. Based on the overall performance of the students in the test, they scored higher in the verb+noun structure than in the adjective+noun structure. Several mistakes were observed in the adjective+noun structure, hence students got the lowest scores in the matching type, which required them to pick a word from each box to form collocations.

To illustrate, Table 1 shows the common mistakes that students made when they formed the adjective+noun structure. Only the most frequent combinations were included in the table below.

Table 1: Common Lexical Errors of Students Test 3

Unusual Combinations (formed by the students)	Expected Combinations
effective version	effective treatment; online version
close issue	close relationship; global issue
high information	high standard; basic information
classic achievement	classic example; academic achievement
active relationship	active participation; close relationship

Looking at the common lexical errors made by students from Test 3, it can be seen that students chose inappropriate adjectives to pair with their preferred nouns. For instance, instead of combining the adjective “effective” with treatment, most students chose to pair it with the noun version. On the other hand, the adjective “close” was paired with the noun “issue” instead of pairing it with the adjective “global”. Another unusual pair of collocation that emerged from the test was “high information”. Although high is not used with information, students might have chosen this adjective to mean that the information is important. Classic achievement was also formed by a number of students. Classic from the options must be paired with example, while achievement should have been paired with academic. However, this unusual combination may be interpreted to mean a type of achievement that most people accomplish (e.g. finishing high school and obtaining a college diploma). Lastly, instead of forming “close relationship” some students answered “active relationship” which to them could mean in constant communication with a friend or a relative. Overall, occurrences of unusual collocation combinations were due to the fact that students needed to depend on their actual collocational knowledge unlike the Collex and Collmatch tests which already provided students with two collocations that they have to choose from.

Table 2: Common Lexical Errors of Students From Test 4

Unusual Combinations (formed by the students)	Expected Combinations
heavy tire	flat tire
flat coffee	instant coffee
fair insurance	medical insurance
fair traffic	heavy traffic

Unlike Test 3, which prompted students to choose an adjective and a noun to form a collocation, Test 4 only required students to choose an adjective to pair with an existing word in each number. Regardless, the students still faced difficulties choosing the correct collocates. These combinations are common in books, movies, and even everyday conversations, however, very few students got these expected combinations correctly.

2. What are the challenges that students encounter when they form collocations?

One of the major aims of this study is to identify the challenges that Arab EFL students face as they use collocations. Through the questionnaires administered, the participants mentioned five major challenges which are: 1) unfamiliarity to words 2) level of difficulty of word combinations 3) inability to use collocations in communication (writing and speaking) 4) correct combinations of collocates and 5) influence of L1 on L2.

Unfamiliarity to Words

Students' inability to recognize words was one of the recurring answers from the questionnaire. To be specific, S1 mentioned that “I don’t know a lot of words”, while S37 wrote “I don’t know which words to use.” Students unfamiliarity with words could be heavily influenced by their limited vocabulary repertoire which is vital in using collocations. Limited vocabulary leads to poor usage and understanding of collocations. In addition, students' inability to understand word meanings contributed to their difficulty in using collocations. Several students mentioned that they do not understand the meaning of words, hence their poor usage of collocations.

Difficulty of Collocations

Another challenge that emerged from the thematic analysis of the questionnaire was the level of difficulty that students encounter when dealing with collocations. This finding is parallel to a number of studies done previously which stated that students found word combinations extremely challenging and confusing. S8, for instance, said that collocations are “difficult and we must understand it more”. Another participant, S30, wrote “it is very difficult to understand”.

Inability to Use Collocations in Communication (Writing and Speaking)

The third challenge of using collocations in sentences is related to the students’ productive and receptive knowledge of lexical collocations. This answer is supported by the result of the collocation test. Students scored better when they were given two collocations and only had to choose which the appropriate combination was. However, students struggled with the tests which required them to combine words themselves. Given their difficulty in combining possible word combinations, it will significantly impact their ability to produce collocations

on their own when writing sentences. In addition, aside from students having difficulty producing collocations when they write, they also struggle using collocations when communicating with others. In fact, several students mentioned that even pronouncing collocations was a problem for them.

Correct Combinations of Collocations

Correct combinations of collocations require good proficiency in English. Hence, collocational competence, as revealed by recent studies, has been linked to English proficiency. With the current study, students mentioned that one of the challenges they face is the way words collocate and added that it was difficult for them to choose which word is the correct collocate of another. This was due to not having been exposed to many activities in class and not having enough avenues for exposing oneself to practice using collocations, as some students mentioned that they rarely use collocations because their family and friends always speak Arabic.

Influence of Students' of L1 on Their L2

Another major challenge that students face is the influence of their first language on their ability to understand the meaning of words. Through the questionnaire administered, students mentioned that it was difficult for them to figure out the meanings of the words and their combinations because there are certain words in English that do not have a direct counterpart in Arabic. Furthermore, the students' L1 was revealed to have influenced their ability to choose the correct words because Arabic, unlike English, does not use several synonyms. Hence, words like "fast" and "quick" only have one counterpart in Arabic which is " سريع".

3. What is the overall collocational competence of the students?

Collocational competence has always been deemed important in improving one's language skills, as one's ability to use collocations and understand collocations promise not only native-like proficiency level, but also a more effective way to communicate with others. After a rigorous analysis of the data, the study reveals that students from both levels have poor collocational competence. In fact, the overall performance of the students was below average. Table 3 shows a detailed representation of the average of both levels in each of the tests.

Table 3: Overall Performance of All Students

Participants	Test 1	Test 2	Test 3	Test 4	Overall Average
L3 and L4 students	48%	58%	25%	42%	45%

Looking at the overall performance of all the students across all tests, the highest average obtained was 58% from the Collmatch test, followed by 48% from the Collex test, then 42% from the fill-in-the-blank test, and 25% from combining collocates. In a more detailed representation, Table 4 and 5 show students' performance in each test including the percentage, mean, and standard deviation.

Table 4: Detailed Performance of Students in Tests 1 and 2

Participants	Collex			Collmatch			Overall Percentage
	P	M	SD	P	M	SD	
L3 and L4 students	48%	10	2.5618	58%	12	1.929	53%

Table 5: Detailed Performance of Students in Tests 3 and 4

Participants	Matching type			Fill in the blank type			Overall Percentage
	P	M	SD	P	M	SD	
L3 and L4 students	25%	3	1.6214	42%	3	1.3677	33.5%

Based on Tables 2 and 3, it can be seen that among the tests administered, the highest performance was observed from the Collmatch test with an overall performance of 58% and a mean of 12 out of 20, which is still below average. For the Collex test, students' overall performance was 48% with a mean of 10 out of 20. 2 points lower than the Collmatch test which indicates below average as well. However, students' performance in both tests 1 and 2 may be considered better when compared to their performance in tests 3 and 4, which required them to form the most appropriate collocations from boxes containing adjectives and nouns and fill in the correct collocates by choosing an adjective from a series of adjectives inside a box, respectively. These results show that the collocational competence of the students is below average because they performed better in tests (1 and 2) which already provided them with collocations and all they had to do was to choose which was the appropriate one. Meanwhile, in tests that required students to form collocations on their own, they got much lower scores that indicate the students' difficulty using collocations on their own. Hence, matching type test and fill-in-the-blank type test proved to be very challenging.

4. Does students' collocational competence progress with proficiency?

As earlier studies revealed, collocational competence was strongly linked with proficiency. Based on the data that underwent statistical treatment, the findings reveal that the collocational competence of students from levels three and four do not progress with proficiency. Table 6 shows the overall performance of each group in the collocation test.

Table 6: Overall Performance of Students Based on Proficiency Levels

Level of Students	**Overall Average**
Intermediate Students (L3)	48%
Upper Intermediate Students (L4)	43%

Looking closely at the overall performance, L3 students performed better when considering the overall average of the tests. Ideally, L3 students' entry score is 140, while L4 students' entry score is 155. With the big difference between the two entry scores, it was expected that L4 students should score higher than L3. However, the difference between the two levels was not that much to be able to show a significant difference between their performances using the t-test.

Table 7: t-Test Result Comparing the Performance of L4 and L3 Students

Participants	Mean	Variance	Standard Deviation	T-Value	Critical Value
Intermediate Students (L3)	28.5789	19.6122	4.4286	1.7063	2.028
Upper Intermediate Students (L4)	26	23.7895	4.8774		

Based on the results of the t-test in Table 7, the calculated t-value is lower than the critical value (1.7063<2.028), hence the means are not significantly different. To put simply, the means of Group 1 and Group 2 are not significantly different at $p < 0.05$. This finding reveals that given the variation in terms of levels and target CEFR scores, there is no significant difference between how both levels performed in the collocation test. This result opposes results of some earlier studies that show students' collocational competence progresses with their proficiency level.

Discussion

Developing students' collocational competence is crucial for language learning, as exposure to recurring word combinations significantly impacts second language acquisition (Snoder, 2019). This study addressed the challenges English learners face, emphasizing the need to help them achieve native-like proficiency.

Analysis revealed that students were more familiar with verb+noun combinations, supported by significant score differences in the Collex and Collmatch tests. This finding aligns with El-Dakh's (2015) study, which showed that students demonstrated less command of adjective+noun patterns.Errors in unusual word combinations were common, particularly due to students' reliance on their mother tongue when selecting adjectives for nouns. Habtoor (2019) noted that such unnatural combinations often result from this reliance. Instructor interviews confirmed that confusion over synonyms was a major issue, particularly in reading and speaking contexts.

The study also identified several challenges students encounter with collocations, including unfamiliarity with words, difficulty with combinations, and the influence of their first language (L1) on their second language (L2) use. Students' vocabulary repertoire and exposure to correct collocations play significant roles in their understanding and usage, paralleling Shammas's (2013) findings regarding master's students' lack of awareness of collocation usage in context.

Collocations containing unfamiliar words hinder students' ability to distinguish correct combinations, impacting their overall proficiency. This aligns with Shammas's (2013) research on master's students and the claims of Farrokh (2012) and Zughoul (1991) that collocates vary by language, complicating comprehension for Arabic speakers.

Textbook limitations were also noted, as they often lack sufficient scaffolding and practice with collocations. Although they cover eight topics, many chapters provide only a few collocations, insufficient for enhancing students' lexical repertoire. Rogosic (2023) found considerable inconsistencies in the coverage of collocations across textbooks, echoing Suarez and Natal (2017) and Eid and Al-Jamal (2023)'s observations that single words are prioritized over collocations. Regarding the influence of L1, 56% of participants acknowledged that Arabic affects their collocational use. This aligns with Sun and Park (2023), who emphasized that L1 transfer can impede L2 collocational acquisition.

Overall, students' collocational competence was below average, with the highest average score of 12 out of 20 (58%) on the Collmatch test, indicating challenges with productive use compared to recognition. This reflects findings from El-Dakhs (2015) and Gaballa and Al-Khayri (2014), which noted poor collocational knowledge among Arab learners. Interestingly, while there was no direct link between collocational competence and proficiency, intermediate learners outperformed upper-intermediate peers, contrasting with studies suggesting advanced learners achieve near-native collocational use (Abdullah and Noor, 2013). Overall, the study supports Halim and Kuiper (2018), who found that students across proficiency levels struggle with producing appropriate multi-word units.

Conclusion

This study aimed to examine foundation year students' collocation errors, investigate challenges that students face when using collocations, and identify the collocational competence. Findings reveal that students had difficulties with lexical collocations and scored unsatisfactorily in both tests. Between the verb+noun and adjective+noun structure, students scored better when tested the former. Having said this, the overall collocational performance of students was below average given the overall performance of 45% combining the results of upper intermediate and intermediate students. However, one key finding from this study is that the intermediate students scored better than the upper-intermediate ones. Looking deeply into the challenges that students face when dealing with collocations, unfamiliarity with words, difficulty of collocations, inability to use collocation in communication, correct combination of collocations, and the influence of L1 on L2 have emerged through the interviews and surveys conducted. These challenges affected the students' collocational competence and their ability to use collocations inside and outside the classroom setting, some of which support earlier studies. In this study, interestingly, the proficiency levels of the learners do not progress with their proficiency levels. The result of the t-test revealed that there is no significant difference between the means of both upper intermediate and intermediate students. Therefore, although there is a huge difference in their proficiency levels, their scores in both tests did not show any.

Recommendations

This study is limited to upper intermediate and intermediate students, focusing only on verb+noun and adjective+noun structures. Future research should include all proficiency levels, from beginner to advanced, to provide a fuller picture of Arab students' collocational

competence, encompassing both lexical and grammatical collocations. Additionally, exploring the impact of translanguaging on teaching collocations could enhance understanding, as pedagogical practices significantly influence students' development in this area.

Given the specific challenges identified, it's crucial to emphasize early exposure to collocations to raise awareness among students. The findings suggest a greater focus on developing collocational competence in language instruction, including direct teaching, bilingual glossaries in EFL textbooks, and bilingual collocation dictionaries.

Current textbooks often inadequately cover collocations, so more explicit, scaffolded teaching is necessary to address learners' specific challenges. This should include a broader range of collocational patterns and tackle issues like synonym confusion and first language reliance. Furthermore, collocation instruction should be tailored to proficiency levels, as intermediate learners sometimes outperform upper-intermediate students. Addressing both receptive and productive collocational knowledge is essential. Integrating these elements into language curricula could significantly enhance students' overall collocational competence.

Official Conference Proceedings

Abstract
This paper aims to discover and identify the challenges encountered by ESL (English as a Second Language) learners in their pursuit of mastering the English past tense. The acquisition of this grammatical aspect constitutes a crucial step in achieving language proficiency, yet it remains a challenge for many non-native speakers. Most ESL students in Brunei sit for the English Cambridge O Levels at the end of their secondary school education and to obtain the highest band in the Writing paper, students must demonstrate highly accurate use of complex spelling, punctuation, and grammar. Despite having been taught the past tense rule over their 12 years of studying English, some ESL students in Brunei still face difficulties in applying the past tense during assessments. Hence, the main objective of this research was to identify the underlying causes hindering students' application of this grammatical concept, especially during assessments. This exploratory case study uncovered twelve ESL students' challenges in applying the past tense through a self-reflective activity. The students' responses were analyzed using thematic analysis to identify common, recurring themes and patterns. The themes derived from the data were: time limitations, confusion of irregular verb spelling, lack of practice, and translating of mother tongue to English. The findings have implications for educators, curriculum designers, and policymakers, aiming to inform the development of targeted interventions that can empower ESL learners to navigate the complexities of the English past tense more effectively.

Introduction

One of the assessment objectives of the Brunei-Cambridge English Language O-level is for students to be able to communicate successfully and show language competency. To obtain the highest band in the Cambridge O Level Paper 1 (the Writing paper), students are required to use highly accurate use of complex spelling, punctuation, and grammar. However, despite having been taught the past tense rule over their years of studying English, O-level students in Year 12 are still facing difficulties in applying the past tense during assessments. The main objective of this research was to identify the underlying causes hindering their application of this grammatical concept.

Background of Research

English language education in Brunei has undergone substantial development over the years. The context of ESL education in Brunei is unique due to the nation's bilingual status, with Malay as the official language and English as a second language. It is essential for Brunei's ESL students to achieve a high level of proficiency because this country's bilingual environment has made English a vital tool for communication, education, and economic development. For instance, in the field of education, most of the subjects learned in Bruneian schools are communicated in English, thus English as ESL proficiency is strongly encouraged in Bruneian primary, secondary, and tertiary education.

English language proficiency is not limited to these 12 years of education; in order to continue their education, students must obtain at least a Credit in English Language at O Level, further emphasizing the importance of English proficiency. The O Levels exam gives significant weight to evaluating students' language proficiency, including their mastery of intricate spelling, punctuation, and grammar. The highest band on the writing portion of the exam requires a high level of grammatical accuracy, which includes using the past tense correctly.

Indeed, the English Language in Brunei now plays the role of ‘gatekeeper’ whereby with a good grasp of the target language, one would almost be likely guaranteed a secure future. This ‘gatekeeper’ role largely explains the dire need for the Ministry of Education to find ways of heightening students’ proficiency level in English. Without credit in their GCE English O-level examinations, students will find it almost impossible to obtain places to study at the local universities or any of the higher institutions. The past tense in English is particularly significant because it is important for communicating past actions and events. Understanding the past tense is crucial for clear communication and is frequently necessary for success in academics.

However, many ESL students in Brunei continue to have difficulty correctly applying this grammatical concept despite receiving rigorous instruction and exposure to it throughout their schooling years, particularly in high-stakes exams like the O Levels. These issues call for a deeper look because they are symptomatic of a larger problem with Brunei's ESL classrooms. Therefore, the main goal of this study is to investigate the root causes that make it difficult for Bruneian ESL students to use the past tense correctly, especially when it comes to assessment situations. To achieve this, an exploratory case study approach was employed, involving twelve ESL students. This study sought to learn more about the specific difficulties these learners have in correctly using the past tense through a self-reflective activity.

The results of this study will have important ramifications for many stakeholders involved in Brunei's ESL education system, such as teachers, curriculum designers, and policymakers. Targeted interventions can be created to effectively address these issues by understanding the difficulties ESL students have learning the past tense. In the end, this study enhances ESL instruction in Brunei by giving students the skills and confidence they need to successfully negotiate the complexities of English grammar, particularly the past tense.

Aims and Objectives

The aim of this research is to uncover underlying factors and causes that contribute to ESL learners' challenges in effectively using the past tense, especially during assessments. The ultimate objective is to inform pedagogy implications such as effective interventions that empower ESL learners to overcome challenges of the English past tense with greater success and confidence.

Research Questions

Hence the following research question this paper seeks to answer:

RQ: What are the recurring themes that emerge from the self-reflective responses on ESL challenges with the English Past Tense?

Literature Review

The acquisition of grammatical aspects, such as verb tenses, is a fundamental component of language proficiency for ESL (English as a Second Language) learners. Among these aspects, the English past tense plays a pivotal role in conveying actions and events that occurred in the past. However, mastering the past tense remains a formidable challenge for many non-native speakers, including ESL students in Brunei. Despite years of English language education, these learners continue to struggle with the accurate application of the past tense, especially during assessments. This literature review explores the challenges faced by ESL learners in mastering the English past tense, provides insights into the causes of these challenges, and highlights the implications for education in Brunei.

Significance of the English Past Tense

The English past tense is a cornerstone of effective communication and language proficiency. It enables learners to express actions and events in relation to time, allowing for the clear and accurate conveyance of narratives and descriptions. In academic settings, mastery of the past tense is essential for writing, comprehension, and overall language competence (Hinkel, 2002). Achieving precision in its usage is vital for ESL students aiming to excel in English language assessments, including the Cambridge O Levels.

Challenges Faced by ESL Learners

Studies into the challenges of the learning of English Past tense have been documented well in the literature. Common issues faced by ESL students in learning the concept are due to English verb inflections and irregularities. One prominent challenge lies in the inflection of regular and irregular verbs in the past tense. ESL learners often struggle with the diverse patterns of verb conjugation, particularly the irregular forms (Eckman, 2004). The inconsistent spelling and pronunciation of irregular verbs can lead to confusion and errors.

Studies conducted in similar contexts to Brunei, such as Malaysia, show ESL students are continuously facing difficulties in past tense, such as a study by Manokaran, Ramalingam & Adriana (2013), with students often making errors in tense shifts and misconceptions of the past tense of the auxiliary verb 'be'. Similary, Jabeen, Kazemian and Shahbaz (2015) claim that incorrect usage of verb tenses are the most common errors found in Iranian ESL students.

The influence of a learner's native language on the acquisition of the past tense is a well-documented phenomenon (Dulay & Burt, 1974; Guo, Liu & Chen, 2014). Often due to the differences in language mechanics, there is an existence of negative transfer which will cause ESL learners to commit errors when they attempt to either speak or write sentences in the second language (Munchen. Arsad, & Razali, 2021). Furthermore, the frequency of negative language transfer occurs higher in low level language learners as they rely on their native language in terms of certain language rules and structures, for example they tend to over-generalise the target language rules during sentence constructions (Febriyanti & Sundari, 2016). This is the case in Brunei, whereby learners may transfer Malay language structures and tenses to English, resulting in incorrect usage (Deterding & Sharbawi, 2013; Deterding & Suhaimi, 2021).

Furthermore, effective language acquisition requires regular practice, especially in applying complex grammatical rules like the past tense. ESL students may not receive adequate opportunities to practice and reinforce their understanding of this aspect (Lightbown & Spada, 2013). Finally, ESL learners often face time constraints when completing written tasks. This can add pressure and hinder their ability to accurately apply the past tense (Hamp-Lyons & Heasly, 2006), especially during high-stakes assessments like the Cambridge O Levels.

Significance of Study

As the status of the English Language continues to take hold, it becomes necessary to understand the needs of ESL learners in order to assist their learning and for teachers to better inform their teaching pedagogy. The contribution of this study to the body of knowledge of ESL teaching of English past tense is believed to be valuable. Understanding ESL challenges in acquiring the English past tense will allow for the following contributions:

a. ESL educators in Brunei and ESL learners would be able to identify the challenges related to the English past tense and provide targeted instruction that addresses these difficulties.
b. Curriculum designers would be able to incorporate more opportunities for ESL learners to practice and reinforce their understanding of the past tense, both in written and spoken contexts based on the findings of this study.
c. Policymakers and educators could consider adaptations in assessment formats to promote accurate application of the past tense in assessments.

Hence, recognizing the challenges of ESL learners and the underlying causes of their inability to grasp the past tense is essential for improving language education in Brunei.

Method

This study utilizes an exploratory case study design. This research was conducted over a two-week period, involving a group of Year 12 ESL students, that consists of 7 boys and 5 girls. The study was constrained by the fact that the researchers had access to only one English O

Level class, and coincidentally it was one of the researchers' own classes, resulting in a limited pool of subjects available for the research.

Students' Task: Reflection Task

The reflection task was designed to help teachers understand the student's understanding of past tense and the difficulties they faced in applying it during tests and exams. The task involved asking students to write short paragraphs explaining their understanding of past tense and the challenges they faced using it. The Table 1 shows the questions asked:

Table 1: Self Reflective Questions

No	Self-reflective questions
1	What do you understand about past tense?
2	Why do you think it was difficult for you to grasp past tense before this, especially during tests?
3	What are the steps that you have learned to improve your knowledge in past tense?

Findings and Discussion

The students' responses were analyzed using thematic analysis to identify common, recurring themes and patterns of students' challenges of learning and applying the English past tense. The constant comparative method was used in the data analysis and the refinement of open codes to axial codes and eventually into themes and sub-themes. The first step of this process is the reduction of data into manageable units and codes (Miles & Huberman, 1994). Data reduction involves the selection, simplification, abstraction, and transformation of the raw data. By the process of data reduction, pieces of information from the data can be combined into categories and themes.

The themes that were derived from the data were as follows:

1) Time limitations during examinations
   Most students said they had a basic understanding of past tense but struggled to apply it correctly during tests and exams due to time constraints and feeling pressured to complete the tasks within the time limits. Students also mentioned due to time constraints they were not able to check and recheck their writing to spot for errors in their use of tenses.
2) Confusions of irregular verbs spelling
   Students reported their confusion in terms of the spellings of irregular verbs such as 'buyed' and 'bought'. Regular verbs in English typically form their past tense by adding "-ed" to the base form (e.g, walk-walked), whereas irregular verbs change their base form entirely (e.g., go-went).
3) Lack of practice
   Students admitted that they lacked writing or grammar practice and did not read widely to be more familiar with the English language grammar.
4) Translating Malay to English
   Others stated that they needed time to translate from their mother tongue language when writing, which caused them to rush to finish their tasks and not have any remaining time to check their work.

To address the challenges faced by students as identified through the analysis, teachers can provide more targeted instructions to address time constraints and students' lack of practise. Interventions could be done to address confusion of irregular verbs spelling. Research on verb conjugation on second language acquisition has shown that distinguishing between regular and irregular verbs is a crucial step in learning the past tense (Lightbrown & Spada, 2013). Additionally, classroom instruction should include contextual learning. Studies have emphasized the importance of using context, such as storytelling or dialogues to help learners understand the practical application of past tense forms (Nation & Chung, 2009).

Furthermore, fostering bilingualism by encouraging students to integrate their mother tongue, Malay, with English can substantially enhance language learning. It is important to change the perspective from viewing the native language as an interference to identifying its potential as a valuable educational tool. This approach aims to raise students' awareness of how they might transfer linguistic structures from Malay into English. By understanding these influences, students can make more knowledgeable language choices, avoid common errors, and ultimately become more proficient in both languages. This linguistic awareness represents the first step in overcoming language challenges, empowering students to navigate the complexities of language acquisition with greater confidence and effectiveness.

Conclusion

In conclusion, the research provided valuable insight into identifying the challenges, issues, and gaps of learning of second language learners, in particular Year 12 English O Level students in Brunei Darussalam, in grasping the concept of past tense. It is important to note that this research was conducted under a limited scope, thus, future studies are recommended to include a larger and more varied sample of ESL learners as participants. A greater and more diverse participant pool will provide a more wide-ranging understanding of the challenges associated with the English past tense in Brunei's educational context. Expanding the participant pool in future research will improve the generalizability of findings and allow for a deeper examination of the challenges related to the English past tense. This will contribute to the development of more effective strategies and interventions for ESL education in Brunei.

Official Conference Proceedings

Abstract
Environmental empathy can be viewed as a moral movement that aims to increase awareness and concern for various environmental problems and issues. This movement encourages changes in the behavior of people who were previously antipathic or indifferent to the environment to empathize with the environment. The purpose of this study is to know and analyze the reality of society in empathizing with the environment and the implementation of environmental empathy through local wisdom in Indonesia in the perspective of postmodernism which can also be a source of learning. This research uses a post-qualitative approach by conducting field research to various indigenous peoples. The results of this study can be understood as follows: (1) the reality of the community being able to maintain and empathize with the environment through the values of local wisdom that are still believed and carried out in everyday life so as to minimize problems or damage to the environment; (2) The implementation of environmental empathy through local wisdom in the perspective of postmodernism is carried out in various activities or traditions while still maintaining the previous culture that has an impact on environmental conservation. This view emphasizes the plurality of values and diverse views of society about the environment, but with a good goal of maintaining a balance of relations between humans and the environment (nature).

Keywords: Environmental Empathy, Local Wisdom, Postmodernism

Introduction

Human behavior and perspectives on the natural world are key factors influencing environmental damage. In 2023, the Indonesian Ministry of Environment and Forestry (https://www.menlhk.go.id) highlighted the "triple planetary crisis" of climate change, pollution, and biodiversity loss. In response, the Indonesian government has focused on environmental protection and sustainable development, including initiatives like Asia-Africa climate change cooperation, tackling plastic pollution, and combating illegal wildlife trade (Kementerian Lingkungan Hidup dan Kehutanan, 2023). These environmental problems are also experienced by everyday communities, particularly those whose livelihoods depend on nature. Environmental degradation is evident in the form of damaged agricultural land and forests, pollution, loss of biodiversity, waste and clean water crises, global warming, and climate change, among other issues. Many of these problems are caused, at least in part, by human activities, which are significant contributors to environmental destruction (Bilqisti et al., 2023; Haris et al., 2016; Pranadji, 2005; Uar et al., 2016;). Environmental sustainability becomes threatened when human needs are driven by the concept of modernity, reducing nature to a mere material object to fulfill those demands (Marfai, 2019).

Given that various environmental issues are closely linked to human activities, addressing these problems requires fundamental changes in how humans think about and interact with the environment, as well as in their behaviors toward it (Keraf, 2010). Cause, the active role of humans is closely linked to the existence, capacity, and quality of social and community organizations that focus on environmental issues, as well as the level of public knowledge and awareness regarding environmental sustainability (Chandra, 2020). Nature must be viewed as something valuable, which in turn fosters positive behavior in interacting with the environment. A Minangkabau proverb states, "Alam Takambang Manjadi Guru" (nature expands to become a teacher), emphasizing that the environment should be regarded as a teacher, offering meaning and lessons for humanity, thus deserving of respect, proper care, preservation, and the ability to draw life wisdom from natural signs. In the study of environmental philosophy or ecosophy from a postmodern perspective, it is also understood that it is essential to interpret and explore the wisdom inherent in the environment, recognizing that it should not merely be seen as a tool to fulfill human needs, but that the environment holds intrinsic value and wisdom (Keraf, 2014). This is expected to educate humans and foster a relationship between humanity and the environment that is more ethical and empathetic, supporting sustainable living and ensuring the continuity of life on Earth.

The importance of empathy toward various environmental issues undoubtedly involves knowledge, attention, and responsibility for the condition and sustainability of the environment to address and overcome these problems. This concern is not overlooked in the field of education, where fostering empathy can serve as a key strategy to enhance educational success in Indonesia. By integrating empathy into the curriculum, it is possible to cultivate a more environmentally conscious and responsible generation, thereby contributing to both individual development and broader societal goals (Sumiati et al., 2021). Producing outstanding individuals by considering the continuity of human life and environmental preservation can be supported by creative pedagogy as "the way of thinking" (Supriatna et al., 2020). This study examines societal realities of environmental empathy and its implementation through local wisdom in Indonesia, viewed from a postmodernist perspective. It explores how indigenous communities empathize with the environment and develop unique paradigms, while also investigating societal behaviors that support

sustainable environmental practices, aiming to cultivate individuals attuned to environmental sustainability for the well-being of future generations.

Method

This study employs a post-qualitative approach, conducting field research within various indigenous communities. Data collection techniques include observation, interviews, and documentation from various references. The study attempts to observe the views and activities of several indigenous communities in Indonesia, particularly the Baduy community in Lebak Banten, the Sinar Resmi community in Sukabumi, West Java, and the Kampung Naga community in Tasikmalaya, West Java.

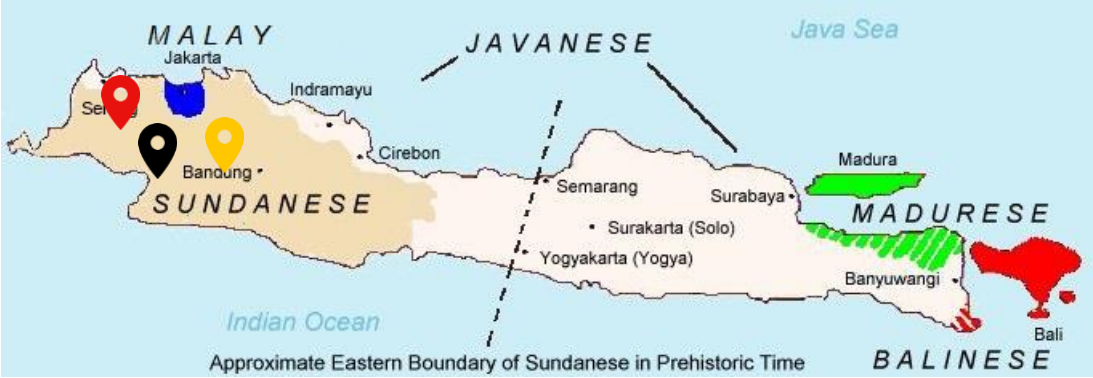

Figure 1: Research Location

Details:

- The Baduy village in Lebak Banten, Banten Province
- The Sinar Resmi village in Sukabumi, West Java Province
- The Kampung Naga village Tasikmalaya, West Java Province

Interviews were conducted with traditional leaders or community figures, as well as local residence, to obtain relevant data for the topic under discussion. The data is further supported by various sources, including books, journals, websites, and other documentation. Subsequently, the data is analyzed using qualitative data analysis, following stages of data collection, data reduction, data display, and conclusion. Within the tradition of post-qualitative research, the procedure focuses on the researcher's style, which is regarded as critical, idealistic, and postmodern/pragmatic. As a result, it is difficult to avoid subjectivity in the development of the research (Bungin, 2020).

Results and Discussion

Indonesia's indigenous communities, numbering in the millions, are key custodians of unique cultural traditions and ways of interacting with the environment. The United Nations highlights their importance globally, as these communities maintain distinct social, cultural, economic, and political characteristics that set them apart from dominant societies (United Nation, 2023). According to data from the Data Indonesia website (https://dataindonesia.id), based on information from the Alliance of Indigenous Peoples of the Archipelago (AMAN) as of August 9, 2023, Indonesia has 4.57 million indigenous people, with the largest populations in Kalimantan (1.40 million), Sumatra (1.27 million), and Sulawesi (1.05 million). Other regions include Bali-Nusa Tenggara (302,799), Maluku (285,728), Java (250,115), and Papua (10,543). Of the total, 2.34 million are male and 2.23 million are female.

Indigenous territories are crucial in understanding environmental empathy, as they reflect the attitudes of communities toward the environment. These areas highlight how indigenous peoples' empathy, rooted in local wisdom and values, influences their relationship with nature. According to data from the Kompas website (https://www.kompas.id), as of August 2023, As of August 2023, Indonesia's indigenous territories cover 26.9 million hectares, with 1,336 maps registered across 155 districts. This is an increase of 1.8 million hectares from March 2023. Of these, 219 territories are officially recognized, covering 3.73 million hectares. Additionally, 123 indigenous forests span 221,648 hectares, with 12.9 million hectares of primary forest and 5.37 million hectares of secondary forest identified. A more detailed depiction of this can be seen in the image below:

Figure 2: Status of Indigenous Territory Recognition in Indonesia as of August 2023 From the Indigenous Territories Registration Agency (BRWA)

The Indonesian Constitution guarantees the existence of indigenous communities, as outlined in Article 18B (2) and reinforced by Article 28I (3), ensuring the respect for their cultural identity and rights. Indigenous communities continue to uphold and practice their local wisdom, customs, and traditions (Sekartaji et al., 2021). Among the many indigenous communities in Indonesia, this study will focus on analyzing several specific indigenous groups. It aims to observe the perspectives and activities of indigenous communities in Indonesia, particularly the Baduy community, the Sinar Resmi community, and the Kampung Naga community.

The Baduy indigenous community, living at the foot of the Kendeng Mountains in Banten Province, is divided into Baduy Luar (Outer) and Baduy Dalam (Inner). They maintain ancestral values centered on environmental preservation, rejecting modern developments and upholding *Sunda Wiwitan* teachings to protect the environment from external influences. The values upheld by the Baduy community (referred to as *pikukuh*) are categorized into four main areas: the value of life, the value of tradition and belief, the value of maintaining balance with nature, and the value of togetherness and cooperation (*gotong royong*) (Ardiyansah et al., 2023). The Baduy community has two groups with distinct lifestyles. The

Baduy Luar (Outer) is more open, using modern items like nails, iron, and instant noodles in their diet. They allow documentation and have more diverse practices. In contrast, the *Baduy Dalam* (Inner) maintain a traditional, nature-based lifestyle, avoiding modern conveniences and documentation. They rely on wooden and bamboo items and live without modern bathing facilities, using the river instead. Despite these differences, both groups share a common belief in preserving nature as the source of life for future generations.

Figure 3: Environmentally Friendly Bridge in Baduy (Personal Documentation, 2023)

Figure 4: House of the *Baduy Luar* Community (Personal Documentation, 2023)

The Baduy indigenous community serves as an exemplary model for the management and utilization of natural resources, demonstrating a balance between the well-being of the community and the preservation of forest ecosystems (Jasmine et al., 2023). The local wisdom of the Baduy community, which upholds traditions to protect nature, reflects the belief that the environment plays a crucial role in human life. Nature provides essential resources for daily needs, including economic, social, and cultural values. This deep respect for the environment has contributed to the preservation of the natural state of the region, including its forests (Mirajiani et al., 2022; Fitri, 2023). The indigenous forests in the Baduy region can be divided into three categories: (1) *Titipan* Forests, which include protected

forests and restricted forests, (2) *Tutupan* or Cultivated Forests, which consist of fields and gardens, and (3) Village Forests or *Dudungusan*, which are located within the settlements (Jasmine et al., 2023). The diagram of indigenous forests in the Baduy region is shown in the image below:

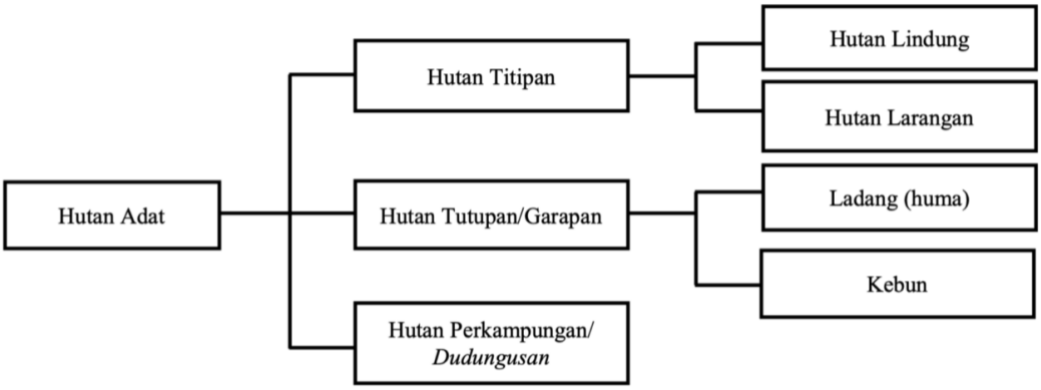

Figure 5: Division of Indigenous Forests in the Baduy Region
Source: Jasmine et al. (2023)

In managing agriculture, the Baduy indigenous community always adheres to the *pikukuh* (customary rules) that have been established. As a result, their farming practices are simple and traditional. They do not plow the land, do not create terraces, and instead use a method called *tugal*, which involves planting seeds using a sharpened piece of bamboo (Mirajiani et al., 2022). The use of pesticides is prohibited, and it is replaced with traditional remedies made from a mixture of various types of leaves combined with palm sap water (*nirah*) (Fitri, 2023). The Baduy community uses agricultural harvests efficiently for food, rituals, and reserves in rice barns (*leuit*). Surplus crops like durian, bananas, and cassava are sold for extra income. Their agricultural practices aim to preserve the environment, avoiding land alterations that could cause degradation. This environmental empathy aligns with postmodern ecocentrism. This theory emphasizes that ethical and moral responsibility applies equally to all aspects of the environment, asserting that human actions should align with the broader ecosystem rather than dominating or exploiting it (Keraf, 2010). The study conducted by Jasmine et al. (2023) also concluded that the management of natural resources in the forest ecosystem by the Baduy indigenous community is considered to be effective.

Figure 6: Village of the *Baduy Luar* Community (Personal Documentation, 2023)
*The village of the *Baduy Dalam* community is prohibited from being documented.

For the next, Sinar Resmi indigenous community led by Abah Asep Nugraha, is in the Cisolok District, Sukabumi, and is part of the Kasepuhan Banten Kidul, a region known for its efforts to preserve its cultural heritage. This community is situated within the Ciletuh Geopark, an area monitored by UNESCO. Sinar Resmi Village spans 4,917 hectares, with 2,950 hectares dedicated to forest and 275 hectares allocated for agriculture. Unlike other Kasepuhan communities, Sinar Resmi has adopted a more modern and open approach to interacting with the government and broader society. The community remains deeply committed to promoting food security without compromising environmental sustainability, a commitment that earned them the prestigious "Adhikarya Pangan Nusantara Award" in 2016 for their role in food security, presented by President Joko Widodo. The traditional agricultural practices that promote food security demonstrated by the Kasepuhan community are closely intertwined with agricultural practices, social institutions, belief systems, and natural elements such as soil, water, air, sunlight, weather, and others (Rahmawati et al., 2008). The tangible manifestation of the values, thoughts, and practices of the Sinar Resmi community is reflected in their agricultural activities, which are regarded as a form of worship. As such, these activities are inseparable from ritual ceremonies, sacredness, and myths (Supriatin et al., 2022).

Figure 7: Agricultural Tools and Irrigation of the Sinar Resmi Indigenous Community (Personal Documentation, 2023)

Figure 8: Agricultural Land of the Sinar Resmi Indigenous Community (Personal Documentation, 2023)

The life principles governing the relationship between humans and the environment in the Sinar Resmi community are encapsulated in the philosophy of "Ibu Bumi, Bapak Langit, and Guru Mangsa." This philosophy can be interpreted as follows: The Earth, regarded as a living entity, is symbolized as a mother. Consequently, the community engages in agricultural activities only once a year as a form of reverence for "Ibu Bumi" (Mother Earth). The phrase "Masa, Ibu" reflects the cultural belief that a mother should not be forced to give birth twice a year, which informs the community's agricultural rhythm. Prior to cultivating the land, the community conducts rituals to seek permission and offer prayers to the Earth, demonstrating respect for the natural world. The concept of "Bapak Langit" embodies the local knowledge derived from celestial events (the sky) that influence agricultural practices. Meanwhile, "Guru Mangsa" refers to the practice of learning from the universe to determine the optimal times for planting and harvesting. This worldview is closely aligned with the postmodern perspective in the theory of biocentrism, which emphasizes that both humans and nature possess intrinsic value. According to this theory, humans have a moral responsibility toward the environment, which is regarded as a living entity. Therefore, all elements of nature, including the Earth, are endowed with inherent dignity and value, contributing to the broader ecological and ethical considerations of life on Earth (Keraf, 2010).

The community expresses gratitude for the agricultural harvest through the annual "Syukuran Seren Taun," a ritual imbued with philosophical significance. This ceremony is a way of giving thanks for the blessings of nature and the Earth's abundance, acknowledging the sustainable harvests that can be enjoyed by current and future generations. The harvested crops are utilized for consumption within the community, shared as alms with neighbors, offered during ritual ceremonies, and stored in rice barns called *leuit* as a food reserve for the family. In addition to its agricultural traditions, the Sinar Resmi indigenous community places a strong emphasis on environmental conservation, particularly in the protection of forests. The community divides its forest areas, known as *leuweung*, into three zones: "hutan titipan" (entrusted forest), "hutan tutupan" (protected forest), and "hutan garapan" (cultivated forest). This division ensures that the environment is sustainably managed, with each zone designated for specific purposes to maintain the balance and conservation of the ecosystem (Prabowo et al., 2021).

Furthermore, it can also be observed how the Naga Village indigenous community demonstrates empathy and maintains a relationship with the environment. The term "Naga" or "Nagawir," meaning cliff, signifies that this indigenous village is in a cliffside area. The Naga Village is situated in the village of Neglasari, Salawu District, Tasikmalaya Regency, West Java. The total land area of Naga Village is 1.5 hectares, with most of it being used for housing in the form of triangular roofed homes made of palm fiber, yards, ponds, and the remaining area used for rice field agriculture, which is harvested twice a year. In building its relationship and empathy with the environment, Naga Village also has a forbidden forest (*hutan larangan*) designated as a protected forest to maintain the natural balance in the surrounding area (Purnama, 2021). All agricultural activities in Naga Village are still carried out using traditional tools, such as when plowing rice fields, planting, repelling pests, and harvesting, with the reason being to avoid damaging the environment (Nurislaminingsih et al., 2022). The indigenous community of Naga Village utilizes their agricultural produce not only to fulfill their daily needs but also to share with neighbors, support ritual ceremonies, and store in rice barns (*leuit*) to ensure food security. The settlement pattern in Naga Village is characterized by stilt houses made of wood, strategically constructed to adapt to the terrain. This design helps mitigate the risks of landslides and earthquakes, reflecting a thoughtful integration of environmental considerations. Such practices are part of a broader strategy to

create a sustainable relationship between humans and the environment, promoting resilience to environmental changes while preserving the community's social and cultural integrity without causing harm to the surrounding ecosystem (Nurdin et al., 2023).

The indigenous community of Naga Village also teaches environmental preservation through a guiding philosophy that states, "It is better not to cut down trees than not to plant them." This implies that before the community can cut down a tree, they must first plant one. This principle reflects a deep concern for and empathy towards environmental sustainability. From a postmodernist perspective, this philosophy aligns with the concept of deep ecology, which emphasizes the need for environmental ethics to be translated into tangible, concrete actions. In this context, the community's practices embody a commitment to ecological responsibility, ensuring that their actions contribute to the long-term well-being of the environment (Keraf, 2010). Indeed, the tangible actions and practices undertaken by the community are inherently tied to broader concerns that involve the collective interests of the entire ecosystem. These practices are not merely driven by individual or isolated motivations but are deeply embedded in a communal responsibility for environmental stewardship. They underscore the interdependent relationship between human needs and ecological balance, reinforcing a commitment to environmental sustainability. The community's efforts reflect a conscientious approach to safeguarding the environment, ensuring that the preservation of natural resources aligns with the welfare of both present and future generations.

Figure 9: The Traditional Village of Kampung Naga Community
(Personal Documentation, 2023)

The actions undertaken by the three indigenous communities discussed above underscore a fundamental alignment with the principles of environmental preservation and sustainability. When specific values or regulations become ingrained within a social group, they essentially institutionalize, and individual behavior is subject to the influence of these norms. Violators of these collective agreements face customary sanctions that have been mutually established by the community. For more detailed understanding can be obtained through the following table:

Table 1: Analyzes the Perspectives and Activities of Three Local Wisdom Communities

Kampung Baduy communities	Sinar Resmi communities	Kampung Naga communities
1. The Baduy community lives by traditional values, keep away modern physical development and utilizing nature sustainably. 2. Within this community, there are two subgroups: *Baduy Luar*, which is more open to interactions with outside societies, and *Baduy Dalam*, which is more closely connected to tradition and nature. 3. Environmental empathy in this community is reflected in their values, such as practicing mutual assistance, and constructing residence without using iron nails. 4. Members of this community engage in simple and environmentally friendly farming, make us of traditional methods and natural fertilizers for pest and disease management. 5. This community manages customary forests by categorizing into three zone to protect environmental sustainability.	1. The Sinar Resmi community sustains its commitment to local cultural values while adapting to modern elements. 2. This community shows excellence in maintaining food security without harming the environment and has received recognition as a sustainable food village. 3. They embrace the philosophy of "Mother Earth, Father Sky, and Teacher of Seasons" (*Ibu Bumi, Bapak Langit, dan Guru Mangsa*), which underscores their respect for nature as a living entity. 4. Agricultural practices in this community that involves rituals and respects for nature, in line with principles of biocentrism in the relationship between humans and the environment. This perspective explains that humans have a moral responsibility to preserve nature as a vital component of life.	1. The Kampung Naga community also sustains its commitment to local cultural values while adapting to modern elements. 2. This community roundly preserves traditional agricultural practices to mitigate environmental degradation. 3. They manage a forbidden forest that serves to protect the ecological balance, reflecting their commitment to environmental conservation. 4. The architectural structure is consists of stilt houses made of wood, designed to adapt to the land conditions to prevent landslides and seismic impacts, thereby to create a balanced system between humans and the environment. 5. This community practices environmental preservation through the philosophy: "It's better not to cut down trees than not to plant them," meaning that if they want to cut down a tree, they must first plant a new one.

Source: Researcher (2024)

The table above illustrates how the cultural realities within indigenous communities frequently reflect local wisdom in understanding and preserving ecosystem balance. This relationship often manifests as a deep empathy toward the surrounding natural environment. These communities do not merely exhibit ethical responsibility and concern for the environment; they also empathize with nature, perceiving themselves as an integral part of

the ecosystem. This represents a form of ecological wisdom grounded in local cultural practices. Such ecological wisdom reflects the community's careful approach to managing and treating nature, ensuring its protection from environmental degradation (Julaeha et al., 2019). The presence of environmental empathy within indigenous communities is frequently the outcome of local wisdom, shaped by years of experience and a deep understanding of the human-environment relationship. Recognizing and valuing these principles of local wisdom can serve as a source of inspiration for advancing environmental preservation and sustainability initiatives. The application of sustainable development principles that are relevant to the environment can be implemented through the approach of ecopedagogy (Supriatna et al., 2018). This approach highlights the importance of incorporating environmental awareness, sustainable practices, and ethical responsibilities into educational systems, encouraging a greater understanding of the relationship between humans and the natural environment. By adopting ecopedagogy, communities can cultivate more sustainable practices and raise ecological awareness among individuals and groups. Sustainable development also requires ecological intelligence to design and implement policies, strategies, and sustainable practices. To this end, the form of ecological intelligence in understanding, realizing, and actualizing the importance of living in harmony with nature can be supported by two pedagogical approaches: ecopedagogy and ethnopedagogy (Supriatna, 2016).

In the context of Cultural Ecology, this theory can also be understood as an approach within postmodernism, which examines the dynamic relationship between human culture and the environment. It highlights the crucial role of culture in shaping how societies engage with and manage their surroundings, particularly in terms of environmental preservation and the sustainable use of natural resources. The implementation of Ecological Wisdom, Ecopedagogy, and Postmodernism can generate three important ideas, namely: 1) the three communities exhibit ecological wisdom embedded in their cultural practices and traditions, where environmental empathy emerges as a result of long-standing experiences that foster a harmonious relationship with nature; 2) the principles of sustainable development can be effectively implemented through the lens of ecopedagogy, which strengthens ecological awareness and emphasizes the importance of living in harmony with the natural world. This approach cultivates a deeper understanding of the interconnectedness between culture, humanity, and the environment, aiming to promote environmental conservation; and 3) the theory of cultural ecology, viewed through a postmodern framework, allows for an exploration of the intricate relationships between culture, humanity, and the environment, emphasizing how local wisdom shapes awareness and attitudes toward environmental stewardship. It can be concluded that the integration of ecological wisdom, ecopedagogy, and postmodern perspectives provides a comprehensive understanding of how communities can maintain a balance between culture and the environment. Through a deeper understanding of the relationship between humans and nature, more sustainable approaches to natural resource management and environmental preservation can be developed. By valuing and implementing local wisdom and strengthening ecological consciousness, we can create a future where harmony between humanity and nature prevails, with sustainability serving as the foundation for all aspects of life.

Conclusion

The study, viewed through the lens of Postmodernism, underscores the pluralism of perspectives, and rejects the notion of a singular narrative or universal truth. In this regard, environmental empathy grounded in the local wisdom of indigenous communities can be

interpreted as a form of subjective truth, one that is recognized and actively lived by these communities. Such an understanding emphasizes the importance of appreciating diverse perspectives on the human-environment relationship, all of which are informed by moral ethics and empathy aimed at preserving and safeguarding the environment in the pursuit of sustainable development, without causing harm to nature. Moreover, this includes the recognition that experiences and empathy toward the environment can vary according to social identity, cultural background, and the local context of an indigenous community. Considering this, the study is of considerable significance, contributing valuable insights into how humans relate empathetically to the environments they inhabit. Furthermore, the research holds potential for expansion and could be more widely implemented in educational settings to further enrich the discourse.

Higher Order Thinking Skills (HOTS) of Elementary School Teacher Education Students in Indonesia: A Systematic Literature Review

Iyoh Maspiroh, Yogyakarta State University, Indonesia
Zuhdan Kun Prasetyo, Yogyakarta State University, Indonesia
Hermanto Hermanto, Yogyakarta State University, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
As prospective teachers, HOTS among elementary school teacher education students is very important to develop. Teaching and learning problems require HOTS to solve them. This literature review aims to determine the profile of HOTS among primary school teacher education students in Indonesia and the efforts that have been made by academics to optimize students' HOTS. The method used in this study is the Preferred Reporting Item for Systematic Reviews and Meta-Analyses (PRISMA). We conducted an extensive review of 997 articles obtained from the Google Scholar database using Harzing's Publish and Perish on the HOTS proficiency profile of primary school teacher education students in Indonesia published in the period 2017–2023. This research was conducted in five stages: 1) determining eligibility criteria; 2) determining information sources; 3) study selection; 4) data collection; and 5) data item selection. As a result, we identified that 77% of articles describing the HOTS of elementary school teacher education students were in the low category, and 22% of articles were in the good or optimal category. Efforts have been made by academics to improve the HOTS of elementary school teacher education students by developing HOTS-oriented learning strategies. This study underlines the importance of improving the HOTS of prospective elementary school teachers and suggests the use of a more comprehensive lecture program to bridge the gap between the skills possessed by prospective elementary school teachers and the skills required by a teacher in the 21st century.

Keywords: HOTS, Elementary School Teacher Education Students

iafor
The International Academic Forum
www.iafor.org

Introduction

One of the education programs that plays a major role in improving the quality of education in Indonesia is the primary school teacher education program. The primary school teacher education program is one of the educational programs in higher education that has the task of educating and producing prospective elementary school teachers following what is needed in the field. In the formulation of the Indonesian Primary School Teacher Education Program Lecturer Association, it is stated that prospective teachers printed by universities are expected to be able to train and develop high-level thinking skills, scientific attitudes, and creativity as early as possible in elementary school students by what students get while studying in college (Julianto et al., 2018).

Elementary school teachers have a very important responsibility in laying the foundation for future student success, shaping student development, and understanding the learning process (Dahlqvist, 2023). Future generations must be equipped with higher-order thinking skills to compete and survive in the face of global challenges (Zivitere et al., 2015). It is believed that it is important to explicitly train students to think at a higher level in the learning process, as it cannot be assumed that students will automatically become good thinkers. Therefore, teachers are expected to stimulate students to engage in higher-order thinking (Wijnen et al., 2021).

However, HOTS-oriented teaching practices are not optimal (Miedijensky et al., 2021). The learning process still tends to be oriented towards memorization and understanding, not reaching the level of analysis, so students have not made meaning of the material they have learned (Usmaedi, 2017).

The low level of higher-order thinking skills is also shown by the PISA (Program for International Students Assessment) results in 2022. PISA is a study conducted by the Organization for Economic Co-Operation and Development (OECD). The 2022 PISA results showed that Indonesia ranked in the bottom 13 out of 81 participating countries. The average reading, math, and science skills of Indonesian students are below the average of ASEAN students (OECD, 2022). The tests given by PISA are tests that require higher-order thinking skills. Thus, it can be seen that most students are not optimal in solving HOTS (high-order thinking skills) type questions.

The above problems have triggered educators, especially at the university level, to try to find strategies or solutions to improve the quality of learning. Improving the quality of learning is directed at developing the skills to think, communicate, and collaborate in solving problems and being able to make decisions appropriately (Djufri et al., 2022).

There have been many analyses of students' higher-order thinking skills, but no studies have reviewed and detailed the results of previous research on the thinking skills of primary school teacher education students over the past five years. Moreover, some studies show that the thinking skills of elementary teacher education students are not always low, some studies show the results that the high thinking skills of elementary teacher education students are optimal. Therefore, it is important to analyze and detail the results of previous research and synthesize and review them systematically.

Given the importance of the achievement of thinking skills of elementary school teacher education students based on the results of previous research to know the comparison between

HOTS and LOTS that have been achieved by students to be followed up with further research. This research is a preliminary study that aims to conduct a literature review on the results of previous research on higher-order thinking skills of students majoring in Elementary Teacher Education over the past five years.

Methods

This systematic review used the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) reporting guidelines to guide the review process. Based on these guidelines, there were several steps in this study:

- Step 1, determine eligibility criteria. The inclusion criteria set for this review guideline were: a) original research written in Indonesian and English; b) research aimed at investigating the higher-order thinking profile of Primary School Teacher Education students in Indonesian universities. The latter criteria were included to answer the research questions. Figure 1 describes the steps in conducting a systematic review.
- Step 2, determining sources of information. Online database search through Google Scholar database using Harzing's Publish and Perish.
- Step 3, study selection. Study selection was conducted in the following four phases: a) keyword searches were selected according to the research interest in reviewing higher-order thinking profiles. The search strings were related to "HOTS profile", "higher order thinking skills", "higher order thinking skills profile", "higher order thinking skills", "higher order thinking skills of PGSD students", b) exploration of the selection of titles, abstracts, and keywords of identified articles was carried out based on eligibility criteria, c) reading of provisions that were not eliminated in the previous stage was carried out in full to determine whether or not they were included in the review, according to the eligibility criteria, d) the article reference list was scanned to find related research.
- Step 4, data collection process. Data collection is done manually using a data extraction form consisting of content, article type, journal name, year, and topic. The assessment consists of reading the full text and extracted data.
- Step 5, data item selection. The information extracted from each data article consisted of the purpose of the study, the type of study and the results of the study. This data is used to determine the profile of PGSD students' high-level thinking skills and the things that influence them.

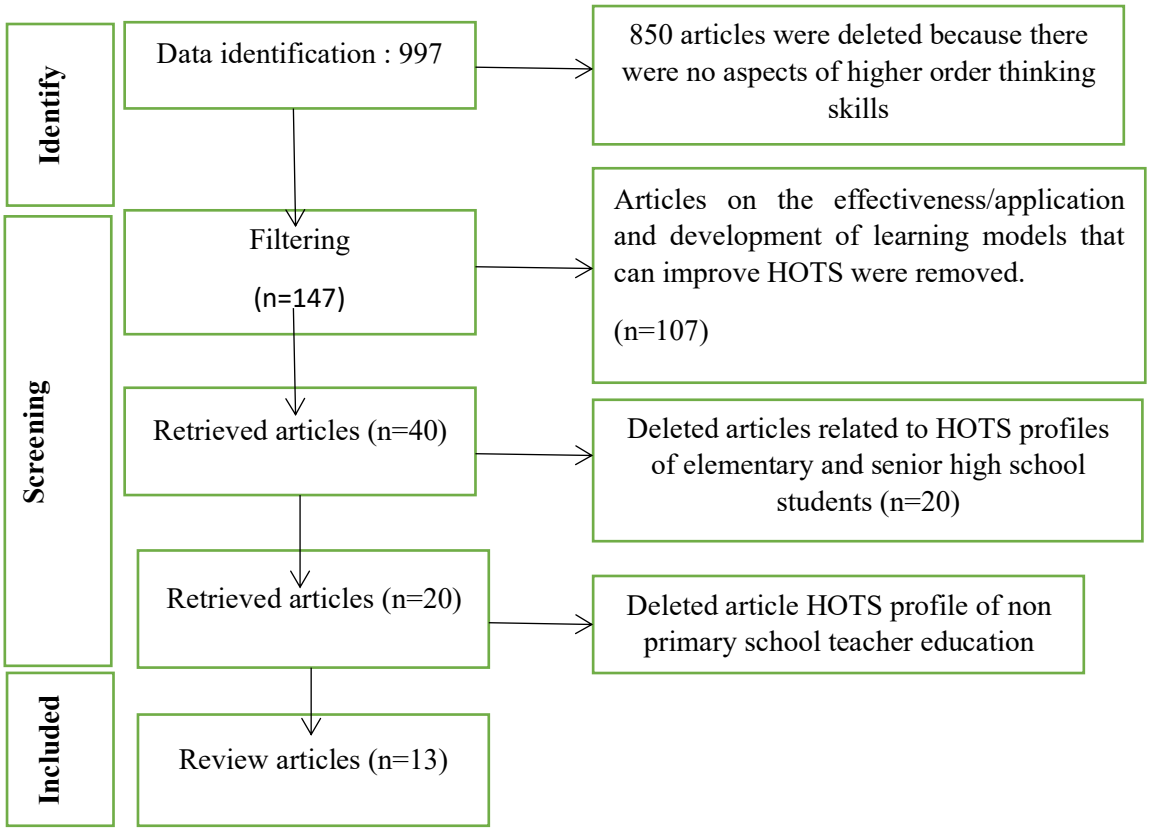

Figure 1: PRISMA Flow Chart

Results and Discussion

The search results on the selected databases provided a total of 997 articles written in English and Bahasa Indonesia studies published from 2015 to April 2023. Of the 997 articles generated from the first study and after the papers were removed before screening; 850 articles were removed because there were no aspects of higher order thinking skills, and 107 articles were removed because they were effectiveness/application and development of learning models that can improve HOTS. 40 articles were selected based on title and abstract, and then the synthesis papers were checked for eligibility by reading the full text. Some articles did not include HOTS profiles of students from elementary to high school (n=20), HOTS profiles of science education students (n=7). Finally, 13 articles were included in this study.

The research topics in the articles that have been screened and deemed appropriate are then reviewed and extracted and analyzed. The extraction results can be seen in Table 1.

Table 1: Extracted Articles

No.	Authors	Aim of study	Method	Result
1	Wiyoko, Tri., & Aprizan. (2020).	Describe the results of the analysis of the skills of the cognitive level of Elementary School Teacher Education students in learning basic natural science.	Qualitative descriptive	Shows that the skills of primary school teacher education STKIP MMB students are still at the Low order thinking skills (LOTS) level.)
2	Djufri, E., Septiani, D., & Hidayatullah, A. S. (2022).	Describing the skills of elementary school teacher education students in critical thinking in science concept courses.	Qualitative descriptive	The results showed that only 6.25% of students had good critical thinking skills, so most students still had low critical thinking skills.
3	Purwanti, Siwi. (2020).	Describe the results of the analysis of students' thinking skills in solving HOTS model science tests in advanced science learning.	Qualitative descriptive	The results showed that students' skills in analyze (C4) were quite good, but at the evaluation (C5) and creation (C6) levels it still had to be improved (Purwanti, 2020).
4	Jusuf, R., Sopandi, W., Ratnawulan, A., & Sa'ud, U. S. (2018).	Describe the results of the analysis of the distribution of National Science Examination questions in 2007-2016 based on the cognitive process dimension and the dimension of student thinking.	Analytic descriptive with a qualitative approach	The results showed that overall the questions made by the central and regional UN organizers in the cognitive process dimension with an average aspect of remembering (C1) 1%, understanding (C2) 13%, application (C3) 35%, analysis (C4) 41%, evaluation (C5) 9%, and creating (C6) 2% while the average basic thinking category was 48% and the high-level thinking category was 52% (Jusuf et al., 2020).
5	Indriani, I. (2021).	To describe students' skills to think at a high level on HOTS questions in the form of problem solving about environmental damage.	Qualitative descriptive	The results showed that students' higher-level thinking skills were optimal (Indriani, 2021).

No.	Authors	Aim of study	Method	Result
6	Nurhayati & Anggraeni (2017).	Describing students' skills to think at a high level on optics material	Qualitative descriptive	The results showed that students' skills to think at a high level was in the moderate category (Nurhayati & Anggraeni, 2017).
7	Wiyoko, Tri., & Aprizan. (2019).	Describe the results of analyzing the profile of critical thinking skills of primary school teacher educationstudents using graded response models in science learning.	Qualitative descriptive	The results showed that critical thinking skills that reached high criteria were only 11.6%. This article presents an example of data collection techniques with written test techniques with description questions. Scoring written tests in this study using Graded Response Models.
8	Rahmawati, S., Hariyadi, S., & Febrianto, F. (2020).	Describe the profile of the cognitive skills of primary school teacher education students in the Teaching and Learning Strategy course.	Qualitative descriptive	The results showed that the skills of school teacher education students at Muhammadiyah Kudus University in the LOTS (Low Order Thinking Skill) cognitive process was higher than the skills of the HOTS cognitive process (Rahmawati, Hariyadi & Febrianto, 2020).
9	Arda. (2020).	Describing the profile of students' cognitive skills levels in learning basic science concepts	Qualitative descriptive	The results showed that the level of thinking skills of students was still at the LOTS level (Arda, 2020).
10	Julianto, Wasis, & Agustini, R. (2018).	Describe the creative thinking skills of students	Qualitative descriptive	The results showed that students' creative thinking skills were in the low category (Julianto et al., 2018).
11	Saila, Nurul. (2022).	describe the results of the analysis of the skills level of students of the Faculty of Teacher Training and Education in solving HOTS (high order thinking skills) questions in statistics courses.	Qualitative descriptive	The results showed that students of the Faculty of Teacher Training and Education of Panca Marga University had mastery of HOTS aspects in solving statistical problems but were uneven, so efforts were needed to improve them (Saila, 2022).
12	Firmansyah, Arif., & Rizal. (2019).	Describe critical thinking skills and student	Qualitative descriptive	The results showed that elementary school teacher education students at STKIP

No.	Authors	Aim of study	Method	Result
		achievement motivation.		Tadulako University had critical thinking skills at low criteria (Firmansyah & Rizal, 2019).
13	Sulistyaningrum, H., Winata, A., & Cacik, Sri. 2019.	To determine the initial skills of 21st century skills so that it can be used to improve the quality of learning.	Qualitative descriptive	The results showed that the initial skills of 21st century skills of Unirow elementary school teacher education students still showed low results. These results are shown from the average skills to think critically students show average results of less than 30%, communicative skills are less than 50%, collaborative skills and creative thinking are less than 45% (Sulistyaningrum et al., 2019).

Based on data extraction, the results show that there are three articles that show the results that the higher-level thinking skills of elementary school teacher education students are in the good category, while ten articles show that they are in the low category. The comparison is described in Figure 2.

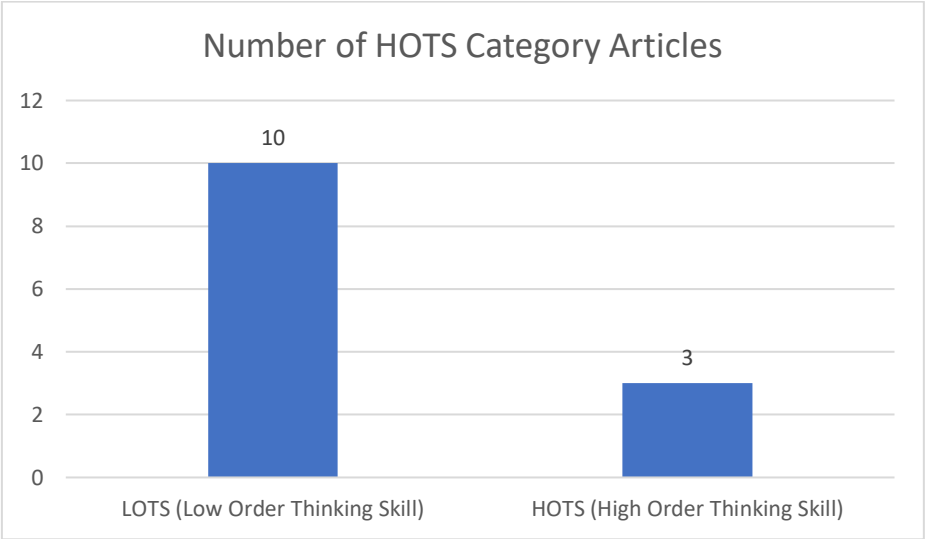

Figure 2: Comparison Diagram of Extracted Articles

Based on the analysis of articles related to level thinking skills, the results show that 3 articles (23%) describe student HOTS at a good or optimal level. Meanwhile, 10 articles (77%) describe the HOTS of PGSD students are still at a low level or Low Order Thinking Skill (LOTS) level, namely at the C1, C2, and C3 levels. This means that the cognitive skills of most PGSD students are still at the LOTS (Low Order Thinking Skill) level.

HOTS is one of the student skills that must be developed through teaching and learning. Teachers' knowledge of HOTS and their teaching and learning tactics are key to successful

education (Retnawati et al., 2018). The low HOTS of students can be caused by several factors including: a) HOTS-oriented learning has not been optimally used, even though students know a concept, they do not necessarily know how to apply it (Wiyoko, 2019), b) student-centered learning (Ichsan et al., 2019), c) the biggest obstacle in teaching and learning higher order thinking is the lack of teacher training and learning time (Davies & Willing, 2023), d) the learning strategies used are less effective in creating and improving HOTS (Misrom et al., 2020).

Strategies that can be done to improve students' HOTS are to design HOTS-oriented learning, including a) using learning models that can improve HOTS can be one of the solutions in improving the quality of learning and of course improving the quality of graduates ((Dewi et al., 2021; Handayani et al., 2019; Wiyoko & Aprizan, 2020), b) creating a smart classroom environment, namely using digital technology or online learning applications (Letchumanan et al., 2022; Lu et al., 2021; Nadarajan et al., 2023; Prahani et al., 2020; Venkatraman et al., 2022), c) using HOTS-oriented assessments (Hadzhikolev et al., 2020; Rintayati et al., 2020), d) implementing collaborative systems in the learning process (Zaid et al., 2018).

Conclusion

The thinking skills of most elementary school teacher education (PGSD) students is still at a low level, namely still at the C1, C2 and C3 levels. This is due to many factors including the skills of lecturers to design learning. HOTS-oriented learning has not been optimally used, so this can be used as a foothold for further research, namely developing learning or lecture programs oriented towards increasing the HOTS of elementary school teacher education students.

Mega Teguh Budiarto, Universitas Negeri Surabaya, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Measuring junior high school students' self-efficacy and self-regulation in mathematics requires valid and reliable measuring instruments. This study aimed to test the validity and reliability of the instrument of the Self-Efficacy Questionnaire (SEQ) and Self-Regulation Questionnaire (SRQ) of junior high school students in mathematics. This research method uses a quantitative approach. Before being given to students, the SEQ and SRQ were empirically validated by three senior lecturers in mathematics education with average scores of 4.60 > 3.50 and 4.50 > 5.50 respectively. SEQ and SRQ was given to 9th-grade students of SMP Muhammadiyah 4 Malang City for 30 minutes, and the researcher directly supervised the implementation. The results of SEQ declared valid with sig. (2-tailed) < 0.05 and Cronbach alpha reliability of 0.976 > 0.70, meanwhile the results of SRQ declared valid with sig. (2-tailed) < 0.05 and Cronbach alpha reliability of 0.971 > 0.70. The 20 valid SEQ and SRQ statements can be used to evaluate junior high school students' self-efficacy and self-regulation in mathematics. It is suggested that future researchers test the instrument on a larger population because the students involved in this study were too few, namely nine students, and the number of statements in the questionnaire should also be considered to be compiled in large numbers.

Keywords: Self-Efficacy, Self-Regulation, Mathematics, Validity, Reliability

Introduction

Research investigations, scientific discoveries, and contemporary discoveries all rely on mathematics, which is a subject that is pertinent to modern schooling (Batiibwe et al., 2020; Mozahem et al., 2021). Mathematics is regarded as the most crucial topic in the secondary school curriculum, connecting algebra, geometry, and trigonometry. It can also be utilised to solve difficulties in daily life (Laranang & Bondoc, 2020). Due to its ability to impact mathematical comprehension and learning, self-efficacy has been extensively described in earlier study (Bandura et al., 1997; Yuksel & Alci, 2012). In the process of learning mathematics, this suggests that students' self-efficacy is crucial (Mumcu & Aktas, 2015; Rittmayer & Beier, 2008). The belief in one's capacity to acquire and excel in mathematics classes is known as self-efficacy in mathematics (Kumar, 2022; Kundu & Ghose, 2016). A conviction that success in maths class will follow from doing particular behaviours. These beliefs, however, have been demonstrated to predict mathematical performance more accurately than other belief structures linked to mathematics (Mumcu & Aktas, 2015; Yuksel & Alci, 2012).

Students with High self-efficacy indicate strong motivation to improve their learning achievement, while students with low self-efficacy tend to find it difficult to improve their learning achievement (Ilgün et al., 2012; Özgen & Bindak, 2011). Student self-efficacy can be measured through three components, namely magnitude, strength, and general (Bandura et al., 1997; Laranang & Bondoc, 2020). Magnitude relates to a person's level of confidence that it can be completed. Strength relates to the level of strength or weakness of a person's beliefs regarding their perceived abilities or individual expectations of their abilities. Generally related to self-efficacy that occurs in certain domains or applies to various activities and situations.

Self-efficacy and mathematics are a complete study to reveal student behavior in solving mathematical problems. The research results show that student self-efficacy influences students' mathematics performance and thanks to good self (Bandura, 1982; Kumar, 2022; Mukhtar et al., 2021). Other research also shows that students' poor self (Görgün & Tican, 2020; Recber et al., 2017; Schukajlow et al., 2022). Thus, self-efficacy in Mathematics is a determining factor in student success.

Similar to self-efficacy, the concept of self-regulation is also rooted in the social cognitive theory proposed by Bandura (Bandura et al., 1997). Self-regulation can be done if students can control themselves in solving problems then evaluating and planning during the learning process (Li et al., 2020). Self-regulation is a process in which students deliberately pursue predetermined goals by controlling, monitoring, and regulating cognitive/metacognitive processes and student learning behavior (Zimmerman, 2000).

According to Zimmerman (2000), pupils must be able to control themselves during the learning process in order to attain the desired outcomes, which include achievement in mathematics. In the classroom, students have the power to guide themselves to affect their own behavioural reactions in addition to being influenced by outside forces. When given learning tasks, students can use cognitive, metacognitive, and behavioural learning strategies to exert control over their activities.

Math learning outcomes can be enhanced by students who exhibit strong self-regulation and vice versa. Students who possess strong self-regulation are able to solve geometry problems

and enhance their learning outcomes. For instance, they are able to concentrate, differentiate between important and irrelevant information, and employ efficient techniques to retain information in long-term memory and retrieve it when required (Arora et al., 2020). On the other hand, pupils who struggle with self-control perform poorly when it comes to solving mathematical problems (Marchis, 2012). This suggests that studies on self-regulation in math problem solving are necessary.

In relation to evaluating student self-efficacy and self-regulation in mathematics, it needs to be supported by capable tools, one of which is a valid instrument. This research aims to measure instruments that are suitable for measuring student self-efficacy and self-regulation in mathematics classes. A valid instrument is very useful for measuring student self-efficacy and self-regulation. Research on the validity and reliability of self-efficacy and self-regulation instruments has been conducted by previous researchers (Anderson & Betz, 2001; Britner & Pajares, 2006; Hampton & Mason, 2003; Lent et al., 1991; Lopez & Lent, 1992; Usher & Pajares, 2007), but it is still rarely done in Indonesia, especially self-efficacy in junior high school students' mathematics classes.

Method

This research uses a quantitative research design. Data collection was carried out in 2022 at Muhammadiyah 4 Middle School, Malang City. The sample size for class 9 at this school consists of one group, 6 boys students and 3 girls students. The researcher chose this research location because he had made observations regarding the problems faced by students, namely low mathematics scores student, self-efficacy, and self-regulation. The Self-Efficacy Questionnaire (SEQ) and Self-Regulation Questionnaire (SRQ) instrument consists of 20 statements in the form of a 1-5 Likert scale. Based on the indicators compiled, the classification of SEQ statements can be divided into three dimensions, namely the first is magnitude which includes statements number 1-5. Second, strength includes statements number 6-13. Third, generally includes statements number 14-20. Meanwhile, the SRQ statement classification consists of indicators, namely planning which includes statements number 1-6, implementation which includes statements number 7-14, and reflection which includes statements number 15-20.

SEQ was adapted from Laranang & Bondoc (2020) about students' self-efficacy in mathematics, meanwhile SRQ was adapted from Brown and colleagues., (1999) about students' self-regulation in mathematics. Before being given to students, the SEQ and SRQ were empirically validated by three senior lecturers in mathematics education with average scores of $4.60 > 3.50$ and $4.50 > 5.50$ respectively. SEQ and SRQ was given to 9 grade 9 students of SMP Muhammadiyah 4 Malang City for 30 minutes, and the researcher carried out direct supervision and was assisted by a mathematics teacher in its implementation. SEQ and SRQ aims to obtain appropriate responses from students for the purposes of this research.

After getting students' answers, SEQ and SRQ validity and reliability were tested. Apart from differences in statement items in the questionnaire, researchers also took into account the situation, conditions, learning location, facilities, and abilities of the students. Test the validity and reliability of SEQ and SRQ using product moment person correlation and Cronbach's alpha.

Results

The results of the validity and reliability tests started from the SEQ, then followed by the SRQ. Both instruments were subjected to descriptive statistical tests with the help of SPSS software version 29.0. The results of the SEQ validity and reliability test show that students' self-efficacy varies. The original SEQ and the translated results into Indonesian can be seen in appendix 1.

The self-efficacy questionnaire (appendix 1), adapted and developed according to the needs of junior high school students in Indonesia. The development of the self-efficacy questionnaire can be seen in Table 1 below.

Table 1: Validity Value of the Self-Efficacy Questionnaire (SEQ)

No	SEQ Statement	WM	VD	Indication	Sig. 2-Tailed
1	I feel confident enough to ask questions in my math class	3.11	Neutral	Moderately high	0.019
2	I am confident that I can do well on the math test.	3.33	Neutral	Moderately high	0.001
3	I believe that I complete math assignments of varying difficulty	3.56	Agree	High	0.005
4	I am confident that I am able to understand and complete mathematics assignments	3.44	Agree	High	0.007
5	I am confident that I am able to choose strategies well in completing mathematics assignments	3.00	Neutral	Moderately high	0.011
6	I believe that I am the type of person who is good at mathematics.	3.22	Neutral	Moderately high	0.004
7	I am confident that I can understand the content in mathematics assignments	3.44	Agree	High	0.001
8	I am confident that I can get an “A” when I study mathematics.	3.44	Agree	High	0.005
9	I am confident that I am able to persist in my efforts to face tasks and challenges	3.22	Neutral	Moderately high	0.017
10	I am confident that I can learn well when given mathematics assignments.	3.22	Neutral	Moderately high	0.001
11	I feel confident when taking math tests.	3.22	Neutral	Moderately high	0.009
12	I still try to complete math assignments even though the assignments are difficult to do	3.44	Agree	High	0.001
13	I believe that I am the type of person who can do math	3.22	Neutral	Moderately high	0.001
14	I feel that I will be able to do well in future math assignments	3.44	Agree	High	0.001

No	SEQ Statement	WM	VD	Indication	Sig. 2-Tailed
15	I am confident that I can do mathematics when I am given a mathematics assignment	3.44	Agree	High	0.013
16	I believe that I can think like a mathematician.	3.22	Neutral	Moderately high	0.009
17	I feel confident when using mathematics outside of school.	3.11	Neutral	Moderately high	0.001
18	I am confident that I can complete math assignments using various methods	3.33	Neutral	Moderately high	0.013
19	I am confident that I can solve math tasks that I have never encountered before	3.00	Neutral	Moderately high	0.009
20	I am sure that mathematics will be useful for my future	3.78	Agree	High	0.011
Overal Weighted Mean		**3.31**	**Neutral**	**Moderately high**	**0.007**

Legend: Range	Verbal Description	Indication
5.00 - 4.21	Strongly Agree (SA)	Very high
4.20 - 3.41	Agree (A)	High
3.40 - 2.61	Neutral (N)	Moderately high
2.60 - 1.81	Disagree (D)	Low
1.80 - 1.00	Strongly Disagree (SD)	Very low

Based on Table 1, the mean is 3.31, the verbal description is declared neutral and it is identified that SEQ is in the moderately high category. Then 20 statements were declared valid with sig. (2-tailed) < 0.05 and Cronbach alpha reliability of 0.976 > 0.70, meaning that the data is concluded to be reliable. Based on the three indicators of self-efficacy measured in the SEQ instrument, satisfactory results were obtained, where 20 SEQ statements were declared valid and reliable. This means that this instrument can be used to measure students' self-efficacy at the junior high school level.

Meanwhile, the results of the validity and reliability tests for the SRQ obtained different results for each item of the SRQ statement. The original SRQ and the translated results in Indonesian can be seen in appendix 2. The self-regulation questionnaire (appendix 2), adapted and developed according to the needs of junior high school students in Indonesia. The development of the self-regulation questionnaire can be seen in Table 2 below.

Table 2: Validity Value of the Self-Regulation Questionnaire (SEQ)

No	SRQ Statement	WM	VD	Indication	Sig. 2-Tailed
1	I am able to make plans for myself.	3.56	Agree	High	0.001
2	I am able to carry out plans that I have made myself.	3.56	Agree	High	0.002
3	I have so many plans that it's hard for me to focus on any one of them.	4.11	Agree	High	0.038
4	I can stick to plans that are working well.	3.11	Neutral	Moderately high	0.001
5	I have no trouble making plans to help me achieve my goals.	3.89	Agree	High	0.001
6	Minor problems or distractions won't throw me off my plan.	3.56	Agree	High	0.001
7	I can usually solve problems that I have planned in advance.	2.89	Neutral	Moderately high	0.020
8	Once I see things that are not right then I immediately do something about it to fix it.	3.33	Neutral	Moderately high	0.019
9	I call others for help when I need it.	3.56	Agree	High	0.006
10	I am able to manage the environment in which I play/study.	3.44	Agree	High	0.005
11	As soon as I see a problem or challenge, I start trying to find a solution and solve it quickly.	3.78	Agree	High	0.033
12	I am good at finding information to solve the problems I face.	3.11	Neutral	Moderately high	0.006
13	When I experience obstacles/challenges, I usually look for the information I need.	3.11	Neutral	Moderately high	0.012
14	When I want to make a decision, I connect it with knowledge and experience that is in line with my understanding.	3.56	Agree	High	0.020
15	I usually double check my math work before submitting it to the teacher.	3.44	Agree	High	0.008
16	When I get a bad grade in math, I keep studying to improve in the future.	3.56	Agree	High	0.005
17	If I want to change, I keep improving myself.	3.67	Agree	High	0.017
18	I learned from my previous mistakes.	3.22	Neutral	Moderately high	0.033
19	I usually evaluate what I have done	3.89	Agree	High	0.023
20	I am the type of person who doesn't give up easily.	3.67	Agree	High	0.001
Overal Weighted Mean		**3.50**	**Agree**	**High**	**0.013**

Legend: Range	Verbal Description	Indication
5.00 - 4.21	Strongly Agree (SA)	Very high
4.20 - 3.41	Agree (A)	High
3.40 - 2.61	Neutral (N)	Moderately high
2.60 - 1.81	Disagree (D)	Low
1.80 - 1.00	Strongly Disagree (SD)	Very low

Based on Table 2, The mean is 3.31, the verbal description is declared agree and it is identified that SRQ is in the high category. Then 20 statements were declared valid with sig. (2-tailed) < 0.05 and Cronbach alpha reliability of 0.971 > 0.70, meaning that the data is concluded to be reliable.

Based on the three indicators of self-regulation measured in the SRQ instrument, satisfactory results were obtained, the same as the SEQ, where 20 SRQ statements were declared valid and reliable. This means that this instrument can be used to measure students' self-regulation at the junior high school level. The SEQ and SRQ instruments that are valid and reliable, each of which is indicated as Moderately high and high, of course have a long process. Starting from obtaining the creation of both instruments, obtaining data from students, analyzing data, and thinking about the usefulness of these two instruments. In Indonesia, research that is relevant to the results of this study is still lacking, so researchers need to adapt to the results of previous studies such as research conducted by Laranang & Bondonc (2020) which validated the self-efficacy instrument and the work of Brown and colleagues., (1999) who compiled a self-regulation questionnaire.

Discussion

A five-point Likert scale is used in the SEQ and SRQ. Most self-efficacy questionnaires use an adapted version of the Sources of Mathematics Self-Efficacy Scale (SMES) developed by Lent and colleagues., (1991). A number of its components have been modified for usage in academic and social contexts after being initially created to evaluate students' sources of mathematical self-efficacy (Anderson & Betz, 2001; Britner & Pajares, 2006; Lopez & Lent, 1992; Usher & Pajares, 2007). A scale to gauge students' sources of mathematical self-efficacy was also created by Matsui and colleagues., (1990) and modified for use with younger pupils (Klassen, 2004). The Sources of Academic Self-Efficacy Scale was created by Hampton and Mason (2003), verified, and then utilised with students who struggled academically in high school and college. Other researchers have employed alternative measures as stand-ins for one or more sources (Chin & Kameoka, 2002; Johnson, 2005) or have depended on unpublished source items (Bates & Khasawneh, 2007; Stevens & Jr, 2006).

Regarding the sources of self-efficacy, there are two key reasons why accurate and trustworthy measuring tools are required. First, self-efficacy plays an important role in students' academic and career choices (Hackett, 2017). Bandura's social cognitive theory, which holds that self-efficacy cannot be adequately assessed without evaluation, is another significant factor supporting the need for psychometrically valid measures of the origins of self-efficacy (Locke, 1987). Researchers must use valid and reliable metrics that accurately reflect their hypothesised sources and their place in the larger social structure if they hope to comprehend the composition of students' self-efficacy. In the field of academic motivation, where the sources of self-efficacy have frequently been operationalised and assessed in ways

that are very different from how Bandura (1997) hypothesised them, this cognitive theory is especially significant.

Several previous studies have shown that self-efficacy instruments can be used and declared valid and reliable, whether collecting self-efficacy instruments for students in tertiary institutions or high schools (Anderson & Betz, 2001; Britner & Pajares, 2006; Hampton & Mason, 2003; Lent et al., 1991; Lopez & Lent, 1992; Usher & Pajares, 2007). The self-efficacy instrument for junior high school students in Indonesia is still under-researched, so the SEQ in this study can be recommended for measuring student self-efficacy, especially at the junior high school level. The SEQ was adapted from Laranang & Bondoc (2020) which consisted of 14 items, then we added 6 statement items, so that the SEQ in this study became 20 statement items, all of which were declared valid and reliable.

Then the self-regulation questionnaire has been developed by several researchers in various countries such as research conducted by Pichardo and colleagues., (2014) who validated the self-regulation questionnaire for students in Spain. Where 50% (n = 417) of students have been confirmed and suggested that the measurement is more efficient to do. SRQ is also adapted from Brown and colleagues., (1999). We adjust to the conditions of students in mathematics classes in Indonesia, so we adjust several sentences related to students in mathematics classes. As the statistical test that has been explained that 20 SRQ items are declared valid and reliable. This study is related to Bagçeci & Kanadli (2014) report on a similar study reporting the validation of a student self-regulation questionnaire at the junior high school level in Turkey. A total of 762 middle school students in Gaziantep were involved in this study, specifically students in grades 5, 6, 7, and 8 in the 2012-2013 academic year. The values obtained were 0.477 and 0.818 respectively and the total correlation was between 0.24 and 0.47. The results of the Pearson correlation of the questionnaire test-retest were obtained at 0.85 and the Cronbach Alpha reliability was 0.78, so the ASRQ adapted into Turkish is valid and reliable. Likewise, the adapted SRQ was obtained valid and reliable into Indonesian.

Conclusion

This research is useful for future students in mathematics classes because the 20 self-efficacy and self-regulation questionnaire statements were declared valid and reliable. The impact of this research is that the SEQ and SRQ which is declared valid can be used to measure students' self-efficacy and self-regulation in mathematics classes, especially at the junior high school level. It is advised that students put in more study time in order to raise their maths proficiency. By actively participating in study sessions with peers, having conversations in math classes, and feeling confident when handed arithmetic homework, they should cultivate a positive attitude towards the topic. By boosting their self-confidence, students can work harder to change their attitudes towards mathematics and become more driven to learn the subject. This research can be supported by similar studies conducted in other cities.

Recommendations

The factors that influence self-efficacy and self-regulation in mathematics can be identified through additional research investigations on larger populations. In order to provide a secure learning environment for kids, educators can uphold a favourable school atmosphere. Teachers can use innovative teaching and learning tactics to increase students' interest in studying mathematical concepts and theories while also helping them build high self-efficacy

and self-regulation to succeed in mathematics. In addition to helping their children who struggle with maths, parents can also assist them understand why their children have a bad attitude towards maths. In order to promote greater academic performance by raising and bolstering higher levels of student success and motivation, schools might suggest ways to enhance their mathematics programs that are specific to the needs, interests, and issues of their students.

Appendices

Appendix 1. Adapted Self-Efficacy Questionnaire

No	SEQ From Laranang & Bondoc (2020)	Translate in Indonesia
1	I feel confident enough to ask questions in my mathematics class	Saya percaya diri untuk mengajukan pertanyaan pada pelajaran matematika
2	I believe I can do well on a mathematics test.	Saya yakin selalu dapat mengerjakan tes matematika dengan baik.
3	I believe I can complete all the assignments in a mathematicscourse.	Saya yakin mampu memahami dan menyelesaikan tugas pada pembelajaran matematika
4	I believe I am the kind of person who is good at mathematics	Saya adalah tipe siswa yang pandai matematika.
5	I believe I will be able to use mathematics in my future careerwhen needed.	Saya yakin bahwa matematika akan berguna untuk masa depan saya ketika dibutuhkan
6	I believe I can understand the content in a mathematics course.	Saya yakin dapat memahami materi pada pelajaran matematika
7	I believe I can get an “A” when I am in a mathematics course.	Saya yakin bisa mendapatkan nilai “A” untuk mata pelajaran matematika.
8	I believe I can learn well in a mathematics course.	Saya yakin mampu bertahan dalam menghadapi tugas dan tantangan dalam kehidupan sehari-hari
9	I feel confident when taking a mathematics test.	Saya percaya diri saat mengikuti tes matematika.
10	I believe I am the type of person who can do mathematics.	Saya yakin bahwa saya tipe siswa yang bisa mengerjakan matematika
11	I feel that I will be able to do well in future mathematics courses.	Saya dapat mengerjakan tugas matematika dengan baik di masa depan
12	I believe I can do the mathematics in a mathematics course	Saya yakin dapat mengerjakan matematika ketika saya diberi tugas matematika
13	I believe I can think like a mathematician.	Saya yakin bahwa saya bisa berpikir seperti ahli matematika.
14	I feel confident when using mathematics outside of school.	Saya percaya diri ketika menggunakan matematika pada kegiatan luar sekolah.

Appendix 2. Adapted Self-Regulation Questionnaire

No	**SRQ From Brown et al., (1999)**	**Translate in Indonesia**
1	I usually keep track of my progress toward my goals.	Saya biasanya melacak kemajuan saya untuk mencapai tujuan saya.
2	My behavior is not that different from other people's.	Perilaku saya tidak jauh berbeda dengan orang lain.
3	Others tell me that I keep on with things too long.	Orang lain mengatakan saya terlalu lama melakukan sesuatu.
4	I doubt I could change even if I wanted to.	Saya ragu bahwa saya bisa berubah, sekalipun saya mau.
5	I have trouble making up my mind about things	Saya kesulitan mengambil keputusan tentang berbagai hal
6	I get easily distracted from my plans.	Saya mudah teralihkan dari rencana saya.
7	I reward myself for progress toward my goals.	Saya memberi penghargaan pada diri sendiri atas kemajuan menuju tujuan saya.
8	I don't notice the effects of my actions until it's too late.	Saya tidak menyadari dampak tindakan saya sampai semuanya terlambat.
9	My behavior is similar to that of my friends.	Perilaku saya mirip dengan teman-teman saya.
10	It's hard for me to see anything helpful about changing my ways.	Sulit bagi saya untuk melihat adanya manfaat dari perubahan kebiasaan saya.
11	I am able to accomplish goals I set for myself.	Saya mampu mencapai tujuan yang saya tetapkan untuk diri saya sendiri.
12	I put off making decisions.	Saya menunda pengambilan keputusan.
13	I have so many plans that it's hard for me to focus on any one of them.	Saya mempunyai begitu banyak rencana sehingga sulit bagi saya untuk fokus pada satu saja.
14	I change the way I do things when I see a problem with how things are going.	Saya mengubah cara saya untuk melakukan sesuatu ketika saya melihat masalah bagaimana sesuatu berjalan.
15	It's hard for me to notice when I've “had enough” (alcohol, food, sweets).	Sulit bagi saya untuk menyadari kapan saya sudah “cukup” (alkohol, makanan, permen).
16	I think a lot about what other people think of me.	Saya banyak berpikir tentang apa yang orang lain pikirkan tentang saya.
17	I am willing to consider other ways of doing things.	Saya bersedia mempertimbangkan cara lain dalam melakukan sesuatu.
18	If I wanted to change, I am confident that I could do it.	Jika saya mau berubah, saya yakin saya bisa melakukannya.
19	When it comes to deciding about a change, I feel overwhelmed by the choices	Ketika harus memutuskan untuk melakukan perubahan, saya merasa kewalahan dengan banyaknya pilihan.
20	I have trouble following through with things once I've made up my mind to do something.	Saya kesulitan menindaklanjuti sesuatu yang sudah saya putuskan untuk dilakukan.
21	I don't seem to learn from my mistakes.	Saya tampaknya tidak belajar dari kesalahan saya.
22	I'm usually careful not to overdo it when working, eating, drinking.	Saya biasanya hati-hati untuk tidak terlalu berlebihan ketika bekerja, makan, minum.

No	**SRQ From Brown et al., (1999)**	**Translate in Indonesia**
23	I tend to compare myself with other people.	Saya cenderung membandingkan diri saya sendiri dengan orang lain.
24	I enjoy a routine, and like things to stay the same.	Saya menikmati rutinitas, dan ingin segala sesuatunya tetap sama.
25	I have sought out advice or information about changing.	Saya telah mencari saran atau informasi tentang perubahan.
26	I can come up with lots of ways to change, but it's hard for me to decide which one to use.	Saya dapat menemukan banyak cara untuk berubah, tetapi sulit bagi saya untuk memutuskan cara mana yang harus digunakan.
27	I can stick to a plan that's working well.	Saya dapat berpegang pada rencana saya yang berjalan dengan baik.
28	I usually only have to make a mistake one time in order to learn from it.	Saya biasanya hanya perlu membuat kesalahan satu kali untuk dapat belajar darinya.
29	I don't learn well from punishment.	Saya tidak belajar dengan baik dari hukuman.
30	I have personal standards, and try to live up to them.	Saya mempunyai standar pribadi dan berusaha untuk memenuhinya.
31	I am set in my ways.	Saya sudah mantap dengan cara-caraku.
32	As soon as I see a problem or challenge, I start looking for possible solutions.	Begitu saya melihat masalah atau tantangan, saya mulai mencari kemungkinan solusinya.
33	I have a hard time setting goals for myself.	Saya kesulitan menetapkan tujuan untuk diri saya sendiri.
34	I have a lot of willpower.	Saya memiliki banyak tekad.
35	When I'm trying to change something, I pay a lot of attention to how I'm doing.	Ketika saya mencoba mengubah sesuatu, saya banyak memerhatikan bagaimana saya melakukannya.
36	I usually judge what I'm doing by the consequences of my actions.	Saya biasanya menilai apa yang saya lakukan berdasarkan konsekuensi tindakan saya.
37	I don't care if I'm different from most people.	Saya tidak peduli jika saya berbeda dari kebanyakan orang.
38	As soon as I see things aren't going right I want to do something about it.	Begitu saya melihat sesuatu tidak berjalan dengan baik, saya ingin melakukan sesuatu.
39	There is usually more than one way to accomplish something.	Biasanya ada lebih dari satu cara untuk mencapai sesuatu.
40	I have trouble making plans to help me reach my goals.	Saya kesulitan membuat rencana untuk membantu saya mencapai tujuan saya.
41	I am able to resist temptation.	Saya mampu menahan godaan.
42	I set goals for myself and keep track of my progress.	Saya menetapkan tujuan untuk diri saya sendiri dan melacak kemajuan saya.
43	Most of the time I don't pay attention to what I'm doing.	Seringkali saya tidak memperhatikan apa yang saya lakukan.
44	I try to be like people around me.	Saya mencoba untuk menjadi seperti orang-orang di sekitar saya.

No	SRQ From Brown et al., (1999)	Translate in Indonesia
45	I tend to keep doing the same thing, even when it doesn't work.	Saya cenderung terus melakukan hal yang sama, bahkan ketika itu tidak berhasil.
46	I can usually find several different possibilities when I want to change something.	Saya biasanya dapat menemukan beberapa kemungkinan berbeda ketika saya ingin mengubah sesuatu.
47	Once I have a goal, I can usually plan how to reach it.	Begitu saya punya tujuan, biasanya saya bisa merencanakan cara mencapainya.
48	I have rules that I stick by no matter what.	Saya memiliki aturan yang saya patuhi, apa pun yang terjadi.
49	If I make a resolution to change something, I pay a lot of attention to how I'm doing.	Jika saya bertekad untuk mengubah sesuatu, saya akan memberi banyak perhatian bagaimana saya melakukannya.
50	Often I don't notice what I'm doing until someone calls it to my attention.	Sering kali saya tidak menyadari apa yang saya lakukan sampai seseorang memberitahu saya.
51	I think a lot about how I'm doing.	Saya banyak berpikir tentang apa yang sedang saya lakukan.
52	Usually I see the need to change before others do.	Biasanya saya melihat perlunya perubahan sebelum orang lain melakukannya.
53	I'm good at finding different ways to get what I want.	Saya pandai menemukan berbagai cara untuk mendapatkan apa yang saya inginkan.
54	I usually think before I act.	Saya biasanya berpikir sebelum bertindak.
55	Little problems or distractions throw me off course.	Masalah-masalah kecil membuat saya keluar jalur rencana saya.
56	I feel bad when I don't meet my goals.	Saya merasa buruk jika saya tidak mencapai tujuan saya.
57	I learn from my mistakes.	Saya belajar dari kesalahan saya.
58	I know how I want to be.	Saya tahu bagaimana saya ingin menjadi.
59	It bothers me when things aren't the way I want them.	Saya merasa terganggu ketika segala sesuatunya tidak berjalan sesuai keinginan saya.
60	I call in others for help when I need it.	Saya meminta bantuan orang lain ketika saya membutuhkannya.
61	Before making a decision, I consider what is likely to happen if I do one thing or another.	Sebelum mengambil keputusan, saya mempertimbangkan apa yang mungkin terjadi jika saya melakukan sesuatu.
62	I give up quickly.	Saya cepat menyerah.
63	I usually decide to change and hope for the best.	Saya biasanya memutuskan untuk berubah dan berharap yang terbaik.

Improving Nutrition Education and Physical Fitness in High School Through a Community-Based Haheho Apps Intervention

Abstract
With the rise of sedentary lifestyles post-COVID-19 pandemic and the adverse effects of handphone use and unhealthy eating habits among high school students, teachers and staff, there is an urgent need for innovative interventions that promote nutrition education and physical activity. So far, several conventional approaches have not shown significant results. This study addresses the need for school communities to initiate active and healthy lifestyle changes by utilizing mobile technology through a school community-based Haheho Apps intervention. Methods: Experimental study with one group pretest-posttest design involving 256 students aged 15-18. 21 teachers and school staff aged 30-58 years old, participants will receive access to community-based Haheho Apps for 8 Weeks focusing on nutrition education and physical activity. Student, teacher and school staff groups receive age-appropriate materials and physical activities. Pre- and post-intervention assessments will measure changes in nutrition knowledge, BMI, and physical fitness. 277 participants consisting of students, teachers, and school staff took the pretest and posttest; participants showed improved nutrition knowledge, BMI, and physical fitness. Statistically significant decreases and increases were recorded overall: a significant reduction in BMI of 42% in the obese group, an increase in BMI of 33% in the less-than-ideal group, and 25% had no change. The Haheho Apps intervention based on the school community is efficacious in improving school community members' knowledge, BMI, and physical fitness.

Keywords: Physical Activity, Knowledge Nutrition, Physical Fitness, Community-Based

Introduction

Every year, the country spends trillions of rupiah to handle public health and health insurance. In fact, if public health is well maintained, starting with instilling, getting used to, and providing knowledge about how to live an active and healthy life from an early age, then the country will be able to save the health budget and divert health subsidies to the development sector (Kristiyanto, 2021).

The health and fitness of school community after the pandemic experienced a tremendous decline. The results of the 2021 Sports Development Index (SDI) report from the Ministry of Youth and Sports of the Republic of Indonesia, randomly selected in 34 provinces, showed a significant decline in physical fitness. It was found that "the fitness level in the very poor category reached 53.63%, the poor category was 22.68%, and only 5.86% were in the very good and superior categories. There was generally no significant change compared to the 2006 SDI data. Although there was an increase in the good and very good categories, there was an increase in the very poor category." (Mutohir et al., 2022). This shows that physical fitness continues to decline. Based on the results (Ministry of Health, 2018) measurement in Indonesia, 8.7% of children aged 13–15 years are malnourished (1.9% are skinny and 6.8% are thin), while 16% are overweight (11.2% are obese and 4.8% are very obese). Based on the results of a multistage fitness test conducted on students at SMA Negeri 1 Kesesi, involving 277 samples including teachers, staff, and students, it was found that 102 people were in the very poor category, 68 people in the poor category, 76 people in the sufficient category, 31 people in the good category, and 15 people in the very good category. In addition, 56.8% of students' Body Mass Index (BMI) were in the normal category, 36.5% in the underweight category, and 6.7% in the overweight category.

The education sector is important in preventing and providing knowledge to school community so that they can have an active and healthy lifestyle throughout life. In an effort to restore the condition of education services and restore the learning process after the COVID-19 pandemic, the Ministry of Education and Culture instructed policymakers in schools as task implementers in the field to create strategies and plans for the recovery of educational services that are structured, systematic and massive involving various parties who have resources power to encourage learning recovery, encourage school community to maintain health by reducing the risk of diseases such as heart disease, stroke, and diabetes, and equip school community to have knowledge of balanced nutrition and calculate daily calorie needs.

The use of applications in the world of education today could be a solution, considering that currently, everyone cannot be separated from gadgets. A more in-depth application technology approach can assist teachers, administrative staff, and students implement learning and exercise programs to improve physical fitness and health. This statement is in line with what was expressed by Tjandrawina (2016). In The Economist Intelligence Unit, 50% of doctors believe that smartphone application technology empowers patients so that they can play a role in managing their health proactively. Physical fitness can help fight COVID-19. According to the statement (Costa et al., 2022) there is a possibility that someone who does not have good physical fitness will appear and cause complications and problems that will be more serious if someone experiences a COVID-19 infection. Therefore, appropriate training is required to increase physical fitness. According to Helmy (2015), training is a type of physical activity that is planned, structured, and repetitive and aims to increase or enhance the physical fitness's constituent components.

Several studies also show positive results. As per research conducted (Okinarum et al., 2017) "There is an increase in mothers ' knowledge of implementing the consumption of a variety of balanced nutrition food for elementary school children before and after using the (SEHATI) application."

According to Florian and Hurych (2022), high-intensity interval training is a type of exercise regimen characterized by short intervals of time considered strenuous. According to Bauer and colleagues (2022) there are several benefits associated with HIIT training, including more control over training and a more systematic approach since it makes it easier for students to understand their daily progress and increases potential energy more quickly than other conditioning methods. Additionally, the program can be completed almost anywhere and does not require specialized training. Physical exercise is considered the primary means of promoting health and protecting the body from various illnesses (Garber et al., 2011).

These conditions motivated the author to create an innovative work the Haheho Apps. Haheho Apps is an Android-based application that includes sports training guides and fitness monitoring and is able to collect fitness data. Various features can increase the school community's knowledge regarding diet and balanced nutrition. Application technology can more deeply assist teachers, students, and school staff in implementing fitness training programs and learning nutrition education.

Method

Methods used in the study This is an experiment. Research experimental considered their own level of the highest certainty. Sugiyono (2017) explain that method study this is used to look for influence treatment certain to other variables in controlled conditions. Researchers predict the study in accordance with the type of research that was developed, namely study quasi-experimental, with the use of the application Heheho App as variable independent, and physical fitness, knowledge nutrition, and body mass index as variable dependent.

Design used in study this is "one group pretest- posttest design." by specific, design study this involves a pretest before given treatment, and posttest after a given use haheho app for 2 months treatments. Although own potential design this sometimes criticized because its instability, such as lack of group control (Groesz et al., 2002). However, Shek and Sun (2012) explain the design this still often used because its practicality and simplicity in lots methodology study. In addition, research quasi-experimental, including pretest - posttest design, very suitable for evaluate new initiatives and programs in environmental education (Zajić et al., 2022).

Agustianti and colleagues (2022) state that results can be known more accurately because they can be compared before and after treatment. Research This will compare pretest results before the use of the application Haheho and post-test physical fitness, nutrition knowledge at SMAN Kesesi.

Data collection techniques were carried out with stage blended learning, namely online and offline learning, which look at face-to-face and online meetings through the Google Meet application. Researchers explain in a short way the use of the Haheho application, then give task movement to students in the form of 18 treatments or exercises in the Haheho application. Instrument in study this is the Multistage Fitness Test (MFT) tool, also known as a MFT (Fenanlampir & Faruq, 2015). MFT Test was carried out with the request of students

to run back and forth, or shuttle runs between two measured lines using meters and limited by cones that are 20 meters apart. Students must run from cone First to cone second while hearing the "beep" sound at the desired tone of their own bleep test rhythm.

For the measurement of nutrition knowledge, quizzes and questionnaires were used to determine activities carried out by the community school for 18 training sessions, which were collected via Google Forms. Instrument this includes a question with a scale response, namely a question for a general summary from the respondent about contents questionnaire.

The body mass index (BMI) is measured by measuring the weight and height of students. Weight measurement uses a digital scale, while height is measured using a standard height-measuring tool. After the weight and height data are obtained, BMI is calculated using the formula weight (in kilograms) divided by height (in meters) squared. This body mass index is used to determine the nutritional status of students, whether they are included in the thin, normal, or obese categories according to the standards set by WHO.

Treatment

The treatment was carried out 18 times in the form of interval training using the Haheho application media, which must be carried out by the school community 18 times. Some of the features of the Haheho application include: (1) An exercise guide menu that functions to guide users in doing exercises to stay safe in accordance with the FITT and SMART principles; (2) an exercise monitoring menu that functions to monitor sports training programs starting from pre-exercise, 18 exercises, post-exercise, to printing fitness certificates; (3) BMI menu to calculate body mass index. (4) Nutritional material that functions to provide training on nutrition. All of this training is directly connected to the LMS; (5) Quiz is menu functions to evaluate the extent of the school community's understanding of physical fitness and nutritional material; (6) The exhibition menu functions as a tool to harvest learning outcomes by exchanging ideas and experiences while running training programs.

The stages of treatment are as follows:

Table 1: Phase *Treatment*

No.	Phase	W Duration
1	Socialization of Multistage Fitness Test, Balanced Nutrition, Use of Haheho Apps	1 session
2	*Pretest*	1 session
3	The treatment was given 18 sessions of movement task training and learning nutrition on LMS	18 sessions practice through project assignments and fill in practice progress
4	*Post Test*	1 session

Giving treatment of 18 exercises of movement tasks to be carried out by school citizens for 2 months in the media Haheho App.

Results and Discussion

Pre Test Results

Before starting treatment, a pretest is carried out to see the student's initial physical fitness level using the Multistage Fitness instrument. Then, the following data is obtained:

Table 2: Statistic Data Description *Pre-test*

Variables	N	Min	Max	mean	Standard deviation
Physical fitness	277	26.4	69.5	44.4	11.1
Knowledge nutrition	277	30	87	60.3	10.2
BMI	277	13	34.6	20.2	3.6

Source: SPSS 26.0 *for Windows*

Table 3: Statistic Data Description *Post-test*

Variables	N	Min	Max	mean	Standard deviation
Physical fitness	277	33.3	69	51.9	11.1
Knowledge nutrition	277	49	100	85.5	7.4
BMI	277	14	34	20.1	3.1

Source: SPSS 26.0 *for Windows*

Based on the results of the statistical data analysis descriptive in the pre-test and post-test, there was a significant change in physical fitness on knowledge of nutrition and body mass index (BMI) of respondents after the intervention. In the pre-test, the physical fitness participant's own range mark is between 26.4 and 69.5, with an average of 44.4 and a standard deviation of 11.1, which indicates the existence of variation between participants. After the intervention, in the post-test, the physical fitness increased with a range mark between 33.3 and 69, and the average increased to 51.9, while the standard deviation remained at 11.1. This shows that improvement in the physical fitness happens to every participant, especially for those with the lowest mark.

Knowledge of nutrition also experienced significant improvement. In the pre-test, the nutrition knowledge score ranged between 30 and 87, with an average of 60.3 and a standard deviation of 10.2. After intervention, on post-test, the value knowledge of nutrition increased in the range of 49 to 100, with an average of 85.5 and a standard deviation decrease to 7.4. The decreased standard deviation indicates that improved nutrition knowledge is more evenly distributed among participants.

For BMI, changes are not too significant. In the pre-test, the BMI value ranged from 13 to 34.6, with an average of 20.2 and a standard deviation of 3.6. After intervention, span BMI values range from 14 to 34, with a slightly higher average. Decreased to 20.1, and the standard deviation decreased to 3.1. Although BMI changes are insignificant, the decreased standard deviation shows that BMI variation between participants is slightly reduced after the intervention. Overall, intervention Is effective in increasing physical fitness and knowledge of nutrition, although the impact on BMI tends to be minimal.

BMI	Pre	.163	.000
	Post	.380	.000

A non-parametric normality test using the Kolmogorov-Smirnov Test showed that most of the data was not normally distributed. For the physical fitness variable, both in the " Pre " condition (before intervention) with a statistical value of .121 and significance of .000, and " Post " (after intervention) with a statistical value of .173 and significance of .000, the data were not normally distributed. Likewise, the BMI variable showed abnormality both in the " Pre " condition, with a statistical value of .163 and significance of .000, and " Post " with a statistical value of .380 and significance of .000. Meanwhile, the knowledge variable only showed a normal distribution in the " Pre " condition with a statistical value of .048 and significance of .200. In contrast, in the " Post " condition it was not normally distributed with a statistical value of .095 and significance of .000.

Hypothesis Testing

Table 5: Wilcoxon Non-parametric Paired Test Table (Sample 277 students)

Variables	Z	Asymp. Sig. (2-tailed)
BMI	-3.048 [b]	.002
Knowledge Nutrition	-14.663 [b]	.000
Physical Fitness	-16.643 [b]	.000

Wilcoxon test results Signed Rank The test showed that the treatment had a significant effect on the variables BMI, knowledge, and physical fitness.

1. BMI

Based on the test results conducted on the BMI variable, a Z value of -3.048 was obtained. This Z value indicates how much the average difference between two data sets (for example, before and after the intervention) is from the mean of zero in a normal distribution unit. In this use, a negative Z value indicates a decrease in BMI after the intervention is applied. This means that after receiving the intervention, participants tend to have a lower BMI compared to before the intervention. Furthermore, the significance value obtained from this analysis is 0.002. In statistical research, this significance value is often compared to the commonly used significance level, which is 0.05 or 5%. If the p-value (significance value) is less than 0.05, then the results are considered statistically significant. Thus, these results indicate that the decrease in BMI after the intervention is statistically significant especially for obese group.

2. Nutritional knowledge

Based on the test results conducted on nutritional knowledge, the Z value obtained for the knowledge variable is -14.663. This number reflects a very significant change in the data; a negative Z value indicates that after the intervention, the participants' knowledge scores increased compared to before the intervention. The greater the absolute value of Z, the greater the difference between the two sets of data being compared. In this case, a high and negative Z value confirms that the intervention has succeeded in substantially increasing participants' knowledge. The significance value obtained from this result is 0.000. When the p-value is 0.000, this indicates that there is very strong evidence to reject the null hypothesis; in other words, the results obtained are very unlikely to occur by chance. In this use, a significance value of 0.000 is far below the general threshold of 0.05, which means that the change in participants' knowledge after the intervention is very statistically significant.

3. Physical fitness

Based on the results of the test conducted on the physical fitness variable, a Z value of -16.643 was obtained. This Z value shows how much the average difference between two data sets (for example, before and after the intervention) is from the mean of zero in normal distribution units. In this use, a negative Z value indicates a significant increase in student physical fitness after the intervention is applied. This means that after receiving the intervention, participants tend to have better physical fitness compared to before the intervention. Furthermore, the significance value obtained from this analysis is 0.000. In statistical research, this significance value is often compared to the general significance level, which is 0.05 or 5%. If the p-value (significance value) is less than 0.05, then the results are considered statistically significant. Thus, these results indicate that the increase in physical fitness after the intervention is statistically significant, which means that the intervention carried out has a real impact on increasing students' physical fitness.

Discussion

1. The Haheho Application on BMI (Body Mass Index)

Haheho application has been proven to have a significant effect on reducing the body mass index (BMI) of obese group participants after following a training program through this application. In the digital era like today, technology plays an increasingly important role in personal health monitoring, and Haheho is one of the innovations that has succeeded in utilizing this development. With a combination of tracking physical activity features, nutritional knowledge, and community support, this application offers a comprehensive approach to help users achieve their health goals.

These results align with several previous studies that have shown that digital application-based interventions effectively reduce BMI and improve overall health. research conducted by Granado-Font and colleagues (2015) Found that the use of health applications that provide guidance and monitoring of physical exercise significantly increases physical activity and helps in weight loss. In the study, digital applications were shown to be able to motivate users to participate in fitness programs, improve exercise patterns, and ultimately reduce BMI.

Another study by Carter and colleagues (2013) It also supports these findings, where technology-based interventions, including the use of apps, were effective in helping participants manage their weight through regular exercise and nutrition monitoring. Apps that combine training features and real-time BMI measurement provide users with the opportunity to manage their progress, which in turn improves fitness outcomes.

In the use of the Haheho application, the intervention provided through structured interval training for 18 sessions had a significant impact on reducing participants' BMI. The application provides key features such as user-tailored exercise guidance, progress monitoring, and BMI calculation, all of which play a role in helping participants achieve their fitness goals. These findings strengthen the conclusion that application-based interventions, including Haheho app, help reduce BMI and contribute to healthier lifestyle changes. The success of the Haheho application in this study adds to the evidence that digital technology can be an effective tool in facilitating fitness and health programs.

2. Haheho Application on Nutritional Knowledge

Haheho application has a significant impact on increasing participants' nutritional knowledge after the intervention. This application is equipped with nutritional education features integrated into the physical training program, such as a nutrition module that provides information about balanced food intake, calorie needs, and the importance of proper nutritional consumption for physical fitness. The quiz feature in the application also allows participants to evaluate their understanding of the nutritional material that has been presented, thus ensuring that the information is well absorbed. Key features of the app include a nutrition module that provides practical guidance on proper food intake, information on daily calorie requirements, and an explanation of the role of each food group in supporting physical fitness.

This feature directly supports previous research that confirms that structured nutrition education through application-based technology can improve participants' understanding of the relationship between diet and health. Research by Ulfa and colleagues (2022) Showed

that a mobile application equipped with interactive nutrition modules significantly increased awareness of the importance of nutritional balance among fitness program participants. Technology-based interventions, including mobile applications, are effective in improving nutrition knowledge and promoting healthy behavior change (Chueh et al., 2024). The Haheho application, with a similar approach, successfully leverages technology to provide relevant and informative nutrition education, thereby encouraging participants to pay more attention to students' diets.

In addition to the information module, this application also has an interactive quiz feature that functions as an evaluation tool for participants. This feature allows users to evaluate their understanding of the material that has been studied, as well as provide direct feedback on their level of understanding. This type of evaluation mechanism refers to research by Tandiono (2024), which found that interactive evaluation tools, such as quizzes, can increase information retention by up to 40% better than passive learning methods. Overall, the Haheho application not only acts as an educational tool but also as an evaluation platform that facilitates in-depth and sustainable improvement of nutritional knowledge.

3. Haheho Application on Physical Fitness

The Haheho app has become a significant tool in improving users' physical fitness, especially in this digital era. One of the main features of Haheho is its ability to offer personalized training programs, which have been shown to increase individuals' motivation and adherence to exercise routines, as explained in a study by Nowosielski and colleagues (2016). The app analyzes user data to recommend appropriate exercise types and intensities, allowing users to gradually increase their physical capacity. In addition, the progress tracking feature provided by Haheho allows users to see their progress in terms of time, distance, and intensity of exercise.

One of the key aspects of Haheho is the personalization of training programs. Research by Almutari and colleagues (2024) Shows that programs tailored to individual needs can increase motivation and engagement in physical activity. By analyzing user data, Haheho is able to recommend exercises that are appropriate to each individual's fitness level and goals. This approach not only helps users achieve their fitness goals but also reduces the risk of injury due to exercises that are not appropriate for the student's physical abilities.

In addition to personalization, the progress tracking feature provided by Haheho also contributes greatly to increasing physical fitness. Research by Bhawankar (2024) Confirms that real-time progress tracking can provide a deep sense of accomplishment, thus encouraging individuals to stay committed to their exercise routine. In this application, users can monitor various metrics such as exercise time, distance traveled, and activity intensity. By seeing real progress, users feel more motivated to continue exercising and overcome students' physical limitations.

Variety in training programs is essential to maintain user interest. Research by Swank (2013) Shows that variety in training can reduce boredom and increase compliance. Haheho offers a variety of training types, from cardio to strength and flexibility, which makes the training experience more interesting and enjoyable. Thus, users are not only focused on one type of training but can explore various activities that can improve overall physical fitness.

In conclusion, the Haheho app functions not only as a training tool but also as a holistic platform that combines personalization, progress tracking, social support, and program variations to improve user physical fitness. By leveraging the scientific research underlying each feature, Haheho is able to provide a significant positive impact on the user's physical abilities, making it an invaluable tool on the journey to better health and fitness. As technology advances and the understanding of fitness improves, apps like Haheho can continue to adapt and evolve to meet the needs of future users.

Conclusion

The program to increase the physical fitness and nutrition knowledge of school community with the Haheho Apps application can increase motivation for undergoing exercise programs and learning balanced nutrition material; This application can also provide more experience for school community in getting to know various variations of movement and intensity of exercise. Through the use of the Haheho apps, fitness training becomes more attractive, increasing motivation to carry out exercise programs. Through the use of this application, the learning material taught becomes clear and meaningful. So it can improve physical fitness and enrich the movement experience. This is proven by the results obtained after being given treatment; there was an increase in physical fitness.

The initial abilities measurement (pre test) showed that the physical fitness level was 37% with the category of very poor, 24% in the poor category, 27 in the sufficient category, 11% in the good category, and 5% in the very good category, meanwhile, for nutrition knowledge, the average score was 60. After carrying out treatment via the Haheho Apps application and carrying out a final ability test (post test), the physical fitness level was obtained at 2% with the category very poor, 7% in the poor category, 60% in the sufficient category, 22% in the good category and 9% in the aspect Nutritional knowledge has increased, as proven by the average score of 85. So it can be concluded that using is a significant influence of using Haheho Apps on improving students ' physical fitness and nutrition knowledge.

Acknowledgments

We are grateful to all those with Whom we have had the pleasure to work during this and others related projects, especially for Seameo Recfon and the Endowment from the Higher Education Financing Agency (BPPT) & Education Fund Management Institute (LPDP), the Republic of Indonesia in supporting this conference paper publication.

Performance Measurements of Community-Friendly Schools in Hong Kong

Kwun-hang Lau, East Bridge University, France

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This research evaluates the performance of community-friendly schools in Hong Kong, a new educational model introduced by CCC Tam Lee Lai Fun Memorial Secondary School since 2016. Community-friendly schools, though few in number, aim to balance resource utilization while fulfilling both educational and social needs. The study adopts a descriptive mixed research method, utilizing questionnaires and interviews as data gathering instruments. The sample consists of 86 students, 19 teachers, and 30 community stakeholders for the questionnaires, while interviews were conducted with a total of 38 participants, including students, teachers, and community stakeholders. The performance of these schools is assessed in terms of their impact on school reputation, students' learning attitudes, academic performance, and community engagement. These aspects are evaluated through three levels of activities - community learning activities, the activities cooperated with community organizations and community services organized by the school. Data analysis includes descriptive statistics, Analyses of Variance, and linear regression models, showcasing the significant effects of these institutions. The study examines changes in students' behavior before and after enrollment, revealing positive correlations between student engagement in community activities and improvements in academic performance, community awareness, and willingness to serve the community. This comprehensive evaluation framework aims to provide insights into the effectiveness of community-friendly schools in achieving educational and social objectives, and their overall reputation within the Hong Kong community.

The International Academic Forum
www.iafor.org

1. Introduction

1.1. Background of the Study

Despite various educational reforms, Hong Kong's education system remains dominated by an examination-driven culture, with a strong emphasis on public examinations like the Hong Kong Diploma of Secondary Education Examination. The New Senior Secondary (NSS) curriculum aimed to ease examination pressure by consolidating public exams and incorporating school-based assessments. However, research by Fok and Yu (2014, 2018) and Lam, Yu & Li (2019) shows that students, parents, and schools continue to prioritize examination results, often at the expense of non-academic learning experiences. This focus has shaped teaching methods, with traditional exam-centric strategies remaining prevalent (Lam, Ho, & Tsang, 2020). Dou and Shek (2022) also found that schools often allocate excessive time to core subjects, limiting opportunities for diverse and enriching learning experiences. These challenges highlight the need for a shift toward more inclusive educational practices that address the varied growth needs of students. At the same time, the reforms open up opportunities to adopt creative teaching approaches, such as community-friendly schools, which integrate learning with local environments and communities to promote holistic student development beyond traditional academics.

Table 1: Hierarchy of Community-Friendly Schools

Level	Focus	Determinants	Level of Engagement
First Level: Community-Based Learning Activities (About the Community)	Connection between students' life environment and learning	The school: 1) includes community elements in the curriculum. 2) identifies suitable topics and resources during curriculum design. 3) organizes learning activities within the local community.	Teacher Level
Second Level: Learning Activities in Collaboration with External Organizations (In the Community)	Partnership between schools and external organizations	The school: 1) collaborates with external organizations to organize learning activities. 2) jointly participate in designing curriculum and activities with external organizations. 3) opens its campus to external organizations for community activities.	Subject/ Committee Level
Third Level: Community Services/Activities Organized by the School (For the Community)	Interaction and mutual benefit between schools and the broader community, using school facilities as a community hub	The school: 1) organizes activities for community residents. 2) invites community residents to participate continuously in school activities. 3) receives support from community residents for its activities. 4) provides solutions or contributes efforts to address social needs or problems in the community	Whole-School Engagement

Community-friendly schools represent an innovative educational model that seeks to integrate academic objectives with societal development. In Hong Kong, schools face increasing pressure to address diverse stakeholder demands, including academic excellence,

student well-being, and community engagement. However, traditional educational frameworks often overlook the potential for schools to serve as hubs of community interaction and development. As illustrated in Table 1: Hierarchy of Community-Friendly Schools, this model is characterized by a progressive engagement structure. The first level, Community-Based Learning Activities (About the Community), focuses on connecting students' life environments with their learning experiences. At this level, schools integrate community elements into the curriculum, select appropriate topics and resources, and organize learning activities within the local community, primarily engaging at the teacher level. The second level, Learning Activities in Collaboration with External Organizations (In the Community), emphasizes partnerships between schools and external entities. Schools collaborate with organizations to co-design curriculum and activities, host joint initiatives, and open their campuses for community-related programs, reflecting engagement at the subject or committee level. The third level, Community Services/Activities Organized by the School (For the Community), fosters interaction and mutual benefit between schools and the broader community. Schools actively organize activities for local residents, invite their participation, receive their support, and address social challenges, representing whole-school engagement. By adopting this hierarchical approach, community-friendly schools not only achieve educational objectives but also enhance societal well-being, serving as pivotal platforms for collaboration and mutual growth (Lau, 2024a).

While prior studies have highlighted the benefits of experiential learning and community-based education, limited research exists on the systematic performance evaluation of community-friendly schools in fostering educational and social outcomes. This research gap underscores the need for a comprehensive framework to assess the dual impacts on students and schools, as well as the broader implications for school development and stakeholder relationships.

The objectives of this study are presented in a complete paragraph to provide clarity and direction. This study aims to evaluate the educational and social performance of community-friendly schools, focusing on how these institutions enhance student engagement, learning motivation, personal growth, and community understanding. Additionally, it seeks to analyze the broader impacts of community-friendly initiatives on schools' roles in education and their relationships with stakeholders, including their reputation and connection with the community. By addressing these objectives, the study provides valuable insights for educators and policymakers to optimize community-friendly school practices.

1.2. Problem Statement

The evolving educational landscape in Hong Kong presents numerous challenges for schools. Stakeholders demand accountability not only in academic performance but also in addressing societal needs. Despite the potential of community-friendly schools to bridge this gap, their effectiveness remains underexplored. Questions persist about how these initiatives impact student development, how engagement in community activities translates into measurable outcomes, and how schools can position themselves as both educational and community leaders. Without a clear understanding of these dynamics, schools may struggle to implement effective strategies that balance educational goals with community contributions.

1.3. Significance of the Study

This study holds significant academic and practical value. Academically, it contributes to the growing body of literature on community-based education by providing a comprehensive evaluation framework for community-friendly schools. The findings offer insights into how experiential and community-based learning activities influence student outcomes and school performance. Practically, the study equips educators, policymakers, and stakeholders with evidence-based strategies to design and implement community-friendly initiatives. By highlighting the dual benefits for students and communities, the study underscores the potential of these schools to transform the educational landscape in Hong Kong and beyond.

1.4. Research Questions

1. How do community-friendly school programs influence students' learning motivation, personal growth, and understanding of their local community?
2. What is the relationship between students' levels of engagement in community activities and their developmental outcomes in terms of motivation, community understanding, and personal growth?
3. How do community-friendly school initiative affects schools' roles in education and their communities, their connections with the community, and their reputation among stakeholders?

2. Methodology

2.1. Research Design and Participants

This exploratory study seeks to fill gaps in understanding schools' performance in educational and social accountability. A mixed-method approach was employed, combining qualitative and quantitative data to provide a comprehensive analysis. According to Creswell and colleagues (2003), mixed-method research involves collecting and analyzing both data types, either concurrently or sequentially, with one often prioritized. This method mitigates the limitations of using only one approach (Creswell & Creswell, 2018).

The research began with a quantitative survey, followed by qualitative interviews with a randomly selected subset of participants to enrich the initial findings. Three paper-and-pencil questionnaires were distributed to students, teachers, and community stakeholders. Comparative analysis highlighted mean differences across these groups, while correlation analysis examined relationships between variables, such as students' involvement in community-school programs and their understanding of and willingness to serve their community.

Semi-structured interviews offered in-depth insights into students' and teachers' experiences with community learning activities, despite the time-intensive nature of data analysis (Marshall & Rossman, 2016). Using a convergent parallel mixed methods approach, the study separately analyzed quantitative and qualitative data before integrating the findings to achieve a comprehensive understanding.

2.2. Population and Sampling

The study targeted three distinct stakeholder groups to ensure diverse perspectives on the performance of community-friendly schools. A total of 86 students from various grade levels were selected through purposive sampling to quantitatively capture a range of experiences with community-friendly initiatives. The teacher sample comprised 19 educators from multiple disciplines, chosen to provide insights into instructional practices and school operations. Additionally, 32 community stakeholders were recruited using stratified sampling to ensure balanced representation of different community roles and levels of engagement with the schools. This sampling strategy facilitated a comprehensive evaluation of the schools' impact from multiple vantage points. Quantitative data were collected through surveys administered to all participants. The surveys assessed the impact of community-friendly schools on student engagement, motivation, community understanding, and personal growth, as well as the schools' role in education, their connection with the community, and their reputation among stakeholders.

To complement the quantitative findings, qualitative data were gathered through interviews with a subset of 28 students, 5 teachers, and 5 community participants. Thematic analysis was employed to identify recurring themes, offering deeper insights into the lived experiences of stakeholders engaged in community-friendly school activities. This mixed-method approach provided a robust and comprehensive evaluation of the schools' multifaceted impact.

2.3. Data Collection Instruments

The study employed two primary instruments for data collection: structured surveys and semi-structured interview guides. The surveys were designed to measure both student and school impacts. For students, the survey incorporated 18 items across four dimensions: engagement (5 items), learning motivation (5 items), community understanding (4 items), and personal growth (4 items), with scores ranging from 1 to 5 (5 indicating the greatest impact, 1 indicating the least impact). For school-level impacts, separate questionnaire items were developed for each stakeholder group to capture their unique perspectives. Teachers assessed the school's role in education (5 items), its connection to the community (4 items), and the school's reputation (4 items). Likert scale responses ranged from 1 (strongly disagree) to 5 (strongly agree). These quantitative measures provided a broad understanding of the impacts on both students and the school as a whole, enabling to identify key trends and patterns.

The qualitative component of the study utilized semi-structured interviews to delve deeper into the experiences and perceptions of various stakeholders. Interview guides were tailored to each group, allowing for a detailed exploration of the impacts of community-friendly school initiatives. Students were asked about how specific activities influenced their engagement, learning motivation, personal growth, and understanding of community issues, often sharing personal anecdotes or moments that stood out. Teachers reflected on the school's role in fostering educational innovation, connecting with the community, and the observed changes in student attitudes and behaviors. Community members and parents provided insights into the perceived benefits of the school's initiatives on the community, its contributions to local well-being, and its influence on the school's reputation. This qualitative data offered nuanced perspectives that enriched the quantitative findings, providing a holistic understanding of the initiatives' impacts.

2.4. Data Processing and Analysis

Quantitative data from the surveys were systematically analyzed using statistical software to ensure precision and reliability in the results. Descriptive statistics, including means, standard deviations, and frequency distributions, provided an overview of stakeholder perceptions across dimensions such as engagement, learning motivation, community understanding, and personal growth. Advanced statistical methods, such as multiple regression analyses, were employed to explore the relationships between community-friendly school activities and specific student and school-level outcomes. For instance, the analysis identified how specific activities influenced factors like engagement and learning motivation. Reliability testing was conducted to validate the internal consistency of survey scales, ensuring robustness and accuracy in the measurements.

Qualitative data from the semi-structured interviews were transcribed verbatim and analyzed using a rigorous thematic analysis approach. This process involved an initial coding phase, where meaningful segments of text were labeled, followed by the identification of recurring themes and patterns. Key themes such as "enhanced community understanding," "improved student confidence," and "strengthened school-community relationships" emerged. To ensure credibility and dependability, the thematic analysis incorporated peer debriefing, where findings were reviewed by colleagues to confirm consistency and relevance. Triangulation was employed by comparing qualitative insights with the quantitative findings, allowing for cross-validation and ensuring validity while reducing potential biases.

The integration of data synthesis further enriched the analysis by combining perspectives from different stakeholders, including students, teachers, parents, and community members. This synthesis facilitated a deeper understanding of the community-friendly school model's multifaceted impacts, providing a comprehensive narrative that captured both measurable outcomes and lived experiences. The mixed-method approach ensured a holistic exploration of the research questions, highlighting the dynamic interplay between theoretical principles and real-world application within community-friendly schools.

3. Results and Discussion

3.1. Impacts on Students

This section presents and discusses the results of the study, focusing on the perceptions of students and teachers toward community-based learning activities, collaborative activities with external organizations, and school-organized community services. Key aspects such as engagement, learning motivation, community understanding, and personal growth are analyzed.

Table 2: Overall Scores of Community Learning Activities on Students' Engagement, Learning Motivation, Community Understanding, and Personal Growth

	Community-based learning activities		Learning activities cooperated with external organizations		Community services/ activities organized by the school		Combined	
	Students N=86	Teachers N=19	Students N=86	Teachers N=19	Students N=86	Teachers N=19	Students N=86	Teachers N=19
Engagement and satisfaction	*3.88*	*4.18*	*3.87*	*4.08*	*3.81*	*4.05*	*3.87*	*4.11*
Learning motivation and attitude	*3.71*	*4.09*	*3.76*	*4.02*	*3.81*	*4.07*	*3.76*	*4.06*
Community understanding and engagement	*3.79*	*4.23*	*3.84*	*4.23*	*3.79*	*4.12*	*3.81*	*4.19*
Personal growth	*3.78*	*4.16*	*3.88*	*4.26*	*3.78*	*4.13*	*3.81*	*4.19*

3.1.1. Engagement and Satisfaction

Table 2 illustrates that all three types of activities significantly contribute to engagement and satisfaction, with average ratings of 3.87 for students and 4.11 for teachers. Among the activities, teachers rated community-based learning activities the highest (M=4.18), indicating a strong belief in their effectiveness in fostering engagement. Students showed a slightly higher engagement with activities organized in cooperation with external organizations (M=3.87), which suggests that exposure to external expertise and resources may be particularly stimulating for them.

A Secondary 5 student reflecting on economics learning activities in the community:

> *Through the economics learning activities in our community, I gained a deeper understanding of issues like negative externalities. At Hung Kiu Bus Stop, I observed how crowded traffic creates problems such as noise and air pollution, which affect the well-being of nearby residents.*

A Secondary 5 student highlights how learning in the community bridges theory and practice in economics:

> *Exploring market structures and addressing air pollution in Hung Kiu sparked our interest in economics. These hands-on experiences revealed how deeply economics is embedded in everyday life—something we rarely get to witness firsthand. No textbook, no matter how detailed, can compare to the insights gained through real-world application.*

Teachers frequently noted the transformative impact of these experiences on students. As Teacher T1 stated:

> *Activities like the food guide in Hung Kiu allow students to explore the community actively, enabling deeper engagement beyond daily interactions.*

3.1.2. Learning Motivation and Attitude

Learning activities also positively influenced students' motivation and attitudes toward learning, with students' ratings averaging 3.76 and teachers' ratings 4.06. School-organized activities received the highest score from students (M=3.81), suggesting that familiar settings with structured guidance from schools can encourage positive learning attitudes. Teachers, however, rated external collaborations more favorably (M=4.02), reflecting their appreciation of the broader perspectives these partnerships bring to educational experiences.

A secondary 5 student emphasizes the importance of experiential learning on motivation:

> *Experiencing it personally is better than just learning from books. Learning on the spot brings more reflection, emotions, and meaningful experiences.*

A Secondary 5 student underscores the value of applying economics to everyday life to foster enthusiasm for learning:

> *By applying economics knowledge to real-life situations, we gained a better understanding of our surroundings, seamlessly integrated what we learned into daily life, and developed a greater enthusiasm for studying the subject.*

3.1.3 Community Understanding and Engagement

Both students and teachers highlighted the role of community learning activities in improving understanding of community dynamics and stakeholders. Teachers gave consistently high ratings across all activities, averaging 4.19, with community-based and externally supported activities receiving identical ratings of 4.23. Students also rated externally supported activities the highest (M=3.84), underscoring their effectiveness in exposing learners to diverse perspectives.

Student S2 reflected on the value of such activities:

> *Visiting the elderly increased my confidence in communicating with people I wouldn't normally interact with, enhancing my understanding of community life.*

A secondary 2 student demonstrates her willingness to serve her community and contribute to its betterment:

> *Some elderly people have issues in their home, so we would talk to the social workers in the community. Then our volunteer team has a home maintenance class. We've gone out to help the elderly with repairs, so there are some activities like that. Participating in the environmental activities let me know that we need to protect the environment where we live better.*

As Secondary Five student S3 remarked after participating in beach clean-ups:

> *These activities increased my awareness of environmental issues, motivating me to adopt sustainable practices in daily life.*

Student S4 noted how their perspective shifted after engaging in community service:

> *I realized there are many areas in the community that need improvement, inspiring me to contribute more to society in the future.*

3.1.4. Personal Growth

Personal growth emerged as a key outcome of the activities, with mean ratings of 3.81 for students and 4.19 for teachers. Teachers perceived activities involving external organizations as the most impactful (M=4.26), while students valued these activities equally with school-organized services (M=3.78). The findings suggest that engagement with community stakeholders and real-world challenges fosters self-awareness and confidence in students.

A secondary 5 student reveals his improvement attitudes toward personal growth:

> *At this school, we care for the elderly and learn from them, such as Chinese painting and calligraphy. Seeing how spirited and optimistic they are has inspired me to overcome my own negativity.*

A secondary 5 student also reveals his improvement attitudes toward interpersonal skills:

> *Through various activities, I have greatly enhanced my interpersonal skills. For instance, volunteering to assist the elderly during community events taught me how to communicate with respect and empathy. Organizing arts workshops as part of a team also helped me develop collaboration skills and the ability to value diverse perspectives. These experiences have boosted my confidence and enabled me to build stronger, more meaningful relationships with others.*

A teacher echoes these activities contribute to facilitating students' personal growth:

> *Initially, some students might be hesitant or shy to engage. However, after participating in volunteer work or small tasks a few times, they gradually take on leadership roles and become more proactive. They may go from simple visits to leading activities at community centres, demonstrating initiative and responsibility. Even though they're not directly involved in organizing, some activities allow them to shine and showcase their talents.*

Overall, the results indicate that the combined impact of all three activity types is highly favorable, with teachers rating them at 4.19 on average and students at 3.81. Teachers' consistently higher ratings reflect their broader appreciation of the strategic goals and outcomes of community learning initiatives. For students, the variation in scores suggests that while activities effectively promote engagement and understanding, there is room to enhance their motivation and willingness to serve the community. The findings reaffirm the effectiveness of community-friendly school model in enriching students' learning experiences and strengthening their connection to the community. Learning activities, especially those

involving external organizations, play a crucial role in fostering personal growth and promoting civic engagement. Future initiatives should aim to expand such collaborations and design activities that further inspire students' willingness to contribute actively to their communities.

3.2. The Relationship Between Students' Engagement and Its Impacts

Table 2 illustrates the relationship between students' involvement in different community activities and their understanding of the community. Three key areas were examined: learning activities within the community, learning activities in cooperation with external organizations, and community services organized by the school. The analysis of students' engagement in community activities reveals significant relationships with their developmental outcomes.

Table 3: The Relationship Between Students' Engagement and Its Impacts

	Multiple R	R Square	t Stat	P-value
First tier: Community-based learning activities				
Learning motivation and attitude	0.8944	0.8001	4.3391	0.0000396**
Community understanding and engagement	0.8389	0.7037	2.9694	0.00389**
Personal growth	0.8345	0.6964	2.99688	0.00390**
Secondary tier: Learning activities cooperated with external organizations				
Learning motivation and attitude	0.8843	0.7820	4.5160	0.00002**
Community understanding and engagement	0.9003	0.8107	3.281	0.0015**
Personal growth	0.9018	0.8132	1.9121	0.0592
Third tier: Community services/activities organized by the school				
Learning motivation and attitude	0.8688	0.7548	3.34911	0.0012**
Community understanding and engagement	0.8867	0.7863	3.2622	0.0016**
Personal growth	0.8913	0.7944	3.2060	0.0019**

Note. Statistical significance at the $p<0.05$ level indicated by * and $p<0.01$ level indicated by **

The analysis of students' engagement in community activities reveals significant relationships with their developmental outcomes. Community-based learning activities demonstrated the highest influence, with a Multiple R value of 0.8944 and an R Square value of 0.8001, indicating that 80.01% of the variance in learning motivation could be attributed to these activities. Similarly, these activities had a strong correlation with community understanding ($R = 0.8389$, $R^2 = 0.7037$) and personal growth ($R = 0.8345$, $R^2 = 0.6964$), both statistically significant at $p < 0.01$. Learning activities with external organizations also showed positive effects on learning motivation ($R = 0.8843$, $R^2 = 0.7820$, $p < 0.01$) and community understanding ($R = 0.9003$, $R^2 = 0.8107$, $p < 0.01$). However, the impact of learning activities with external organizations on personal growth ($R = 0.9018$, $R^2 = 0.8132$, $p = 0.0592$) is not statistically significant since the p-value exceeds 0.05. However, it shows a positive trend, suggesting further investigation may be warranted. Community services organized by schools further highlighted substantial contributions to learning motivation ($R = 0.8688$, $R^2 = 0.7548$, $p < 0.01$), community understanding ($R = 0.8867$, $R^2 = 0.7863$, $p < 0.01$), and personal growth ($R = 0.8913$, $R^2 = 0.7944$, $p < 0.01$). The statistical insignificance observed in the external organization's activities' impact on personal growth suggests variability in how these programs influence student development.

This analysis underscores the critical role of engagement in community activities, demonstrating that greater participation fosters motivation, understanding, and growth. Moreover, the findings highlight the potential for refining external collaborative efforts to ensure consistent benefits across all developmental dimensions.

3.3 Impacts on Schools

The role of community-friendly schools extends beyond the confines of traditional education, serving as vital bridges between academic environments and the broader community. By organizing community services and fostering active collaboration with stakeholders, these schools aim to create a twofold impact: enhancing the educational experience while addressing social needs. This section examines how community-friendly schools influence key areas such as educational roles and responsibilities, their ability to strengthen community connections, and their reputation among stakeholders. Drawing from quantitative and qualitative analyses, the findings highlight the multifaceted contributions these schools make to societal development and the perceptions of students, teachers, and community members.

3.3.1 Roles in Education and Communities

Table 4: Perceptions of Students, Teachers, and Community Stakeholders on the Purpose and Impact of Community Services and Activities Organized by the School

	Students (N=86)		Teachers (N=19)		Community Stakeholders (N=32)	
Survey Items	M	SD	M	SD	M	SD
The community services/activities organized by the school are for educational purposes.	3.91	0.94	4.21	1.03	4.44	0.88
The community services/activities organized by the school create positive impacts on bot h students and community.	3.97	0.94	4.26	0.99	4.47	0.84
The school has responsibilities to serve the c ommunity.	3.83	1.05	4.05	1.18	3.88	0.98
The community services/activities organized by the school are unique from the services fr om other organizations in the community.					4.19	0.90
The community services/activities organized by the school make my life more fulfilling.					4.00	0.92

A community stakeholder emphasizes the uniqueness of these activities:

> *The school's programs are different from other community services because they bring a fresh perspective. For example, having students monitor air quality and discuss their findings with the community not only educates the students but also empowers local residents to think about their environment differently.*

A student highlights the dual benefits of the activities:

I didn't realize how much I could learn by helping others. At first, I thought it was just about volunteering, but I've gained new skills and even found ways to apply what I've learned in class to real-life situations.

Table 4 underscores the perceptions of students, teachers, and community stakeholders regarding the dual purpose of community services and activities organized by the school in addressing educational and community needs. Teachers rated the educational significance of this initiative the highest (M = 4.21, SD = 1.03), closely followed by community stakeholders (M = 4.44, SD = 0.88), while students rated them slightly lower (M = 3.91, SD = 0.94). Similarly, the positive impacts on both students and the community were acknowledged across all groups, with community stakeholders providing the highest mean score (M = 4.47, SD = 0.84), followed by teachers (M = 4.26, SD = 0.99), and students (M = 3.97, SD = 0.94). These findings suggest that although all groups recognize the value of these activities, students may benefit from a deeper understanding of their broader impact. Additionally, stakeholders emphasized the unique nature of the school's programs, which not only enhances learning but also empowers the community. As one student reflected, these activities provide opportunities to apply classroom knowledge in real-life contexts, fostering both skill development and a sense of fulfillment.

3.3.2 Connection With Communities

Table 5: Perceptions of Students, Teachers, and Community Stakeholders on How Community Services and Activities Strengthen Connections With the Community

	Students (N=86)		Teachers (N=19)		Community Stakeholders (N=32)	
Survey Items	M	SD	M	SD	M	SD
The community services/activities improves the school's ties with the community.	3.84	0.97	4.37	1.01	4.38	0.87
Participating community services/activities organized by the school help me to understand more about teenagers.					4.03	0.90
The community services/activities improved my understanding on the school.					4.06	0.95
Participating in community services/activities organized by the school broadens my social network.					4.03	0.90

A teacher discusses how these activities build stronger ties with the community:

These services allow the school to act as a bridge. By involving local residents in events or discussions, we've seen a mutual understanding grow. Community members start seeing the school not just as a place of learning but as an active part of their lives.

A community stakeholder notes the broadening impact of school-organized activities:

Before participating in these programs, I didn't know much about the younger generation or what schools were doing. Now, I feel more connected, and I've even made friends through these activities. It's a win-win for everyone involved.

Table 5 highlights the significant role of school-organized activities in strengthening connections with the community. Teachers (M = 4.37, SD = 1.01) and community stakeholders (M = 4.38, SD = 0.87) rated these efforts highly, underscoring their positive impact. However, students provided a comparatively lower mean score of 3.84 (SD = 0.97), suggesting room for improvement in engaging students with the community-oriented objectives of these activities. Community stakeholders also reported that participating in this initiative enhanced their understanding of the school (M = 4.06, SD = 0.95) and expanded their social networks (M = 4.03, SD = 0.90). These findings emphasize the school's role as a bridge between students and the community, fostering mutual understanding and collaboration. As one teacher observed, these activities position the school as an integral part of the community by creating opportunities for interaction and shared learning. A community stakeholder further noted how these programs not only deepen their connection with the younger generation but also provide platforms for building meaningful relationships, making the initiative mutually beneficial. While the school's efforts are highly effective among external stakeholders, there is potential to enhance students' appreciation and engagement with the community-building initiative.

3.3.3 Reputation Among Stakeholders

Table 6: Perceptions of Students, Teachers, and Community Stakeholders on the Impact of Community Services and Activities on the School's Reputation

	Students (N=86)		Teachers (N=19)		Community Stakeholders (N=32)	
Survey Items	M	SD	M	SD	M	SD
The community services/activities makes the school differenetiates it from other schools.	3.91	0.98	4.11	1.05	4.09	0.96
The community services/activities improves reputation in the community.	3.88	0.94	4.37	0.90	4.19	0.93
I will recommend the community-friendly schools to other people I know.					4.19	0.86
More schools should work as community-friendly schools.					4.22	0.91

A community stakeholder shares their confidence in recommending the school:

I've spoken with friends and family about the school's programs, and they're always impressed. I tell them it's not just about academics here; it's about preparing the next generation to make a real difference.

A student comments on the school's unique approach:

Our school is different because it doesn't just focus on tests and grades. It's about how we can contribute to the community and learn from it too. It's something I'm proud of, and I think other schools should try it too.

Table 6 illustrates the positive impact of community-friendly schools on their reputation among various stakeholders. Teachers rated the school's ability to differentiate itself from others with a mean score of 4.11 (SD = 1.05), followed closely by community stakeholders (M = 4.09, SD = 0.96) and students (M = 3.91, SD = 0.98). Regarding the school's reputation within the community, teachers provided the highest rating (M = 4.37, SD = 0.90), with community stakeholders giving a similarly strong score (M = 4.19, SD = 0.93), while students offered a lower rating of 3.88 (SD = 0.94). Community stakeholders also showed strong confidence in recommending community-friendly schools to others (M = 4.19, SD = 0.86) and advocated for the expansion of this educational model (M = 4.22, SD = 0.91). These findings highlight how teachers and community stakeholders, in particular, recognize the school's efforts to build social relationships and improve standing in a competitive environment, significantly enhancing its reputation and social capital (Lau, 2024b). As noted by one stakeholder, the school's focus extends beyond academics to preparing students to contribute meaningfully to the community, a quality they are proud to share with others. Similarly, a student expressed pride in the school's unique approach, emphasizing the integration of community engagement with learning. While the school's reputation is highly regarded by teachers and stakeholders, there is an opportunity to further enhance students' awareness and appreciation of the initiative.

4. Conclusions

The study highlights the effectiveness of community-friendly school initiative in enhancing educational outcomes and societal contributions. These programs enrich students' learning experiences, foster personal growth, and strengthen schools' roles as community hubs. By addressing diverse stakeholder needs, these schools have the potential to redefine education in Hong Kong and beyond.

4.1. Key Findings

Community-friendly school activities significantly enhance all-round development in students, equipping them with essential skills to cope with future challenges while boosting engagement, learning motivation, community understanding, and personal growth. The initiative align with experiential learning theories like Kolb's Learning Cycle, emphasizing active participation in real-world contexts for deeper learning and skill development (Kolb & Kolb, 2017; Kong, 2021). By fostering holistic development, they help students build resilience, adaptability, and problem-solving skills, preparing them to navigate complex, uncertain environments. Activities involving external organizations broaden students' perspectives, fostering critical thinking, self-reflection, and flexibility in learning, as Eyler and Giles (2002) argue that service learning is particularly effective for understanding complex issues within larger systems through repeated application of concepts in realistic settings. Survey results reinforce these principles, with students rating personal growth (M=3.81) and engagement and satisfaction (M=3.87) highly, while teachers also valued activities with external organizations (M=4.26), consistent with findings by Krug (1994) that such programs improve self-esteem and attitudes toward school and community. This aligns with the role of community-friendly schools in fostering all-round development as a core function of their educational contributions. Moreover, these initiative cultivates practical skills and emotional intelligence, promoting self-regulation, teamwork, and leadership abilities. Conrad and Hedin's (1989) research highlights service learning's role in enhancing self-esteem, fostering social responsibility, and promoting complex thinking, while Voukelatou (2019) emphasizes the importance of mental, emotional, and social interactions in

creating dynamic learning environments. By integrating theory with practice, community-friendly schools fulfill their educational role by providing a holistic approach that prepares students for life beyond the classroom, making them active contributors to their communities while enhancing their self-awareness, critical thinking, and readiness to face future challenges.

Motivation, as a critical driver of learning, is shaped by various factors, including the learner, the educator, course content, teaching methods, and the learning environment (D'Souza and Maheshwari, 2010). Community-based activities provide authentic contexts for students to exercise autonomy and achieve competence, accounting for 80.01% of the variance in learning motivation ($R=0.8944$). Gelona (2011) and Kosgeroglu et al. (2009) highlight motivation as essential for goal-oriented behavior and educational success. However, variability in personal growth observed in external collaborations ($p=0.0592$) suggests the need for refinements to ensure consistent alignment with theoretical principles and practical goals. Community-friendly school initiative embodies Robert Blum's (1995) vision of evolving educational goals, emphasizing critical thinking, collaboration, and real-world problem-solving. By integrating real-world applications and fostering collaboration, these programs cultivate self-awareness and lifelong learning abilities, enabling students to connect theoretical knowledge with real-world challenges effectively (Guo et al., 2016). These contributions underscore the pivotal role of community-friendly schools in building stronger connections between education and community, as the initiative integrates real-world problem-solving with educational excellence.

Community-friendly initiative has elevated the role of schools as vital learning hubs that serve not only students but also their communities, creating mutual benefits for all three major stakeholders—schools, students, and the community. This initiative fosters deeper connections with stakeholders, with teachers highly valuing their role in relationship-building and community engagement ($M=4.37$). Students' moderate appreciation suggests room for enhancing alignment with their interests, underscoring the importance of evolving this initiative to better meet their needs. The OECD's Future of Schooling report envisions schools as dynamic hubs where diversity, experimentation, and community integration drive learning, civic engagement, and social innovation (OECD, 2020). As hubs of community connection, community-friendly schools actively bridge the gap between education and real-world application, helping students and communities address shared challenges. Community-friendly schools embody this vision by implementing hands-on learning experiences that transcend traditional classroom boundaries—such as monitoring river water quality, analyzing air pollution, and solving local challenges through humanities projects. These activities not only enrich students' learning and personal growth but also empower communities by fostering collaboration and addressing local concerns. Research highlights that such initiative enhances school reputation by showcasing adaptability and societal contributions (Brown et al., 2006; Gilpin, 2010; Helm, 2011). By embracing diversity, experiential learning, and community involvement, community-friendly schools strengthen their role as centers of mutual benefit—empowering students with critical skills, enhancing community well-being, and establishing schools as pivotal agents of civic engagement, social innovation, and sustainable development.

4.2. Recommendations

In light of the findings and limitations identified in this study, we propose several key recommendations for future research aimed at enhancing the understanding and effectiveness

of community-friendly schools. These recommendations focus on addressing the challenges of sampling, measurement, data collection, and cultural context, as well as mitigating the impact of time, resource constraints, and subjectivity in self-evaluation.

To evaluate the lasting effects of community-friendly school initiative, future research should consider conducting longitudinal studies. These studies could track students over several years to assess changes in personal growth, academic performance, career development, and social responsibility. By examining how early exposure to community engagement influences life-long learning and societal contributions, researcher can provide a more comprehensive understanding of the sustained benefits of these programs. Incorporating more robust score scales with additional questions targeting areas such as personal growth, civic awareness, and critical thinking can help uncover deeper insights into students' developmental trajectories.

Future research should expand its scope to encompass a diverse range of schools from various regions and educational systems. Including schools of different sizes, types, and cultural settings through random sampling methods can enhance the generalizability of findings. Comparative studies across different contexts would provide valuable insights into the patterns, variations, and challenges in implementing community-friendly initiative. By broadening the research scope, it becomes possible to identify best practices and tailor strategies to suit different community and educational needs.

Improving the precision and reliability of measurement tools is essential for advancing research on community-friendly schools. Questionnaires and interview protocols should be refined through pilot testing to ensure clarity and effectiveness, while triangulation methods—such as combining qualitative interviews, quantitative surveys, and observational data—can help reduce bias and validate findings. To enable a more nuanced evaluation, future research should introduce comprehensive score scales that assess the overall performance of schools as community-friendly hubs. These scales can integrate various dimensions, including academic outcomes, stakeholder satisfaction, community engagement, resource efficiency, reputation, connection with the community, and the role of education within the community. Additionally, more detailed score scales tailored to evaluating the impact on students should be developed, incorporating indicators for personal and social development, problem-solving abilities, and adaptability. Including metrics to measure broader benefits such as community cohesion, resource utilization, and societal contributions would provide deeper insights and guide schools in refining their initiatives. By systematically measuring these areas, researcher can identify strengths and areas for improvement, ensure accountability, and support the continued development of community-friendly schools.

Using Case Studies to Develop Policymaking Competencies in Continuing Education: Integrating Practice and Experience

June Gwee, Civil Service College, Singapore

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This paper presents findings on the use of case studies in practitioner-based, continuing education public policy programmes. Unlike academic programmes that lead to a degree or certificate, continuing education programmes are normally shorter in duration and comprise stackable segments to cater to the needs of working adults. Adult learners of foundation-level public policy programmes want to develop policymaking skills to solve everyday policy problems. Learning with case studies serve a dual function in the development of foundational policymaking skills through two instructional methods: learning through inquiry and learning through practitioner stories. They can develop critical thinking, systems thinking, creative thinking and communications skills. At the same time, they can contain a rich source of policy domain knowledge, tacit knowledge and practitioner-based experience which are integral to policymaking. Case study praxis in adult education is varied and extends beyond the case method.

Introduction

Policymaking can be defined as a purposeful course of action taken to deal with a problem or issue for a specific outcome (Anderson, 1997). It is a complex task that involves policy domain knowledge, sense-making, critical thinking, systems analysis and creative thinking. Often, it is an iterative rather than a linear and sequential event. Some have referred to policy and policymaking as a chaos of purposes and accidents (Sutton, 1999). Neither can any policy be truly novel because every idea, person and event is connected—"In modern days, policymaking never occurs in greenfield sites, as there is always a preexisting policy that must be modified or overturned, leading to friction between existing and proposed policies" (Manazir, 2023, p. 4).[1]

Competencies are a set of interrelated knowledge, skills and attitudes that represents a job role and which can be measured against well-established standards, as well as reinforced through training and development (Parry, 1996). The report on Competencies for Policymaking (Schwendinger et al., 2022) identified 36 competencies for innovative policymaking organised into seven clusters: Advise the Political Level, Innovate, Work with Evidence, Be Futures Literate, Engage with Citizens and Stakeholders, Collaborate and Communicate. Many of these skills cannot be taught but learnt. Case studies, as part of the case method for inductive learning, have been effective for acquiring the praxis of policymaking because they provide a real-world context for critical thinking and decision-making.

The case method is among the oldest form of experiential and flipped learning where learners interact with one another to discuss issues and problems set within a story that has several variables interacting with one another. When used as part of the case method, learners analyze data to discover the problem and solve it themselves (Prince & Felder, 2006). In academic programmes, students analyse theory and apply theoretical models to real-world situations (Brooke, 2006). This approach enables students to (a) develop generic skills required for policy practice, (b) gain a deeper understanding of policy theory, acquire knowledge about policy theory and policy practice in the context of practice, and (c) demonstrate an ability to apply theory to analyse policy problems (Walker, 2009). Students are required to demonstrate these abilities either through assessments in the form of graded written examinations or class discussions with marks given for participation.

Beyond the academic setting, especially in non-degree programmes where the goal of learners is to obtain specific real-world skills and knowledge to supplement existing education, the objective of this research is to examine the use of case studies in the development of policymaking competencies in continuing education. This research presents the findings from how case studies were used in two foundation-level policy programmes: the Policy in Practice (PIP) Programme and the Foundation Policy Programme: Thinking and Writing Clearly (FPP) at the Civil Service College Singapore.

The Three-Stage Learning Process

Since policymaking is an interaction with the past and present, while involving multiple players (individuals, agencies, groups) within a given system and domain, the narrative

[1] Manazir, S. H. Reimagining public policy formulation and analysis: a comprehensive theoretical framework for public policy. *Discov glob soc* 1, 16(2023). https://doi/org/10.1007/s44282-023-00018-4

situated in the case study offers a well-conceptualised setting for learners to interpret, analyse and make decisions about issues and problems within a specific context.

The traditional case method strategy is done through a three-stage learning process that requires individual preparation, small group discussion and large group discussion (Wood et al., 2023). This is similar to flipped learning methodology where learners actively read or watch lectures and analyse them before participating in group problem-solving activities (Baig & Yadegaridehkordi, 2023). During individual preparation, learners are given the case study before the start of the programme to be familiar with the contents of the case study. Individual preparation requires discipline and motivation because "there has to be hunger and commitment behind this search for the right analysis, solution and implementation" (Maufette-Leenders et al., 2001, p. 20–21).[2]

After individual preparation, learners discuss the case study in small groups to "check insights; assumptions and preparation against those of others; clarify understanding; listen attentively and critically to others; and argue for positions based on convictions developed during the individual preparation stage" (Maufette-Leenders et al., 2001, p. 22).[3] Both individual preparation and small group discussions take place outside of curriculum time (i.e. class) and are lead-ups to the large group discussion. Large group discussion is the finale where learners gather in a single large group, in class, to engage in deep discussions centred on a case study. The goal of the large group discussion is to push the learning beyond what could be achieved individually and in small groups.

Public Policy Programmes

Learners from the PIP and FPP programmes comprised policy officers with one to two years of policy work experience. They were nominated to attend the programmes to improve their policymaking competencies required in their job roles. A challenge for those relatively new to policymaking is the lack of work experience, policy experience and exposure to the workings within government. To plug this gap, foundational policy programmes were designed for learners to participate in deep learning where they would apply models and complete tasks and while doing so, be sufficiently engaged with the learning content and process of learning to discover insights about policy practice. The main elements of the PIP and FPP programmes are summarised in Table 1.

Table 1: Overview of Foundation Policy Programmes PIP and FPP

	Policy in Practice Programme (PIP)	**Foundation Policy Programme: Thinking and Writing Clearly (FPP)**
Learning outcomes	1. Describe the policy development and evaluation cycle 2. Analyse the common challenges faced at each stage of the cycle 3. Propose factors that help you make effective public policies	1. Define policy problems 2. Analyse common challenges in the policymaking process 3. Write and convey policies concisely and clearly
Target learners	Policy officers involved in policy operations	Policy officers involved in policy design and review
Duration of programme	2 days	2 days
Topics covered	Structure of Government, Policy Development and Implementation Cycle, Principles of Governance, Public Service Values	Structure of Government, Problem Definition, Policy Development and Evaluation Cycle, Principles of Governance, Policy Writing, Structuring Arguments
Number of case study discussions	2	1
Duration of case study session	90 mins	60 mins
Format of Programme	Synchronous Virtual	Synchronous Face-to-Face
Average number of learners per session	50	30 (based on 8 sessions)
Assessment Requirement	Nil (Formative Assessment)	Nil (Formative Assessment)
Course Completion Requirement	85% of Attendance	85% of Attendance
Total number of Programmes from Jan 2023 to Oct 2024	11	8

Methodology

Research was conducted by triangulating data from three sources: programme evaluation questionnaires of learners who attended the programmes, in-depth interviews with instructors who used case studies for discussions in the PIP and FPP programmes, and in-class observation of the case study discussions. This methodology enabled data to be collected

from three independent yet related sources which helped reduce potential biases and improve data reliability and validity.

From January 2023 to June 2024, there were a total of 19 PIP and FPP programmes with 774 learners from more than 60 public agencies across the Singapore Public Service. These programmes were conducted by four instructors who could choose two out of a selection of five case studies for their programmes. The case studies used in the programmes typically comprised 10-page structured cases that described policy issues and challenges. With a small sample size of instructors and case studies, this research aimed to minimise distraction from other variables such as trainer dispositions, facilitation styles, case study topics, and narrative styles of case studies which could affect the engagement of learners. The consistent use of only five case study topics and a common terminology by instructors helped to define for learners what is a case study and what learning with case studies entail. The programme evaluation questionnaire of all participants in the 19 runs of the programmes formed the full sample for the quantitative survey of this research.

A factor that might affect research reliability is the different platform in which case study discussions took place: virtually in PIP and face-to-face in FPP. Learner engagements could vary when case study discussions took place in different learning spaces. Bearing in mind that the data collected under different conditions could affect data reliability, this variable was accounted for during data analysis.

Programme Evaluation Questionnaire

The programme evaluation questionnaire (Table 2) comprised multiple choice (questions 1 to 11) and open-ended questions (questions 12 to 13). This was a standard questionnaire that was applied across both PIP and FPP programmes, as well as other programmes within the College. Overall, the effectiveness of the programme was based on scores received in the areas of learner engagement, acquisition of knowledge/skills/insights, and application of learning. Questions that targeted the effectiveness of learning through case studies are found in close-ended questions 5, 6, 7 and 8. Open-ended questions 12 and 13 allowed learners to provide additional feedback in verbatim. The response rate from the questionnaire survey was 87%.

Table 2: Programme Evaluation Questionnaire

1. I believe that the intended outcome(s) of this learning experience has been met.
2. I was engaged during the learning experience.
3. I acquired useful knowledge/skills/insights that will support me in my work.
4. I am able to apply what I have learnt.
5. My learning has been enhanced by the use of this case study.
6. I am satisfied that the content for the case study was presented in a concise and coherent manner.
7. I am willing to recommend this case study to others who are interested in this topic.
8. My learning has been enhanced by the use of this case study.
9. I felt that the instructor was effective in helping me learn.
10. I am satisfied with the administrative and logistical support.
11. On the whole, I am satisfied with the learning experience.
12. What were the best features of the learning experience?
13. How could the learning experience be improved?

In-Depth Interviews

The interview questions for instructors were designed around three areas: the background & experience of the instructors which gave context to their approach in using case studies for learning, their instructional design process in preparing and conducting case study discussions to achieve the desired outcomes, and their views on the effectiveness of case studies to achieve policymaking competencies.

The qualitative interviews were semi-structured to allow follow-up questions, clarifying questions or the fine-tuning of questions during the interview process. A first interview was conducted with an instructor with similar sample profile to test the interview questions for phrasing, sequencing and probes, as well as conduct a trial run of the data collection procedure and interview process. From the feedback received, the interview questions were simplified and shortened. Some questions were modified to distinguish responses between knowledge development versus skill development. The final interview guide is presented in Table 3.

Table 3: In-Depth Interview Guide

1. How did you prepare and conduct these case study discussions?
2. On average, what proportion of learners had read the case study before class?
3. To what extent were learners able to identify the problems/issues presented in the case study?
4. How did learners apply policy concepts, frameworks and tools to the problem/issues outlined in the case study?
5. How did learners understand the complexities of policy practice?
6. How effective were learners in identifying and explaining the operating contexts and policy principles presented through the case study?
7. To what extent do learners bring their experience into the discussions?
8. What worked or didn't work in allowing learners to demonstrate policymaking competencies when analysing the policy issues?
9. How effective was the case study in enabling you to facilitate a good learning experience? What worked or didn't work?
10. In your view, how can we improve the effectiveness of case studies for learning?

Direct Observation

Direct observation of the case study discussion enabled the author to observe and assess how learners demonstrate policymaking competencies in the areas of critical thinking, systems thinking, decision-making, communication skills and creative thinking. These competencies were identified when mapping FPP and PIP learning outcomes to case instructors' instructional design strategies, while referencing the report on competencies for policymaking by Schwendinger and colleagues (2022). Bloom's Taxonomy framework was used to gauge the level of complexity demonstrated by learners when trying to achieve the learning objectives (Bloom et al., 1956). During direct observation of the case study discussions in the programmes, a checklist was used to assess the extent (Always, Sometimes, Limited) in which each item was demonstrated in the checklist (Table 4). The checklist was mapped to the questions in the in-depth interviews and programme evaluation questionnaire. Observer bias was reduced by focusing on long-term observable behaviours rather than short term impressions.

Table 4: Checklist for Observation of Case Discussion

Item	Mapping to:		Degree of Evidence (Always, Sometimes, Limited)
	In-depth Interview Questions	**Programme Evaluation Questionnaire**	
Lesson Design			
1. Learners read and prepared the case study before class	Q2	Q12, Q13	
2. Instructor set context and provided a clear introduction to the case study and learning objectives	Q1	Q6, Q9	
3. Learners were actively engaged and participated freely in the discussion	Q1	Q2, Q9, Q12, Q13	
4. Instructor summarised the key points and takeaways from the discussion	Q1	Q1, Q9	
5. The learning objectives for the session were met	Q1	Q1, Q3, Q12, Q13	
Critical Thinking Skills			
6. Learners examined the situation from multiple and different viewpoints	Q3, Q6, Q7, Q8, Q9	Q3, Q4	
7. Learners evaluated ideas, arguments, or methods with sound reasoning	Q4, Q5, Q7, Q8	-	
8. Learners identified the problem and its root cause	Q3, Q4, Q5, Q6, Q8	-	
Systems Thinking Skills			
9. Learners were able to understand and describe key aspects of the system as part of the operating environment	Q3, Q5, Q6, Q7, Q8	-	
10. Learners evaluated impacts within the sector/industry and explained the significance of various cause and effects	Q3, Q5, Q7, Q8	Q11, Q12, Q13	
11. Learners explained the behaviour of the system within the operating environment	Q3, Q5, Q6, Q7, Q8	Q3, Q4	
Communication Skills			
12. Learners composed arguments and present logical reasoning based on evidence from the case study to support their arguments	Q5, Q7, Q8	Q3, Q4	
13. Learners applied and referenced relevant frameworks and concepts in explaining their arguments	Q4, Q6	Q3, Q4	
Creative Thinking Skills			
14. Learners suggested new ideas that were not previously used in the domain	Q7, Q9	-	

Findings

The qualitative data from interview transcripts and open-ended questionnaire feedback were scrutinised through ground-up coding by labelling and clustering data. The labels were then analysed systematically and used to identify themes and sub-themes. These were later cross-referenced and compared against quantitative data of learners' ratings of the programmes.

Using content and thematic analysis, three themes emerged: "Syndicate-based Learning", "Contextualised Policymaking" and "Practitioner Insights and Tacit Knowledge".

Syndicate-Based Learning

Syndicate-based learning was more suitable for adult learners of the programmes. Syndicate learning can be described as cooperative peer learning involving small groups of 5 and 10 learners working to find answers for a common task within a fixed timeframe (McKerlie, 2018). There were two main differences between Wood's three-step learning approach and the syndicate approach. First, individual preparation and small group discussion in the syndicate approach were conducted in class rather than before class. Second, large group discussion in a single conversation was replaced by groups presentations on their assigned questions.

Although learners were given the case studies for pre-reading at least two weeks before the start of the programme, most did not spend much time on the materials. Being in the initial years of their career, many were deeply entrenched in their day-to-day work and could not devote time to read the pre-programme materials. With busy work schedules, it was challenging for adult learners to read the case studies before class, much less form small groups to discuss them before class. Beyond work, they would rather devote time to family commitments and other personal activities.

> "Many of us have our Business-As-Usual work to do and would only glance through the pre-course materials."(Respondent)

> "This is where I think adult learning is very different. Most of the learners would say 'No time, because I've got so much work to do.' They are busy. There is no protected time for them to read. They were taking work time to carry out learning activities required by the programme. Then there were other reasons— 'I also have family things to do.' Most feel that 'I have work pressure, I have family pressure. So, I skim through the case study. I don't really have a good sense of the case study, or I haven't read it." (Instructor A)

As adult learners were often less prepared when entering a case study discussion, instructors unanimously used syndicate learning approach because it helped to level up learners who might not have read or analysed the case study to do so at the small group discussions. Furthermore, completion of the programmes was based on 85% of attendance and no grades were awarded for formative assessment. Hence, instructors also found the syndicate approach best suited for adult learners, compared to the three-stage learning approach (Table 5).

Table 5: A Comparison of Three-Stage Learning Process and Syndicate Learning Approach

	Three-Stage Learning Process by Wood et. al	**Syndicate Learning Approach**
Individual Learning	Learners read case studies prior to class	Learners read case studies in class
Small Group learning	Small groups discuss and analyse case studies prior to class	Small groups are formed in class and given a specific question to discuss and answer
Large Group Discussion	Instructor facilitates large group discussion in a single conversation	Groups take turn to present their answers to the assigned question

For both programmes, ratings specific to case study discussions were consistent at a mean of 4.3 out of 5, regardless of class size (30 learners versus 50 learners) and mode of delivery (face-to-face versus virtual programmes). However, overall scores for all other categories, including engagement during the learning experience, effectiveness of instructor, and programme learning outcomes were all higher for FPP which was conducted face-to-face and had an average class size of 30 learners. Qualitative feedback from PIP learners highlighted that the Zoom platform was less conducive for case study discussions of complex issues, and it was difficult to sustain attention.

Contextualised Policymaking

Through questioning techniques that centred on 'how', 'what' and 'why' that corresponded with levels 2 to 5 of the Bloom's Taxonomy (Bloom et al., 1956), instructors probed learners to analyse the information provided in the case study to identify policy issues, apply policy frameworks, present their policy ideas and solve policy problems, i.e. the performance goals of competencies required of policymakers. Observations of large group discussions and in-class presentations revealed that adult learners in these programmes were highly articulate and could present their ideas clearly and convincingly to a high extent. However, they were only able to sense-make issues based on the information provided in the case study, demonstrate critical thinking, systems thinking and creative thinking to a moderate extent when making policy decisions (Table 6).

Table 6: Demonstration of Policymaking Competencies

Competencies	**Description of Competencies**
To a high extent	
Communications	Ability to explain with evidence and empathy
To a moderate extent	
Critical Thinking	Ability to sense-make, analyse complex problems, evaluate options and make decisions based on logic and evidence
Systems Thinking	Ability to connect issues with the larger system and its interdependencies
Creative Thinking	Ability to suggest different and new ideas previously not used in the policy domain
Domain Knowledge	Understanding of policy context, operating context, policy domain

Learners' analyses were limited by their own policy and work experience because they were at the early stages of their career. While effective in analysing policy issues and presenting well thought-through issues based on the information provided in the case study, they had limited knowledge of their own policy domains, other policy domains and the inter-dependencies within the larger system.

Learners could only apply critical thinking based on what could be gleaned from the case study but could not deepen discussions. Some had provided feedback that they would prefer case studies situated in their own policy domains so that they could better analyse policy problems within the context of their work.

> "It is hard to formulate policy analysis for content areas we are not familiar with, and within such a short period of time." (Respondent)

> "The quality of discussion depended a lot on group members' contribution." (Respondent)

> "For this group of younger policymakers, we need to have a case study that is situated in their domain because ultimately, they are making policies within their domains. This is very different from if you are using a case study in say, a leadership programme where you can use a case study from any domain to learn leadership lessons. In a policy programme, it is about the practice of policymaking within a very specific domain. I need to keep coming back to ask them how is this relevant to them in their current job role, in their current context." (Instructor B)

Still, adult learners were hungry for knowledge about how to navigate the operating environment within their policy domains (e.g., social, economics, health and education).

Practitioner Insights & Tacit Knowledge

Learners were keen to discover authentic, behind-the-scenes, domain-specific policy insights and tacit knowledge from past and current policymakers, which make these stories quite unlike case studies used for inquiry-based learning where certain facts may be hidden or contained in the teaching note. They wanted to know how experienced and veteran policymakers identified root causes of policy issues, made decisions about trade-offs and dealt with dilemmas faced during policymaking. These case studies also contained policy fundamentals, policy principles, policy vision, and operating context which were needed for young policymakers to develop sensibilities, ethos and evaluative judgement in policymaking.

> "In terms of storytelling, it is really powerful. It's not just about skills. It is powerful at imparting knowledge. 'Oh, is this what happened?' 'Is this how government works together?' 'I didn't know this back-story?' Learners find this interesting but it may not directly lead to them acquiring policymaking skills. It is beyond inductive learning. It inspires ethos, a sense of belonging, which is very powerful." (Instructor B)

> "The case studies were really interesting and enlightening, so more sample case studies (as optional reading, maybe)." (Respondent)

A consistent idea that emerged was the use of shorter structured stories in learning. Conciseness and format were as important as the substance of the content itself. Learners were also drawn to shorter and more concise case studies with some degree of interaction.

> "Length has become something of a concern. Patience for case studies is very thin. The length is something that people don't have patience for anymore. They are not doing a degree programme and they don't have patience for a long case study. Case studies have evolved. They don't have to be written down. They can be videos, podcasts, etc." (Instructor B)

The three themes are linked by two instructional strategies—learning through Inquiry and learning through practitioner stories. The former enables policymakers to develop critical thinking skills while the latter develops policy domain knowledge and policy sensibilities.

Both are essential competencies for policymakers to integrate policy theories with practitioner experience (Figure 1).

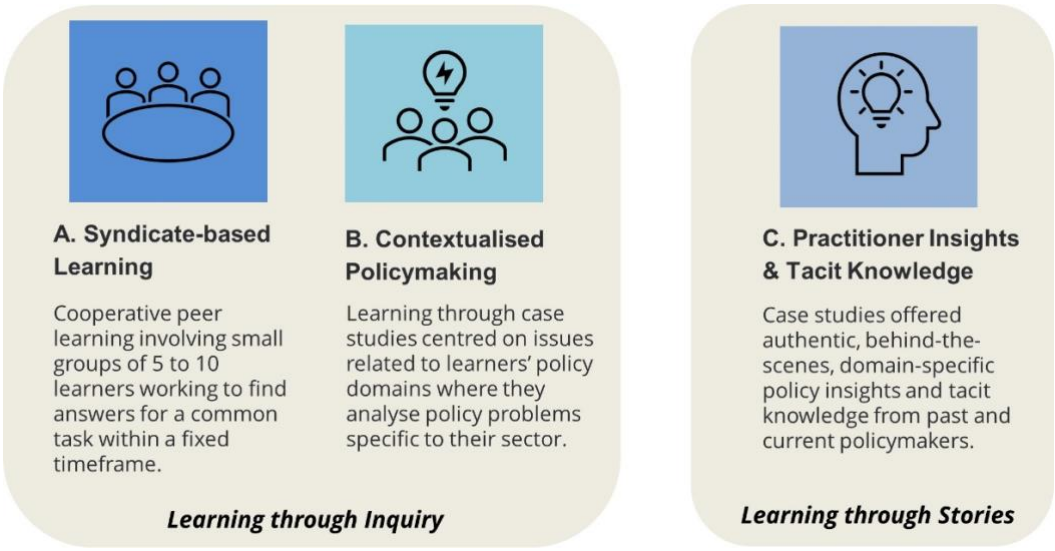

Figure 1: Overview of Research Findings

Conclusion

From this research, it can be concluded that learning with case studies is useful and relevant to the development of policymaking competencies, but they serve different functions in continuing education of policymakers. First, policy domain knowledge is integral to policymaking, alongside other policy skills such as critical thinking, sense-making, communication, etc. At the core of understanding the praxis of policymaking lies the tacit and practical knowledge of policy veterans. All of which are essential to the development of policy-related competencies. Second, case studies serve a dual function in the development of foundational policymaking competencies. They are used for inquiry-based learning and story-based learning. Both types of learning are needed for competency development of policymakers (Figure 2).

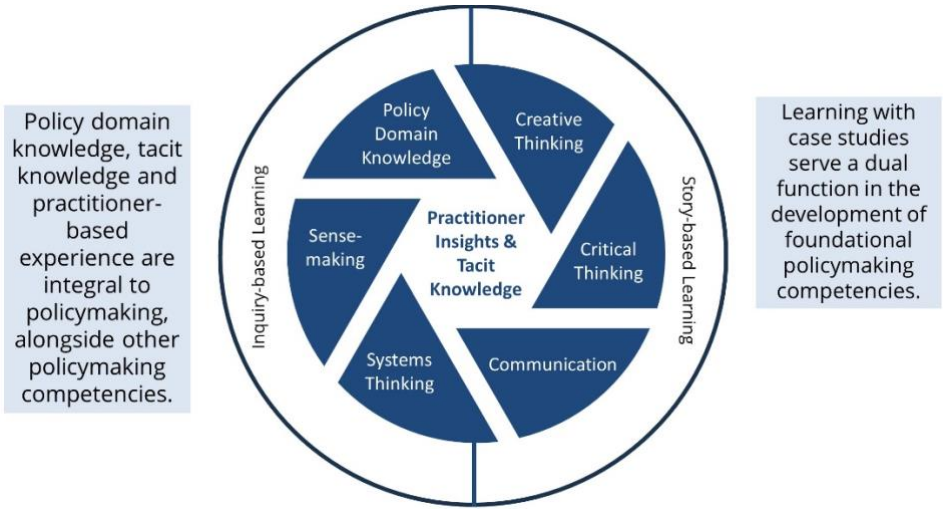

Figure 2: Overview of Research Findings

The composition, design and usage of case studies in both forms are dependent on the learning goals, learner motivations and learning preferences. For adult learners in continuing

education programmes, learning with case studies for policymaking is more effective if case studies are situated in the learners' policy domains. Simply because policy is not developed in a vacuum and is situated within specific operating contexts with social, political and economic stimuli, the context in which policy is made and the understanding of the policy domain and the context in which policy is made is part of policymaking and a much-needed competency. This echoes the research by Collins, Green and Hunter (Collins et al., 1999) which emphasised the importance of linking policy context with policy process to strengthen policy analysis. Clearly, there are benefits of using domain-specific case studies in foundational policy programmes. However, it may be challenging to implement. Policy classes would have to be customised to specific groups of learners which may be resource-intensive and difficult to scale.

In foundational policy programmes where learners could benefit from deeper learning from the knowledge and experience of veteran policymakers, a variety of case studies in different modalities could be designed and curated to meet different learning needs, as well as offer a wider array of learning experiences. Programme design could vary to include a combination of teaching cases for facilitated, inquiry-based learning and story-based cases for self-directed learning.

Whether for inquiry-based or self-directed story-based learning, case studies are effective in the development of policymaking competencies because they provide "a focal point around which analysis, experiences, expertise, and observations can be exchanged" (Harling and Akridge, 1998, p. 3).[4] According to Barnes, "a good case is not just a history; it relates an event—or sequence of events—that contains enough perplexities to inspire a rich educational discussion. The goal of a good case is to present rich data coherently" (Barnes et al., 1994, p. 71–72).[5]

There are differences in writing and designing a case study for facilitated learning in a classroom setting or for self-directed, self-paced learning by adult learners. Learning with cases is effective only if there are purposefully designed, well-crafted narratives and engaged learners. The way the case study narrative is structured, sequenced, presented and distributed could be vastly different depending on how it is used. There is scope for further research on how to design a good case study to achieve different learning goals that are useful to adult learners in developing policymaking competencies.

Virtual Linguistic Landscape of Saudi Arabia's Language Policy in Higher Educational Institutions' Websites

Nadine Emirey Lacsina, Al Yamamah University, Saudi Arabia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study aims at examining Saudi Arabia's language policy through the virtual linguistic landscape (VLL) of the kingdom's higher educational institutions' websites. The study sought to reveal the languages evident in the university websites, their informational and symbolic functions, and the current language situation of the Kingdom. Results reveal that there are four available languages; English, Arabic, Spanish and French. However, most of the university websites only offered English and Arabic. Hence, multilingual accessibility was not strongly observed. The informational function reveals the speech communities present mainly spoke English and Arabic. Also, it is revealed that highly populous non-Arabic speaking expatriate nationalities were not recognized in terms of language inclusion in the websites, proving the value that the institutions assign to English and Arabic. On the other hand, English was deemed to be a tool to disseminate information to non-Arabic speaking users. In terms of language dominance, English emerged to be valued more than Arabic as reflected through most university websites' preference for English as their default language. The use of English was driven by international collaborations, global ranking efforts, benchmarking curriculums, preparation for Vision 2030, spread of Islamic faith, and better international representation. Considering all the findings vis-à-vis the Kingdom's language policy, the study reveals that the observed bilingual nature of university websites' VLL reflected the country's current language policy.

Keywords: Virtual Linguistic Landscape, Language Prestige, Informational and Symbolic Functions, Websites, Saudi Arabia

Introduction

Studies on language use in public spaces have spurred research in semiotics, sociolinguistics, applied linguistics, and discourse analysis. Landry and Bourhis (1997) introduced the concept of 'linguistic landscape' (LL), focusing on language in public signs. Recent research has expanded to the 'virtual linguistic landscape' (VLL), as noted by Ivkovic and Lotherington (2009), which examines language use in digital environments. VLL mirrors LL by exploring language hegemony, policy, learning, and multilingualism. Biro (2018) emphasized that virtual signages enhance LL studies by examining community language practices. Despite its growing popularity, VLL remains a newer field requiring further research across various online platforms.

As countries adapt to an expanding global trade environment, the interplay between government policies and their sociocultural effects becomes increasingly important. One significant aspect of this is language policy, which encompasses the rules and laws that directly impact a nation. Language policy is defined as the outcome of a planning process aligned with national goals, including national language planning (Jernudd & Das Gupta, 1971). Governments exert influence over institutions, particularly education systems, to perpetuate language policies at various levels for diverse purposes. Shohamy (2006) emphasizes that authorities implement language policies not only directly but also through agents like schools and universities, which help disseminate both official and de facto policies. This highlights the mechanisms through which policies are executed and their implications.

In the context of virtual linguistic landscapes (VLL), the analysis of university websites reveals how language policy is manifested. Gomaa (2020) points out that the visibility and presence of language on these websites contribute to a perceived hierarchy of language within a specific context.

Symbolic and Informational Functions of LL and VLL

Linguistic landscape has two functions which are informational and symbolic (Landry & Bourhis, 1997). The informational function of LL serves as an attributive marker of the language community which lives in a geographical territory. Because of this, LL helps to make apparent the territorial restrictions of the specific language group staying in adjoined territories, through clear-cut language boundaries. On the other hand, the symbolic function of LL serves as an indicator of ideology due to the fact that languages have their own value and status, hence the prevalence of a particular language on public signs can symbolize the strength of a certain language community in a certain location. Not only does it show the vitality of the in-group's language, but it also shows how that particular language community can have control on key sectors, such as economy, media, education, and civil administration (Landry & Bourhis, 1997). On a different note, Ivkovic and Lotherington (2009) exclaims that the informational function is to state a fact and inform people of events and can be measured by the successful delivery of information and the relevance of the content presentation. On the other hand, symbolic function goes beyond the objective of informing and stating a fact, rather it involves the analysis language choice and its use to present the content.

Multilingualism and Virtual Linguistic Landscape

VLL, as an extension of linguistic landscape, also addresses questions about multilingualism, which is a given since VLL is delocalized, hence the languages available in the virtual space can cater to as many users as possible. According to Ivkovic and Lotherington (2009), multilingual options and choices have increased significantly due to the fact that the web is continuously evolving hence increase in multilingual capabilities through computer-mediated communication can be evidently seen.

Studies on multilingualism open more opportunities to look into language choice and provide a safe space for minority languages. For instance, in a study conducted by Thorne and Ivkovic (2015) who looked into plurilingual interaction on Youtube, their study revealed that the commentsection of Youtube and other social media platforms open opportunities to study multilingual processes. Although cyberspace propagates the use of many languages as in the case of Sperlich (2005) who underscored that although English is the lingua franca in virtual space, other languages have been increasingly visible and that multiple language access and exchanges have been made possible through multilingual pages, some research also exclaims that the use of English in cyberspace hinders the propagation of other languages online.

Language Policy and Planning and Virtual Linguistic Landscape

VLL can also provide substantial insights about language policy and planning. In fact, languagepolicy and planning has a key role in linguistic landscape (Hult, 2018), which is the physical counterpart of VLL. For instance, the relationship between LL and language policy can be seen inthe studies of both Cenoz and Gorter (2006) who investigated multilingualism in the Netherlandsand Spain. Their study revealed that public signs in Spain were dominated by the minority language as compared to the signs in the Netherlands, hence, reveals the stronger language policyin Spain which was aimed at protecting and propagating the use of Spain's minority language. In another study by Rosendal (2009) on Rwanda-French bilingualism and Rwanda-French-English trilingualism, his study revealed that the positioning of languages on signs in markets andnewspaper affects not only the people's usage of both the national and official language, but alsothe status of non-African languages.

Linguistic Landscape and Language Situation in Saudi Arabia

Saudi Vision 2030 was announced in April 2016 by the Crown Prince Mohammed bin Salman as an introduction to the country's shift in its strategy to better achieve global status as an economic force. Despite the country's rich natural reserves of oil, the decrease of international use for this resource is central to the government's tactic to shift its investments towards cultivating the manpower that is its youth. Hence, one of the more significant ways to carefully develop its humancapital is through the crafting of an educational sector that caters to adaptability in an ever- changing market (Alzahrani, 2017). With these, the scarce linguistic landscape studies done in the kingdom reflects the country's efforts to embrace multiculturalism which is manifested through bilingual public signs in both the physical world and the virtual space.

Language Policy and Planning in Saudi Arabia

Saudi Arabia's national and official language is Arabic which can be classified into three: Classical Arabic, Standard Arabic, and Modern Standard Arabic (Alhaider, 2018). There are

about 220,000,000 Arabic speakers in the world and Arabic is one of the most used languages on the internet as revealed in the research conducted by Benaida and colleagues (2018). Based on the official educational policies as stated by the Ministry of Education, Arabic is the medium of instruction in all subjects; however, students are taught at least one foreign language which is English. Students, especially in the public schools are strongly encouraged to read, write, and speak Arabic in order to maintain students' mother tongue and avoid code-switching which may impair their proficiency in Arabic (Payne & Almansour, 2014). Furthermore, Arabic is a major subject and is taught at all levels regardless of the type of school--public or private.

Despite the important and beneficial results of the earlier research on virtual linguistic landscape, further investigation on language choice, language representation and language policy are needed because cyberspace offers varied, complex network of information. In addition, majority of the research done using these networks focused their data analysis using either government-run websites and portals or social media platforms. Hence, little research is done in order to examine the linguistic phenomena in privately- owned websites across different genres.

Statement of the Problem

The study generally aimed to examine the language policy of Saudi Arabia as manifested in the virtual linguistic landscape of both the government and private universities. Specifically, this study will answer following research questions:

1) What languages are evident in the websites of public and private universities?
2) What informational and symbolic functions do the languages in the websites reveal?
3) How do the languages used reflect the language policy and the language situation in the Kingdom?

Theoretical Frameworks

The first framework is Ivkovic and Lotherington's (2009) informational and symbolic functions of VLL. The informational function conveys facts and events, measured by effective communication and content relevance. The symbolic function analyzes language choice and its presentation.

The second framework is Spolsky and Cooper's (1991) three-conditional model, which offers insights into language choice through three conditions: 1) the sign-writer's skill, 2) the presumed reader, and 3) the symbolic language condition.

The third framework is Fasold's language prestige (2006), which explains that language prestige encompasses not only the dominant language but also the preferred languages within speech communities.

Method

This research aimed to examine the language policy of the Kingdom of Saudi Arabia as reflected in the virtual linguistic landscape of educational institutions, utilizing a descriptive qualitative design. This approach facilitated the analysis of the languages used, available, preferred, and the target audience of the websites studied. Due to the information overload on

websites, not all content was analyzed; instead, selective focus was applied, a process described by Guest and colleagues (2012) as "winnowing data."

Corpora of the Study

The study's corpora consisted of public and private Saudi university websites accessible via search engines like Google, including 18 sites from six provinces: Makkah, Riyadh, Eastern, Madinah, Asir, and Al-Qassim. Purposive sampling was employed to select these provinces, allowing the researcher to effectively address the research question (Creswell, 2014). The provinces were chosen based on factors like population, location, and the presence of at least one public and one private university.

Data Analysis

First, each website was analyzed for the languages used on the front page and in the language tab, with a frequency count identifying the most common language across the sites. Second, this frequency data allowed for an analysis of the informational function of VLL, revealing different speech communities. Third, language dominance and preference were assessed using the frequency count, designating the most frequent language as dominant. The order of languages in the translation lists was also recorded. Fourth, Spolsky's and Cooper's (1991) three-conditional model was applied to examine language choice in depth. Fifth, the symbolic function of VLL was analyzed to uncover the reasons behind language dominance and preference. Next, the value assigned to each language by the university websites was examined to determine which languages held more prestige among local speech communities. Finally, the initial interpretations and analyses were compiled to assess whether the VLL of the university websites accurately reflect these findings.

Results and Discussion

Evident Languages in the Websites of Public and Private Universities

A key aspect of linguistic landscape studies is the collection of languages in public spaces, with sign counting being a primary focus (Barni & Bagna, 2015). Similarly, virtual linguistic landscape studies gather data on languages used online, providing insight into linguistic communities and territorial boundaries.

To identify the prominent languages, frequency counts recorded the languages available on the websites. The analysis categorized the websites into three groups: 1) monolingual, 2) bilingual, and 3) multilingual. Of the websites analyzed, 11% (2) were monolingual, 83% (15) were bilingual, and 6% (1) was multilingual. The available languages included English, Arabic, French, and Spanish.

Table 1: Languages Available in the University Websites

Languages Available	Number of Universities	Percentage
English	18	100%
Arabic	16	89%
French	1	6%
Spanish	1	6%

Table 1 outlines the languages available on university websites. All universities provided English, often as the default language on their landing pages. However, only 89% (16 universities) included Arabic, with King Fahd University of Petroleum and Minerals and Prince Mohammad bin Fahd University offering only English.

Regarding French, only King Abdulaziz University provides this option, reflecting the decline in French teaching in the kingdom since its removal in 1970 (Barnawi & Al-Hawsawi, 2016; Hudhayri, 2021). King Abdulaziz University also offers Spanish, which accounts for 6% of the total options across the 18 universities. These findings align with Korpela's (2003) research on the prominence of multiple languages in international communication.

In terms of multilingualism, only King Abdulaziz University offers accessibility to English, Arabic, French, and Spanish, allowing users to select their preferred language on its website (see Figure 1).

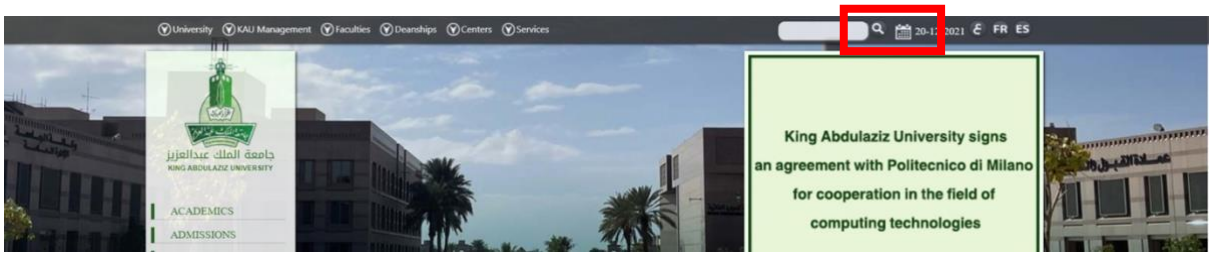

Figure 1: King Abdulaziz University's Multilingual Accessibility Option

Table 2: Number of University Websites With English and Arabic Options

Default Language	No. of Universities	Percentage
Universities with both English and Arabic as available languages	16	89%
Universities with only English as the available language	2	11%
Total	18	100%

Most universities provide a bilingual option, allowing users to choose between Arabic and English, which enhances user comfort while browsing for information. This aligns with

Farivar's (2011) study, which found that website audiences feel more at ease when information is presented in their language rather than merely translated.

The current study found that 89% (16 universities) utilized both languages on their websites, while 11% (2 universities) exclusively used English: King Fahd University of Petroleum and Minerals and Prince Mohammad bin Fahd University. King Fahd University was a pioneer in using English as a medium of instruction (EMI) for courses like medicine and engineering, highlighting its strong emphasis on the English language (Barnawi & Al-Hawsawi, 2016).

Table 3: University Websites and Their Default Languages

University Websites	No. of Universities	Percentage
University websites using English as their default language	10	56%
University websites using Arabic as their default language	8	44%
Total	18	100%

Table 3 shows that most university websites, including King Saud University, Al Imam Muhammad Ibn Saud University, and others, use English as their default language. This facilitates access to information for foreign visitors, while Arabic speakers must locate the language option to switch to Arabic.

Specifically, 56% of the websites default to English, while 44% (8 universities) use Arabic, including King Faisal University and King Khalid University. This setup aids Arabic speakers, making navigation easier, but non-Arabic speakers must convert the page to English.

These findings align with Payne and Mansour's (2014) study, which indicated that English competes significantly with Arabic, posing a potential threat to national identity and local beliefs in favor of Western influences.

The Informational and Symbolic Functions of the Languages Used in the Websites

Informational Functions of the University Websites

The languages documented on the websites indicate that: (1) Saudi Arabia has non-Arabic speaking communities; (2) minority languages representing small linguistic communities are absent; (3) both Arabic and English serve as communication mediums. Additionally, following Ivkovic and Lotherington's (2009) definition of informational function, (4) the primary purpose of university websites is to deliver essential information.

The Presence of Non-Arabic Speaking Nationalities in Saudi Arabia

The informational function reflects the language community in a territory (Bourhis, 1992). The virtual linguistic landscape of university websites reveals both the speech communities and territorial restrictions in the study regions. Results show that the population is nearly split between Saudis (56%) and foreigners (44%). Among foreigners, Indians, Syrians, and

Pakistanis are the predominant nationalities, as noted by Global Media Insight (2022) and the United Nations (2019).

This cultural and linguistic diversity has created competitiveness among speech communities (Holmes, 2013). Habtoor (2012) highlighted that nearly half of Saudi Arabia's population consists of non-Saudis from various geographical backgrounds, contributing to a rich cultural and linguistic environment. Table 4 presents the population of Saudis and non-Saudis in each province of Saudi Arabia as recorded by the General Authority for Statistics in 2017.

Table 4: Population of Saudi and Non-Saudi in the Major Provinces in Saudi Arabia

Province	Population				Total
	Saudi	Percentage	Non-Saudi	Percentage	
Riyadh	4,583,751	57%	3,430,927	43%	8,014,678
Makkah	4,516,577	53%	4,041,189	47%	8,557,766
Eastern	3,090,272	65%	1,697,103	35%	4,787,375
Asir	1,750,131	79%	461,744	21%	2,211,875
Madinah	1,376,244	65%	756,435	35%	2,132,679
Qassim	1,009,543	71%	414,392	29%	1,423,935

The population data indicates that more than half of residents in the provinces are Saudis, reflecting the government's efforts to enhance education, trade, and technology, which encourage Saudis to remain in the kingdom. Additionally, the Vision 2030 initiative attracts foreigners, aiming to position Saudi Arabia as a leading global country by boosting tourism and business.

Notably, in populous provinces like Riyadh and Makkah, the populations of Saudis and non-Saudis are nearly equal, suggesting a rich diversity of speech communities and increased language interaction. In contrast, provinces like Eastern, Asir, Madinah, and Qassim show a significant disparity between Saudis and non-Saudis.

Analyzing the specific populations and available languages reveals distinct speech communities in different provinces. For instance, in Qassim and Madinah, universities further apart tend to reflect differing language preferences; while the closer universities default to Arabic, the more isolated university opts for English.

Absence of Minority Languages

Analysis reveals that while university websites reflect existing linguistic communities, they lack representation for minority languages spoken by foreign nationals whose primary language is not Arabic. According to Table 4, although 16 nationalities are noted—8 of which were listed by the United Nations in 2019—none of the languages spoken by non-Arabic speakers appear on the websites. While Yemenis, Egyptians, and others speak Arabic, nationalities like Indians, Pakistanis, and Filipinos use languages not represented.

This absence highlights that, despite their significant populations, these languages are not recognized on university websites, reflecting the dominance of Arabic and English. This situation aligns with Kelly-Holmes and Pietikainen's (2013) observation that minority languages can be overlooked even when they form a sizable demographic. This contrasts with findings from Ivkovic and Lotherington (2009) and Kelly-Holmes and Pietikainen (2013), which advocate for multilingualism and the acknowledgment of minor languages on websites.

English as a Medium of Communication

The absence of minority languages on the websites indicates that English not only represents a major linguistic community but also serves as a lingua franca for non-Arabic speakers. This suggests that both Arabic and English are used by university website creators to communicate with their audiences.

Analysis of language presence shows that four languages are available (as noted in Table 1), with only one university offering French and Spanish; the rest provide only Arabic and English. English is the default language for 56% of the websites (10 out of 18), while Arabic accounts for 44% (8 out of 18). This highlights that the lack of representation for minor languages necessitates the use of English to reach non-Arabic speakers.

These findings align with Gomaa's (2020) study on Bahrain's government e-portal, where Arabic targets Arabic speakers and English addresses non-Arabic communities, emphasizing linguistic rights despite the exclusion of other languages.

University Websites as a Means to Deliver Information

In addition to territorial restrictions and the representation of linguistic communities, the study examined the informational function of university websites, focusing on their ability to convey facts and reference events (Ivkovic & Lotherington, 2009). This analysis revealed that the primary purpose of these websites is to provide vital information about the universities, emphasizing the efficiency and relevance of their content.

For Riyadh province, all universities included sections like "About Us," colleges, research, faculty, student life, news, e-services, and social media links. Important updates are found in the main content area as users scroll. In Makkah, common tabs include "About the University," research, student experience, admissions, and social media. News and announcements are prominently displayed on the landing page. In the Eastern province, universities feature sections on background, faculty, student life, and research, with facts and figures available in the website body. Asir province websites provide links for languages, contact details, and colleges, along with news and announcements in the body. Qassim universities offer links like language options, university background, admissions, and e-services, while also featuring news and employee portals. Lastly, in Madinah, common links include language options, student and staff information, research, admissions, and services, with news and statistics presented in the body.

Symbolic Functions of the University Websites

The languages featured on the university websites reveal several symbolic functions: (1) the rapid spread of English; (2) its status as a prestigious language to attract students and faculty;

(3) its importance as a language to learn; (4) its role as a gateway to global growth; and (5) the influence of location on language choice.

The symbolic function of these websites reflects underlying ideologies linked to language preferences. As Landry and Bourhis (1997) noted, this function indicates the importance certain communities assign to specific languages, highlighting their strength and control over sectors like education. The status and prestige associated with particular languages further explain their prevalence.

Three key theories guide this examination of the websites' symbolic functions: Spolsky and Cooper's (1991) three-conditional model for language choice, which incorporates the presumed reader condition and symbolic language condition, and Ivkovic and Lotherington's (2009) insights. Additionally, the status and prestige attributed to specific languages are underscored by Fasold's (2006) concept of language prestige.

The Fast Spread of English

The data in Table 1 shows that all 18 universities (100%) offer English for website navigation, while 16 universities (89%) provide Arabic alongside English. According to Table 3, 56% of the universities use English as their default language, compared to 44% that default to Arabic.

Despite Arabic being the official language of Saudi Arabia, English has become the dominant language on these websites, reflecting its role in disseminating information in the kingdom. This trend mirrors findings by Giannakoulopoulos and colleagues (2020), which noted English's prevalence across various EU websites, including monolingual sites that sometimes use English instead of the national language. Similarly, Nunes-da-Cunha and colleagues (2019) highlighted how institutions strive for global reach through English, which has become the common language in Europe. Additionally, Mongeon and Paul-Hus (2016) found that English is the most-used language in academic journals, indicating a preference among non-native authors to publish in English.

Websites' Utilization of English as a Means to Attract Students and Faculty

The emergence of English as the dominant language on university websites prompted the use of Spolsky and Cooper's (1991) three-conditional model to analyze language choice motivations. The first condition, regarding the sign-writer's proficiency, underscores the need for accurate information dissemination. While many websites underwent proofreading, some errors in spelling, grammar, and punctuation were evident, indicating varying proficiency levels. For instance, typographical errors included misspellings like "univeristy" and unnecessary capitalization in titles.

The second condition, the presumed reader condition, focuses on the language users are expected to understand. All websites offered both Arabic and English, targeting local and international audiences. English is employed to appeal to a broader audience, as noted in Giannakoulopoulos and colleagues (2020). Universities using English as the default language also aim to attract international collaborations.

The third condition, the symbolic value condition, connects to Ivkovic and Lotherington's symbolic function. Websites were categorized into three types: (1) English-only, (2) English

as the default language with Arabic options, and (3) Arabic as the default with English options. King Fahd University and Prince Mohammad bin Fahd University exemplify English-only sites, indicating a preference for a global audience. Most universities used English as the default, reflecting a desire for international recognition, while Arabic-default sites aimed to attract Arabic-speaking visitors.

The prioritization of Arabic underscores its cultural significance, especially given Saudi Arabia's status as a center for Islamic teachings. Initiatives to promote Arabic in education and business further reinforce its importance. While some universities provide English options, key content often remains in Arabic, indicating a focus on local Arabic-speaking populations. Overall, these findings reflect a balance between global aspirations and local cultural identity.

English as an Important Language to Learn

The dominance of English on university websites aligns with findings from various studies (Kelly-Holmes & Pietikainen, 2013; Ivkovic & Lotherington, 2009; Berezkina, 2018; Koskinen, 2013) that highlight English as a lingua franca and the most utilized language online. In Saudi Arabia, where English is the official foreign language, its strong presence on university websites, alongside Arabic, reflects its significance. This mirrors Huhtala and colleagues (2021), who noted English as a neutral choice online, and Lee (2016), who emphasized its prevalence on social media, even among those with lower proficiency.

These findings support earlier claims by Burchfield (1985) and Coupland and Bishop (2007) about the international prestige of English, which can lead to feelings of deprivation for those who do not speak it.

To further validate these conclusions, Fasold's (2006) concept of language prestige illustrates how academic communities assign value to languages. Analysis shows that 10 out of 18 university websites use English as their default language, with 2 using it exclusively. This dominance reflects the high regard for English within the universities and their communities, as evidenced by the order of language presentation on some websites.

The high prestige associated with English indicates its importance as a language to learn, serving as a gateway to scientific knowledge and the propagation of Islamic faith (Elyas & Badawood, 2016). English's status is further reinforced by its inclusion in educational curricula and scholarship programs that promote study in English-speaking countries (Alshahrani, 2016).

English as a Gateway to Global Growth

The findings align with Saudi Arabia's current socio-political and economic context as it seeks to thrive on the global stage. The prestige that academic communities assign to English reflects its importance in the global market, supported by analytical data. Learning English benefits Saudis and enhances the country's economic capacity for global relations (Alrashidi & Phan, 2015). Politically, English aids the Saudi government in expanding its military capabilities (Cordesman, 2002).

This aligns with the economic goals outlined in Vision 2030, as universities recognize the need for linguistic adaptation through international collaborations, faculty diversification, and

partnerships with prestigious institutions. For example, KFUPM has been a pioneer in using English as a medium of instruction (Barnawi & Al-Hawsawi, 2016). Higher education institutions are also focusing on improving students' English proficiency, as it is essential for engaging in international scientific and trade activities, reflecting this in their missions and objectives.

Influence of Location on Language Choice

A significant finding from the analysis reveals a connection between language preference and location. In three of the six provinces—Asir, Qassim, and Madinah—Arabic is prioritized on university websites, reflecting their demographics: 79%, 65%, and 71% Saudi populations, respectively. This suggests that language choice is influenced by the dominant speech communities in these areas. This aligns with Giannakoulopouluos and colleagues (2020), who noted that culture, geography, and population shape language use on websites. Similarly, Hippala and colleagues (2019) and Loikkanen (2020) found that location heavily influences language choices on social media.

However, Sulaiman Al Rajhi University and University of Prince Mugrin differ from this trend; both use English as their default language despite being in Qassim and Madinah. Their choice is driven by collaborations with international entities, which enhance the credibility of their academic programs.

Language Policy and Language Situation in the Kingdom As Reflected by the Virtual Linguistic Landscape of the Websites

The analysis reveals a strong connection between language preference and location, highlighting three key points about bilingualism in Saudi Arabia: (1) alignment of virtual linguistic landscape (VLL) with local languages (LL), (2) emphasis on English, and (3) bilingualism in cyberspace, with English serving as a lingua franca for minor linguistic groups.

Bilingualism is evident, as 15 out of 18 university websites offer both Arabic and English. Despite English being the dominant language, some universities in Saudi-majority areas still use Arabic as their default. This finding supports prior studies (Blum, 2014; Alhaider, 2018; Alfaifi, 2015) that consider Saudi Arabia bilingual based on linguistic landscape analyses.

The prevalence of English on university websites reflects its growing significance in the kingdom, especially for communication with the increasing foreign population (Al-Tamimi, 2019). The government recognizes the need for English in science and technology and aligns its language policies with global economic integration.

Although Arabic remains the official language, the dominance of English on these websites challenges previous claims of a heavily multilingual virtual landscape (Almoaily, 2019; Ivkovic & Lotherington, 2009), as only Arabic and English are primarily used. Notably, this trend underscores the limited recognition of other foreign languages, emphasizing English as a common ground for non-Arabic speakers. This aligns with Kelly-Holmes and Pietikainen (2013), who noted that English is often used to address diverse audiences.

The current language situation reflects the country’s language policy, where both English and Arabic are officially recognized. English holds a prominent role, supported by historical

policies to teach English as a foreign language (Al Haider, 2018). The shift towards English in education and the economy illustrates the government's efforts to modernize and adapt to globalization (Barnawi & Al-Hawsawi, 2016; Al-Tamimi, 2019).

The focus on English also arises from socio-political motivations, as language policy evolves alongside trade and modernization efforts. The emphasis on English, especially post-9/11, reflects a desire to foster cultural acceptance and promote a peaceful image of Islam (Barnawi & Al-Hawsawi, 2016; Payne & Mansour, 2013). The Ministry of Education's policies aim to prepare students to engage globally while maintaining cultural integrity (Elyas & Badawood, 2016).

Conclusion

The study examined the virtual linguistic landscape of higher education institutions in Saudi Arabia to analyze the government's language policy as reflected on their websites. A sample of 18 university websites from the most populated provinces was analyzed using the informational and symbolic functions (Ivkovic & Lotherington, 2009; Landry & Bourhis, 1997).

The analysis revealed that 15 out of 18 universities offered bilingual options in English and Arabic, reflecting the speech communities in their regions. However, minor linguistic communities of migrants and foreigners were largely unrecognized on these websites, indicating a lack of inclusivity. English was primarily used to present important information to foreign users, while Arabic dominated in areas with a higher Saudi population.

The study also highlighted that the dominance of English as the default language was a strategic choice to cater to international audiences, aligning with the kingdom's efforts to globalize its education system. The use of English signifies its prestige and importance for information dissemination, especially in academic contexts.

Applying Spolsky and Cooper's (1991) three-condition model, the study found some websites contained language errors, impacting the sign-writer's skill condition. The presumed reader condition underscored that universities in mixed-population areas targeted foreigners, while those in Saudi-dominant areas focused on local Arabic speakers.

Furthermore, the websites' preference for English reflects a broader trend towards embracing globalization, consistent with the kingdom's Vision 2030 initiative aimed at attracting foreign investment and talent. Partnerships and collaborations with internationally recognized universities were crucial factors influencing the language choice, enabling these institutions to leverage global academic standards and enhance their credibility. Additionally, the analysis pointed to a growing recognition of the role of English in scientific and technological fields, illustrating how language policy is shaped by economic and educational imperatives. This shift not only aims to improve the proficiency of Saudi students but also positions the kingdom as an emerging hub for international education and commerce. Overall, the findings underscore the complex interplay between language use, cultural identity, and globalization in Saudi Arabia's academic landscape.

Official Conference Proceedings

Abstract
"Recruitment" is an important key and strategic tool for businesses to gain competitive capital and advantages. Businesses should disclose more accurate information about internal conditions and real job previews in recruitment activities to help job applicants understand the work environment and make the right decision to seek employment. This study used the *thinglink* digital platform to design an educational game that simulates the working environment of a hospital nursing station. The learning objectives of the game are: Players take on the role of a new nurse who is soon to enter the workplace, and visit the wards of a hospital for a workplace visit. The game utilizes *Google Forms'* highly interactive situated questions and answers to allow the player to explore the salary and benefits as well as the realistic work environment. The study involved 22 nursing students over 18 years of age in Taiwan, and the results showed that the learners' mean scores on flow, game elements, and game feedback were significantly higher than the median (i.e., 3) on the five-point Likert scale, and activity anxiety scores were lower than 3. In addition, the qualitative feedback indicated that the recruitment through situated interactive simulation games is vivid and interesting, and it gives the player a feeling of being in the real world and a more comprehensive understanding of the workplace environment. The information obtained from the interactive feedback can enhance the player's memory of important information, especially salary bonuses, annual leave, etc., which allows the player to consider in-depth the willingness to enter the hospital. Compared with the traditional campus recruitment, it can help the applicants to understand the hospital's salary and benefit information. Therefore, the results of this study suggest that the "recruiting game" through the situated interactive simulation mechanism is more effective in enhancing the applicants' comprehension of the salary and benefits and the working environment.

Introduction

Recruitment is a pain point for many organizations, business leaders, and human resource professionals, and a critical key to competitive capital and advantage (Morgan, 2023). According to The Resilience Revolution: PwC's Global Crisis and Resilience Survey 2023, which explored the results of 1,812 business leaders around the world, the impact events they are most worried about in the next two years include employee retention and recruitment difficulties, according to Taiwan Union of Nurses Association (TUNA) statistics show that the number of first-time registered nurse practitioners has been declining year after year, and the percentage of those actually practicing in hospitals has hit a nine-year low, indicating that attracting talent is particularly difficult as new generations enter the workforce and job seekers' values about work and organizations evolve (Kalleberg & Marsden, 2019).

In the past, nursing careers were mostly recruited through campus recruiting or hospital websites, and traditional oral, graphic, or video presentations were used to introduce the hospital's working environment and benefits and salaries (Morgan, 2023). Such a lack of interactive presentation fails to present the hospital's internal strengths and characteristics.

When applicants are unable to fully understand the actual working environment of the hospital, they are prone to have high and unrealistic expectations, which may result in the recruitment of talents that do not meet the needs of the organization, which in turn increases the turnover rate (Baur et al., 2014) and affects the team's stability and work efficiency. However, Realistic job previews (RJP), which refers to the provision of a preview of what the job will really be like during the recruitment process, can have a significant impact on improving job retention, reducing turnover, and increasing job satisfaction (Morgan, 2023).

When companies are willing to provide more real information about the organization and the job during the recruiting process, especially important information that is difficult for applicants to access during the job search process (e.g., salary and benefits), it is more likely to help them make more informed job search decisions (Connelly et al., 2011).

Morgan (2023) states that real job previews can include digital interactive simulations of work situations, allowing applicants to take part in an immersive gaming experience prior to an interview is considered to be one of the most effective predictive tools in the recruitment process, and that all learning processes involve 'role-playing', therefore gamification mechanisms demonstrate how participants can be invested in new identities or roles, and that this engagement can be a powerful motivation to promote classroom and workplace deeper learning (Gee, 2003), whilst triggering a sense of engagement, motivation and achievement (Hassan et al., 2021), as well as reducing learning anxiety (Coffland & Huff, 2022).

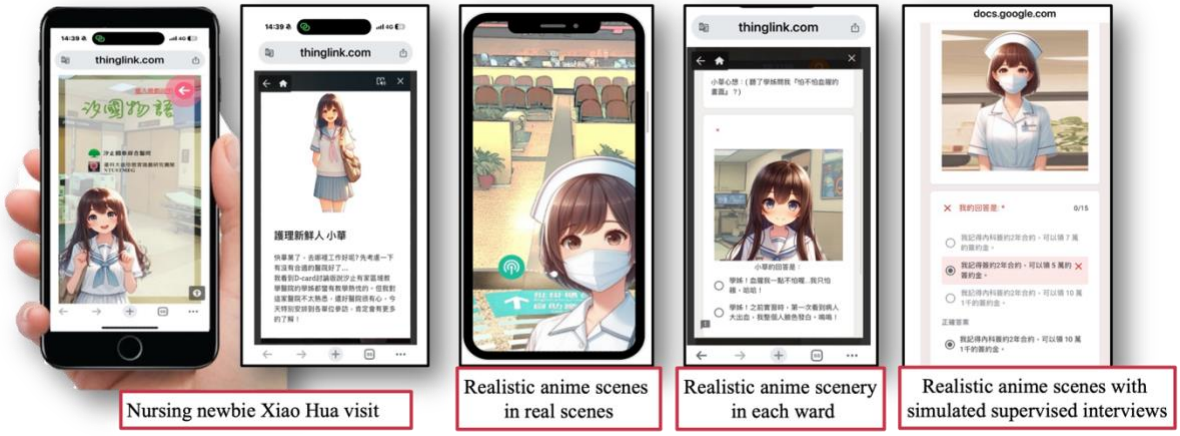

Figure 1: Combination of *Thinglink's* Simulated Situation and *Google Forms'* Highly Interactive Simulation for Role-Playing to Enhance the Understanding of the Workplace

This study utilized the *Thinglink* digital platform to design "The Hospital Story", a contextual educational game that simulates the working environment of a hospital nursing station as shown in Fig. 1. The learning objective of the game is to allow the player to take on the role of a new nursing recruit and conduct environmental visits to hospital wards such as the emergency room, the operating room, the intensive care unit (ICU), the gynaecology and Paediatrics Ward, the medical Ward, and the surgical ward, as shown in Fig. 2. Through the highly interactive simulation provided by *Google Forms*, the player was asked questions to strengthen the memory of important information that the player had explored, such as benefits, vacations, further education, and accommodation costs, as shown in Figure 3, and finally, through the game's "Supervisory Interviews", the player was able to confirm his/her willingness to join the company and his/her level of understanding of the information, so that he/she could understand the work environment more closely with the real situation.

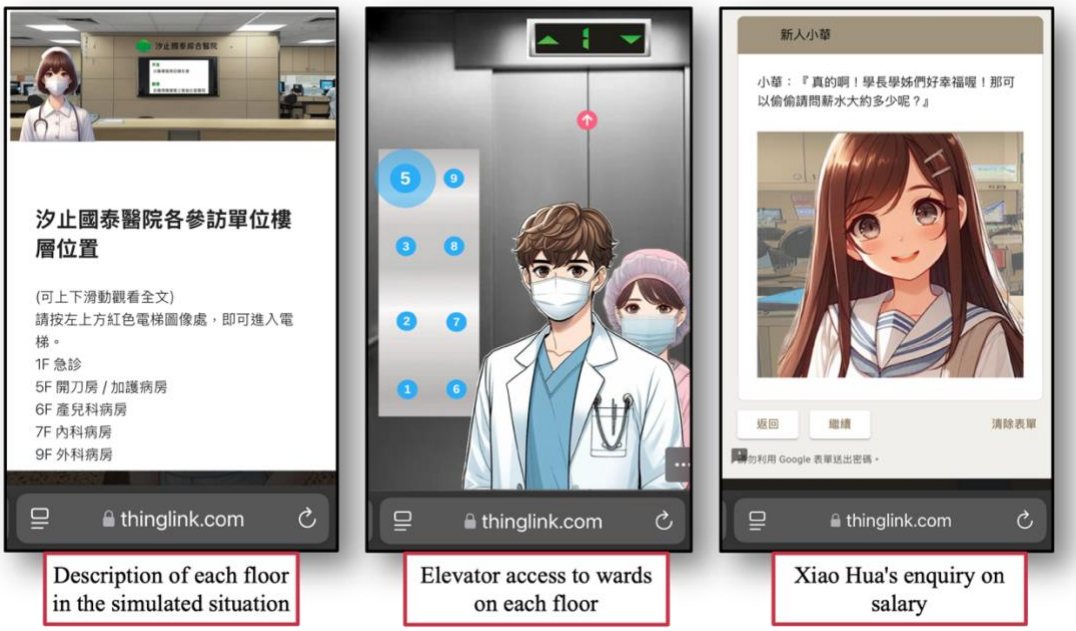

Figure 2: Highly Interactive Simulated Scene Through *Thinglink* and *Google Forms*

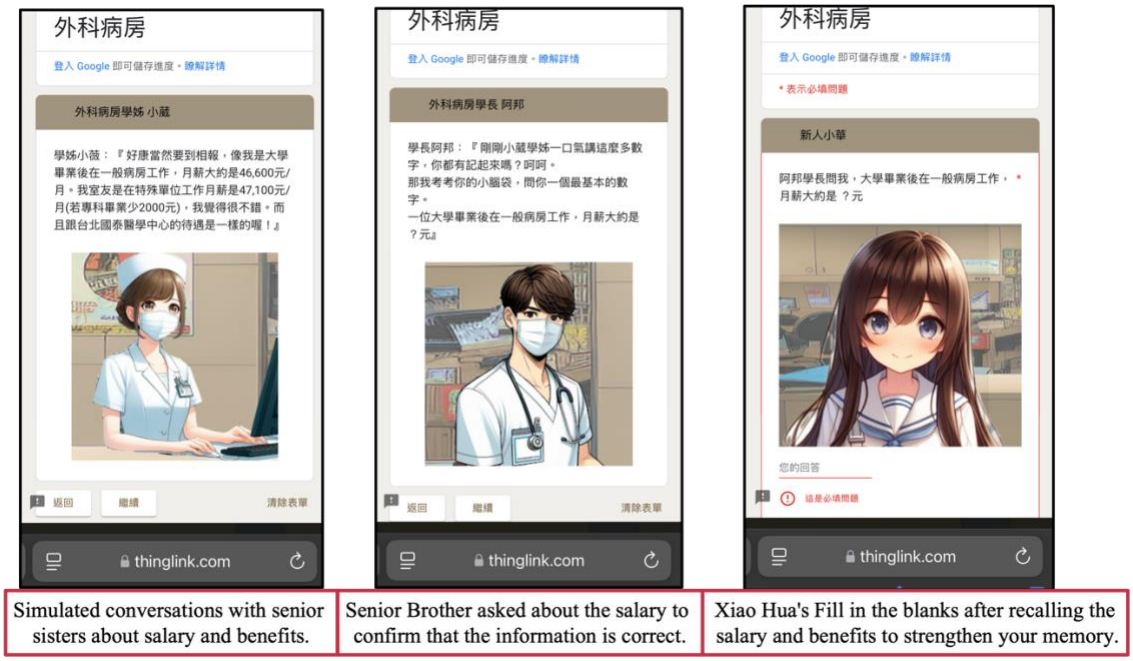

Simulated conversations with senior sisters about salary and benefits.	Senior Brother asked about the salary to confirm that the information is correct.	Xiao Hua's Fill in the blanks after recalling the salary and benefits to strengthen your memory.

Figure 3: Simulation of a Highly Interactive and Realistic Salary Question and Answer Mechanism Through *Thinglink* and *Google Forms*

Methods

This study is a pilot research study, the participants were 22 nursing students over the age of 18 in Taiwan, the way of conducting was 5 minutes of introduction of the game platform and rules, 20 minutes of game time, and 10 minutes of questionnaire survey, this study investigated the flows experiences scale, the activity anxiety scale, the game feedback (perceived usefulness, perceived ease of use), and the game elements. The other part of the questionnaire consisted of 4 semi-structured questions focusing on whether the game mechanism of this study could enhance the learners' understanding of the hospital's welfare policies and increase their understanding of the hospital's working environment.

Results and Discussions

According to the single-sample Wilcoxon Singed-Rank analyses as in Table 1, on the flow experience scale, overall flow (M=4.45, SD=0.46), flow antecedents (M=4.53, SD=0.45), and flow experience (M=4.38, SD=0.53) participants all scored significantly above the median (ie.3). Mean activity anxiety (M=1.93, SD=0.98) scores on the activity anxiety scale were all below the median (i.e., 3). Table 2 scores for participants in game feedback (M=4.49, SD=0.40), game usefulness (M=4.57, SD=0.50), game ease of use (M=4.39, SD=0.35), game elements (M=4.39, SD=0.57), and sense of achievement (M=4.45, SD=0.67) were all significantly higher than the median (ie.3). Through the qualitative analysis, the participants indicated that the game was simple to play, the interactive question-and-answer format could deepen their memory and understanding of the content, it gave them a sense of being in the real world, they could understand the working environment of each department before entering the workplace, they had to memorize the content of the questions and answers, and they could think about their willingness to work in the hospital more deeply.

Table 1: The Mean and Standard Deviation of Learners' Flow and Learning Anxiety (*N*=22)

	M	*SD*	*Z*	*Sig.*
Overall Flow	4.45	0.46	4.11***	0.000
Flow antecedents	4.53	0.45	4.12***	0.000
Flow experience	4.38	0.53	4.11***	0.000
Learning anxiety	1.93	0.98	-3.58***	0.000

Conclusions and Limitations

This study developed a digital contextual role-playing educational game, "The Hospital Story", to enhance the understanding of the work environment. Through the personalized game process, it can effectively enhance the player's engagement, participation, and sense of achievement, and there is not too much anxiety about the activity, and the player also feels that the operation is simple and immersive, which is suitable for mastering the work environment before joining the company to increase the understanding of the work environment. Morgan (2023) pointed out that the immersive game experience that applicants participate in before the interview can be used as one of the tools to predict retention in the recruitment process, so it is suggested that the future research design can be added to the experimental group and the control group, to explore the effectiveness of the recruitment process in depth, and also can be added to the interactive scaffolding of the GenAI in order to increase the interactivity and fidelity of the game situation.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The print media are currently focused on impressive design, creative graphic, and special production techniques to stand out among electronic media. The objective of this study was to create a motivated book sample to promote print media for learning enhancement by using creative design of printing, decorating, and book making. The graphic arts were designed to choose by learners in 3 themes: carnival, underwater, retro through online questionnaires, and the carnival theme was the most interesting. The mock-up of hard cover book sized of 10.63 x 12.28 inches was made by using 350-g art card paper for cover and 260-g art card paper for text with 10 die-cutting pages. The colorful graphic arts were printed on the paper with a wide color gamut of 7-color digital press. The die-cutting pages and pop-up 3D paper art was made using a digital cutter. The content in a book was included of printing systems, printing materials, product samples, special techniques of printing, production process and coating methods. The qualities of the book were evaluated by 3 experts in a printing house. The satisfactions were evaluated by the learners, staffs in the printing house and consumer samples using online questionnaire of 5-level rating scale. The qualities of content, illustration, character, and composition were very good level. The satisfaction regarding to the effectiveness, motivation and book format was very high level. Therefore, the print media using various creative designs could be applied for learning motivation and at the same time promotion of print media production.

Introduction

Advances in technology and digital media are playing an increasingly important role today. To stand out among electronic media, the print media must be improved by focusing on impressive design, creative graphics, and special techniques. To promote print media and provide graduates with practical skills and knowledge about printing technology. Four-year undergraduate programs focusing on printing techniques, materials, and processes, including hands-on experience through projects and practical sessions have been developed at many educational institutions.

There are several techniques to make and decorate the books in the post-press which is the final stage of the printing process which turns the printed materials into printed products such as coating, lamination, die-cutting, folding, binding, trimming, etc. The die-cutting is a technique giving your book a completely unique look and makes it stand out from any other product. The process is used to cut shapes out of the material rather than straight trimming. Die cutting is often used for art books allowing the reader to interested in the decorative designs, bullet holes, and many shape edges. The coating or lamination significantly improved color accuracy and increased contrast, making the printed material more visually appealing, enhance the print quality and the durability. There are two primary types of coatings frequently used in the industry; matte and glossy, each offering distinct advantages based on the desired visual effect and functionality.

Many instructors are looking for ways to get their students hands-on in the post-press course and excited to attend the practice class. As an educational developer and a teacher assistant for undergraduate students at the department of Printing and Packaging Technology, King Mongkut's University of Technology Thonburi (KMUTT), the real example of print media was made to enhance learning and understanding of book making with various decoration techniques. The objectives of study were to design and produce a motivated book sample to promote print media for learning enhancement by using creative design of printing and decorating, to evaluate the qualities of print media by experts, and to assess the satisfaction of instructors and learners sample group. This teaching technique not only helps the students to have more skills, experience, and inspiration for print media production and value adding, but also fostering their self-learning in printing technology.

Methodology

The requirement of instructors for suitable methods of book as a print media production were surveyed using the questionnaire with a Google Form. The Adobe Illustrator was used for graphic design and the Adobe Acrobat Pro was used for book layout and imposition. The appropriate graphic design was selected through three team as follows:

Theme 1: Underwater that is cool tone blue
Theme 2: Carnival that is warm tone red color
Theme 3: Retro that is grey color

The structure and format of book mockup) was created on the real blank paper and the die-cut work with a digital cutting machine was tested for approval. After decision, the PDF file of graphics designed by the Adobe Acrobat Pro was sent to print with the Hp Indigo 12000 Digital Press which can create special hi-fi color printing with 7-color printing: Cyan, Magenta, Yellow, Black, Orange, Violet, and Green for eye-catching. The printed sheet was then laminated with the gloss and matte film before making the die-cut edges with innovative

shape design using ZUND G3 L2500 machine. The book was assembled into a butterfly-style binding with glue spray to make a special book.

The qualities in the format structure and graphics of the book were evaluated by three experts in printing technology. The satisfaction assessment was performed by five instructors and a sample group of thirty persons including graduated students, alumni, and others involved in printing through an online questionnaire of Google Form with 5-point scale, as shown in Table 1.

Table 1: The Criteria of 5-Point Rating Scale for Evaluation

Scale	Scale Interval	Opinion for Quality	Description for Satisfaction
5	4.50-5.00	Excellent	Very Satisfied
4	3.50-4.49	Good	Satisfied
3	2.50-3.49	Average	Neutral
2	1.50-2.49	Poor	Dissatisfied
1	1.00-1.49	Very Poor	Very Dissatisfied

Results and Discussion

After requirement analysis, the mock-up of hard cover book sized of 10.63 x 12.28 inches was then made by using 350-g art card paper for cover and 260-g art card paper for text with 10 die-cutting pages, as shown in Figure 1. The pop-up pages inside the book were made of 260 gsm Silk Card paper. The sticker samples attached in the book were paper and PP material. The graphic images in the book included of 22% drawing, 37% photography, and 41% cartoon. The desired layout format is Step & Repeat and the selected graphic style is Carnival theme with 89% popular voting, as shown in Figure 2.

Figure 2 shows the book cover made from 350 gsm art card paper printed with the design of Carnival theme that is warm tone red color and die-cut window as pocket flap for easy holding. A matte plastic film lamination technique was applied for protection and enhanced durability. The back cover showed a graphic design continuous strip from the front cover.

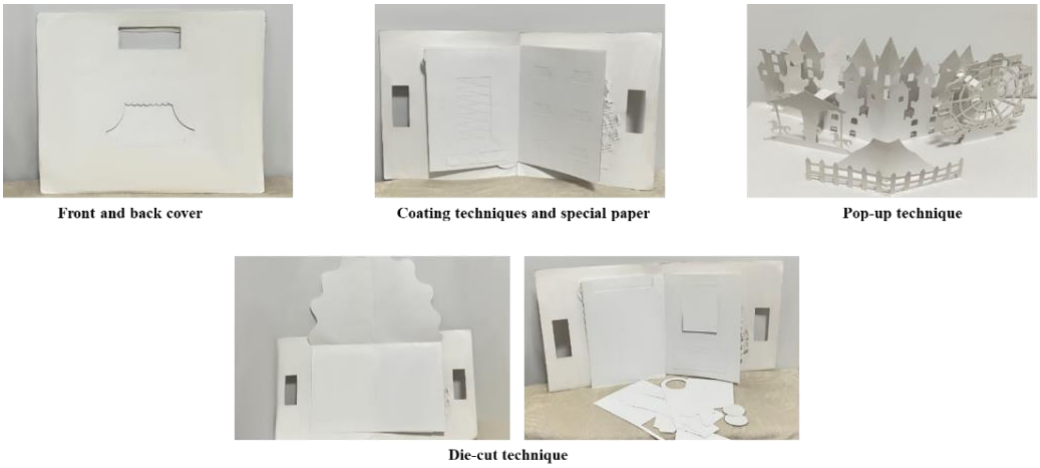

Figure 1: Mockup of Book Creating for Decision Before Real Making

Figure 2: Front and Back Cover of Book

Figure 3: Inside the Book

Figure 3 shows the art card paper of 260 gsm used for book content inside with die-cutting techniques such as window cut, rounded edge cut, or wave-like pattern cut. The book was finished using a butterfly-style binding, making open flat at 180 degrees. The content in book was included of information about printing systems, printing materials, product samples, special techniques of printing, production process, coating methods and plastic film lamination. The book also showed comparison of gloss coating and matte coating. There are various parts to play with or can be slid in and out. The left side of the page includes a business card holder, photo frame, cup sleeve, and door hanger while the right side of the page includes post-it notes size of 3.14 x 4.44 inches and stickers size of 1.96 x 1.96 inches, as shown in Figure 4. There was a pop-up of papercut attached to the book which stand up 90◦ and become 3D when the book was unfolded, as shown in Figure 5.

Figure 4: Examples of Various Techniques

Figure 5: Pop-Up Technique

The 3D Paper Arts are designed in a Carnival theme, consisting of a castle, carousel, swing and fence. Assembling the pop-up design involves applying glue to the die-cut pieces and

attaching them to the base of the book. The qualities of book were assessed by 3 experts in print media relating to content, visual aspect, character side, and components in book.

Table 2: Content Quality Assessment by 3 Experts

Topics for Evaluation	Mean score	S.D.	Level
1. Clarity and conciseness of presented content	4.75	0.50	Excellent
2. Continuity of content used in presentation	4.50	0.58	Excellent
3. Appropriateness of content for target audience	4.50	0.58	Excellent
4. Alignment of content with objectives and matter	4.75	0.50	Excellent
5. Accuracy of content	4.75	0.50	Excellent
Average score	4.5	0.58	Excellent

Table 3: Illustration Quality Assessment by 3 Experts

Topics for Evaluation	Mean score	S.D.	Level
1. Easy for Application	4.5	0.58	Excellent
2. Quality, Beauty and Colors of Illustrations	5	0	Excellent
3. Clarity in Visual Communication	4.75	0.5	Excellent
4. Stimulating Interest	5	0	Excellent
5. Consistency of Illustrations with Content	4.75	0.5	
6. Appropriateness of Illustrations Quantity	4.5	0.5	Excellent
Average score	4.79	0.35	Excellent

Tables 2 and 3 show the average score results of quality assessment in content and in illustrations which were rate as excellent.

Table 4: Satisfaction Assessment by 5 Instructors Due to Efficiency for Teaching/ Learning

Topics for Evaluation	Mean score	S.D.	Level
1. Beauty of Design	4.6	0.89	Very Satisfied
2. Relationship between Illustrations and Content	4.6	0.89	Very Satisfied
3. Clearly Visible of Text	4.4	1.34	Satisfied
4. Easy for Reading	4.4	0.89	Satisfied
5. Motivation of Book Structure	4.6	0.89	Very Satisfied
Average score	4.52	0.98	Very Satisfied

Table 5: Satisfaction Assessment by 5 Instructors Due to Print Media Format

Topics for Evaluation	Mean score	S.D.	Level
1. Portability of Book	4.4	0.89	Satisfied
2. Appreciation in Book	4.6	0.89	Very Satisfied
3. Easily Understand for Learners	4.4	0.89	Satisfied
4. Promote more Learning	4.4	1.34	Satisfied
Average score	4.45	1.0	Satisfied

Tables 4 and 5 show the average score results of satisfaction assessment by 5 instructors in efficiency for teaching/ learning and print media format which were rated as very satisfied and satisfied, respectively.

Table 6: Satisfaction Assessment by 30 Graduating Students, Alumni, and Involved Person in Printing Due to Efficiency for Teaching/ Learning

Topics for Evaluation	Mean score	S.D.	Level
1. Beauty of Design	4.8	0.89	Very Satisfied
2. Relationship between Illustrations and Content	4.7	0.59	Very Satisfied
3. Clearly Visible of Text	4.27	0.69	Satisfied
4. Easy for Reading	4.4	0.67	Satisfied
5. Motivation of Book Structure	4.8	0.55	Very Satisfied
Average score	4.59	0.60	Very Satisfied

Table 7: Satisfaction Assessment by 30 Graduating Students, Alumni, and Involved Person in Printing Due to Print Media Format

Topics for Evaluation	Mean score	S.D.	Level
1. Content in Printing Technique	4.6	0.49	Very Satisfied
2. Information and Knowledge Gaining	4.67	0.6	Very Satisfied
Average score	4.64	0.55	Very Satisfied

Tables 6 and 7 show the average score results of Satisfaction assessment by 30 graduating students, alumni, and involved person in printing in Efficiency for teaching/learning and print media format which were rated as very satisfied.

Conclusion

The quality evaluation of content and illustrations falls into the “Excellent” category. The satisfaction evaluation from instructors regarding usability and the format of the printed media showed rated as “Very Satisfied”. Additionally, the satisfaction evaluation from the sample group, including graduating students, alumni, and individuals involved in printing, regarding usability and the format of the print media, resulted in “Very Satisfied”. The designers have created innovative print media, highlighting materials and special techniques clearly, meeting the requirements of our instructors. The results achieved the intended objectives and serve as an excellent example for learning motivation in print media production with special technique for value added to overcome the electronic media.

PRIMM Model Towards Malaysian Matriculation Students' Motivation in Learning Programming

Tevya Letchumanan, Sarawak Matriculation College, Malaysia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
As computer programming becomes one of the most sought-after skills, novice learners, especially Malaysian Matriculation students, struggle to grasp the ideas of computational thinking. The lack of time in the traditional classroom also inhibits constructive communication. These also cause high stress and low self-efficacy in learning programming languages. This research has been guided by constructivism to design a Predict-Run-Investigate-Modify-Make (PRIMM) module that will allow learners to think at a higher-order level via social constructivism theory, engagement theory, and self-determination theory. The literature has strengthened the role of PRIMM in improving the academic performance of students. However, there is a gap in how the PRIMM model improves motivation, engagement, and academic success among pre-university students in the Malaysian context. This research aims to design a PRIMM module by underpinning the constructivism framework, exploring the role of the PRIMM model in mediating learning motivation, authentic engagement, and reducing stress, and validating the module via a focus group. Phenomenological research was carried out to achieve these objectives, and volunteer participants were subjected to focus group interviews. Five major themes emerged from the focus group interview: Motivated, Engaged, Enjoyable, Efficient, and Collaboration. Research findings state that the PRIMM module developed has improved collaboration, learning interest, learning motivation, and authentic engagement and has reduced stress in learning programming languages among beginners. The findings of this research provide a framework for lecturers to redesign the computer science classrooms in Malaysian matriculation colleges via classroom activities that implement problem-solving before formal instructions.

Introduction

Background of Study

Computational thinking skills such as problem-solving, recursive thinking, and programming knowledge are no longer considered skills exclusively required for computer scientists but for professionals from the engineering, economics, and education analytical fields (Apiola et al., 2010; Song et al., 2021). For novice students, however, the introduction to computational thinking, syntaxes, semantics, and overall structure of programming languages are all complex and overwhelming to learn over a short period. Even after learning the theories, students struggle to apply the content they have learned to build a robust program, which often leads to frustrations and a loss of interest and motivation, resulting in a higher drop rate. It is essential to continuously maintain students' motivation, engagement, passion, and joy to ensure that students successfully master programming. Motivation is often associated with learning via self-regulation, metacognition, and persistence. One way to achieve this is via the use of the PRIMM model. The Predict-Run-Investigate-Modify-Make (PRIMM) approach was built based on the Use-Modify-Create (UMC) model, where students read and predict what a program will do before investigating the actual output and finally build their code based on the comprehension from previous steps. Since student-centered learning has been encouraged in educational institutions to improve student accountability, student engagement, and active learning, the PRIMM model can be implemented to meet the demands of the knowledge and skills learners are expected to obtain at the end of each lesson. Specifically, the approach requires students to predict an output based on prior knowledge or logic, allowing students to learn from the success or failure to guess the outputs and providing them more time to engage in the classroom.

Problem Statements

Students face a lack of constructive communication between peers and the instructor (Garvin-Doxas & Barker, 2004). In the conventional classroom, teachers spend a substantial amount of time delivering the subject matter, resulting in less discussion time. The lack of communication results in students being unable to build knowledge to solve problems and failing to get guidance to solve the problems they could potentially have. Consequently, students also tend not to get any support to fix their misconceptions. This goes in line with Bandura's social cognitive theory that emphasises the occurrence of learning in a social context. While the study by Sentance and colleagues (2019a) on the PRIMM model itself has reported that students taught via the PRIMM model have academically performed better than students in the traditional control group, there is a gap in studies on the implication of the PRIMM model amongst Malaysian Matriculation Students via constructive communication that can improve motivation given the 64 hours allocated per semester to teach computer science, specifically Java Programming in Malaysian Matriculation Program.

Another problem that learners face when learning a programming language is the lack of problem-solving skills in computer science (Cheah, 2020). While students can understand the syntax theoretically, they fail to build high-level analytical thinking that can produce effective solutions to a problem causing a lack of motivation to learn programming. Additionally, applying programming knowledge in different contexts has become a struggle because students tend only to have surface knowledge of content-specific programming. Studies on the UMC model, such as those by Martin and colleagues (2020) and Salac and fellows (2020), have indicated the role of the model in improving computational thinking.

However, there is a gap in studies with these two elements overlapping in teaching programming and a gap in the studies on the role of motivation in improving engagement when studying computer programming. There is also a gap in the studies for these elements with the PRIMM model, especially for the Malaysian Matriculation setting.

Learners have also reported stress in learning computer programming due to low self-efficacy (Rahardjo et al., 2013). According to Figueiredo and Garcia-Penalvo Jr (2020) and Amoloza (2015), independently working on programming subjects leads students to a higher cognitive load. This induces stress, which has a detrimental impact on engaging with lessons and, thus, learning programming as a whole. This negatively affects the retention rate and lowers the students' achievement rate. In addition, learners tend to think of computer science tasks and problems as harder than they actually are. This leads to constant self-criticism, and learners stop engaging with the classroom lessons and activities without any motivation to learn. Low self-efficacy also limits the learners' positive attitudes toward learning programming languages and their cognitive skills. Although studies by Piteira and Costa (2013) and Salguero and colleagues (2021) have pointed out the stress and anxiety faced by students when learning programming, there is a lack of research on how the issue can be approached via the learning engagement caused by the PRIMM model.

Research Questions

1. How to design and develop teaching and learning module based on the PRIMM model for Malaysian matriculation computer science students?
2. What is the role of the PRIMM model in mediating learning motivation when learning computer programming?
3. How does learning motivation improve students' authentic engagement when learning Java programming through the PRIMM model?
4. What is the role of the PRIMM model in reducing the stress faced by students when learning computer programming?

Purpose and Objectives

In response to the challenges faced by novices in learning Java programming, the purpose of the study is to examine the implementation of the PRIMM model in improving Malaysian matriculation computer science students' motivation to learn computer programming. The objectives of the research are:

Main Objective: To design and develop teaching and learning module based on the PRIMM model for Malaysian matriculation computer science students by applying the constructivism elements.

Specific Objectives:

1. To explore the role of the PRIMM model in mediating the learning motivation when learning computer programming.
2. To discover the role of motivation in mediating students' authentic engagement when learning computer programming through the PRIMM model.
3. To understand the role of the PRIMM model in reducing the stress faced by students when learning computer programming.

Literature Review

PRIMM Model

The PRIMM model concentrates on having students discuss how and why computer programs operate before the students edit and write their programs Sentance and colleagues (2019b). This method addresses the issue of beginners developing programs before they are yet able to read them. The model primarily draws from three main areas of research, namely, Tracing and read-before-you-write by Lister and colleagues (2009a), Use-Modify-Create by Lee and colleagues (2011), and Levels of Abstraction by Perrenet and colleagues (2005a). PRIMM encourages self-regulation and metacognition while providing students and teachers with a language to discuss the tactics they are employing. According to Sentence (2021), the PRIMM model focuses on the five principles: read code before you write code, work collaboratively to talk about programs, focus on code comprehension, use existing starter programs, and gradually take ownership of programs. The five stages of the PRIMM are explained based on the study by Sentence and Waite (2017), as shown in Figure 1.

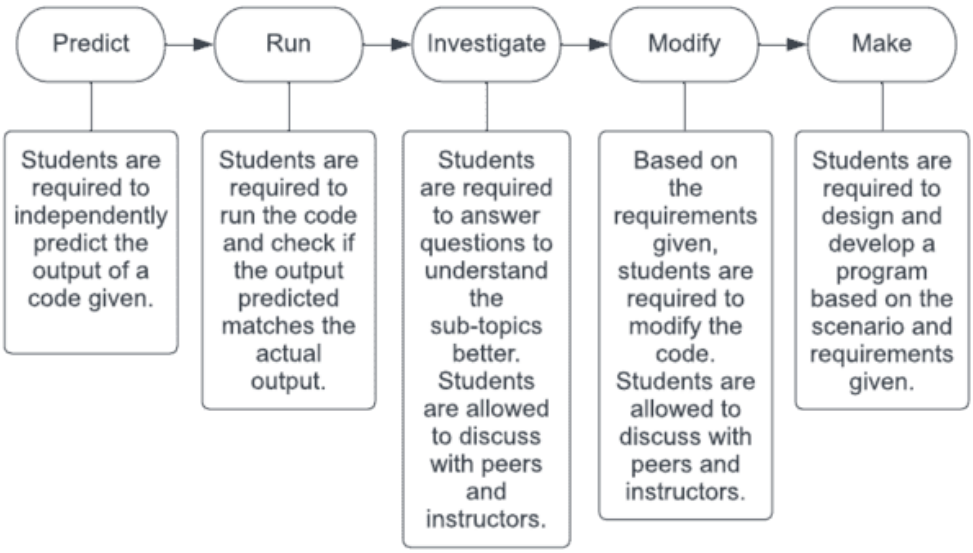

Figure 1: Five Stages of the PRIMM Model

Malaysian Matriculation Programme

The Malaysian Matriculation Programme is a pre-university programme with two and four-semester programs. Learners who have completed Sijil Pelajaran Malaysia (SPM) and are not over 20 years old are eligible to apply for the programme has met the grade requirements. Upon completing the program, learners pursue their degree within local public universities, private educational institutions, or international institutions. Science and accounting streams are available within the two-semester system (SDS), and the four-semester system (SES) offers science, accounting, and engineering streams. The Science stream offers modules for Life Science, Physical Science, and Computer Science. The computer science subject is taught as part of the Physical Science and Computer Science modules. After the first two semesters, the SES students will follow the exact curriculum specifications drafted for SDS. The Curriculum Specification (CS) for the SDS semester 2 Computer Science (SC025) used in this research is attached in Appendix A.

Learning Motivation

Learning motivation acts as the driving force for students to achieve learning goals and to strengthen and improve knowledge acquisition Shabani (2016). It is an essential predictor of the learning success rate (Schnotz et al., 2009). At the initial and bottleneck stages of learning, extrinsic motivation yields better results until learning becomes autonomous, after which students gain fun and a sense of achievement via intrinsic motivation (Lin et al., 2017).

Motivation on the students' side is crucial for successful cumulative learning due to the importance of persistence when learning new concepts. Learning motivation in a classroom implementing the PRIMM model reflects students' engagement and contribution during all five stages of the model. To ensure the effectiveness of the PRIMM model, students are expected to be actively engaged in all class activities, and for this, students must be motivated to participate first. Despite intrinsic motivation being stated to be superior, most human endeavours cannot be intrinsically motivated after childhood because the ability to be intrinsically driven is curtailed by societal expectations. Therefore, in this study, intrinsic and extrinsic motivation are both explored to measure the dimensions of learning motivation in a programming classroom taught using the PRIMM model.

Learning Engagement

Student learning engagement is the involvement of students in their studies and the persistence that the students must have to accomplish desired goals (Saeed & Zyngier, 2012). Students are said to be engaged when they are involved, committed, and attentive in classroom activities despite the obstacles faced in completing the tasks. Motivation and academic engagement are reciprocal, as motivation may affect students' engagement in academic tasks (Singh et al., 2002; Z. Wu, 2019). The levels of engagement are examined based on the five dimensions: authentic, engagement, passive compliance and rebellion (Digamon & Cinches, 2017). In authentic engagement, students have a high level of curiosity and personal significance in their work and do not back down from a difficulty. Saeed and Zyngier (2012) propose an analysis of the type of motivation that has a stronger association with authentic student engagement since students' intrinsic motivation showed authentic engagement while students with extrinsic motivation only showed ritual engagement that may not fully assist learning. As such, this study focuses on the role of intrinsic and extrinsic motivation in mediating the students' authentic engagement when the PRIMM model is implemented in the classroom to teach programming.

Stress in Learning

Stress is when an individual finds a circumstance or challenge that surpasses their ability to solve it (Lindau et al., 2016). As such, the interpretation of the stress level is subjective for each student based on their cognitive capacity. The perception of stress in learning is not solely dependent on the volume of learning tasks but can also be influenced by the nature of the learning expected (Rudland et al., 2020). Challenges can manifest in various forms, including grappling with complex subject matter, mastering a particular skill, or deciphering critical information from intricate patient histories. Both learners and educators have the potential to shape the intensity and nature of the stressors encountered, although often, it is the educator who determines these factors, in addition to the characteristics of the learning environment. The study by Von Hausswolff and colleagues (2020a) states that the decrease in stress associated with hands-on learning could explain the small positive effect on the test

after one week. The connection between cognition and bodily feeling is highlighted, suggesting that emotions play a role in understanding and meaning-making. Therefore, managing students' stress levels is crucial to maximise learning motivation and information retention.

Guided Theory

The study is guided by three theories namely, self-determination theory, engagement theory, and social constructivism theory. These theories are used to support the study in identifying the role of the PRIMM model in improving learning motivation programming skills and reducing stress. Figure 2 shows the incorporation of the theories into developing the PRIMM module.

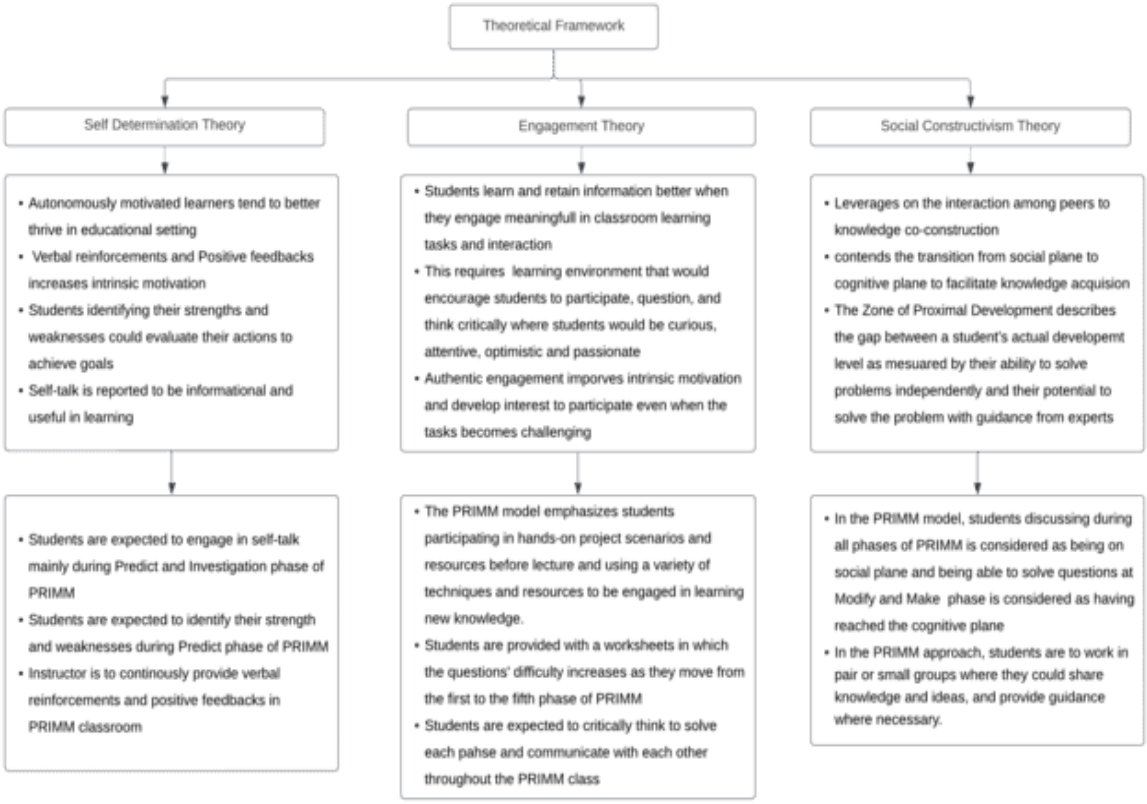

Figure 2: The Guided Theories in Developing the PRIMM Module

Method

Research Design

A phenomenological research design was used as part of the qualitative research approach. The phenomenological design investigates an individual's lived experiences while barring the researcher's preconceived assumptions regarding the topic. In this research, the phenomenological design has been utilised to elicit the lived experience of novice learners who have experienced the PRIMM model to learn computer science. The selection of a phenomenological design enables an in-depth exploration of learners' motivation in learning computer science via the PRIMM model as well as the best techniques of the PRIMM model encountered in the implementation process. Designing a PRIMM module that is best suited for novice learners learning Java programming is also important.

The syllabus of the Matriculation computer science program is divided into four chapters. In the first chapter, Introduction to Programming, students learn about the programming language paradigm and the translator programs. In chapter two, Approach in Problem-Solving, students are taught the five problem-solving steps. In the third and fourth chapters, students learn about the identifiers, variables, constants, expressions, control structures, arrays, and methods of Java Programming Language.

The PRIMM model will be used to teach Chapter Three: Design a Solution involving the introduction to control structures and Chapter Four: Java Language, which includes sub-topics on data types, variables, constants, two-dimensional arrays, and methods. For each subtopic, students must complete a worksheet attached to the Google Classroom. Together, these six worksheets are to form an efficient module to teach SC025 in the Malaysian matriculation program. A total of 10 hours would be spent on each subtopic. While students complete the worksheets, the instructor provides explanations, scaffolding, and guidance toward a better understanding the topic. Verbal reinforcements via positive feedback would be given throughout the classes to leverage self-determination theory. As the students move towards the Modify and Make sections of the worksheets, guidance will be gradually withheld so that students can apply what they have learned. Students are expected to be intrinsically motivated to solve these questions. In each worksheet, five questions are set, each representing a phase of the PRIMM model. Six worksheets have been prepared to cover nine sub-topics. Table 1 in Appendix B shows the worksheet, the subtopics covered in the worksheets, and the learning objectives for each worksheet. The complete module, which consists of Worksheet 1 to Worksheet 6, is attached in Appendix C.

Sample and Sampling Method

The learners are all to be from the science stream, computer science subject in Sarawak Matriculation College to ensure all the participants have experienced the PRIMM classroom directly via the researcher. The context is Computer Science learners in the class for whom it is their first time learning programming for public examination. In this study, 24 learners who were registered in the computer science subject will be recruited. The learners were taught using (Bybee, 2009) 5E instructional model for the first two chapters and the newly developed PRIMM module for chapters three and four. A non-probability sampling was used because the study was qualitative. A purposeful sampling method was used to select study groups. In this context, criterion sampling has been used. In selecting the participants, criteria such as being voluntary, having not studied any programming language for exam purposes prior to entering the Matriculation program, and having attended at least 90% of the classes throughout the semester were sought. Plummer-D'Amato (2013) states that using four to five focus groups is adequate. As such, four focus groups were formed for this study. Six participants were recruited into each focus group to be interviewed for a maximum of 60 minutes as suggested by Giibs (1997). To bar any gender bias and to ensure comfortable focus group interviews, each group was formed to have three male and three female students.

Data Collection Procedures

The data collection process for this study is done after students have been introduced to the complete module via focus group interviews. The data was collected from the participants who have learned Java programming language via the PRIMM module over 16 weeks. Figure 3 shows the flow and timeline of module development and data collection.

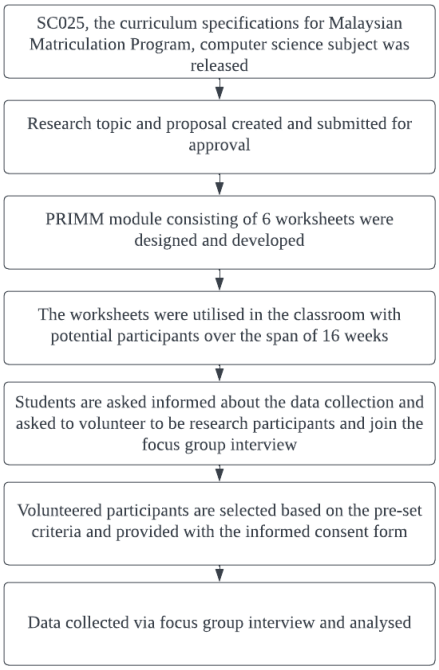

Figure 3: Flow and Timeline of Module Development and Data Collection

Focus group interviews were conducted with the learners to analyse the design of the learning module based on PRIMM and the effectiveness of the new PRIMM module. The focus group interviews have been used to discuss different perspectives on the PRIMM module approach within a limited duration. Based on the study conducted by Fern (1982), Plummer-D'Amato (2013), and Rabiee (2004), the participants were grouped into three groups of six for focus group interviews with a maximum time duration of 60 minutes so that enough input could be derived from the discussion without exhausting the participants. Each interview was conducted online, using Google Meet. The interview was recorded with the participant's permission and stored in Google Drive with a password.

According to Bevan (2014), phenomenological interviewing should focus on collecting data to examine participants' lived experiences. Therefore, in-depth information concerning participants' experiences must be gathered via open questions. The interview protocol for this study starts with asking participants to describe the PRIMM classroom they participated in in detail. Based on the participants' answers, they were questioned on the techniques used to complete the PRIMM worksheets and how they helped them. To answer the research questions, participants were questioned on how the newly developed PRIMM module has helped them to improve communication, learning motivation, and engagement. The interview protocol for the focus group interview with learners is attached in Appendix D.

Data Analysis Procedures

Each focus group interview was immediately transcribed with behavior annotations and phonetic transcription of dialects and filler words. The interview transcription is attached in Appendix E. The transcriptions include annotations for behavior to assist in analysing learners' emotions concerning learners' motivation state as a result of participating in the PRIMM module. Phonetic transcription of dialects and filler words is included since the

research population comprises learners from Sarawak Matriculation College who mixed the local dialect during the focus group interview.

The focus group interviews were analyzed using thematic analysis as this provided flexibility and a comprehensive explanation of data. Thematic analysis was useful when looking for subjective information about learners' experiences and views of the PRIMM model and the newly developed module. Themes were identified using inductive coding to free the research from the researcher's theoretical interest. The researcher then grouped the recurring topics during the data collection and grouped the codes into themes to summarize the data sections in a useful way to achieve research objectives. Next, the researcher looked for common codes to form themes relevant to the research questions, reviewed the selected themes, and then finalized the themes. These steps must be done sequentially to ensure the data are relevant to answer the research questions.

Qualitative data coding is used to create and assign codes to categorize data extracts. The codes are then used to derive themes and patterns for thematic analysis. At this stage, similar data types were labeled and grouped to generate themes and ensure that data analysis was manageable. Inductive coding was used for this research. As such, the researcher developed the codes based on what was found in the data. Inductive coding has been used since the data collection involves interviews, and the direction of the conversation has yet to be known. Inductive coding was also selected for this research since there exists a big gap in research on the PRIMM classroom among pre-university computer science learners.

In the first stage, broad codes were derived from the interview, and structural coding was used to describe the data in a condensed manner. The data is then coded based on the interview transcription so that data can be structured into smaller pieces for further analysis. The researcher then coded line-by-line to add details to the codes. The researcher used the major themes and subthemes for the data to be synthesized. The researcher went through all the transcripts and the codes to conduct quality appraisals and analyze the data and its quality to ensure the accuracy of data for each code.

A total of 24 students participated in four focus group interviews whereby 50% of the participants were male and the other female. In this paper, participants were identified by group number and random participant number within that group, and participants' quotations are indicated in italics. Quotations in languages other than English have been typed in red font and a translation has been provided in parentheses.

Discussion

The complete version of the themes, subthemes, and participant quotes are attached in Appendix F.

The main idea of collaboration that the PRIMM module has allowed is the ability to discuss not only each other's answers but also each other's ideas. Participants pointed out that they could see multiple algorithms for the same question and test each one to find the most optimal solution. Discussions were sometimes also made with the instructor for further understanding. It has also allowed students to study the problem as a group and deduce ideas about each subtopic. Therefore, when completing the worksheets, students learn about the concepts with similar-minded peers. In this situation, students learn and teach their peers,

which, according to the participants, has helped them to remember the concepts better. The findings in accordance with the research questions are discussed in the paragraphs below.

Research Question 1: How to design and develop a teaching and learning module based on the PRIMM model for Malaysian matriculation computer science students?

To address the main objective of the research and the first research question, the design of a PRIMM module to teach programming in the Malaysian Matriculation Program is best when it has scope for students to practice coding in the classroom with peer communication and collaboration as well as a step-by-step increase in terms of difficulty with a relationship between the worksheets such that each worksheet can be used as a reference. The findings also suggest that each worksheet can have more than one question for each phase of PRIMM to allow better exposure. The findings regarding the provision of the module's answer scheme have contradicted. Some participants have found that not having an answer scheme is more motivating since they do not have to focus on getting the exact-worded, correct answers. However, participants have also stated that having an answer scheme would further increase the probability of using the module as revision material. A study by Sinta and colleagues (2019) on students' improvement in learning grammar via Quizziz has found that releasing the answer key to the students improved their ability to identify their strengths and weaknesses, improving their learning. Therefore, it is suggested that an answer scheme is prepared and given to students after the worksheet in the module has been completed.

Research Question 2: What is the role of the PRIMM model in mediating learning motivation when learning computer programming?

This PRIMM model has developed intrinsic motivation amongst the students, where students tend to continue doing the worksheets despite getting the answers wrong in the first round to achieve personal satisfaction. Theories and applications of intrinsic motivation are connected to fostering respectful exchanges and facilitating profound learning. This is partly attributed to individuals channelling their efforts into activities that naturally provide a sense of fulfilment (Ginsberg & Wlodkowski, 2019). The module has also extrinsically motivated students via healthy competition. It has been found that students are motivated to learn and complete the module after seeing their peers complete it. Participants stated that seeing their peers understand the concept and solve the questions encouraged them to continue to learn even when they had gotten the prediction wrong or struggled to solve the questions in the previous worksheets. On the other hand, once they start getting better at solving the questions, the feeling of satisfaction eventually improves learning interest. The module also reassures students that with practice, they will be able to master the content.

Research Question 3: How does learning motivation improve students' authentic engagement when learning Java programming through the PRIMM model?

Learning motivation has been a stepping stone in improving authentic engagement in PRIMM classrooms, consistent with the literature review. The direct impacts of intrinsic or extrinsic motivation on academic performance have been evident through learning engagement (H. Wu et al., 2020). The PRIMM module developed has fostered authentic engagement through high-level curiosity, personal significance, and determination. The engagement was also observed when students actively discussed the questions and answers with each other. All participants stated and agreed that the motivation they developed to complete the module to get the satisfaction of completing it kept them engaged in the

classroom. It has also been found that students have also run the code from Question multiple times after checking their prediction in an attempt to understand the concepts better before attempting Question 3.

Research Question 4: What is the role of the PRIMM model in improving Java programming skills among Malaysian matriculation computer science students?

It has been found that solving all questions correctly without the instructor's intervention during the first worksheet was nearly impossible for all participants. However, participants were able to solve the worksheets, especially Question 5, on either the first attempt or after a short discussion with their peers. This assures that continuous hands-on practice is a form of higher cognitive work as supported by Zainuddin and Halili (2016) which has improved the matriculation students' Java programming skills. The study also found that the PRIMM module paved the way for understanding programming language concepts by doing the programming itself. Understanding the concepts and the curiosity to learn resulted in deeper learning. The Module has also allowed students to detect their weaknesses and learn from their mistakes. This way, students made fewer errors as they progressed through the worksheets and developed better algorithms to solve Question 5 faster. This learning method is also supported by Fischer and colleagues (2006). According to the authors, deriving lessons from mistakes and close calls and individual and systemic accountability are important in promoting knowledge acquisition.

Research Question 5: What is the role of the PRIMM model in reducing the stress faced by students when learning computer programming?

The findings suggest that the PRIMM model improved learning interest and reduced students' learning stress. For students who have continuously heard that programming is difficult and believed in the perception, completing the model has given them the confidence to believe in their abilities. The discussions among peers have tremendously helped when students were stuck with solving the questions and fixing the bugs which alleviated students' stress and is in line with the study conducted by Choi and colleagues (2021). For students who struggled to convert their theoretical knowledge into the application, implementing the module helped them gain hands-on experience in coding while learning the concepts.

Conclusion

The review of literature has exhibited success on the PRIMM model in improving learning performance and at the same time, has pointed out the gap in the mediating role of learning motivation towards academic performance, especially in the scope of the Malaysian matriculation program. There is a huge gap in the implementation of the PRIMM model among pre-university computer science students, especially in the Malaysian context. While studies have been conducted on the success of the PRIMM model towards the academic performance of learners, the impact of the model on motivation and engagement, as well as the impact of the model in pre-university and Malaysian student settings, is still unknown. Underpinning the engagement theory, social constructivism, and self-determination theory, this research aims to design and develop a PRIMM module suitable for computer science learners of the Malaysian matriculation program. Research findings from the focus group interviews and thematic analysis found that the PRIMM module was efficient in learning programming, and students were motivated to learn and enjoyed the PRIMM classroom, where students had the opportunity to collaborate with peers and were engaged throughout

the classroom. The instructors and learners must have a say in understanding the perspective of teaching and learning. This research could act as a guide for instructors who are planning on redesigning the computer science classrooms for lecturers from matriculation colleges around Malaysia to develop new in-class activities. The PRIMM module that was developed can be efficiently used by Malaysian Matriculation colleges to teach programming.

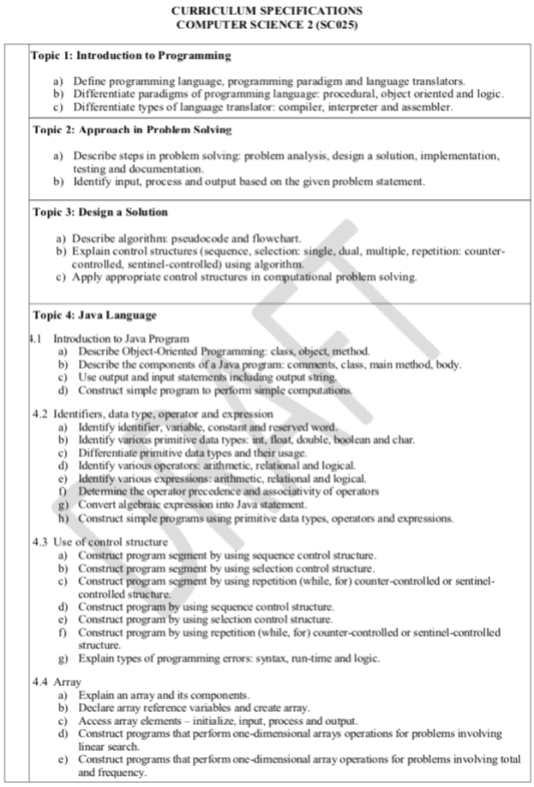
Appendices

Appendix A



CURRICULUM SPECIFICATIONS
COMPUTER SCIENCE 2 (SC025)

Topic 1: Introduction to Programming

a) Define programming language, programming paradigm and language translators.
b) Differentiate paradigms of programming language: procedural, object oriented and logic.
c) Differentiate types of language translator: compiler, interpreter and assembler.

Topic 2: Approach in Problem Solving

a) Describe steps in problem solving: problem analysis, design a solution, implementation, testing and documentation.
b) Identify input, process and output based on the given problem statement.

Topic 3: Design a Solution

a) Describe algorithm: pseudocode and flowchart.
b) Explain control structures (sequence, selection: single, dual, multiple, repetition: counter-controlled, sentinel-controlled) using algorithm.
c) Apply appropriate control structures in computational problem solving.

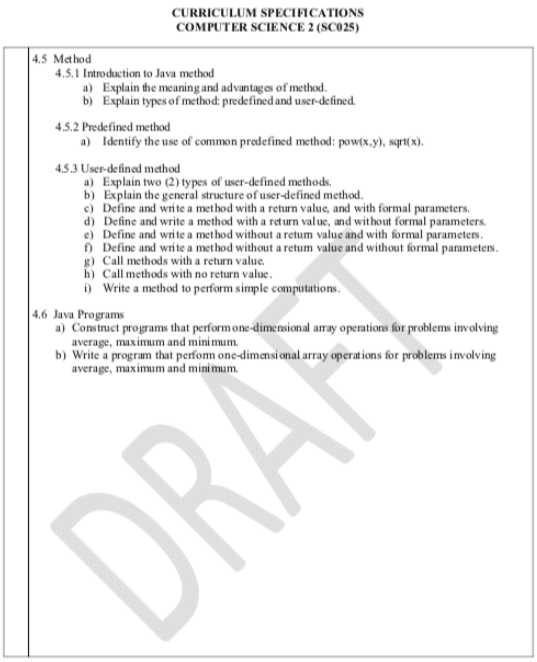
Topic 4: Java Language

4.1 Introduction to Java Program
a) Describe Object-Oriented Programming: class, object, method.
b) Describe the components of a Java program: comments, class, main method, body.
c) Use output and input statements including output string.
d) Construct simple program to perform simple computations.

4.2 Identifiers, data type, operator and expression
a) Identify identifier, variable, constant and reserved word.
b) Identify various primitive data types: int, float, double, boolean and char.
c) Differentiate primitive data types and their usage.
d) Identify various operators: arithmetic, relational and logical.
e) Identify various expressions: arithmetic, relational and logical.
f) Determine the operator precedence and associativity of operators
g) Convert algebraic expression into Java statement.
h) Construct simple programs using primitive data types, operators and expressions.

4.3 Use of control structure
a) Construct program segment by using sequence control structure.
b) Construct program segment by using selection control structure.
c) Construct program segment by using repetition (while, for) counter-controlled or sentinel-controlled structure.
d) Construct program by using sequence control structure.
e) Construct program by using selection control structure.
f) Construct program by using repetition (while, for) counter-controlled or sentinel-controlled structure.
g) Explain types of programming errors: syntax, run-time and logic.

4.4 Array
a) Explain an array and its components.
b) Declare array reference variables and create array.
c) Access array elements – initialize, input, process and output.
d) Construct programs that perform one-dimensional arrays operations for problems involving linear search.
e) Construct programs that perform one-dimensional array operations for problems involving total and frequency.



CURRICULUM SPECIFICATIONS
COMPUTER SCIENCE 2 (SC025)

4.5 Method
4.5.1 Introduction to Java method
a) Explain the meaning and advantages of method.
b) Explain types of method: predefined and user-defined.

4.5.2 Predefined method
a) Identify the use of common predefined method: pow(x,y), sqrt(x).

4.5.3 User-defined method
a) Explain two (2) types of user-defined methods.
b) Explain the general structure of user-defined method.
c) Define and write a method with a return value, and with formal parameters.
d) Define and write a method with a return value, and without formal parameters.
e) Define and write a method without a return value and with formal parameters.
f) Define and write a method without a return value and without formal parameters.
g) Call methods with a return value.
h) Call methods with no return value.
i) Write a method to perform simple computations.

4.6 Java Programs
a) Construct programs that perform one-dimensional array operations for problems involving average, maximum and minimum.
b) Write a program that perform one-dimensional array operations for problems involving average, maximum and minimum.

Interview Protocol Project	: PRIMM Model towards Malaysian Matriculation Students' Motivation in Learning Programming
Time of Interview	: (To be Confirmed)
Date	: (To be Confirmed)
Place	: Online (Google Meet)
Interviewer	: Researcher - Tevya Letchumanan
Interviewee	: Students
Questions	:

1. Would you be able to describe you experience with the PRIMM module in the computer science classrooms with as much details as possible.
2. You have experienced the traditional classroom approach when learning the first two chapters and the PRIMM approach to learn the other two. Which way do you prefer to learn computer science? – Why?
3. How helpful was PRIMM model to increase your participation in classroom activities?
4. How was the PRIMM module prepared helpful in improving your communication and collaboration amongst your peers?
5. How did the PRIMM module help managing the stress of learning computer science?
6. What are, if any, the challenges of learning computer science in a PRIMM classroom?
7. Overall, in what ways has the PRIMM model that you experienced managed to improve your motivation in learning computer science at matriculation level?

National-Level Cross-Cluster Rotation Training in Obstetrics and Gynaecology: Through the Looking Glass of Residents

Chun Phoy Cheng Rachel, KK Women's and Children's Hospital, Singapore
Manisha Mathur, KK Women's and Children's Hospital, Singapore
Citra Mattar, National University Hospital, Singapore
Yang Liying, Singapore General Hospital, Singapore
Jill Lee Cheng Sim, KK Women's and Children's Hospital, Singapore

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
In Singapore, there are 2 sponsoring institutions (SI) under the Obstetrics and Gynaecology (OBGYN) residency program, namely SingHealth and National University Health System. The compulsory cross-cluster rotation training (CCRT) exercise was introduced in 2023 as an additional component to the six-year OBGYN residency program. Thirteen fifth-year residents (R5) in both SI underwent CCRT in the 2023/2024 academic year. This study aims to explore the R5s' perceived views on CCRT experience. Findings from this study will allow opportunity for better curriculum development at national level. R5s were invited to write a reflection essay on their CCRT experience. Resident identities were anonymized. Using a constructivist approach, these essays were analysed and grouped under the six core competencies of the Accreditation Council for Graduate Medical Education (ACGME). Residents reported medical knowledge gains as each SI had a different spectrum of OBGYN patients. The area of greatest gain was in system-based practice. Residents observed different models of care and identified areas to benefit patients' care. Residents recognised that CCRT provided lessons that would revise their practice in their institutions, in keeping with practice-based learning and improvement. Additionally, residents reported improved interpersonal communication across institutions and various faculty members. Whilst all residents expressed anxiety prior to CCRT, host programs offered adequate support through close faculty and peer support. Interestingly, there were different opinions regarding the sufficiency of CCRT duration. Overall, the residents agreed that CCRT exercise was a useful and good experience to enrich their existing residency training and further develop their core skills.

Introduction

In 2010, the postgraduate medical education in Singapore successfully transitioned from the old United Kingdom-based specialists' accreditation system to the new United States-based residency program under the provision of MOH Holdings (MOHH), the holding company of Singapore's public healthcare clusters. The Obstetrics and Gynaecology (OBGYN) residency program is sponsored by two institutions, namely SingHealth and National University Health System (NUHS).

In the pre-residency era, the specialists' accreditation system was a six-year program, divided equally into two phases - Basic Specialist Training (BST) and Advanced Specialist Training (AST). The trainees did their cross-cluster rotation during AST period for a total of six months. Similarly, the OBGYN residency program consists of a six-year comprehensive training program, which includes four years of junior residency and two years of senior residency.

The BST/AST specialist training program involved skill-based clinical training and a summative examination of three years of BST, followed by three years of AST. Progression in training was time-based with an emphasis on the summative examination, consisting of the specialist Member of the Royal College of Obstetrics and Gynaecology (MRCOG).

The new United States-based residency system was adapted because of its structured training framework and a curriculum based on the six core competencies introduced by the Accreditation Council for Graduate Medical Education (ACGME) which consist of: patient care, medical knowledge, practice-based learning and improvement, interpersonal and communication skills, professionalism, and systems-based practice (Figure 1) (Yin et al., 2015; Leach D. C., 2001).

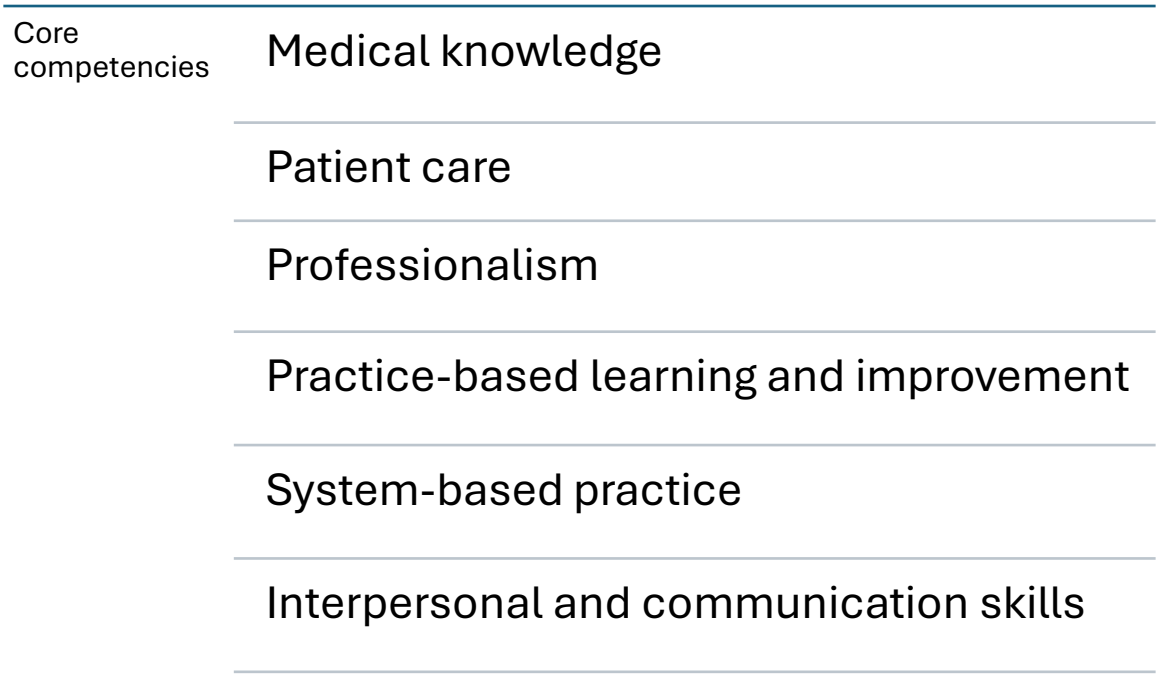

Figure 1: Core Competencies of ACGME

Under the new residency system, the cross-cluster rotation training (CCRT) was temporarily placed on hold to concentrate on other aspects of competencies. In 2020, the residency

faculty under MOHH made plans to resume CCRT. Once again, the CCRT project was deferred due to the emerging Covid infection. Fast forward three years later into 2023, the CCRT was implemented. The institutions selected for CCRT were KK Women's and Children's Hospital (KKH) which is part of the SingHealth institution and National University Hospital (NUH) which is part of the NUHS institution.

Objectives

The compulsory CCRT exercise was created to enhance residency training in both institutions and to strengthen the six core competencies set out by ACGME committee.

This study aims to explore the perceived views of all residents affected by CCRT on the experience of CCRT, a new and additional component to the familiar OBGYN residency training.

We hypothesize that residents would have both positive and negative experiences from the compulsory CCRT exercise which was introduced at short notice.

Findings from this study will allow opportunity for better CCRT curriculum development at national level and open possibilities of considering the introduction of compulsory CCRT in other residency programs around the world.

Methods

A total of 13 OBGYN R5s from both SIs underwent CCRT exercise in the 2023/24 academic year (Chart 1). There were eight SingHealth residents and five NUHS residents involved in this assignment. The rotation periods varied due to the difference in numbers of residents. To ensure manpower allocation in both institutions were balanced, NUHS residents spent 2 months in KKH, while SingHealth residents spent 1-2 months in NUH. The postings included in this rotation were Reproductive Medicine (RM), Maternal Foetal Medicine (MFM), and General Obstetrics and Gynaecology (GOG) which were the core postings in R5 rotation (Figure 2 and 3). Arrangements were made to ensure the residents' training were not compromised in any way. The residents were supervised by the program director, associate program director or the core faculty members during their CCRT.

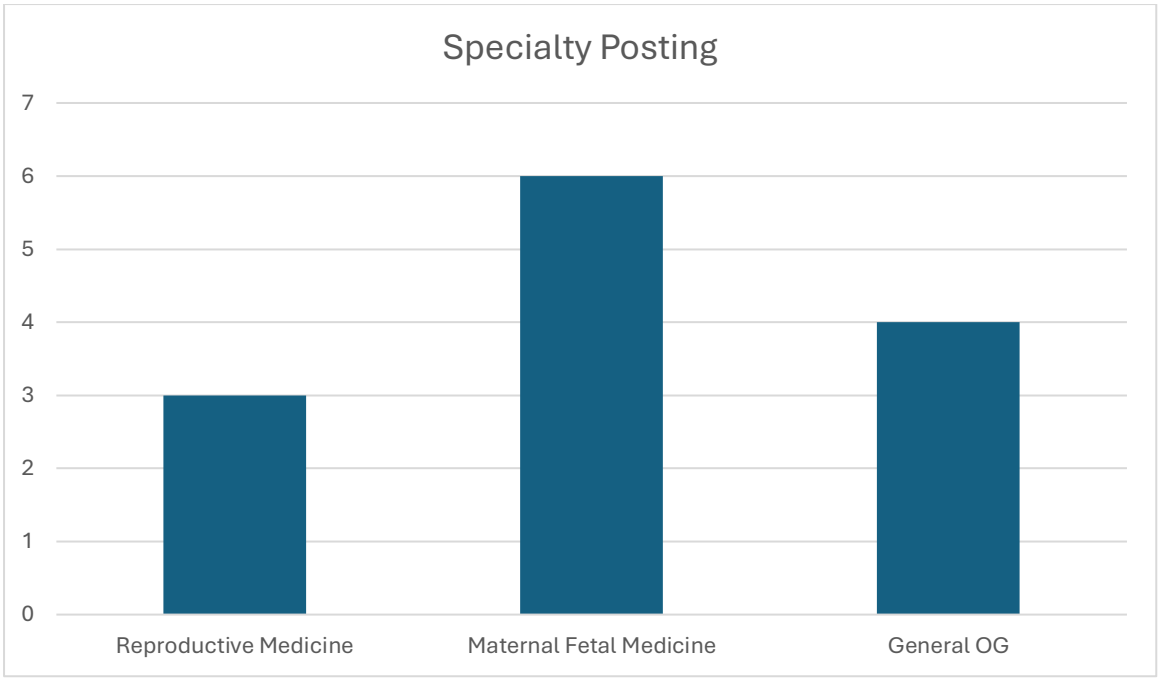

Chart 1: Number of Residents in Each Specialty Posting During Cross Cluster Rotation Training

R5	Reproductive Medicine (3 months)	Maternal Fetal Medicine (2 months)	Benign Gynaecology (2 months at NUHS/KKH, 2 months at KKH)	Benign Gynaecology at SGH (2 months)	Gynae Oncology at SGH (1 month)
R6	Maternal Fetal Medicine (3 months)	Reproductive Medicine (3 months)	Gynae Oncology (4 months)	Maternal Fetal Medicine at SGH (1 month) / Reproductive Medicine (1 month)	Gynae Oncology at SGH (1 month)

Figure 2: Sample Rotation Chart for Senior Residents of SingHealth OBGYN Residency Program

R5 & R6

	Training Objectives					
POSTING	Stations to cover	Learning objectives	Patient Care	Medical Knowledge	Communication Skills	Systems-based Practice
MFM	Obs ward (pre/postnatal), Jade OBS, FCC, GDM + HRC, FCC + fetal anomalies/genetic counselling, supervise EL LSCS, EM LSCS	Antenatal and postnatal care, low and high risk pregnancies, Priming Suite, MTPT, discharge summaries and audits. Intrapartum care, operative deliveries, Em + EL CS, acute complications. Senior Resident OSATS.	• Comprehensive understanding of varying presentations and treatment options for OBGYN conditions. • Recognizes atypical presentations of OBGYN conditions. • Manages patients with complex and atypical OBGYN conditions and complications. • Effectively supervises and educates R1-4. • Arranges for multidisciplinary and collaborative care. • Delivers bad news on complications or death.	Demonstrates advanced knowledge necessary for management of OBGYN conditions. • Effectively supervises and educates lower level residents regarding OBGYN conditions. • Collaborates and provides consultation to other members of the OBGYN team regarding care of patient. • Manages or co-manages critically ill patients. • Implements evidence-based treatment.	• Counsels patients/families about complications/bad outcomes. Incorporates risk management in process. • Participates in patient/family education • Leads interdisciplinary health care teams • Leads effective transitions of care and team debriefing. • Responds to requests for consultation in a timely manner and communicates recommendations to the requesting team.	• Compassion, integrity, respect for others. Punctuality, responsiveness; Reliability. Coaches others to do the same. • Self-awareness of fatigue and stress, management of stressors. • Reports errors / near misses to the institutional surveillance systems. Able to conduct root cause analysis. • Actively participates in quality improvement /patient safety projects. Organises and leads institutional QI /patient safety projects. • Contributes to peer reviewed medical literature.
GYN-ONC	Gyn-Onc ward, pre-/post-surgery care, Cancer clinics. Colposcopy, MBOT Gyn Onc + Robotics	Pre-/Post-surgical care, RT/chemotherapy care, ordering TPN, Tumour Board, proficiency in major abdominal surgery. Senior Resident OSATS.				
REI	REI ward (pre/post surgery) + Jade GYN + Menopause/Adol outpt + Subfertility clinic + CHR + MCOT/IVF + MBOT/MIS	Gyn pre-/post-op care, complex conditions (OHSS, TOA, AUB), EMD gyn admissions, discharge summaries and audits. Senior Resident OSATS.				
BG	MCOT (minors) + Jade GYN + NTF GYN + MBOT (majors) + BG/UG wards + Outpt hysteroscopy / UG + MIS Accreditation (To reach Level 2) + Robotics SR training	Inpatient pre-/post-surgery care, proficiency in major operations, independence and safety in emergency surgeries, ambulatory care, outpatient procedures. To complete Senior Resident OSATS.				
CCR	2 months (minimum of 1 month) in whichever posting they are assigned by their PD. The R5 will continue with the subspecialty training programme in the host institute, and this will be accredited towards their 6 month posting at their parent institute.	Subspecialty training mirroring the R5's assigned posting + general OG; R5 will fulfill existing list of requirements. The content/skill to achieve during the cross-cluster rotation will need to ensure that the residents' training needs are not compromised in any way and will not result in the need to make up for them in other rotations. The appropriate handover of supervision will be handled between the PDs.				

Figure 3: Sample Rotation Chart for Senior Residents of NUHS OBGYN Residency Program

They were invited to write a reflection essay on their experience of CCRT at the mid-point or endpoint of their CCRT posting. Resident identities were anonymized prior to qualitative analysis. Using a constructivist approach, these essays were analysed thematically and grouped under the six core competencies of the ACGME.

Results/Discussion

Eight out of 13 reflection essays were analysed according to the six core competencies of the ACGME.

Residents from both sponsoring institutions (SI) agreed that this CCRT rotation allows them to enrich their medical knowledge via evidence-based practice and practice-based learning. They were able to experience the outpatient services in both general clinics and specialty clinics and participate in active counselling during clinic sessions which builds their confidence and further enhance their knowledge. Practice-based learning enhances the trainees' ability in various aspects of self-learning and self-improvement (Yang, B, 2024). One resident recommended tagged clinic session before running the clinic independently to allow time to adapt to the new institution's practice.

The area of greatest gain was in system-based practice. System-based practice allows the residents to understand complex systems and the physician's role in them, navigate them for the benefit of patients, and participate in continually improving them (Guralnick, S., 2021). Residents observed different models of care and reflected on strengths, challenges and recognized areas to benefit patients' care and safety. The NUH residents acknowledged the significant heavier workload and valued the extensive range of OBGYN case varieties in KKH, especially the non-obstetric related conditions in pregnant patients. The exposure to such cases was beneficial to their clinical development. In addition, they were impressed with the multi-disciplinary care provided by the STORK (One Stop Obstetric High Risk) Centre for obstetric patients with medical conditions and hope that this service can be started in NUH. Similarly, the KKH residents agreed that the daily morning meetings in NUH with teaching didactics protected from clinical service commitments were very educational and mind-stimulating. However, one resident reported a disadvantage of these daily meetings – very early daily ward round before the meetings.

Each OBGYN resident in KKH has a mentor which changes every 6 months. This allows a one-to-one assessment and supervision which includes surgical procedure opportunities. On the other hand, the NUH residents do not have a specific mentor, but they have a protected operating time as per rotation schedule. All SingHealth residents reported limited surgical exposure during their CCRT, and one resident reported unequal division of surgical cases among the residents. On the contrary, the NUH residents appreciated the mentor-mentee relationship in SingHealth institution but felt that this may compromise the learning opportunity for other trainees in the same subspecialty rotation. Another resident felt that the junior residents' involvement in surgical cases was limited.

About half of the residents reported good exposure to procedures such as assisted vaginal deliveries and foetal-related procedures during their CCRT rotation. At the end of their rotations, the SingHealth trainees felt more empowered and pro-active in guiding the junior residents through procedures and surgeries which is a common practice in NUH.

Both SI have different electronic system platforms - Sunrise Citrix Manager in KKH and Epic Systems Corporation in NUH. Majority of the residents reported difficulty adjusting to the new electronic systems. In addition to the anxiousness that came with new working environment, this technical issue created unnecessary stress to the residents during this transition. This can adversely affect the residents' training and overall experience in the SI.

One resident suggested to take into consideration the resident's subspecialty of interest when planning CCRT exercise. This may help to create positive attitude and attentiveness during the rotation.

Interpersonal communication is paramount for forming and maintaining relationships (Govindaraju, 2021). The residents reported improved interpersonal communication not just across institutions but also for their individual skills as they learn from and observe a greater number of faculty through the CCRT. New friendship was formed, social circles were expanded, and the residents did not report any struggle in forming peer relationship with colleagues and faculty.

Whilst all residents expressed anxiety prior to CCRT, host program directors provided adequate support to visiting trainees through close faculty and peer support. The consultants and residents in both the SI were helpful, friendly and approachable.

Interestingly, there were different opinions regarding the adequacy of CCRT duration. Some residents felt a 2-month rotation was adequate while the others felt it was relatively short. A resident who did a 1-month rotation preferred a longer posting while another resident felt the CCRT exercise was not beneficial and minimised the learning opportunities in their own institution.

Conclusions

CCRT allows the residents to enhance their existing residency training, further develop their core skills, and push them to achieve greater heights in their professional career. The residents felt their medical knowledge significantly improved since the CCRT as they learned the different practices in both institutions.

Additionally, interpersonal interaction and communication among the healthcare personnel in both institutions which were fortified during this exchange further ensure a holistic care for our large population of OBGYN patients.

Most of the residents expressed slight anxiety at the beginning of their rotation. Nevertheless, they felt adequately supported during their CCRT exercise. This allows the residents to adapt and build resilience, a quality that would come in handy in their lifelong learning journey.

Recommendations from the residents should be taken into consideration to improve CCRT planning for the upcoming R5 residents in the 2024/2025 academic year.

In conclusion, majority of the residents felt that CCRT was beneficial, and it was a good experience.

Acknowledgement

We thank the residents and residency executives for their assistance in data collection.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Decision making is an increasingly valued skill in both schools and workplace. Lectures and case analysis remain limited in fostering decision-making skills due to a lack of contextual simulation, insufficient interactivity, and low learning motivation. Utilizing game-based learning to develop decision-making skills may help overcome these limitations. Therefore, in this study, we designed a decision-making game with a story plot, generative AI (GAI) simulation character interaction, and a clue inference mechanism to solve the limitations. This study designed a Non-Player Character (NPC) in a simulated dialog style through GAI. Learners played the role of a police detective in the game and they could talk to the victim which played by a GAI NPC, which was scripted by our research team. They have to explore, collect, and analyze clues, and make decisions about the location of the robbers' hideout within a limited period of time. A total of 15 participants engaged in the empirical evaluation of this study. It was found that the learners had a high level of flow, and moderate anxiety, and a high level of acceptance of the game, and that they believed that the game could help them to develop their ability. In addition, 80% of these learners felt that the game experience was more anthropomorphic than common GPTs, and the dialogues were more like real-life interactions. Learners also mentioned that the clues provided by the NPC were helpful, including location characteristics, and experiences of the incident, which could help them reason during decision-making.

Introduction

Bhatti and colleagues (2022) identified the required employability skills of business graduates and business executives also agreed on the employability skills of the graduates such as problem solving, decision making skills are listed among the important workplace skills in their study. Decision making is also considered as an important skill in the workplace (Chowdhury & Miah, 2019). As decision making skill is emphasized in the workplace and schools, how to cultivate these skills has become an important issue. It has been mentioned that when learners do not receive adequate and timely guidance, it will affect their knowledge acquisition and learning effectiveness (Tsai et al., 2015). An appropriate decision-making training environment can help learners better understand the course content, and appropriately challenging tasks can help develop competence (Türkistanli & Kuleyin, 2022). In an error-aware environment, learners are able to deal with simulated situations in their own way and acquire employability skills. However, it has been mentioned that the construction of the simulation environment and the design of the game requires a significant time cost (Lean et al., 2020).

Therefore, this study focuses on the simulation part of the storyline, character setting and dialogues, and presents the game through the Web, and designs a GAI decision-making training game. It has been found that the main function of asking the player questions in games is to: solve problems for the learner, provide guidance for the learner's task, and stimulate his/her thinking process (Sung & Hwang, 2013). The design of the character dialogues in this study contains many clues to the case. Learners must play the game and gradually piece together the truth of the events.

Methods

The participants of this study were recruited through a recruitment process and consisted of 15 individuals. In order to assess the learners' flow status, this study referred to Kiili's (2006) flow status chart and used the Chinese version translated by Hou and Li (2014). In order to assess learners' acceptance of the game, this study modified the Technology Acceptance Scale proposed by Davis (1989). In addition, this study referred the game motivation elements proposed by Hou (2016). The studies used a five-point Likert scale to evaluate the game design elements.

This study designed the GAI decision-making game” The case of the kidnapping of the writer Xiang”. The game featured a realistic storyline, generative AI for realistic character interaction, and a clue-based inference mechanism. Learners took on the role of a police detective in the game and talk to GAI's realistic NPC characters, which scripted by our research team, to explore, collect and analyze clues, and make decisions on the location of the gangster's hideout and the case in a limited period of time. Players were allowed to enter the words they want to ask in the dialog box and get a reply from Writer Xiang, as shown in Figure 1. At the same time, they used the map at the bottom left of the game interface to find the place where Writer Sho is imprisoned, and wrote down the result of their inference in the Google form at the bottom right, as shown in Figure 2.

Figure 1: Game Interface for "The Case of the Kidnapping of the Writer Xiang"

Figure 2: Google Form for Decision Making

Results and Discussions

Table 1 presented the statistical results of learner's flow status after the task. Overall flow status (M=4.07) was significantly higher than the scale median (i.e., 3), and the sub-dimensions flow antecedents (M=3.85), and flow experience (M=4.25) were also significantly higher than the scale median (i.e., 3). It could be seen that learners have a high level of immersion as they talk to GAI simulated NPC characters, analyze clues, locate places of captivity and make inferences. Türkistanli and Kuleyin (2022) mentioned that appropriately challenging tasks in decision-making training environments and assignments also contribute to the development of competence.

Table 1: The Statistical Results of Learner's Flow Status

	(*N*=15)			
	M	*SD*	*Z*	*Sig.*
Overall Flow	4.07	.472	3.411**	.001
Flow antecedents	3.85	.498	3.301**	.001
Challenge-skill balance	3.43	.884	1.865	.062
Goals of an activity	4.27	.704	3.361**	.001
Unambiguous Feedback	3.43	.776	1.872	.061
Control	4.10	.806	3.170**	.002
Playability	4.03	.719	3.082**	.002
Flow experience	4.25	.514	3.414**	.001
Concentration	4.45	.561	3.436**	.001
Time distortion	4.33	.699	3.236**	.001
Autotelic experience	4.45	.465	3.431**	.001
Loss of self-consciousness	3.37	1.008	1.334	.182

*p <0.05, **p <0.01

Table 2 presented the statistical results of activity anxiety. Overall anxiety (M=2.62) was lower than the median (i.e., 3) of the scale, indicating that the learners were less anxious during the game. According to the game acceptance statistics, the overall acceptance (M=4.04), sub-dimensions cognitive usefulness (M=3.91) and cognitive ease of use (M=4.18) were significantly higher than the median of the scale (i.e., 3); and the game design element (M=4.23), was significantly higher than the median of the scale (i.e., 3). The results showed that the game was well accepted and not only did it help the learners at the cognitive level, the game was also easy to use. Kuo and Hou (2024) mentioned that learners were highly receptive and motivated to decision-based game-based training. Chien and colleagues (2023), on the other hand, mentioned that interactive and immersive contextual decision-making games, in addition to providing learners with a high level of concentration, also have high flow status and high acceptance.

Table 2: The Mean and Standard Deviation of Learners' Game Anxiety, Game Feedback, and Game Elements

	(*N*=15)			
	M	*SD*	*Z*	*Sig.*
Game Anxiety	2.62	.783	-1.736	.083
Game Feedback	4.04	.700	3.24**	.001
Game Usefulness	3.91	.947	2.73**	.006
Game Ease of Use	4.18	.700	3.34**	.001
Game elements	4.23	.539	3.41**	.001

*p <0.05, **p <0.01

Conclusions and Limitations

This study found that learners had a high degree of flow status, and moderate anxiety, and high acceptance of the game during the GAI decision-making game, which learners perceived as helping them develop their abilities, and also showed that the form of the game in dialogue with the GAI was acceptable to the learners. In addition, according to the feedback from the learners, 80% of the learners think that it is more anthropomorphic than the general GPT, and the conversation is more like a real person interaction. Some learners also mentioned that the

clues provided by the NPC characters were very helpful, including the characteristics of the location and the experience of the incident, which helped them to inference in decision-making.

In addition to the above findings, this study also identified some limitations and research directions. Decision making can be measured and explored in greater depth in the future, and the content of conversations between learners and GAI can be analyzed in greater depth. Include the content of the inquiry, the classification of clues, such as: the background story of the GAI character, the details of the kidnapping process, and the description of the captivity site, in order to better understand the learner's mastery of the clues and why to make the final inference.

Literature Review of the Impact of Strength Training and Plyometric Training on Basketball Performance

Jun Wan, Jiangxi University of Software Professional Technology, China

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This paper aims to provide an extensive literature review of academic papers written in English about the impact of strength exercises on basketball performance across different educational and training institutions. Resistance training, also known as strength training or weight training, involves using resistance to muscle contractions to enhance strength, anaerobic endurance, and muscle size, and plyometric training enhances neuromuscular coordination by training the nervous system, making movements more automatic during activity, resulting in improved performance. This article comprehensively reviews and evaluates basketball players' strength and plyometric training methods, offering valuable insights and references for scientifically enhancing their shooting, dribbling, and speed performance. The literature review found several key insights into the effects of strength and plyometric training on basketball players. Previous research highlighted that plyometric training (PT) effectively enhances agility, and functional strength training was found to significantly boost lower limb explosive power. Combining strength and plyometric training improved vertical jump performance and reduced injury risk. Core training improved endurance and balance but had limited sport-specific effects. Overall, the literature supports the importance of strength training in enhancing performance and preventing injuries in basketball players. Strength training seems to be very important for inducing basketball performance. It not only builds muscle but also improves basketball skill level. The results show us that a lot of the research has been done on these two training methods separately, and these results imply that more research needs to be done on combining the two methods to impact basketball performance.

iafor
The International Academic Forum
www.iafor.org

Introduction

With the continuous development of the economy, basketball has become increasingly popular. There are basketball leagues of different levels worldwide, such as the Chinese Professional Basketball League, the European Professional Basketball League, and the American Professional Basketball League. Basketball is a group competition that involves high-intensity activities like jumping, sprinting, directional changes, and physical confrontations. Due to the limited space of basketball games, it is easy to get injured during the fierce competition. (Ransone, 2017). According to research strength training can enhance the strength and endurance of basketball players and improve their game performance while reducing the risk of injury. Knowing how individual athletes should adapt the strength training regime to their usual practice routine is also essential in basketball training. It can not only help improve muscle strength but also prevent injuries.

Terminology

Basketball

Basketball was invented by Dr. James Naismith in 1891. Since then, it has spread and developed rapidly around the world. It is currently estimated that about 450 million players and fans worldwide exist. Basketball is also one of the most popular sports in China today, and basketball has become a part of Chinese culture. The most prestigious basketball league is the American Professional Basketball League. There are also basketball leagues of different levels in different parts of the world, such as the Chinese Basketball Professional League, the European Basketball Professional League, etc. (*About FIBA About the CIES SPORTS Observatory*, n.d.).

Strength Training

Strength training, which includes weightlifting and resistance exercises, focuses on building muscular strength and endurance. Beyond traditional weightlifting, it includes bodyweight exercises, isometric holds, and plyometric movements. This wide range of methods makes it adaptable to different sports, helping to enhance athletic performance and physical conditioning (*Strength Training*, 2024). Strength training follows the basic principle of repeatedly overloading a muscle group. This is usually done by contracting the muscle against heavy resistance and returning to the starting position. The process is repeated several times until the muscle reaches the point of failure. The fundamental approach to resistance training is based on progressive overload, where muscles are subjected to increasing resistance levels to promote strength gains. This method enhances muscular strength and endurance by progressively challenging the muscles within their capacity. They respond by becoming more prominent and more substantial. Beginner strength trainers are training the neurological aspect of strength, which is the brain's ability to generate a rate of action potential in neurons that will produce a muscle contraction close to the maximum potential of the muscle. (Schoenfeld et al., 2017). Strength training can alter the body's metabolic rate by utilizing anaerobic energy metabolism to support muscle development and promote long-term metabolic adaptations. Regular resistance training induces the adaptation of enzymes and substrates involved in energy supply, ultimately leading to increased muscle mass. Studies have shown that chronic resistance training responds to glycolytic muscle fibers with more vital anaerobic metabolism (Freitas, 2017).

Plyometric Training

Plyometric training (PT) is a specialized form of strength training commonly employed in team and individual sports to enhance sport-specific performance. It focuses on explosive movements, improving power, speed, and agility, essential for athletic success (Davies et al., 2015). It has become increasingly popular and recognized by many athletes and coaches in the past few decades. PT is one of the practical training methods that can improve athlete performance, and compared with other training, it is more targeted and can help shorten the muscle training cycle (Ugarkovic et al., 2021). Some research indicates that a 7-week plyometric training program improved quadriceps muscle contractility in adolescent female basketball players but reduced agility and jump performance, with no change in balance (Meszler & Váczi, 2019a). PT has been shown to improve physical qualities, such as strength, jump height, running economy, agility, sprint speed, and endurance. PT exercises involve explosive muscle movements, which are divided into three phases: the pre-activation phase (eccentric contraction), retention phase (isometric contraction), and shortening phase (concentric contraction), which together constitute the stretch-shortening cycle (SSC). The rapid transition from the eccentric phase to the concentric phase will increase force output by inhibiting the protective function of the Golgi tendon organ to a greater extent, and it can enhance the mechanical properties of the tendon complex, strengthen the elasticity of connective tissue, and optimize the mechanics of the myofilament bridge structure and motor unit activation (Davies et al., 2015). These adaptive changes help improve muscle strength, dynamic stability, neuromuscular control, contraction speed, and joint stiffness.

The Impact of Strength Training on Basketball

In basketball games, good athletes usually have strong bodies and sufficient advantages in basketball confrontation. Strength training is a widely recognized and very effective training method that can improve muscle function, functional performance, and health parameters (Garber et al., 2011). During the off-season of basketball, athletes will improve their physical fitness and reduce the risk of injury by enhancing explosive power, endurance, and high-intensity strength training. This is a straightforward and effective training method. Helming, (2019, as cited in Strasunskas & Guðjónsson, 2020a), pointed out that adding strength training to a regular training program is generally valuable in competitive sports because it can help athletes perform at a higher level and prevent injuries. This shows the importance of strength training. Strength depends on more than just muscle size, as neural adaptations play a significant role in strength gains. These adaptations improve the nervous system's ability to recruit muscle fibers efficiently, enhance motor unit synchronization, and increase firing rates. As a result, individuals can experience differing strength improvements even with similar muscle mass, as the nervous system optimizes muscle activation and coordination, leading to enhanced force production (Brooks et al., 2019). Studies have shown that strength exercises improved vertical jump performance, take-off speed, maximal jump height, work output, power, and running speed over short distances (5 and 20 meters), and another study also concluded that strength training directly enhances basketball performance by increasing players' strength and power (Mikolajec et al., 2012). Türker & Yüksel (2021) found that the findings of this research indicate that functional and supportive strength training has positively impacted body fat percentage, aerobic capacity, and dynamic balance. Basketball is a sport that requires frequent contact and confrontation between players. The game is fast-paced, and players must have excellent explosive power to sprint, stop, and jump quickly to complete each round of offense and defense. At the same time, basketball players must have good muscle endurance and stamina. A study by Yong (2023) showed that the results

suggested that functional strength training can significantly enhance the explosive power of basketball athletes' lower limbs.

Plyometric Training Impact on Basketball

Basketball is a very confrontational sport. Plyometric training effectively enhances agility in basketball players, and plyometric jump training (PJT) increases tendon stiffness, allowing for a faster and more effective force transfer from muscle to bone (Legerlotz et al., 2016; Meszler & Váczi, 2019a). Such an effect may improve the physical fitness of youth athletes (Myers et al., 2017). Chen and colleagues (2023) studied the impact of PT on the lower limbs of young athletes (including football players, track and field athletes, and basketball players. The findings revealed that PT can help improve muscle maximum strength and neural adaptation and improve the explosive power and jumping of adolescent athletes' lower limbs. Research also shows that even a limited amount of plyometric training could improve jumping performance in elite junior basketball players, and this improvement could be partly related to an increase in the maximal voluntary force of hip extensors and the rate of force development of knee extensors (Ugarkovic et al., 2021). Scholars added that PT could improve hip joint force generation characteristics, the transmission efficiency of the connection between upper and lower limbs, and the speed of fast breaks after basketball players receive the ball. Another study showed a fascinating experiment in which they found that PT can significantly improve basketball players' muscle strength, linear sprint speed, change of direction speed, and balance, and pointed out that the results of the effects are not related to gender or age, especially in basketball. Among athletes, PT can significantly increase the distance of the standing long jump and significantly shorten the time of the 10-meter and 40-meter change of direction sprint (Ramirez-Campillo et al., 2022). PT has also considerably improved the performance of female basketball players in multiple areas. These include jumping and shooting skills, sprinting and cutting abilities, muscle characteristics, balance, and overall skill-related performance. This indicates that PT positively enhances female basketball players' physical fitness and sports performance. It can be seen that the impact of PT on basketball is not only the basketball technology itself but also the effect on physical fitness, helping to improve muscle strength and enhance explosive power and self-coordination.

Summary

A review of previous research relevant to this study establishes a solid foundation for understanding the role of strength training (ST) and plyometric training (PT) in enhancing basketball performance. The growth of basketball as a sport must be distinct from scientific training models, particularly those that target specific athletic needs. PT, in particular, focuses on the lower limbs and involves explosive jumping exercises that strengthen leg muscles and enhance overall jumping ability. Multiple studies have reinforced the strong connection between PT and improved jumping performance, which is especially critical in basketball, where strength training plays an integral role. Muscle strength is a key source of athletic power, and strength training has been shown to increase muscle fiber density and enhance various forms of strength, including maximum strength, endurance, and explosive power. When integrated with plyometric exercises, strength training significantly improves speed, agility, dynamic balance, and overall physical performance. It also contributes to injury prevention and endurance enhancement. The simplicity of PT and ST makes them practical for daily training and suitable for broad applications. This review highlights the scientific basis for adopting these methods in basketball training, offering a valuable framework for

coaches to design more effective training regimens and player selection strategies. By combining strength and plyometric training, basketball players can experience enhanced physical attributes crucial for performance on the court.

Table 1: Review of Previous Research

Author	**Research Focus**	**Key Findings**
(Woolstenhulme et al., 2004)	Strength training	This study shows that strength training does not negatively affect vertical jump height, anaerobic power, or shooting accuracy.
(Meszler & Váczi, 2019b)	Plyometric training	The study indicates that when regular basketball training and games are combined with high-volume plyometric training, there are no significant functional improvements. This is attributed to the fatigue resulting from insufficient recovery between training sessions, which can hinder the intended benefits of plyometric exercises.
(Mikolajec et al., 2012)	Strength exercise	"This study underscores that strength exercises improved vertical jump performance, take-off speed, maximal jump height, work output, power, and running speed over short distances (5 and 20 meters).
(Mikolajec et al., 2012)	Strength exercise	The study concluded that strength training enhances basketball performance by increasing players' strength and power.
(Strasunskas & Guðjónsson, 2020b)	Strength training	This research concludes that adding strength training to a basketball training regime leads to positive outcomes in physical performance, injury prevention, and endurance.
(Zhang & Zhang, 2023)	Strength training	The research highlights that strength training can enhance physical endurance and explosive power in young people, improving speed, agility, and other physical attributes.
(Türker & Yüksel, 2021)	Strength training	This research indicates that functional and supportive strength training has positively impacted body fat percentage, aerobic capacity, and dynamic balance.
(Yong, 2023)	Strength training	The results suggested that Functional strength training can significantly enhance the explosive power of basketball athletes' lower limbs.
(Meng, 2022)	strength and Quality Training	The results suggest that strength and Quality Training achieved significantly better bench press performance than the traditional group, confirming the effectiveness of the new strength training method.
(Uysal et al., 2023)	plyometric exercises and traditional strength exercises	The investigation demonstrates that Combining both ways is designed to help basketball players improve their ability to jump higher.

(Woolstenhulme et al., 2004)	Strength training	The data indicates that prior strength training does not negatively affect the vertical jump height, anaerobic power, or shooting accuracy of collegiate women's basketball players.
(Yáñez-García et al., 2022)	combined high-speed resistance training and plyometrics	These findings suggest that high-speed resistance training combined with plyometrics improves strength, jumping, and sprint speed in young basketball players, but its effectiveness decreases with age.
(Li, 2022)	Core strength training	The research highlights that Core strengthening training can improve the physical fitness of college basketball players.
(Şahiner & Koca, 2021)	Core training	The research emphasizes that core strengthening training can significantly enhance the physical fitness of college basketball players, contributing to improvements in stability, balance, and overall athletic performance.
(Feng et al., 2024)	core strength training	The findings of this research indicate that the 12-week CST program significantly enhanced dynamic balance, agility, and dribbling skills in adolescent basketball players, highlighting its value in training.
(Ugarkovic et al., 2021)	plyometric training	The study proves limited plyometric training could improve jumping performance in elite junior basketball players. This improvement could be partly related to an increase in the maximal voluntary force of hip extensors and the rate of force development of knee extensors.
(Meszler & Váczi, 2019a; SENTU MITRA et al., 2013)	Plyometric training, Resistance training	The results indicate that plyometric training effectively enhances agility in basketball players.
(Kons et al., 2023)	plyometric training	The available evidence indicates that plyometric training improves most related physical fitness parameters and sports performance.
(Meszler & Váczi, 2019a)	plyometric training	Based on the study's findings, a 7-week plyometric training program improved quadriceps muscle contractility in adolescent female basketball players but reduced agility and jump performance, with no change in balance

Practical Recommendations for Coaches and Athletes

Basketball training programs should incorporate specific plyometric exercises, such as box jumps, depth jumps, and bounding drills, to enhance explosive power, speed, agility, balance, and coordination, particularly in young athletes through low-frequency, high-volume, mixed-type sessions over the long term (Zhou et al., 2024). To translate these physical fitness gains into game performance, integrating sport-specific drills like sprinting to a jump shot ensures improved speed and power are effectively utilized in real game situations, bridging the gap between conditioning and technical skills (Deng et al., 2023). Monitoring athlete progress

and adjusting programs based on individual responses, including performance metrics, fatigue, and recovery, is essential for optimizing outcomes (Sáez De Villarreal et al., 2021). Additionally, combining plyometrics with strength, core, and functional training offers a holistic approach that enhances endurance, strength, balance, and agility. Tools like the Reactive Strength Index (RSI) and force-velocity profiling can further tailor plyometric exercises to address specific athletic needs, making training regimens more targeted and effective for basketball performance (Bremec, 2017).

Future Research Directions

Future research should explore optimal training schedules that align with athletes' seasonal demands and avoid overtraining to enhance the scope and effectiveness of strength and plyometric training in basketball. There is also a need for individualized training programs that consider athletes' unique physiological and experiential backgrounds to maximize performance gains. Understanding the underlying physiological mechanisms of training adaptations through advanced molecular and biomechanical studies could further refine training methods. Additionally, evaluating the effectiveness of various recovery interventions could provide insights into maximizing training benefits and minimizing injury risks. Comparative studies are also crucial to identify which exercises most effectively enhance specific basketball skills, such as shooting and dribbling. Finally, investigating the long-term effects of systematic strength and plyometric training on athletes' career longevity and injury prevalence could offer valuable guidelines for sustained athletic development. Addressing these areas will provide a deeper understanding of how tailored training protocols can be developed to enhance basketball players' performance and well-being.

Conclusion

This literature review underscores the significant impact of strength and plyometric training on enhancing basketball performance. Strength training has been proven to build muscular strength, endurance, and explosive power, which are pivotal for basketball players in achieving superior performance and mitigating injury risks. Plyometric training complements these gains by improving neuromuscular coordination, agility, jump height, and speed—attributes that are essential for basketball's high-intensity demands. Combining strength and plyometric training offers synergistic benefits, including improved vertical jump height, sprint speed, and overall athletic functionality. However, core strengthening demonstrates limited sport-specific effects while contributing to stability and balance. This indicates a need for more integrated approaches to training regimens.

Future research should prioritize exploring the combined effects of strength and plyometric training on basketball performance, mainly focusing on sport-specific adaptations and individualized training protocols. The findings of this review provide a robust framework for coaches and athletes to adopt scientifically informed training programs that not only maximize athletic potential but also address injury prevention, ensuring sustained performance and career longevity for basketball players.

Abstract
Although museums converted from cultural heritage are of high historical value, they may not be able to retain the old historical elements due to changes in business strategies and lose the historical value of the original scene. Museum tour guides can still take visitors back to the past through oral tours, there is still limited understanding due to insufficient information retained on site. Therefore, this study attempts to design an alternative reality museum tour game that combines simulated historical storylines and role-playing for a marine museum transformed from a thermal power station. Players can use their mobile phones to open the game and read the storylines to match the real historical scene in the museum park. Using first-person role-playing, players can walk around the existing museum park and explore the events of each historical site, interact with the virtual characters and solve the unexpected events that happened at the thermal power station at the time to immerse themselves in the simulated historical situation. Seventeen participants engaged in this study. The result revealed that the players had a high level of flow, and moderate anxiety. About cognitive loads, a certain degree of intrinsic cognitive load was generated by the long storytelling, the low level of extraneous cognitive load and the high level of germane cognitive load reported indicated that this game can increase the player's commitment to the game and advance the player to think about the content of the game simultaneously.

Introduction

In order to promote the preservation and safeguarding of the world heritage, UNESCO launched the Memory of the World Programme in 1992, which has three main objectives: to preserve the world heritage using the most appropriate techniques, to facilitate access to and use of the world heritage, and to raise awareness among all human beings of the existence and significance of the world heritage (Edmondson et al., 2020).

Under the promotion of this project, more and more cultural heritage in Taiwan have been transformed into museums and preserved using adaptive re-use of old buildings. Unfortunately, many of the revitalized cultural assets can hardly show the historical features and values of the old venues due to the different management policies of the venues and the functions of the old buildings. Although many museums have used oral guided tours to recreate the appearance of the museums before the revitalization process, they still suffer from the problem of incomplete information or the limited number of guided tours.

As a result, many museums have turned to the development of digital educational games recreating the original appearance of cultural heritage through digital technology and game mechanisms. Many studies have pointed out that digital educational games can not only attract learners of different educational levels and knowledge areas to learn about cultural heritage but also raise learners' awareness of the preservation of cultural heritage (Petrucco & Agostini, 2016; Garcia-Fernandez & Medeiros, 2019).

Alternative Reality Game (ARG) is a type of game that uses digital technology to connect virtual reality and physical interaction. It is very suitable for educational games with cultural heritage themes (Zarraonandia et al., 2024) The characteristic of alternative reality games is that they use immersive narrative methods to attract players into the game, which can not only inspire players' literacy skills, but also create novel visiting experiences for museums (Davies et al., 2012).

However, some studies have said that many ARGs on the topic of cultural heritage lack interactivity and explorability, which makes it more difficult for players to feel like they are stepping into a historical context, and it is difficult for them to gain a deeper understanding of the historical content and preservation value of cultural heritage. The key reason for this may lie in the fact that these games are not designed from the experiences and perspectives of the educators in the field, which can lead to the production of games that do not meet the educational needs of the field and the game mechanisms of the learning context (Zarraonandia et al., 2024).

Therefore, this study attempts to design an alternative reality museum tour game that combines a simulated historical storyline and role-playing for a marine museum converted from a thermal power station, based on the museum's collection of literature and historical materials by educators familiar with the museum's background. Players can use their mobile phones to open the game and read the storylines to match the real historical scene in the museum park (Figure 1). They were using first-person role-playing, and the learning scaffolding of the digital system to understand the historical information of each site, summarize the answers to the puzzles from the dialogue between yourself and the virtual NPCs, and generate the immersive feeling of returning to the past historical scene, to achieve the effect of both learning scientific knowledge and historical immersion (Figure 2).

Figure 1: Players play the game through the graphic story in the ARG game against the real historical sites.

Figure 2: After entering the game, players can read the game content and puzzle clues to think, deduce, and summarize the answers.

The purpose of this study was to investigate the flow, activity anxiety, and cognitive load condition of the learners in an alternative reality museum tour game of cultural assets that combines a simulated historical storyline with role-playing, and to observe the historical immersive experiences generated by the learners during the game. Therefore, the following two research questions were asked in this study:

Q1: What are learners' state of flow, activity anxiety, and cognitive load during the game?

Q2: Can learners produce historical empathy phenomena in this game?

Method

The participants in this study were 17 university students and public people (8 males and 9 females) in Taiwan. We used the post-test questionnaire survey method in quantitative

research all experiments were conducted online. The Kiili Flow Scale (2006) translated and revised by Hou & Li (2014) was referred to in this study. The flow scale includes two dimensions: Flow Antecedents and Flow Experience. All scales were scored according to the Likert scale. The reliability of the flow questionnaire (Cronbach's alpha=0.792) indicated a high degree of internal consistency. In terms of the anxiety of the game by the learner, the AMAS anxiety scale proposed by Carey, Hill, Devine and Szűcs (2017) modified by this study and the Likert scale was used. The reliability of the anxiety scale (Cronbach's alpha=0.853), which has credibility. In terms of the cognitive load of the learning by the learner, the cognitive load scale proposed by Leppink, Paas, Van der Vleuten, Van Gog and Van Merriënboer (2014) modified by this study was used, which included three dimensions: Intrinsic Cognitive Load, Extraneous Cognitive Load, and Germane Cognitive Load, and the Likert scale was used. The reliability of the cognitive load scale, intrinsic cognitive load (Cronbach's alpha=0.846), extraneous cognitive load (Cronbach's alpha=0.817), germane cognitive load (Cronbach's alpha=0.899), three cognitive load dimensions has credibility. Historical empathy quantitative survey proposed by Endacott and Brooks (2013) historical empathy interview methods, which included three dimensions: Historical Contextualization, Perspective Taking, and Affective Connection, used to understand learners' cognitive understanding and emotional engagement with historical scenes and characters. Prior to the study, subjects would sign an institutional review board. The learning activity was an alternative reality museum tour game, which included game explanation (10 minutes), game activities (60 minutes), and post-test questionnaire (20 minutes).

Result

In this study, the Wilcoxon signed-rank test was used to analyze learners' flow, anxiety, and cognitive load, the results shown as Table 1. The result revealed that the overall flow (M=4.37) was significantly higher than the median (the median in a five-point scale=3). This indicates that the overall game activity design mechanism enables the learner to clearly understand the game's objective of the activity and is proactively engaged in the game to complete tasks, achieving a high level of flow experience. The result revealed that the overall anxiety (M=1.99) was significantly lower than the median. The result revealed that the cognitive load, intrinsic cognitive load (M=2.12) was significantly lower than the median. This indicates that the content of the game is designed to have a lower intrinsic cognitive load on the learner; extraneous cognitive load (M=1.12) was significantly lower than the median. This indicates that the game does not place too much external cognitive load on the learners; germane cognitive load (M=4.72) was significantly higher than the median. This indicates that the game design promotes learners to think more and generate useful cognitive. Furthermore, historical empathy surveys show that most of the learners said that they could feel that they were in Japanese colonial period in Taiwan when thermal power plants were still in operation, and that they could empathize with the difficulties faced by the staff of the power plants during emergencies, as well as the lives of the people living in the vicinity of the thermal power plants at that time.

Table 1: Flow, Anxiety and Cognitive Load Descriptive Statistical Analysis

Dimension	***M***	***SD***	***Z***	***p***
Overall Flow	4.37	0.34	3.626***	.000
Flow antecedents	4.31	0.46	3.625***	.000
Flow experience	4.42	0.35	3.625***	.000
Overall Anxiety	1.99	0.73	-3.386**	.001
Overall Cognitive Load				
Intrinsic Cognitive Load	2.12	0.98	-2.748**	.006
Extraneous Cognitive Load	1.12	0.20	-3.782***	.000
Germane Cognitive Load	4.72	0.39	3.711***	.000

***$p < 0.001$; **$p < 0.01$

Conclusion

In this study, we use design an alternative reality museum tour game that combines simulated historical storylines and role-playing for a marine museum transformed from a thermal power station. Players can use their mobile phones to open the game and read the storylines to match the real historical scene in the museum park. Using first-person role-playing, players can walk around the existing museum park and explore the events of each historical site, interact with the virtual characters and solve the unexpected events that happened at the thermal power station at the time to immerse themselves in the simulated historical situation.

The result revealed that the players had a high level of flow, and moderate anxiety. About cognitive loads, a certain degree of intrinsic cognitive load was generated by the long storytelling, the low level of extraneous cognitive load and the high level of germane cognitive load reported indicated that this game can increase the player's commitment to the game and advance the player to think about the content of the game simultaneously. After the initial analysis of this study, this study will continue to explore the effect of the study on the learners compared to the control group (join other learning scaffolds) by means of a quasi-experimental design.

Abstract
In recent years, the application of generative AI's (GAI) adaptive characteristics in education has rapidly emerged. However, general GAI in educational games often lacks realistic situations and operational fidelity, leading to limited authentic experiences and difficulties in learning transfer. Additionally, GAI frequently produces inaccurate or off-topic responses. To address these limitations, this study designs a historical education problem-solving game based on a previous research team's framework of using GPT as a game Non-Player Character (NPC) (Chen & Hou, 2024). The game incorporates realistic story situations and reduces off-topic NPC responses. In the game, learners play as the close friend of the protagonist and collaborate with GPT-based NPC peers designed by the research team. They conduct online information searches within a limited time to find the historical period in which the game protagonist disappeared and the name of the current building to save the protagonist. A total of 17 participants engaged in the empirical evaluation of this study. The study found that learners exhibited a high flow state, perceived the game as highly playable and enjoyable, and had a high acceptance of the game. Additionally, 70% of learners believed that the game helped with historical learning, and nearly 50% felt that it was closer to real human interaction compared to typical GPT conversations. The study demonstrates that a GPT-based NPC, enhanced with contextual stories and reduced off-topic responses, can effectively improve learners' gaming experience.

Keywords: Generative AI, Problem-Solving Exploration Skills, Operational Realism

Introduction

With the rapid emergence of generative AI, various educational applications have quickly risen, bringing benefits to learners. Research has shown that AI-generated gamified assessment strategies significantly enhance student engagement and motivation, improving learning outcomes (Bachiri et al., 2023). Integrating escape room games with AI chatbots allows educators to design immersive educational experiences more easily, enhancing teaching efficiency and effectiveness (Fotaris et al., 2023). AI-assisted gamified learning can boost students' intrinsic motivation, reduce cognitive load, and foster effective learning behaviors in scientific education (Chen, C.-H., & Chang, C.-L., 2024). Chen and Hou (2024) found that incorporating ChatGPT-based situational NPCs into educational games enables students to maintain high motivation and engagement without excessive anxiety. However, general generative AI lacks situational and operational realism in educational games, limiting the sense of authenticity and making learning transfer more difficult. For instance, Benjamin Emihovich and colleagues (2020) examined improvements in problem-solving skills and found no significant difference in PISA problem-solving test performance between using popular video games like *World of Warcraft* and cognitive training games like *CogniFit*. This suggests that without realistic scenarios or relevant subject knowledge, effectiveness remains limited, and the same holds for AI-driven research. Furthermore, current generative AI answers often contain a certain error rate, but tutor versions designed by researchers show lower error rates than those without prior configuration (Bastani et al., 2024).

Building on this, our research developed a narrative context and implemented character-personalized GPT. Furthermore, based on previous research by Chen and Hou (2024), which used GPT as an NPC in games, we designed a historical educational problem-solving game titled *The Disappearance of Bi-Ting*, incorporating a realistic narrative and reducing off-topic NPC responses.

Methods

Participants in this study were 17 adults over the age of 18 from Taiwan (8 males and 9 females), recruited through online registration. None of the participants had previously experienced a GenAI-integrated game-based learning activity. Each participant used a personal computer and conducted the online learning activity in a private space. The entire study was conducted online.

This activity is conducted on a Google Sites webpage, integrating game text, Google Form puzzles, and GPT-based NPCs. Before starting, learners watch an introduction video covering the game story and instructions. Learners play as the protagonist's close friend, tasked with finding the year and specific time-space location where their friend has disappeared within a limited timeframe. Throughout the game, learners interact with a GPT-based NPC developed by the team, which guides players to think critically without directly providing correct answers. Learners must assess the NPC's information and may conduct online searches for further information.

The activity was divided into several stages. First, a 10-minute introduction was given on the game story and operation. This was followed by a 30-minute game experience. After the game, a 20-minute post-test was conducted. Finally, a 10-minute discussion and explanation session was held to conclude the day’s activity, making the total duration approximately 70 minutes.

The instruments included a Flow Scale, a Game Anxiety Scale, a Game Feedback Scale, a Game Elements Scale, and a self-reported questionnaire. The Flow Scale, translated and revised by Hou and Li (2014) from Kill's Flow Scale (2006), covered flow antecedents and flow experience. To assess participant anxiety, this study adapted Hung's (2001) Activity Anxiety Scale. Game Feedback was measured using Davis's (1989) scale, which includes perceived usefulness and ease of use. The Game Elements Scale was based on game motivational elements proposed by Hou (2016). All of the above scales were evaluated using a five-point Likert scale. The self-reported questionnaire collected data on realism and usage effectiveness based on the characteristics of the GPT-based NPC and historical learning outcomes in this study.

Figure 1: Game Format and NPC Interaction Interface

Results and Discussions

In the quantitative questionnaire section of this study, a one-sample Wilcoxon signed-rank test was used to analyze. Table 1 shows that the overall flow (M=4.19) is significantly higher than the median of the scale (i.e., 3), indicating that the design of this study provided learners with clear goals, appropriate difficulty, and a high sense of self-mastery, thereby fostering a high flow experience and encouraging active participation. Game anxiety (M=2.80) did not significantly differ from the median of the scale (i.e., 3), suggesting that the study design created a moderate level of anxiety during the learning process. Game acceptance (M=4.08) was significantly higher than the median of the scale (i.e., 3), indicating that the game is easy to engage with and helps users develop online information skills. Additionally, game elements (M=4.19) were significantly higher than the median of the scale (i.e., 3), suggesting that the study design allowed learners to feel a sense of control while incorporating a degree of uncertainty and challenge, which made the game enjoyable. Participants also reported a sense of achievement upon completing levels and expressed a willingness to experience similar games in the future.

Table 1: Flow and Activity Anxiety and Game Acceptance Descriptive Statistical Analysis

Dimension	*M*	*SD*	*Z*	Sig.
Overall Flow	4.19	0.62	3.62***	0.000
Flow antecedents	4.18	0.65	3.52***	0.000
Flow experience	4.20	0.64	3.58***	0.000
Game Anxiety	2.80	0.82	-1.11	0.266
Game Feedback	4.08	0.49	3.52***	0.000
Game Usefulness	3.93	0.64	3.45**	0.001
Game Ease of Use	4.27	0.63	3.54***	0.000
Game Elements	4.19	0.65	3.64***	0.000

**$p < 0.01$, ***$p < 0.001$

In the self-reported questionnaire section, as shown in Figure 2 and 3, regarding the realism of NPC dialogue, 41.8% of participants felt that it resembled a real person, while 11.76% mentioned that it was similar to other AIs but still felt like conversing with a human. They noted that the responses were more emotional, less rigid, and did not reveal all the answers at once, prompting further inquiries. In terms of providing informational support, 76.47% reported that the NPC was helpful in the information search process, such as by answering with relevant details (who, when, where, what), offering related keywords, and helping to narrow down the scope of clues. During gameplay, 70.59% indicated that with the help of NPC Xiao-Rou, they could conduct information searches more quickly and efficiently focus on relevant data. Additionally, 70.59% of participants mentioned that the game enhanced their understanding of Tainan's history during the Japanese colonial period, motivating them to explore the bustling locations, historical events, architecture, and streets of Tainan at that time, thus contributing positively to their learning.

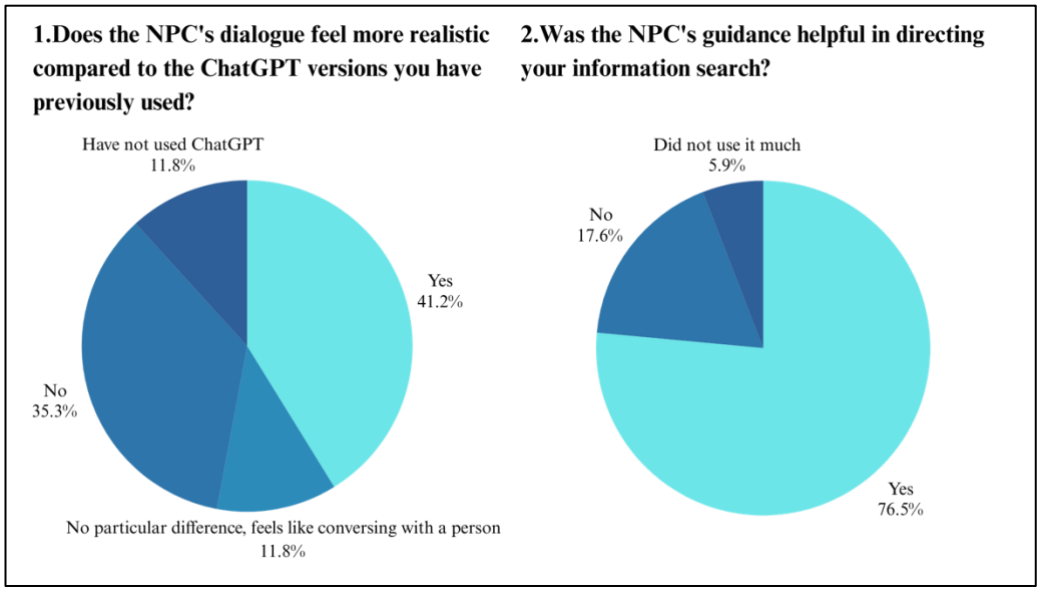

Figure 2: Responses of Participants in the Self-Reported Questionnaire

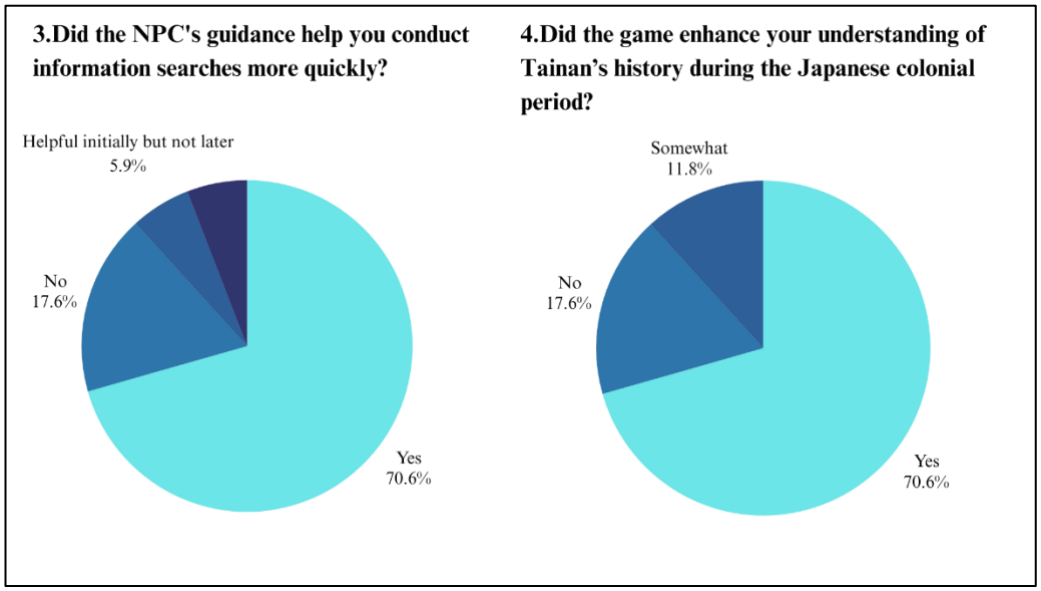

Figure 3: Responses of Participants in the Self-Reported Questionnaire

Conclusions and Limitations

"The Disappearance of Bi-Ting" is a history-themed problem-solving game, based on situational storytelling and GPT-based NPCs designed to minimize off-topic responses. Players use textual clues and interact with the NPC to gradually gather and focus on relevant information, fostering participants' information-gathering skills. Data analysis reveals significant differences in flow state and game acceptance, suggesting that the problem-solving game, which integrates realistic storytelling and GPT-based NPCs, not only enhances learners' gaming experience and flow but also improves their ability to utilize information effectively. Additionally, anxiety levels did not reach statistical significance, indicating that the study did not induce excessive or inadequate activity-related anxiety among participants. This approach can serve as a model in designing educational games. The study's historical knowledge problem-solving game was reported by learners to be beneficial for understanding local historical culture.

Future research will employ a quasi-experimental design to compare the effects on learners between an experimental group using GPT-based NPCs and a control group (two participants per group engaging in online text discussions without GPT-based NPCs).

Implementation of EMI in Taiwan's Higher Education: Exploring Students' Perspective on the Challenges and Their Needs

Chen-An Chang, National Chengchi University, Taiwan
Shan-Yun Huang, National Taiwan University, Taiwan
I-Jan Peng, National Taiwan University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Taiwan's recent bilingual education policy has driven universities to promote English-medium instruction (EMI) courses. While research has explored teacher perspectives on EMI implementation, student experiences remain understudied. This quantitative study addresses this gap by investigating the perceptions and self-reported experiences of 1,137 Taiwanese Mandarin-speaking university students enrolled in EMI courses, whose first language is Taiwanese Mandarin only. This research sheds light on student preferences, challenges, and learning needs in EMI courses. By highlighting these aspects, the study aims to inform instructors on how to effectively plan and deliver EMI instruction while providing appropriate learning resources aligned with students' varying English abilities.

Keywords: English-Medium Instruction (EMI), Students' Perception and Experience, Quantitative Study

iafor
The International Academic Forum
www.iafor.org

Introduction

In line with global trends in politics and economics (National Development Council, 2018; Hsu, 2021), Taiwan has developed its bilingual education policy, known as the Bilingual Policy 2030. The primary objectives of this policy are to "raise the nation's international perspective" (National Development Council, 2018, p. 2), "spur national economic prosperity" (National Development Council, 2018, p. 6), and "enhance young people's English communication skills" (National Development Council, 2018, p. 1). To support these goals, Taiwan's Ministry of Education (MOE) launched the Program on Bilingual Education for Students in College (BEST Program) in 2021, establishing two specific targets for higher education students (Ministry of Education, 2020):

I. Goals of BEST Program

a. 50% of undergraduate students acquire an English proficiency equivalent to CEFR B2 before entering their sophomore year
b. 50% of credits earning from EMI classes for second-year and first-year graduate students

To achieve this goal, higher education institutions in Taiwan, supported by the BEST Program, have introduced English as a Medium of Instruction (EMI) courses. These courses aim to immerse students in an English-speaking environment, facilitate the acquisition of technical vocabulary, and foster disciplinary literacy. Since the implementation of EMI courses in 2021, limited research has explored students' learning preferences, challenges, and needs under this new language policy. To address this gap, we conducted a quantitative study to evaluate students' perceived challenges, learning strategies, and preferred support or resources for EMI courses.

This paper is structured as follows: first, it reviews the existing literature on EMI in Taiwan, identifies research gaps, and highlights the significance of the present study. It then outlines the quantitative study conducted with students at National Taiwan University and examines the findings, with a focus on variations in students' English proficiency levels. Finally, the paper concludes by summarizing the key insights and offering recommendations for instructors to design and adapt EMI courses to better meet students' needs.

Literature Review

Recent studies on bilingual education in Taiwan can be categorized into three areas: course development and pedagogical skills (e.g., Chen et al., 2020; Lin, 2016), challenges and arrangements from teachers' perspectives (e.g., Graham et al., 2021; Graham & Yeh, 2023), and concerns regarding language policy (e.g., Chen & Lin, 2021; Hsu, 2021; Ngangbam, 2022; Ferrer & Lin, 2021; Huang, 2021; Chou & Ching, 2012; Tsou, 2021; Wang, 2021; National Development Council, 2018, 2021).

While these studies shed light on teachers' and scholars' perspectives, they often neglect students' actual experiences with the policy. This oversight creates a critical gap, as understanding students' challenges is essential for educators to refine EMI course design and for policymakers to make the language policy more practical for classroom implementation. Addressing this gap forms the core motivation for our study. In the following subsection, we present our research objectives and questions, highlighting the significance of our work.

Research Objectives, Questions & Its Significance

This research has two primary objectives: to identify the challenges students face in EMI courses and to determine the types of learning support they prefer from instructors. To achieve these goals, we formulated the following research questions:

II. Research Questions

a. What are students' expectations when enrolling in EMI courses?
b. What are students' preferences regarding course activities?
c. What are students' actual experiences in EMI courses?

These questions address students' perspectives at different stages of their engagement with EMI courses: before enrollment, during the courses, and after completion. The first question examines whether students enroll in EMI courses primarily for content learning or to improve English proficiency. The second explores activities instructors could apply to enhance learning experiences. The third investigates challenges faced during the courses and the types of support students find most beneficial.

While teachers and institutions are key to implementing the Bilingual Policy 2030, students play an equally critical role in the success of EMI classrooms. This study examines students' expectations, preferences, and challenges, offering both practical and theoretical contributions. The findings aim to support the development of more inclusive, student-centered bilingual education policies and equip educators with evidence-based strategies to adapt their teaching practices, ultimately enhancing learning outcomes. Finally, this research contributes to global discussions on bilingual education by offering comparative insights for regions pursuing similar policies and bridging the gap between institutional objectives and classroom realities.

Current Study

This section presents a quantitative study that investigates the challenges students encounter in EMI courses and the types of support they prefer. The study is structured as follows: the first subsection outlines the research design and method, the second details the procedures, and the third presents the results.

Design & Method

To address the research questions, this study organizes its survey questions into four main categories: students' backgrounds, expectations for EMI courses, preferences for course activities, and actual experiences in EMI courses, represented as (1), (2), (3), and (4), respectively. Categories (2), (3), and (4) align directly with the research questions outlined earlier, with specific questions tailored to each category.

(1) Student's backgrounds:

a. Which degree am I in?
b. Which college am I from?
c. Which year of study am I in?
d. What is my English proficiency level on the CEFR scale?
e. What is/are my native language(s)?

(2) The expectations of taking EMI courses:

a. What was my expectation of this course before I signed up? (single-select)
b. How confident am I in using English to take this course? (single-select)

(3) The preference for activities in courses:

a. Irrespective of the language of the course, to me, what is the most interesting activity? (single-select)
b. In this course, the most interesting activity for me is? (single-select)

(4) The actual experiences in EMI courses:

a. What am I most worried about using English in this course? (multi-select)
b. Among all the EMI courses (not English language learning courses) I took, what methods can assist me in comprehending the course material most effectively? (single-select)
c. Considering this course is mediated in English, I would appreciate it if my instructor could provide me with the following learning support or resources. (multi-select)

Note that this study specifically focuses on the perspectives of Taiwanese students whose mother tongue is exclusively Taiwanese Mandarin. To ensure the validity of the data, question (1-e) serves as a control measure.

Procedure

The data for this questionnaire study was collected via Google Forms, requiring all participants to complete the survey in full. A total of 1,373 students participated, incentivized by a lottery offering multiple rewards. Of these, 1,175 identified Taiwanese Mandarin as their sole native language, while the remaining 198 were either bilingual in Taiwanese Mandarin and English or non-native speakers of Taiwanese Mandarin.

Results

This section presents the results of the collected data. As our research focuses on university students whose native language is exclusively Taiwanese Mandarin, we analyze and report the findings from the 1,175 participants in this category. For clarity, the results are presented according to the categories outlined earlier. We begin with the findings from category (1).

Results of Category (1)—Student's Backgrounds.

The first question (1-a) asked students about their level of study. Among the 1,175 Taiwanese Mandarin-speaking students, 886 were undergraduates, 251 were graduate students, and 38 were PhD candidates. The proportions for each group are illustrated in Figure 1.

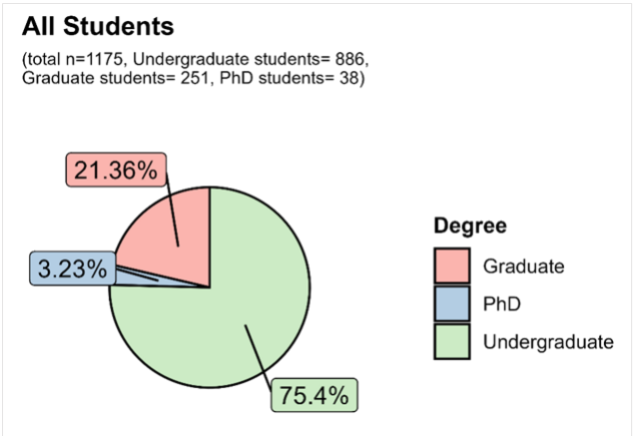

Figure 1: The Results of (1-a), *"Which degree am I in?"*

Figure 1 shows that the majority of participants in this study are undergraduates. Note that course designs for undergraduates and graduates in Taiwan often differ significantly: undergraduate courses are typically lecture-based, while graduate courses are more likely seminar- or colloquium-based. To ensure accurate representation of students' opinions and needs, the data from this study are analyzed separately by degree level.

The data from PhD students, due to their negligible proportion compared to undergraduates and graduates, are excluded from specific analysis to avoid bias. We begin by examining the undergraduate participants, starting with their colleges, as shown in Figure 2.

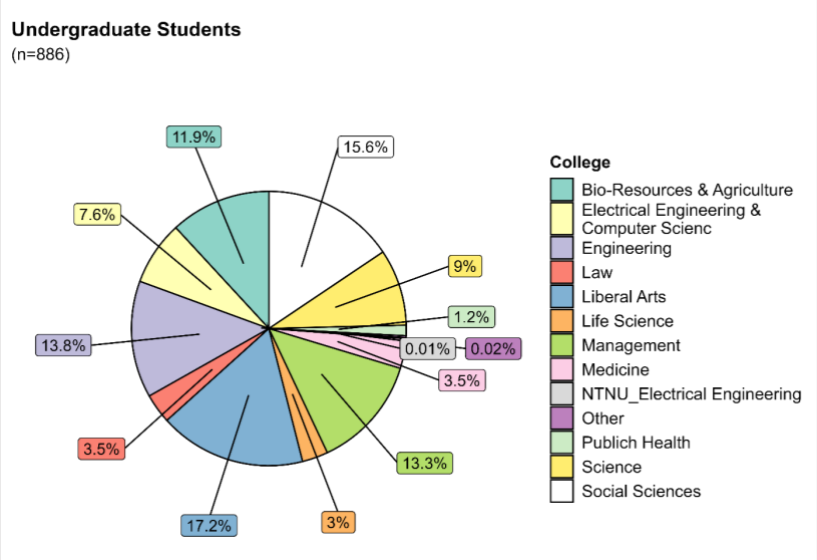

Figure 2: Undergraduate Students' Result of (1-b),
"Which college am I in? "

Figure 2 reveals that undergraduate students represent a diverse range of colleges. However, the majority of participants are concentrated in five colleges: Liberal Arts, Engineering, Bio-Resources & Agriculture, Management, and Social Sciences.

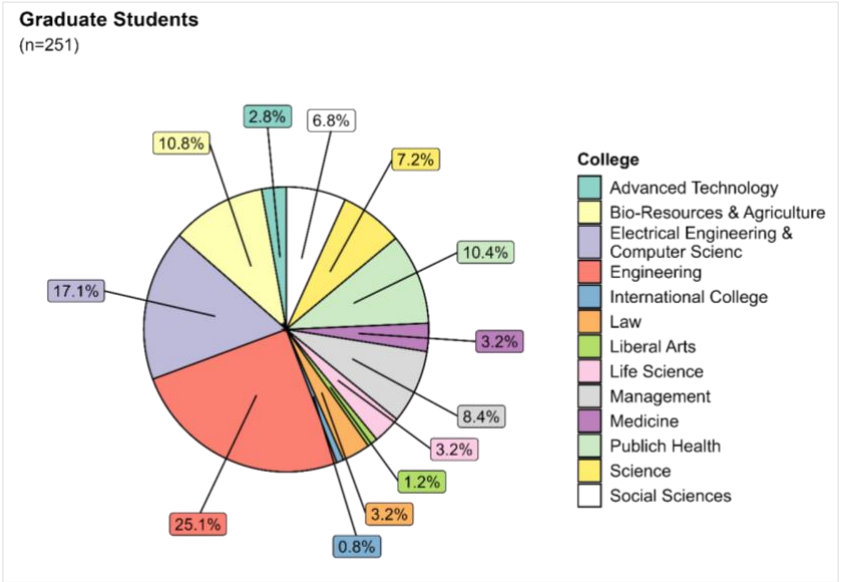

Figure 3: Graduate Students' Result of (1-b),
"Which college am I in?"

Figure 3 shows that graduate students come from various colleges. Unlike undergraduates, the majority of graduate participants are from the College of Engineering, comprising over one-quarter of the sample. Other significant groups include students from the College of Electrical Engineering & Computer Science (17.1%), College of Bio-Resources & Agriculture (10.8%), College of Advanced Technology (10.4%), and College of Social Sciences (8.4%).

Next, students were asked about their year of study. Figures 4 and 5 present the results for undergraduates and graduates, respectively. Among undergraduate participants, 28.5% are freshmen, 34.4% sophomores, 18% juniors, and 18.9% seniors or higher. The distribution of undergraduates across years of study is relatively balanced.

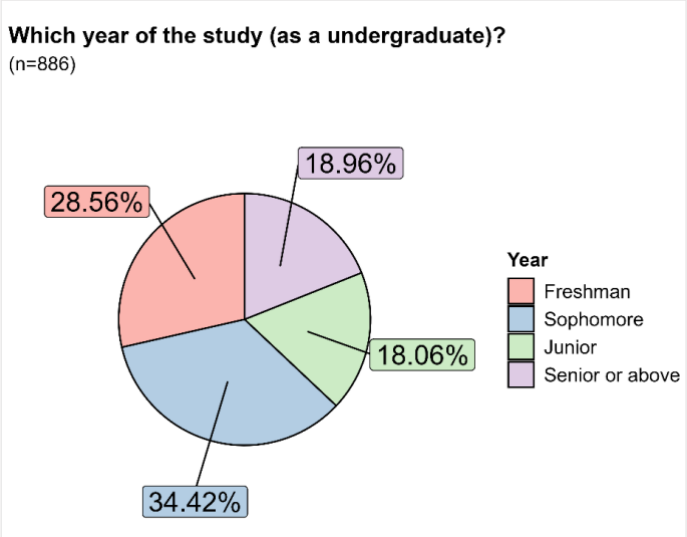

Figure 4: Undergraduate Students' Result of (1-c),
"Which year of the study am I in?"

In contrast to undergraduates, the data collected from graduate students in their third or fourth year of study is minimal. This is expected, as graduate programs typically require 18 months to two years of full-time study. As shown in Figure 5, the majority of graduate participants are first-year students (71.3%), while second-year students comprise 25.5%, accounting for over a quarter of the graduate sample.

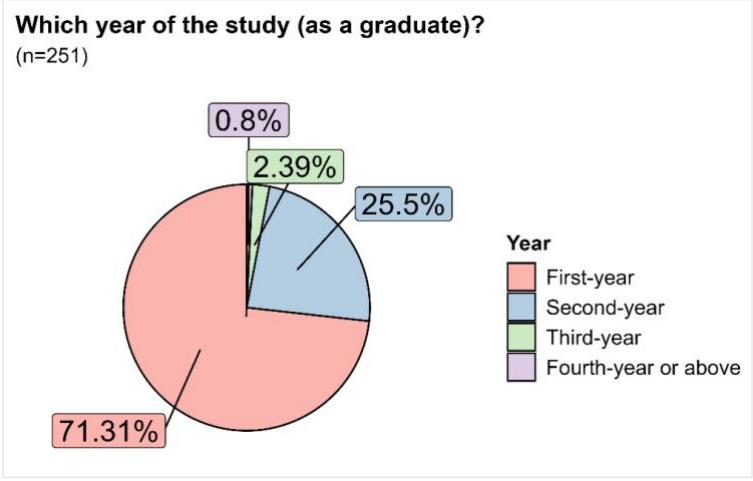

Figure 5: Graduate Students' Result of (1-c),
"Which year of the study am I in?"

The final question in category (1) assessed students' English proficiency using the Common European Framework of Reference for Languages (CEFR) scale. Figure 6 presents the results for undergraduate and graduate students.

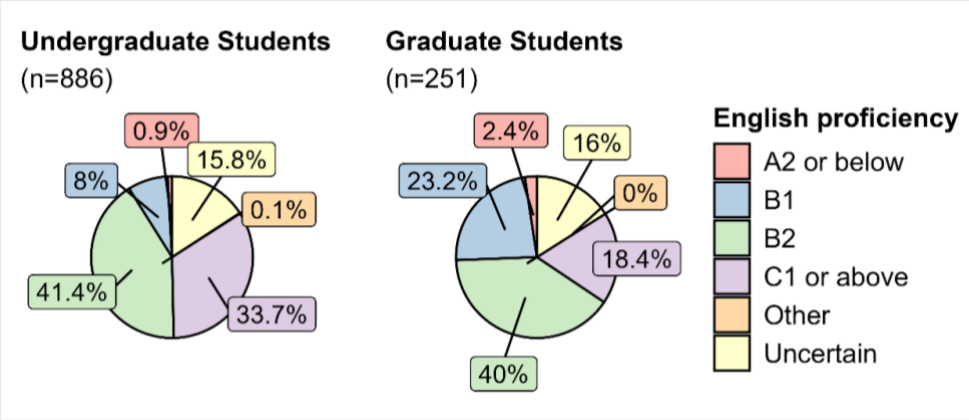

Figure 6: Undergraduate and Graduate Students' rResult of (1-d),
"What is my English proficiency level?"

Figure 6 shows that 33.7% of undergraduate students are at the C1 level or higher, while 41.4% are at the B2 level. This indicates that most undergraduates at National Taiwan University possess upper-intermediate to advanced English proficiency. In comparison, graduate students' English proficiency is slightly lower. Only 18.4% of graduate students are at the C1 level or higher, while 23.2% are at the B1 level. This suggests that graduate students generally have intermediate to upper-intermediate proficiency.

Results of Category (2)—Expectation of Taking EMI Courses.

Next, we examine students' expectations for taking EMI courses, the second category of this study. The first question in this category explores students' expectations prior to enrolling in the courses, with the results shown in Figure 7.

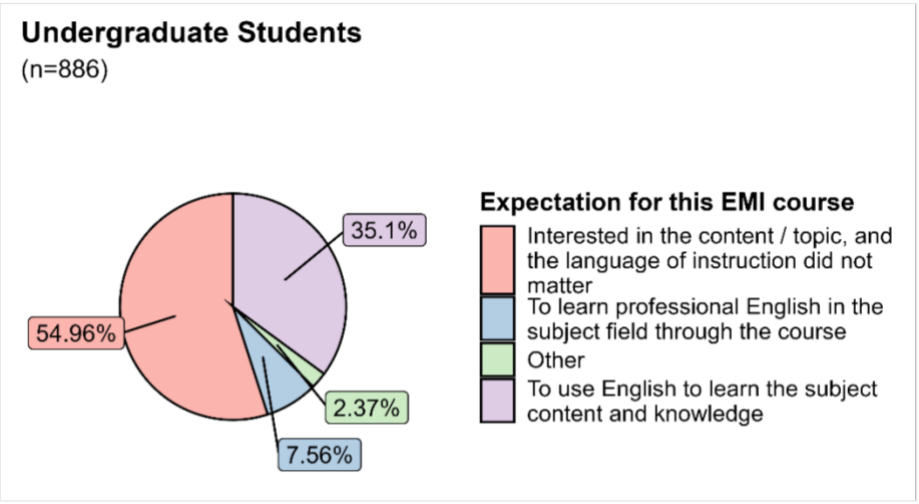

Figure 7: Undergraduate Students' Result of (2-a),
"*What was my expectation of this course before I signed up?*"

Figure 7 shows that over half of undergraduate students prioritize the content or topic of the EMI course, with the language of instruction being largely irrelevant to them. In contrast,

35.1% of undergraduates express a desire to use English as a medium for learning subject content and knowledge. Only 7.5% aim to develop professional English skills specific to their field of study, while 2.4% mention other reasons.

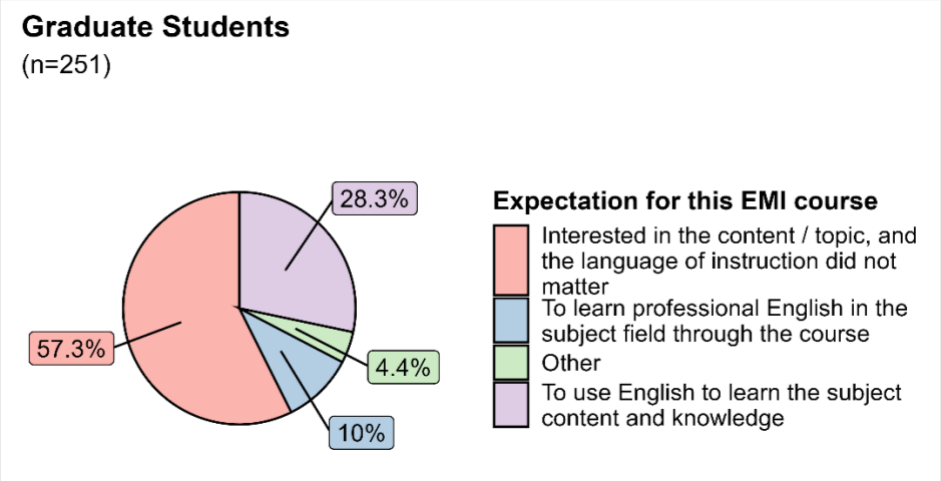

Figure 8: Graduate Students' Result of (2-a),
"*What was my expectation of this course before I signed up?*"

The results for graduate students in question (2-a) are similar to those of undergraduates. As shown in Figure 8, 57% of graduate students take EMI courses primarily out of interest in the content or topic, while 28.3% aim to use English to learn subject content and knowledge. Only 10% expect to acquire professional English specific to their field.

The final question in (2-b) explores students' confidence in using English to take EMI courses. The results are presented in Figure 9.

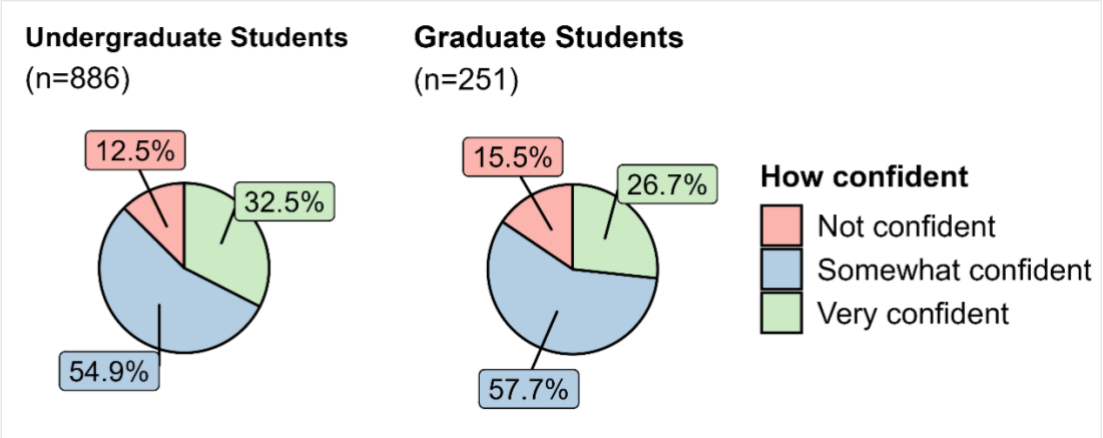

Figure 9: Undergraduate and Graduate students' Result of (2-b),
"*How confident am I in using English to take this course?*"

The results indicate that more than half of undergraduate and graduate students are somewhat confident in using English for EMI courses (54.9% and 57.7%, respectively). While 32.5% of undergraduates are very confident, the percentage is lower among graduates, with only 26.7% reporting high confidence. However, a notable portion of students lack confidence entirely, with 12.5% of undergraduates and 15.5% of graduates indicating no confidence at all.

Results of Category (3)—Preference for Activities in Courses.

Beyond exploring students' expectations for EMI courses, we also examined their preferences for course activities. The first question in this category (3-a) asks about the most interesting activities, regardless of the course language. Figure 10 presents the results for undergraduate students, revealing clear preferences. The top three activities are group discussions (30.7%), applying course content to real-life scenarios (27.4%), and midterm/final projects, essays, or displays (17.5%).

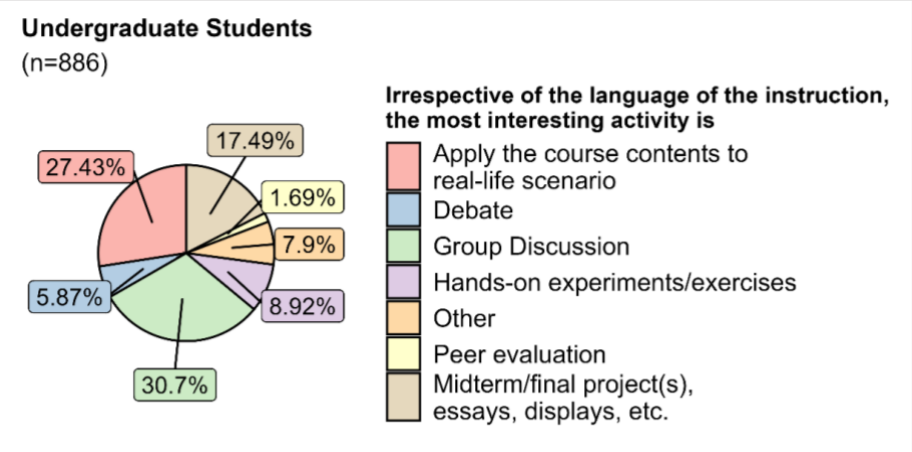

Figure 10: Undergraduate Students' Result of (3-a),
"*Irrespective of the language of the course, to me, what is the most interesting activity?* "

Similarly, graduate students identified group discussions (26.3%), midterm/final projects, essays, or displays (25.9%), and applying course content to real-life scenarios (23.5%) as the most interesting activities, as shown in Figure 11. These results highlight that debate and peer evaluation are the least preferred activities among both undergraduate and graduate students.

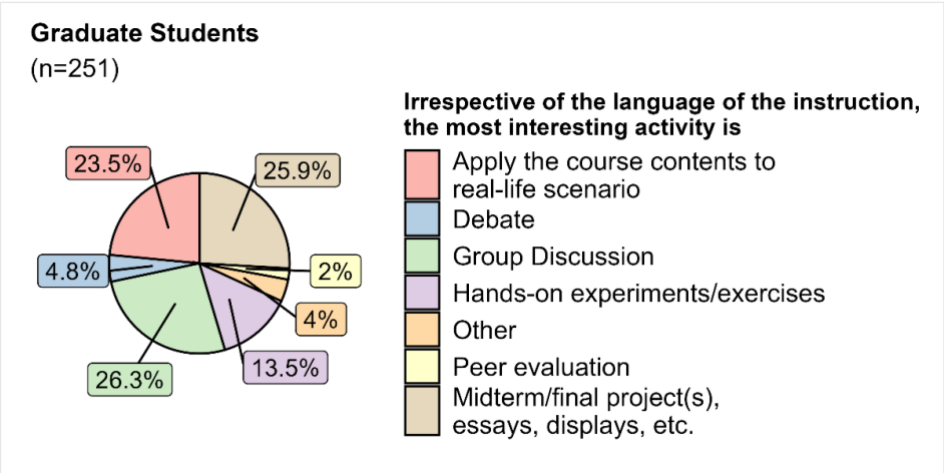

Figure 11: Graduate Students' Result of (3-a),
"*Irrespective of the language of the course, to me, what is the most interesting activity?*"

We also examined whether students' activity preferences change when courses are delivered in English. Comparing Figure 10 (undergraduates' preferences regardless of the language of

instruction) with Figure 12 (preferences in EMI courses), no notable differences in activity preferences were observed for undergraduate students.

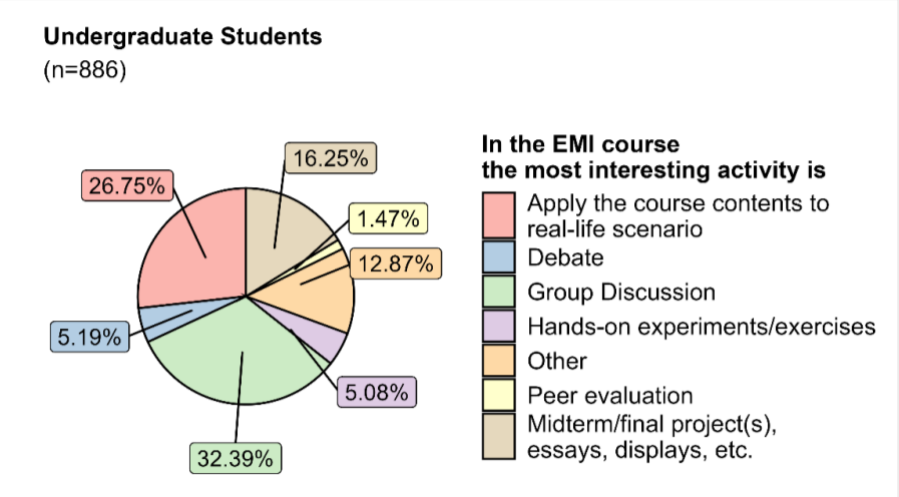

Figure 12: Undergraduate Students' Result of (3-b),
"*In this course, the most interesting activity for me is?*"

Similarly, we investigated the most interesting activities for graduate students and whether their preferences differ in EMI courses. The results are presented in Figure 13.

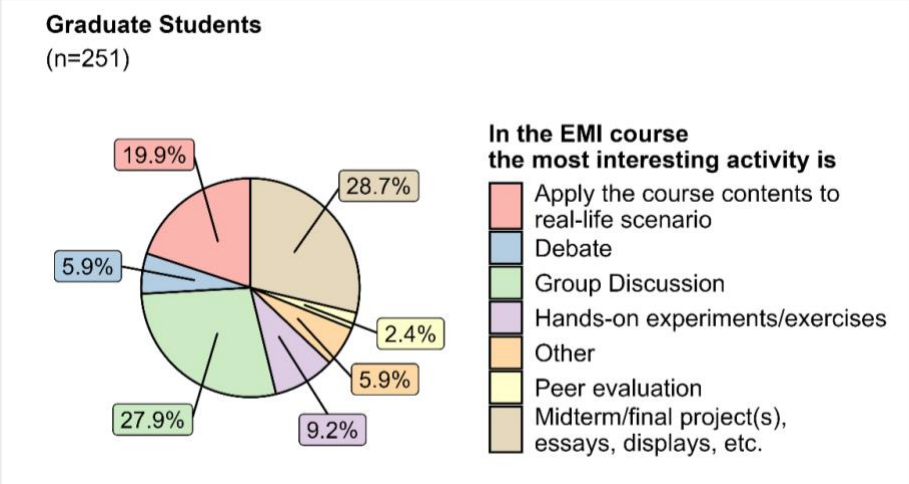

Figure 13: Graduate Students' Result of (3-b),
"*In this course, the most interesting activity for me is?* "

Figure 13 shows that for graduate students, group discussions remain the most favored activity. However, midterm projects, essays, and displays emerge as the second most preferred activity, differing from undergraduate preferences. This may reflect graduate students' need for tangible achievements, given their advanced theoretical knowledge.

When we compare the graduate results of (3-a) and (3-b), we find no significant differences. This indicates that the language of instruction does not influence students' activity preferences.

Results of Category (4)—Actual Experiences in EMI Courses.

Finally, we examine students' actual experiences in EMI courses. The first question in this category (4-a) addresses concerns about using English in EMI courses. As a multi-select question, the results for undergraduate students are presented in Figure 14.

Only 22% of students express concerns about reading course materials and assigned papers in English. However, understanding course content delivered in English (42%) and asking questions or participating in discussions in English (38%) are notable areas of concern. Conversely, giving presentations in English (22.5%), taking exams in English (15%), and completing assignments in English (15%) seem to pose fewer challenges for students.

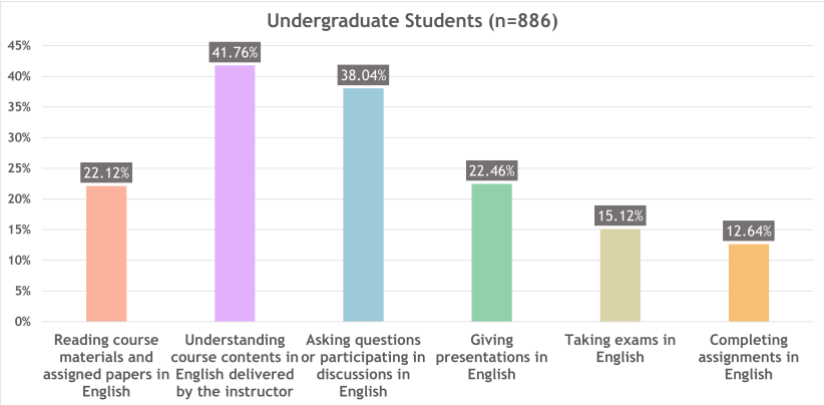

Figure 14: Undergraduate Students' Result of (4-a),
"What am I most worried about using English in this course?"

In contrast to undergraduate results, Figure 15 reveals that graduate students report lower levels of concern regarding reading course materials and assigned papers in English (11.2%), taking exams in English (6.4%), and completing assignments in English (10.8%). However, like undergraduates, graduate students express significant concerns about understanding course content delivered in English (40.6%) and asking questions or participating in discussions in English (41.4%). Notably, concerns about giving presentations in English are higher among graduate students (30.3%) compared to undergraduates. This may be attributed to the seminar- or colloquium-based nature of graduate courses, often requiring students to present in class.

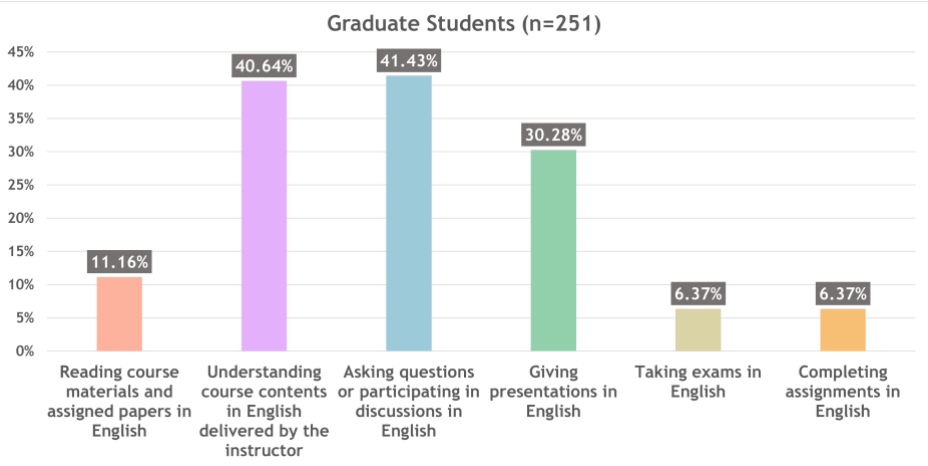

Figure 15: Graduate Students' Result of (4-a),
"What am I most worried about using English in this course?"

To better understand how students effectively comprehend course material in EMI courses, we analyzed undergraduate responses, as shown in Figure 16. The most effective method identified is using supplementary materials, accounting for 38.5% of responses. Taking notes is the second most effective method, favored by 25.6% of students. Interacting in pairs or small groups (16%) and asking questions (14.3%) also contribute to better comprehension. Conversely, discussing course content with TAs was deemed least helpful, with only 4% of students selecting this option.

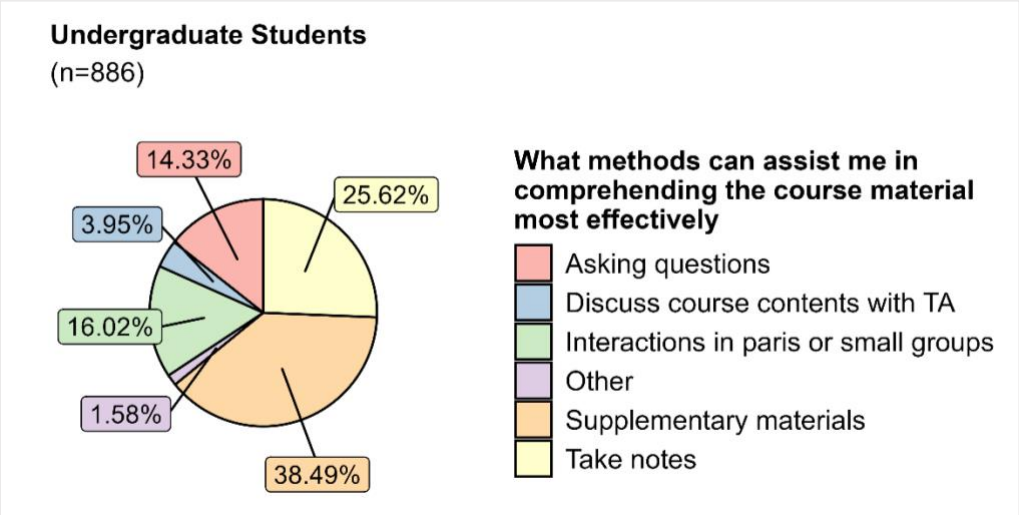

Figure 16: Undergraduate Students' Result of (4-b),
"Among all the EMI courses I took, what methods can assist me in comprehending the course materials most effectively?"

For graduate students, the most effective method for understanding course content mirrors undergraduate results, as shown in Figure 17. Supplementary materials remain the most preferred method, comprising 37.4% of responses. Other effective strategies include taking notes (21.5%), interacting in pairs or small groups (20.3%), and asking questions (16.3%). Similar to undergraduates, discussing course content with TAs is deemed least effective, with only 3.2% of graduate students selecting this option.

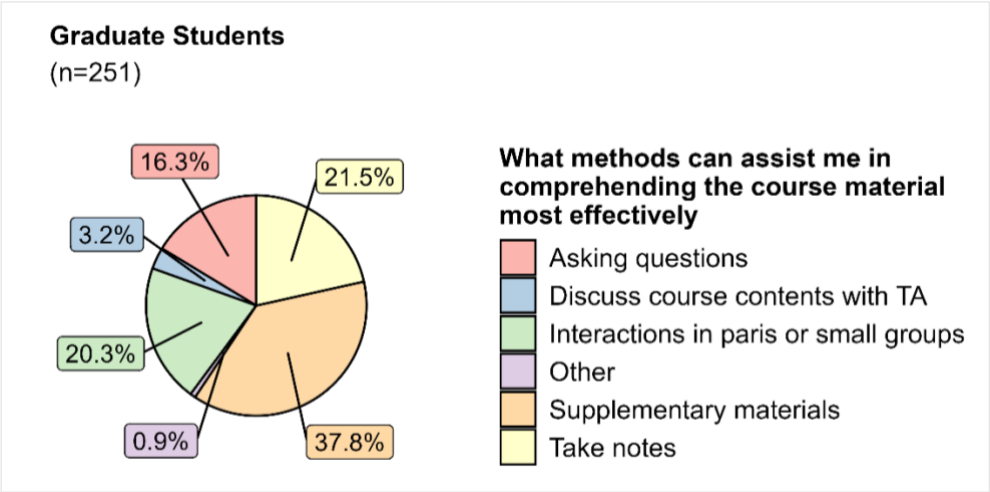

Figure 17: Graduate Students' Result of (4-b),
"Among all the EMI courses I took, what methods can assist me in comprehending the course materials most effectively?"

The final question in the questionnaire explores the types of learning support or resources students would like from their instructors. Figures 18 and 19 present the results for undergraduate and graduate students, respectively. This question allowed multiple selections.

As shown in Figure 18, nearly half of undergraduate students prefer a glossary of course terminology (44.9%) and supplementary materials for preview or review (34.7%). Furthermore, 32.6% value instructors providing relevant prior knowledge. In contrast, only 22.2% of students consider tutorials or counseling with EMI teaching assistants helpful.

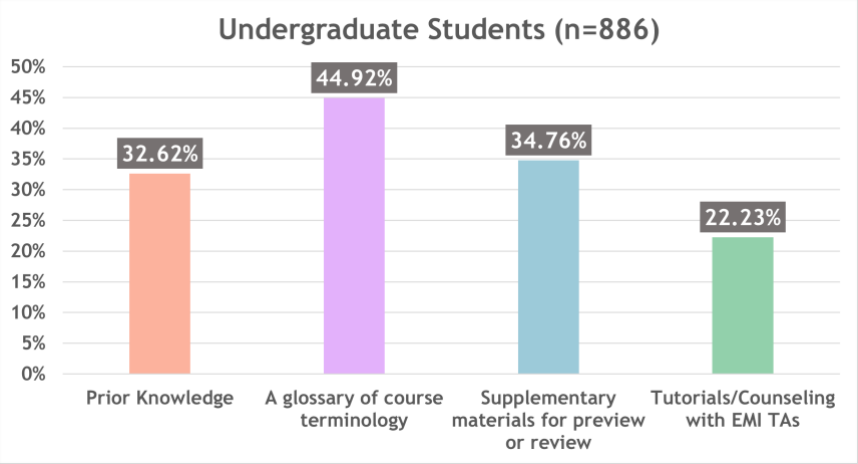

Figure 18: Undergraduate Students' Result of (4-c),
"Considering this course is mediated in English, I would appreciate it if my instructor could provide me with the following learning support or resources."

When we examine the results for graduate students, as shown in Figure 19, nearly half (49%) identify supplementary materials as a key resource for their learning. In contrast, only 20.7% find tutorials or counseling with EMI teaching assistants helpful. Compared to undergraduates, a higher proportion of graduate students (42.6%) value the provision of prior knowledge, while fewer (29.5%) prioritize a glossary of course terminology. This difference is unsurprising, as graduate courses typically require a stronger foundation of background knowledge, and graduate students are generally more familiar with field-specific terminology from their undergraduate studies.

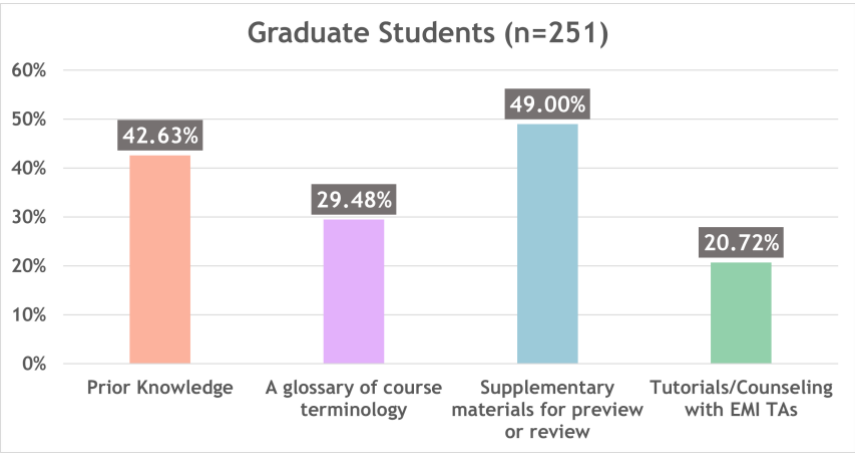

Figure 19: Graduate Students' Result of (4-c),
"Considering this course is mediated in English, I would appreciate it if my instructor could provide me with the following learning support or resources."

Summary of Results

The key results of this questionnaire study are summarized below.

1. Most undergraduates have upper-intermediate to advanced proficiency, while most graduate students are at an intermediate level.
2. The primary motivation for both undergraduates and graduates is interest in course content or topics, regardless of the language of instruction.
3. Over half of both undergraduate and graduate students are somewhat confident in using English for EMI courses.
4. Undergraduates favor group discussions and applying course content to real-life scenarios, while graduates prefer midterm/final projects, essays, displays, and group discussions.
5. Both undergraduates and graduates are most concerned about understanding course content delivered in English and engaging in discussions or asking questions. In addition, nearly one-third of graduate students also worry about giving presentations in English.
6. Both undergraduates and graduates find the following most effective:
    - Supplementary materials
    - Taking notes
    - Asking questions
7. Undergraduates value a glossary of course terminology and supplementary materials, while graduates prioritize supplementary materials and prior knowledge.

Data Analyses & Discussions

Given that English proficiency plays a critical role in students' ability to succeed in EMI courses, we conducted a further analysis to examine whether challenges and needs differ based on proficiency levels. In this section, the results are grouped according to students' English proficiency as defined by the CEFR. Data from students who were uncertain about their proficiency level were excluded, resulting in a total of 983 valid responses. Among these, 16 students were at A2 level or below, 131 at B1 level, 486 at B2 level, and 350 at C1 level or above.

Data Analyses

The first issue we address is students' confidence in using English in EMI courses. We hypothesize that students with intermediate or lower English proficiency are less confident in EMI courses compared to those with upper-intermediate or advanced proficiency. To examine this assumption, we present the data in Figure 20.

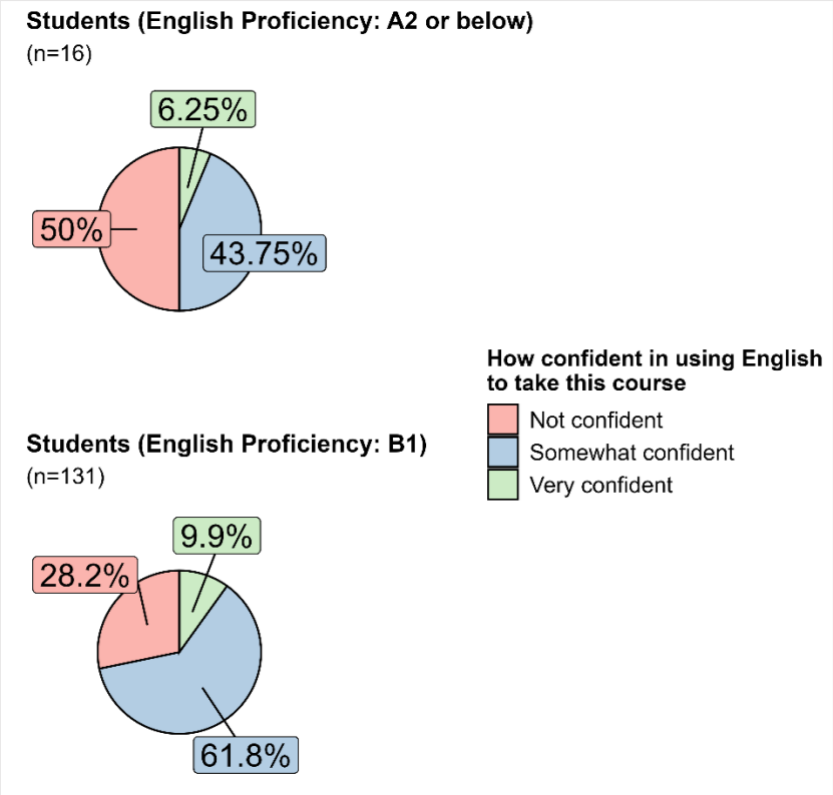

Figure 20: Pre-intermediate and Intermediate Students' Confidence in Using English to Take EMI Courses

Based on the results shown in Figure 20, approximately half of the students whose English proficiency is A2 or below are not confident at all in using English for EMI courses, while the other half are somewhat confident. The data suggest that confidence significantly increases as English proficiency improves. For students at the intermediate level (i.e., B1), nearly 62% are somewhat confident. However, around 30% of B1-level students still report lacking confidence. To enhance students' confidence in taking EMI courses, higher education institutions should consider offering training courses or EMI preparation programs to help students improve their English proficiency before enrolling in EMI courses.

Another key issue is understanding students' performance in EMI courses. To address this, question (5) in the questionnaire investigates the strategies students use to comprehend course content. We are particularly interested in whether these strategies differ between students with lower and higher English proficiency. Figure 21 presents the results of question (5), categorized by English proficiency level.

(5) Among all the EMI courses (not English language learning courses) I took, what methods can assist me in comprehending the course materials most effectively?

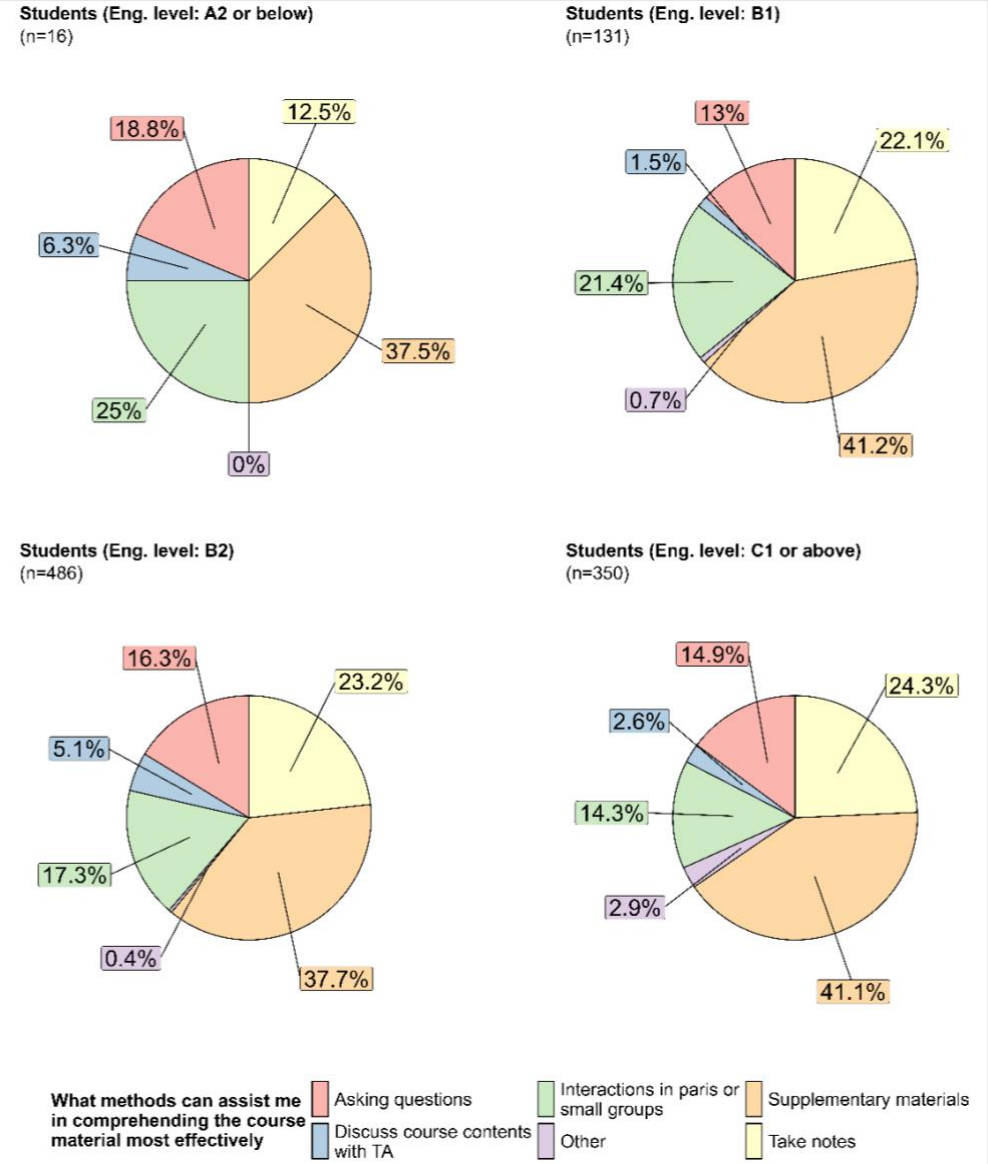

Figure 21: The Result of (5) Grouped by English Proficiency

As shown in Figure 21, the most effective method for all students, regardless of English proficiency level, is using supplementary materials. For pre-intermediate students, approximately one-fourth found pair or group interactions particularly helpful, while only about 13% considered note-taking effective. This contrasts with the results for intermediate and advanced students. It is possible that pre-intermediate students lack the proficiency needed to simultaneously listen to EMI course content and take notes, making peer discussions a more significant learning strategy for them.

In addition to examining students' strategies for coping with EMI course content, we aim to identify additional learning supports or resources that instructors could provide. This is addressed by question (6) in the study, with the results presented in Figure 22.

(6) Considering this course is mediated in English, I would appreciate it if my instructor could provide me with the following learning supports or resources (Select all that apply).

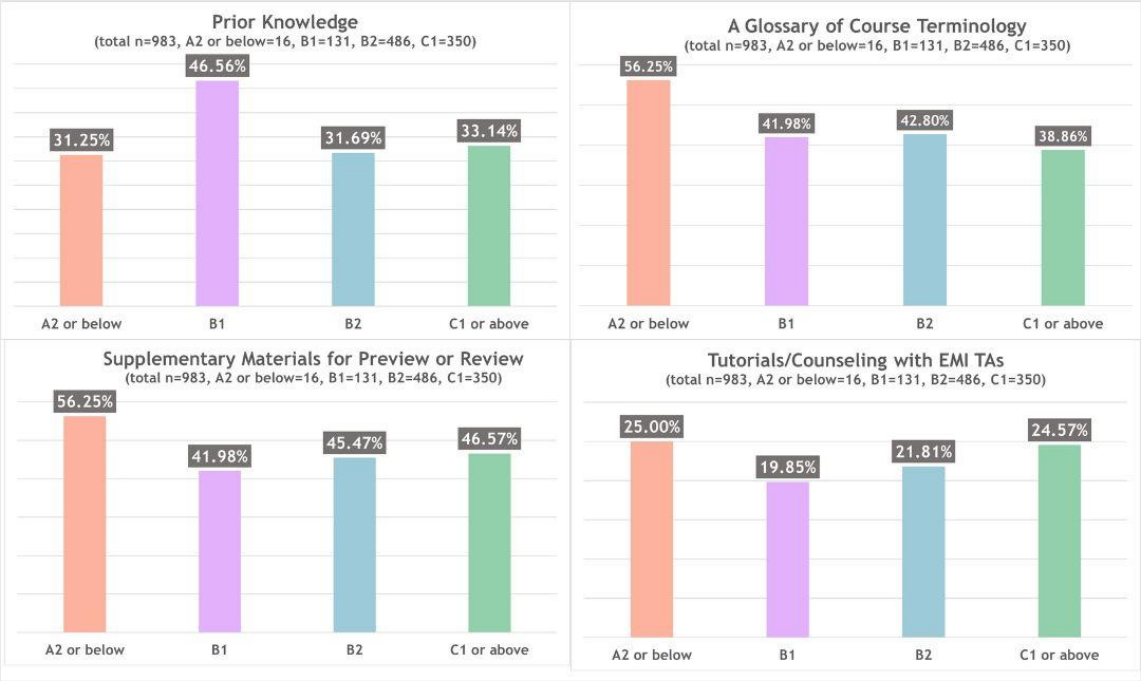

Figure 22: The Result of (6) Grouped by English Proficiency

We begin by addressing the need for prior knowledge. Approximately 30% of pre-intermediate, upper-intermediate, and advanced students reported requiring prior knowledge, with intermediate students showing an even higher need—an unexpected result.

Next, regarding the provision of a glossary of terminology, nearly 60% of pre-intermediate students found it necessary, while the need declined to around 35% among more advanced students.

Providing supplementary materials emerged as another key resource. Across all proficiency levels, at least 40% of students appreciated supplementary materials, with pre-intermediate students expressing a particularly high demand, exceeding 50%.

The final option considered was providing tutorials or counseling with EMI teaching assistants (EMI TAs). This form of support was the least favored, with only around 20% of students across all proficiency levels expressing a need for it. This finding prompts further questions about the low perceived usefulness of EMI TA support.

Two possible reasons were identified. First, in some departments, TAs are assigned limited roles, such as taking attendance or grading basic assignments, which may render them ineffective in addressing students' academic needs. Second, current TAs may lack adequate training, particularly in instructional English, as tutorials and counseling sessions are conducted in English. For instance, leading discussions in English requires specialized skills. Therefore, similar to instructors, TAs must undergo targeted training to effectively support students in EMI contexts.

Lastly, we aim to understand students' concerns about using English in EMI courses, which is addressed by question (7) in the study. This question is particularly significant, as it allows us to consider how instructors might help alleviate students' anxiety about using English in these

courses. The results of question (7), categorized by students' English proficiency, are presented in Figure 23.

(7) What am I most worried about using English in this course (Select all that apply).

Figure 23: The Result of (7) Grouped by English Proficiency

Based on the results in Figure 23, it is evident that reading course materials and assigned papers in English, as well as taking exams in English, are not significant concerns for students, regardless of their English proficiency level. These findings are unsurprising, as students are likely to have anticipated and prepared for these common requirements when opting to enroll in EMI courses.

Next, we examine the results concerning students' ability to understand course content delivered in English by instructors. It is important to clarify that this focus is on the delivery of content in English, not the content itself. Over half of pre-intermediate and intermediate students expressed concerns about this issue, with the figure only slightly declining to around 45% for upper-intermediate students—a level we still consider significant. This finding shows the critical role of instructors' instructional English proficiency and pedagogical skills in EMI teaching. On one hand, better instructional English is believed to enhance students' comprehension of course content. Thus, we recommend that institutions offer training in instructional English, such as formulaic expressions, to support instructors. On the other hand,

even instructors with advanced English skills may struggle to deliver content effectively when transitioning from teaching in their native language to teaching in English. This challenge suggests the need for improved pedagogical approaches. As Prabjandee and Nilpirom (2022, p. 424) argue, "Transforming monolingual disciplinary classes into EMI is not simply about changing the language of instruction; instead, it requires teachers to re-evaluate their existing pedagogy and change it to a learner-centered approach." Consequently, institutions should also prioritize workshops on teaching enhancements to help instructors adapt their methodologies to the EMI context.

Next, we examine the results related to asking questions or participating in discussions in English. Surprisingly, over 50% of students with intermediate English proficiency express concerns about this—a proportion even higher than that of students with pre-intermediate proficiency (37.5%). Notably, upper-intermediate (42.1%) and advanced-level students (29%) also report similar concerns. These findings suggest that institutions should design EMI preparation programs, focusing on enhancing students' oral communication skills.

Furthermore, when it comes to giving presentations in English, as many as 43% of pre-intermediate students express concerns about this task—a significantly higher proportion compared to intermediate or more advanced students. This outcome likely reflects the fact that presentations can be prepared and practiced in advance, whereas asking questions or participating in discussions often requires spontaneous responses. Therefore, it is crucial for students to recognize the importance of improving their English-speaking proficiency before enrolling in EMI courses.

Lastly, we note that most students are not concerned about completing assignments in English, although around 30% of pre-intermediate students express concerns. Based on this finding, we recommend that instructors offer additional support to pre-intermediate students when assigning tasks.

Discussions

In this section, we further analyze the collected data by students' English proficiency levels to identify the specific needs at each level. First, we found that as students progress from lower-intermediate to upper-intermediate English proficiency, their confidence in using English in EMI courses significantly increases. This indicates the need for adequate training to improve students' English proficiency, providing a solid foundation for successful participation in EMI courses.

In addition, we observed that supplementary materials are the most effective method for aiding course comprehension across all proficiency levels. However, for students with a proficiency level of B1 or below, pair or small group interactions also play a particularly important role.

We furthermore explored whether instructors should offer differentiated support based on students' English proficiency levels. The results show no significant differences: students across all levels value the provision of a glossary of course terminology and supplementary materials.

Finally, we analyzed students' primary concerns about EMI courses in relation to their proficiency levels. Students at the C1 level or above expressed minimal concern about

understanding course content delivered in English. In contrast, those at the B2 level or below reported significantly greater challenges with comprehension. For intermediate and upper-intermediate students, participating in questions or discussions in English emerged as a major concern. These findings highlight the importance of enhancing both listening and speaking skills for students across different proficiency levels.

Conclusion

This paper explores students' perspectives on the challenges and needs of EMI courses, drawing on data from 1,137 Taiwanese Mandarin-speaking university students. The findings reveal students' expectations, preferred activities, and actual experiences. For most students, the primary focus of EMI courses is the course content, with the language of instruction being a secondary concern. Regardless of the language used, students favor group discussions and activities that apply course content to real-life scenarios.

However, students express concerns about understanding course content delivered in English and participating in discussions conducted in English, underscoring the importance of developing listening and speaking skills in EMI contexts. Supplementary materials and glossaries of terminology are identified as valuable resources to help address these challenges.

These quantitative findings offer valuable insights into student perspectives on EMI in Taiwan’s higher education. With the EMI policy now in its third year, we recommend that future research reevaluate students' needs to determine whether adjustments are required to enhance the EMI learning environment.

Acknowledgments

This research would not have been possible without the support of the Center for Bilingual Education (CBE) at National Taiwan University (NTU). We also wish to express our gratitude to Shi-Tong Ding, Hung-Jen Wang, and Hsiao-Wei Yuan for their valuable contributions to the CBE. A special thanks goes to team members for their assistance with the questionnaire study. Finally, we extend our appreciation to all the NTU students who participated in the questionnaire, providing the data for this study. We gratefully acknowledge the funding support from the Ministry of Education of Taiwan for the NTU CBE.

Evaluation of a Financial Education Board Game Integrating Historical Contextual Events and Simulated Trading Mechanisms

Zheng-Hong Pan, National Taiwan University of Science and Technology, Taiwan
Shen-Yang Ni, National Taiwan University of Science and Technology, Taiwan
Huei-Tse Hou, National Taiwan University of Science and Technology, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The key to financial education is not merely financial knowledge, but more importantly, the skills of money investment and management. Without simulated financial operations and experiencing the effects of social contextual events on the market, learning transfer becomes challenging. Game-based learning provides a solution that motivates learners to engage actively, while also simulating contextual events, thus offering realistic experiences and feedback. By integrating real historical background events, learners can immerse themselves in a vivid trading scene. This immersive experience not only enhances the fun of learning but also facilitates historical empathy among learners, while simultaneously deepening their historical knowledge and financial skills. In our study, we developed a financial education board game set in 17th-century Europe, where learners played the role of the Dutchman. The game allowed learners to participate in the flower futures market, experiencing market fluctuations due to historical events and making investment decisions based on risk assessments. The empirical evaluation involving 16 participants indicated that the board game with historical contexts enabled learners to enter a state of flow and achieve focused learning. Moreover, learners found it beneficial to grasp the concepts of futures trading through the game. Furthermore, 80% of participants reported feeling immersed in the historical setting, and they were able to empathize the Dutch sentiments about the futures market at that time.

Introduction

Financial literacy is crucial in the 21st century (OECD, 2014), and improving public financial literacy has become a significant global educational priority. Financial education effectively addresses gaps in financial literacy and enhances financial decision-making (Von Gaudecker, 2015). Promoting financial education not only improves financial literacy but also guides learners in making informed financial decisions in diverse scenarios. Game-based learning provides learners with the opportunity to make decisions by simulating financial operations and experiencing the impact of social contextual events on the market, thereby fostering decision-making skills and shaping positive financial attitudes. However, games can be overly engaging, sometimes causing learners to prioritize entertainment over educational objectives. Some games may be too complex or disconnected from real life, diverting learners' attention from the intended learning content. Previous research suggests that effective learning games integrate content knowledge into gameplay (Ke, 2016). Learning games should provide structured problem-solving experiences that facilitate knowledge and cognitive development applicable beyond the game context. According to Habgood and Ainsworth (2011), a game's educational value lies in its core game mechanism, with learning elements integrated into engaging gameplay.

In this study, we developed a financial education board game set in 17th-century Dutch history, where learners played the role of Dutchman. The game allows learners to engage in a flower futures market, draw event cards reflecting the effects of historical events on market volatility, and assess the risks of futures trading. The game mechanism is repeated in a turn-based manner, and each turn is divided into the following four stages:

(1) Information search - players can use their mobile phones to search for market information and clues as a reference for investment targets. This will help players enter the futures market and make early arrangements, as shown in Figures 1 and 2.
(2) Commodity trading - players can freely choose to buy and sell spot goods and futures, or hand over the spot goods to historical figures to complete tasks and earn rewards. The narrative of historical figures is also one of the clues in the game, as shown in Figure 3.
(3) Events occurring - fluctuations in flower market prices will be affected by wars or economic events in the 17th-century Netherlands. Players cannot predict whether a war or an economic event is about to happen, which will make the flower market full of uncertainty, as shown in Figure 4.
(4) Price Settling - players who invest in futures will experience gains and losses based on the fluctuations in futures prices.

Competition is a crucial element in a play-and-learn environment, as the decisions of other players can influence individual choices and judgments regarding the investment market. The player with the most funds will win the game.

Figure 1: Players Search for Information via Mobile Phones

Figure 2: Determine Future Changes in the Flower Market Through Information and Make Early Arrangements

Figure 3: Needs and Clues of Historical Figures

Figure 4: Impact of War Events and Economic Events on the Flower Market

By incorporating real historical situations and events, learners can immerse themselves in a vivid trading environment, allowing them to empathize with the decisions and emotions of historical figures in relation to the futures market. The purpose of this study is to explore learners' flow state, activity anxiety, and game acceptance in a financial education board game that combines historical contextual events, and to observe learners' experiences of historical empathy in the game. Therefore, this study poses the following two research questions:

(1) What are learners' flow state, activity anxiety, and game acceptance in games?
(2) Can learners experience historical empathy in games?

Method

The participants were 16 students in the 12th grade (9 males and 7 females) in Taiwan. We used a single-group posttest design. This study adopted the Kiili Flow Scale (2006) translated

by Hou and Li (2014) and revised into Chinese. The flow scale consists of two dimensions: flow antecedents and flow experience. The reliability (Cronbach's alpha=0.934) of the flow questionnaire showed a high degree of internal consistency. The reliability of the learning anxiety scale, assessed using the AMAS Anxiety Scale developed by Carey et al. (2017), was found to be acceptable (Cronbach's alpha=0.710). Regarding the scale used to measure learners' acceptance of games, this study adopts the technology acceptance scale proposed by Davis (1989) modified by Hou and Li (2014), which includes three dimensions: perceived usefulness, perceived ease of use, and game design elements. The Acceptance scale demonstrated high reliability (Cronbach's alpha=0.923). Historical empathy is the process by which learners engage cognitively and emotionally with historical figures in order to better understand their life experiences, decisions, and behaviors at that time. This study developed a questionnaire based on the concept of historical empathy proposed by Endacott and Brooks (2013) to observe the phenomenon of learners' historical empathy. The scholar divided historical empathy into three dimensions, namely Historical Contextualization, Perspective Taking and Affective Connection. Prior to the study, all participants were asked to sign an informed consent form. The study activities consisted of 10-minute game explanation, 60-minute game activity, and 20-minute post-test questionnaire.

Results

The Wilcoxon signed-rank test was used to analyze learners' flow, learning anxiety, and acceptance in this study, with results presented in Table 1. The findings revealed that the overall flow (M=4.26) was significantly higher than the median (median 3 on a 5-point Likert scale), indicating that the gamified activity design effectively conveyed the game's objectives to learners, prompting active engagement and resulting in a heightened flow experience. Furthermore, the overall anxiety (M=2.02) was significantly lower than the median, suggesting a reduction in anxiety among learners during gameplay. Similarly, the overall acceptance (M=4.65) exceeded the median, signifying learners' positive reception of the game's ease of use and its facilitation of understanding futures concepts and trading processes. In addition, 80% of the participants in the historical empathy questionnaire said that they were immersed in the Dutch era, empathized with people's feelings about the futures market, and deeply understood the impact and emotions brought about by the economic bubble.

Table 1: Flow, Anxiety and Acceptance Descriptive Statistical Analysis

Dimension	***M***	***SD***	***Z***	***p***
Overall Flow	4.26	0.60	3.517^{***}	.000
Flow antecedents	4.21	0.65	3.443^{**}	.001
Flow experience	4.32	0.55	3.466^{**}	.001
Overall Anxiety	2.02	0.49	-3.522^{***}	.000
Overall Acceptance	4.65	0.43	3.536^{***}	.000
Perceived Usefulness	4.75	0.34	3.591^{***}	.000
Perceived Ease of Use	4.56	0.61	3.570^{***}	.000
Game Elements	4.63	0.53	3.556^{***}	.000

$^{***}p < 0.001$; $^{**}p < 0.01$

Conclusion

This study designed a financial education board games integrating historical contextual events, enabling learners to understand the experiences of the Dutch in the 17th century. It aimed to enhance financial literacy through practical futures trading operations. Furthermore, guided by the game's context, learners can immerse themselves in the political and social atmosphere of that era, providing a first-person perspective to examine the environment of historical figures. This approach allows for a deeper understanding of the decision-making behaviors of those figures and the impact of historical events, fostering a sense of historical empathy among learners.

We adopted a single-group posttest design to analyze learners' flow state, activity anxiety, and game acceptance in a financial education board game combined with historical situations, and to observe learners' experiences of historical empathy in the game. The results showed that board games integrating historical contextual events can help learners enter a flow state, reduce anxiety, and foster a high level of acceptance for learning through board games. After preliminary analysis, this study will continue to explore learners' learning effectiveness in depth through a quasi-experimental design in the future, and explore the impact of board game learning on learners compared to video learning methods.

One Program, Two Pathways: The Transformative Learning Journeys of 2 Adult Learners in Graduate School

Jennifer Poh Sim Tan, HELP University, Malaysia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This paper documents the transformative learning of 2 working women adult learners who returned to higher education for the Master of Education (Teaching and Learning). This graduate degree offers two different teaching and learning pathway; the traditional pathway comprising on-campus classes with 11 modules to complete and the APEL Q pathway which requires learners to complete 4 instruments instead of the 11 modules. Learners do not attend physical classes and are assigned an Advisor each who will guide the learners throughout their entire academic journey. To understand how adults learn, Knowles's (1984) Andragogy framework and Mezirow's (2000) transformative learning provide the conceptual framework. The Andragogy framework proposed a set of five assumptions i.e. the learner's making personal decisions, life experiences, readiness, orientation, and motivation to learn explains the learners' intentions for further study while Mezirow's (2000) definition of transformative learning enlightens on how both learners acquired new perspectives which lead to understanding the changes in events. Narrative inquiry was used as the research approach with questionnaire and interviews as data to answer three research questions; what are the experiences of working adult who return to school, have these experiences transformed their lives and does the program structure make a difference in the learning journey? Results reported positive outcomes from the emotional, professional, social, and even physical aspects since completion of the graduate program.

Introduction

This paper presents a detailed examination of the transformative learning experiences of two working women who returned to higher education to pursue the Master of Education (Teaching and Learning) degree in a Malaysian private university in. The graduate program offers two pathways: a traditional on-campus route that involves 11 modules, and the APEL Q (Accreditation of Prior Experiential Learning) route, which allows learners to complete four instruments rather than attending physical classes. This study investigates how both adult learners navigated their educational journey and what transformations they experienced in the process.

The theoretical frameworks that underpin this study were Knowles's (1984) *Andragogy* and Mezirow's (2000) *Transformative Learning Theory*. These frameworks offer a comprehensive understanding of how adults learn and change through when they decide to go back to school after a long period of absence due to work, family and other personal commitments. Through the narrative inquiry approach which comprised a set of questions for the participants to reflect on before the lengthy interview of 2.5 hours, this paper explores the learners' experiences, the impact of the program structure, and how their educational journey transformed their lives, both personally and professionally. The findings reveal significant emotional, professional, social, and physical changes in the learners' lives after completing the program.

The Context: A Dual Pathway Graduate Program

The Master of Education (Teaching and Learning) in a Malaysian private institution of higher learning, offers adult learners two distinct pathways for completing their degree: the traditional pathway and the APEL Q pathway. The traditional pathway is held during the weekends and is an on-campus, modular system, requiring students to attend classes and complete 11 modules. In contrast, the APEL Q pathway is designed for adult learners with at least 20 years of prior work experience and relevant qualifications. Instead of attending physical classes, learners in this pathway are required to complete four comprehensive assessment instruments.; Portfolio, Field Validation Visit, Challenge Test and the Capstone Project. For the APEL Q program, each learner is assigned an academic advisor who provides guidance throughout the program, ensuring that their learning is both self-directed and tailored to their individual experiences, 2 assessors (internal and external) and a moderator who ensures the validity and reliability of the assessments.

Both routes allow for working adults, who often have professional and personal commitments, the flexibility to pursue higher education while continuing their careers and managing other responsibilities. For the two learners in this study, both routes provided an opportunity to reflect on and integrate their professional experiences into their academic learning. Three research questions guide this study; what are the experiences of working adults who return to higher education, how have these experiences transformed their lives and does the program structure (traditional vs. APEL Q) make a difference in the learning journey.

Theoretical Frameworks: Andragogy and Transformative Learning

To understand the learning experiences of these adult learners, the study is grounded in two key theoretical frameworks: *Andragogy* (Knowles, 1984) and *Transformative Learning* (Mezirow, 2000).

Knowles' (1984) Andragogy emphasizes that adults learn differently from children and identifies five key assumptions about adult learners:

1. Self-Concept: Adults prefer to be self-directed in their learning and are accountable for making decisions about their education which include the route of their studies and the strategies they use to achieve learning goals.
2. Life Experience: Adults learners bring a wealth of life experiences to the learning process which in turn, enhances their understanding and affords a valuable basis for learning.
3. Readiness to Learn: Adults learners are driven to learn when they see the learning as relevant to their life or career and are more likely to participate in learning that is relatable to their lives.
4. Orientation to Learning: Adult learners tend to focus on problem-solving and real-world applications of knowledge. They seek learning that helps them address specific challenges in their professional and personal lives.
5. Motivation: Adults learners are motivated primarily by internal factors, such as the desire for personal growth or career advancement, rather than external rewards.

In the case of the two learners in this study, both demonstrated high levels of self-direction, bringing their life experiences into their learning process. Their readiness to learn was driven by the desire to enhance their professional competences, and their motivation to complete the program was entrenched in a commitment to self-improvement and career progression as noted in the interview when one mentioned that "*I decided to give it a try because I was thinking why not challenge myself to do something."* and *"one of the main reason* (to do this) *is I want to upscale myself.*

Transformative Learning, as defined by Mezirow, involves a process of critical reflection that leads to a shift in perspective. Mezirow (2000) argues that transformative learning occurs when individuals critically examine their beliefs, assumptions, and understanding of the world, often resulting in a profound change in how they perceive themselves and their environments. This process involves the following stages:

1. Disorienting Dilemma: Learners face an experience that challenges their existing worldview.
2. Critical Reflection: Learners engage in reflection, questioning their prior assumptions and beliefs.
3. Perspective Transformation: As a result of critical reflection, learners adopt new ways of thinking and understanding.

For the two learners in this study, their return to education highlighted the disorienting dilemma(s) that challenged their current professional and personal identities for example, how they learnt in the past and their teaching and classroom management in the present. One learner mentioned "*main reason for taking the program is really to answer questions for myself from my younger colleagues and it's good to probably hear about different ways to doing things."* These experiences allowed them to reflect on their teaching practices, professional roles, and approaches to learning. Through this process of reflection, they both

experienced a perspective transformation, which led them to re-evaluate their pedagogical practices and consider alternate approaches to teaching and learning.

Research Methodology: Narrative Inquiry

The study employed narrative inquiry as its research approach. Narrative inquiry is a qualitative method that emphasizes understanding individuals' lived experiences through storytelling. This approach was particularly suited to capturing the transformative learning journeys of adult learners, as it allowed the researchers to explore the personal narratives of the participants in depth.

The participants comprised Shean, a mother of two who is in her early 50s. She obtained her undergraduate degree in Canada and works in an organization that organises team building sessions for corporate organisations. Once a week, she teaches English in a private tuition centre. Shean underwent the conventional program. Kris, who is also in her early 50s, received her Diploma in Early Childhood a few years ago, and was trained as a music teacher. Her hobbies include travelling and she is also an art and craft enthusiast. Kris is the owner and Principal of an Early Childhood Centre and she undertook the APEL Q route.

Data was collected through a in-depth interview which comprised a 185-page transcript with the two learners. The research sought to answer three central questions:

1. What are the experiences of working adults who return to school?
2. How have these experiences transformed their lives?
3. Does the program structure make a difference in the learning journey?

Findings and Discussion

The findings of this study highlight the significant transformations that occurred in the emotional, professional, social, and physical aspects of the learners' lives after completing the graduate program.

Emotional Transformation*:* Both learners reported a sense of pride and fulfilment from overcoming the challenges of balancing work, family, and study. The emotional satisfaction of completing a graduate program despite these challenges was apparent when one of them mentioned that she "*never knew I had done so much in the past, and I am proud of what I have achieved."*

Professional Transformation: Professionally, both learners experienced substantial growth. They reported feeling more competent and confident in their teaching roles. Through the program, they were exposed to new pedagogical strategies and invaluable insights, which they were able to integrate into their teaching practices. For example, one of them mentioned that she has "*become so much more confident in my work place…the past traumatic incident that took place which I was doing this… and how I managed to overcome all of it…while struggling with the project (capstone)…."* The other learner was excited because she learnt new ways to teach, "*experimenting on my students on when I learned about flip learning from Dr XXX ... what was this flip learning? I tested that even on my students and WOW, it works."* She continues to be current in her teaching and says *I'm still experimenting up to today and that that really drives me, I have to say."*

This led to a shift in their professional identity, as they saw themselves not just as educators, but as lifelong learners and reflective practitioners.

Social Transformation*:* Socially, the learners noted the importance of building connections with peers and mentors throughout the program, although this was more apparent for the learner in the conventional route who mentioned that she reminded herself that she has to be "*really very conscious about every decision I make in group projects "*. Additionally, the opportunity to collaborate with others helped her expand her professional networks and gain a sense of community.

Physical Transformation*:* Although the program was intellectually stimulating, it also brought physical challenges. The learners had to balance demanding work schedules, family responsibilities, and academic commitments, for example one learner mentioned that she and her peers would *"meet at like 11:00 PM to 12 midnight …only then we can work because some mums put their kids to sleep at 12 midnight, you know?"* Additionally, the flexibility of the APEL Q pathway allowed one learner to manage these challenges more effectively, and both learners reported that the program's structure made it possible for them to succeed without significant physical or emotional burnout.

Conclusion

The findings of this study demonstrate the transformative potential of adult education programs like the Master of Education (Teaching and Learning) that offer flexible learning pathways, such as the APEL Q route. The use of Knowles's Andragogy and Mezirow's Transformative Learning theories provides a useful framework for understanding the motivations, experiences, and outcomes of adult learners in this context. The learners in this study experienced significant emotional, professional, social, and physical transformations, all of which were made possible by the program's structure and the opportunity to engage in self-directed, reflective learning.

Ultimately, this study highlights the importance of providing adult learners with flexible, relevant, and supportive learning environments that cater to their unique needs and life experiences. By doing so, higher education institutions can foster transformative learning that positively impacts both the personal and professional lives of adult learners.

Challenges and Opportunities of AI in Revitalizing and Preserving Endangered Languages in Kenya

Hesborn Ondiba, Tokyo University of Science, Japan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Kenya's rich variety of languages carries important cultural and traditional knowledge. However, many of these languages are disappearing because of the growing influence of English, Kiswahili, and other challenges. This language loss threatens cultural identity and the preservation of traditional knowledge. This study aims to explore how Artificial Intelligence (AI) can help revitalize endangered languages in Kenya and ensure their survival. The study uses secondary data from reports, academic studies, and policy reviews to examine Kenya's language landscape, technological capabilities, and challenges to AI adoption. Key challenges include a lack of skilled professionals, limited internet access, weak policies, and ethical concerns about data ownership. Findings show that despite these challenges, AI offers opportunities to preserve endangered languages. For example, AI can create digital tools for speech-to-text transcription, personalized learning platforms, and digital repositories for storing linguistic data. These tools can help younger generations reconnect with their cultural roots. While AI has great potential, addressing infrastructure gaps, creating clear policies, and involving communities are essential to success. With strategic efforts, AI can play a transformative role in preserving Kenya's endangered languages and protecting its cultural heritage for future generations.

Keywords: AI, Endangered Languages, Culture

1. Introduction

1.1 Importance of Language in Society

Language is a cornerstone of human society, serving as a fundamental tool for communication, cultural expression, and the preservation of knowledge. Scholars consistently assert that language and culture are inseparable, with language acting as both a mirror and a shaper of cultural identity (Peeters, 2015). The interplay between language and culture extends beyond communication; it transmits traditions, values, and norms across generations. Jiang (2000) captures this duality through metaphors, likening language and culture to a living organism: language represents the flesh, and culture the blood. Without culture, language would lack depth, and without language, culture would lose its form. This metaphor underscores the significance of language as a communicative tool and as the societal glue facilitating mutual understanding and cohesion.

The relationship between language and identity further demonstrates its societal importance. Rovira (2008) highlights that language is intrinsic to cultural identity and serves as how people convey their innermost selves across generations. She describes how the loss of one's language often leads to a disconnection from cultural roots and identity, emphasizing that language carries a community's history, traditions, and shared experiences. For instance, the erosion of a home language among immigrants can disrupt familial bonds and cultural continuity, illustrating language's vital role in shaping personal and collective identity.

Languages in Africa play key role in preserving and sharing cultural traditions, as seen in practices like songs, proverbs, riddles, and tongue twisters. Zeleza (2016) explains that African languages are not just tools for communication. They represent communities' values and creative expressions, holding their cultural history and shared ideas. He also emphasizes that African languages support the transfer of culture and problem-solving across disciplines. These languages store traditional knowledge and provide ways to work together and innovate in modern settings. Supporting African languages is more than protecting heritage; it strengthens societies and encourages creativity to tackle today's challenges (Mbunwe-Samba, 2012).

1.2 Language Endangerment in Kenya

Language loss is a pressing global issue that poses significant risks to cultural diversity and human heritage. The gradual disappearance of languages erodes communities' collective identity and knowledge. Several critical factors contribute to this phenomenon, each deeply interconnected with societal, environmental, and political contexts (Derhemi & Moseley, 2023).

In Kenya, urbanization and social mobility have contributed to a decline in the use of indigenous languages. Parents often prioritize teaching their children English or Kiswahili, which are viewed as symbols of education and socioeconomic advancement. This shift is further reinforced by educational policies prioritizing dominant languages over indigenous ones. For example, local languages are taught only up to the third grade in linguistically homogenous areas, while Kiswahili replaces indigenous languages in urban schools (Wamalwa & Stephen, 2013).

Economic imperatives often force members of Indigenous communities in Kenya to migrate to urban centers in search of better education and employment opportunities. In these new environments, dominant languages frequently replace indigenous ones as tools for communication and socioeconomic mobility. This trend diminishes the use of indigenous languages, as children who grow up in urban centres are disconnected from their linguistic heritage (Obiero, 2008). Over time, such shifts contribute to the erosion of linguistic diversity, particularly among younger generations in urbanized settings.

The spread of global media and digital platforms has worsened the decline of minority languages. Indigenous communities often lack the resources to represent their languages in these spaces. This allows dominant languages like English and Kiswahili dominate media, education, and online platforms. In Kenya, many endangered languages, are not documented or codified, making it difficult to include them in digital technologies. As a result, younger generations prefer dominant languages that are more accessible and seen as economically beneficial, further pushing native languages aside (Wamalwa & Stephen, 2013).

1.3 Kenya's Linguistic Landscape

Kenya's linguistic landscape is both diverse and complex, reflecting the country's rich cultural and ethnic heritage. Estimates of the number of languages spoken in Kenya range widely, from 30 to 74, depending on classification criteria. Obiero (2008) notes between 30 and 60 languages, while Barasa (2023) identifies 66 native and eight non-native languages, including English and French. These languages belong to three primary linguistic families: Bantu, Nilotic, and Cushitic. Bantu languages account for the majority at 65%, followed by Nilotic at 32%, and Cushitic languages comprising the remaining 3% (Obiero, 2008). Kiswahili, the national language, is a Bantu language widely used as a lingua franca, facilitating communication across the country's ethnolinguistic groups. Meanwhile, English is an official language and the primary medium of instruction from primary school through university, reinforcing its prominence in formal education and governance.

Wamalwa and Oluoch (2013) report that at least seven languages in Kenya, are classified as endangered. They are predominantly spoken by the older generation, particularly those aged 50 years and above, and according to the Atlas of the World’s Languages in Danger (2010), six Kenyan languages, El Molo, Kore, Lorkoti, Sogoo (also known as Okiek), Yaaku, and Kinare have already become extinct, as illustrated in Table 1. This alarming trend prompts a critical question: Can Artificial Intelligence (AI) be harnessed to revitalize Suba and preserve the invaluable indigenous knowledge embedded within the language?

Table 1: Vitality Levels for Endangered Languages of Kenya

Language	No. of speakers	Vitality
Suba	157,787	Vulnerable
Burji	39,000	Vulnerable
Boni	20,103	Definitely endangered
Bong'om	1,000	Definitely endangered
Dahalo	575	Severely endangered
Ongamo	200	Critically endangered
Omotik	50	Critically endangered
Elmolo	-	Extinct
Kinare	-	Extinct
Kore	-	Extinct
Lorkoti	-	Extinct
Sogoo	-	Extinct
Yaaku	-	Extinct

Source: Moseley, C. (2010) and KNBS (2019)

1.4 Rationale for AI in Language Preservation

A growing number of researchers in sociolinguistics and anthropology are examining the AI's transformative potential in revitalizing endangered languages and preserving cultural heritage (Gray, 2023; Jafari, 2023). Advances in AI, particularly in Natural Language Processing (NLP), have resulted in innovative tools that enhance communication, translation, and education across diverse languages (Hohenstein et al., 2023). These technologies play a pivotal role in preserving endangered languages and expanding their accessibility to wider audiences.

However, significant challenges persist, particularly in underrepresented regions such as Africa and other developing countries, where the application of AI for language preservation remains largely unexplored. Factors like limited institutional capacity, inadequate Information and Communication Technology (ICT) infrastructure, and region-specific socio-cultural barriers shape the outcomes of AI initiatives (Romaine, 2017). To address these issues developing AI-driven models tailored to local contexts is crucial, moving beyond "one-size-fits-all" approaches that often fail to meet the unique needs of diverse linguistic communities (Arakpogun et al., 2021).

This study seeks to identify key challenges and opportunities in leveraging AI to revitalize and preserve Kenya's endangered linguistic heritage. Specifically, the study aims to:

i. Identify challenges to AI adoption in Kenya.
ii. Explore how AI tools can support endangered language revitalization and preservation in Kenya.

2. Materials and Methods

The research design follows a qualitative approach, focusing on secondary data and literature analysis. Secondary data was gathered from existing databases, reports, and field studies to

contextualize the challenges and opportunities specific to Kenya. The research focused on several key for preserving endangered languages in Kenya. First, demographic and linguistic trends were analyzed to gather data on endangered language speakers, providing insights into language vitality and usage patterns. Second, the study examined educational resources and initiatives to support language learning and revitalization efforts. Third, Kenya's technological and policy landscape was assessed, including an evaluation of the country's ICT infrastructure, AI readiness, and policy frameworks related to digital tools and language preservation. This comprehensive analysis was essential for identifying barriers to AI adoption and evaluating the feasibility of implementing AI-driven interventions tailored to the Kenyan context.

3. Challenges to AI Adoption in Kenya

3.1 Limited Skilled Professionals

Kenya faces significant challenges in harnessing the potential of AI due to a shortage of skilled professionals with the necessary technical expertise and training. The current education system in Kenya does not adequately prepare students for careers in AI, leaving a gap in technical knowledge and expertise. AI requires specialized skills in machine learning, data science, and software development, but there are too few qualified instructors to provide advanced training in these fields. A study by Omonga (2023) showed that there are not enough qualified individuals in Kenya to manage AI technologies effectively.

A related issue is the brain drain, where skilled professionals migrate to the Global North or the Arab Gulf regions for better job opportunities. Political instability, limited resources, and economic challenges drive this trend, leaving Kenya with fewer experts to tackle local AI problems (Omonga, 2023). This loss of talent makes it difficult to build sustainable AI solutions tailored to Kenya's linguistic and cultural diversity.

Insufficient funding for AI research worsens the situation. Projects that preserve endangered languages often receive little financial support compared to urgent priorities like healthcare and food security. The high cost of AI implementation, and Kenya's reliance on foreign aid limit the ability to fund and prioritize local initiatives (Ndungi & Siregar, 2023). This lack of funding limits the opportunities for young researchers to advance their skills in localized AI and technology research, stifling the development of a skilled workforce needed to address these challenges effectively.

3.2 Insufficient Research Data and Infrastructure

Another barrier to effective AI adoption in Kenya is the lack of comprehensive frameworks and infrastructure for research data management (RDM). While the Data Protection Act (2019) focuses on safeguarding personal data, it does not address research data management (RDM) (Imbuga, 2017). This leaves individual researchers or institutions to handle data independently, often without consistent standards or guidelines, which makes data sharing and reuse extremely difficult. For example, NACOSTI (the National Commission for Science, Technology, and Innovation) does not require researchers to submit data management plans (DMPs) when applying for funding. As a result, RDM practices remain uncoordinated, and valuable research data is often poorly managed (Nakitare et al., 2024).

The lack of intense Information Technology (IT) infrastructure worsens this problem. Kenya has made some progress with data repositories; for instance, it hosts Africa's second-highest institutional repositories (Nakitare et al., 2024). However, these repositories are not well-utilized for research data storage. Platforms like the Kenya Open Data Portal and the Kenya Medical Research Institute (KEMRI) Welcome Trust Research Programme Data Repository exist. However, their use remains limited, and researchers often struggle to archive or retrieve data. There is also a shortage of dedicated research data storage systems, which are crucial for building AI tools to preserve endangered languages (Ng'eno & Mutula, 2022).

Many researchers in Kenya lack the necessary data management skills to effectively use existing infrastructure effectively. A 2019 study at the Technical University of Kenya found that RDM practices were happening at an individual level, with no institutional support to standardize data management processes. This skill gap means datasets are often poorly archived, fragmented, or inaccessible for further use (Allela & Mwai, 2019).

3.3 Internet Connectivity and Accessibility

Internet connectivity remains a significant challenge in using AI to preserve indigenous languages in Kenya, particularly in rural areas where most endangered speakers live. A significant digital divide exists between urban and rural populations (Mukuni, 2019). While cities enjoy better internet access, rural areas still face poor or non-existent connectivity, limiting their ability to use AI tools effectively.

The high cost of ICT services further restricts access. For many communities, the subscription fees for reliable internet are unaffordable, making digital resources inaccessible to those who need them most. Even where the internet is available, the poor quality of connections causes disruptions (Ntorukiri et al., 2022). Unreliable and slow speeds make tasks such as speech-to-text transcription and managing large language databases extremely challenging, delaying AI model development.

Kenya benefits from infrastructure like submarine fibre-optic cables; however, these advancements have primarily served urban centers. Rural populations continue to be excluded from these benefits due to limited investments in last-mile connectivity (Ntorukiri et al., 2022).

3.4 Lack of AI Use and Regulatory Policies

While initiatives such as the National AI Strategy by the Ministry of ICT and the AI Code of Practice drafted by the Kenya Bureau of Standards (KEBS) are steps in the right direction, progress has been slow, and specific policies focusing on AI for language preservation are still lacking (Ndungi & Siregar, 2023). This leaves a regulatory gap, making integrating AI solutions into cultural and linguistic preservation challenging.

One major issue is that existing laws like the Data Protection Act (2019) and the Computer Misuse and Cybercrimes Act (2018) primarily focus on personal data protection and critical infrastructure (Amol et al., 2024). However, they do not address critical concerns such as the ownership of linguistic data or the fair use of AI in marginalized communities. For example, Indigenous knowledge and cultural data could be exploited without clear policies governing

their use, leading to ethical challenges and mistrust between communities and AI developers (Amol et al., 2024).

The lack of institutional support and proper governance frameworks for AI adoption worsens the problem. Universities and research institutions often struggle with insufficient funding and infrastructure to develop localized AI tools that meet Kenya's specific needs (Imbuga, 2019). For instance, similar infrastructural challenges have been observed in Kenyan universities, where poor investment in ICT tools like computers and weak internet connectivity hinder technology adoption. These barriers slow AI innovation and prevent partnerships and funding opportunities essential for building AI-driven solutions tailored to Kenya's endangered languages (Ntorukiri, 2022).

3.5 Ethical Concerns: Data Ownership and Cultural Sensitivity

Ethical concerns about data ownership and cultural sensitivity present significant challenges in using AI to preserve endangered languages in Kenya. One critical issue is determining who owns the cultural and linguistic data collected for AI projects (Gray, 2023). Without clear rules, indigenous communities risk losing control of their cultural heritage. For example, Ndungi & Siregar (2023) highlight that data collected for AI tools in healthcare and education often lacks local consent and ownership frameworks, leading to concerns about data exploitation. These practices can create mistrust between communities, researchers, and developers, making collaboration more difficult.

Cultural sensitivity is equally important because indigenous languages are deeply connected to unique beliefs, spiritual practices, and sacred knowledge. AI models that misrepresent or commercialize these cultural elements can harm communities and reduce trust in technology (Raj, 2024). For instance, generalized AI tools often fail to capture the contextual depth of Indigenous languages, leading to inaccurate portrayals that erase their true meaning and significance. This problem is particularly evident when AI is applied to oral languages, where nuances like tone and rhythm are integral to meaning (Huriye, 2023).

The issue is further complicated by low digital literacy among indigenous communities. Without the skills to understand or monitor AI tools, these communities cannot ensure their data is used ethically or advocate for their rights. Huriye (2023) points out that in areas like agriculture, communities are often left out of decisions about AI tools, leading to solutions that do not fit their cultural, social, or economic needs.

4. AI Opportunities

Advancement in AI offers significant opportunities for revitalizing and preserving endangered languages in Kenya. By leveraging modern technologies, AI can address challenges such as insufficient documentation, low digital literacy, and cultural marginalization (Jafari, 2023). Key opportunities include language and cultural documentation, technological integration, AI-powered learning tools, and cultural content creation.

4.1 Language and Cultural Documentation

AI can play a key role in documenting and preserving endangered languages in Kenya by using innovative tools. Technologies such as speech-to-text recognition and audio

transcription enable the digital recording of oral traditions, conversations, and stories (Hohenstein et al., 2023). These tools are exceptionally vital for the languages listed in Table 1, which are at varying levels of endangerment. The development of digital repositories and databases enhances these preservation efforts by providing a secure and organized means of storing linguistic data. Additionally, metadata integration captures essential details such as speaker demographics, cultural significance, and geographical contexts, ensuring comprehensive and meaningful documentation. Data compression and forward-compatible technologies can be employed to safeguard this linguistic heritage for future generations, to ensure long-term accessibility and adaptability to future innovations (Raj, 2024).

4.2 Integration in Technology and Digital Platforms

Using technology to support endangered languages makes them more visible and accessible. AI-powered tools, like linguistic corpora, help create models for annotation, transcription, and text-to-speech conversion tasks. These tools are handy for preserving oral histories and cultural details often missing from written records (Jones-Evans et al., 2011).

Digital platforms like search engines, websites, and social media make these languages accessible to a broader audience and encourage active use. AI can also track language trends, helping communities stay visible online. Voice and speech recognition technologies further aid in preserving oral traditions. Integrating endangered languages into digital platforms ensures they remain relevant and valuable in today’s connected world (Jones-Evans et al., 2011).

4.3 AI-Powered Language Learning Tools

AI-driven tools are transforming how endangered languages are taught and revived. Platforms like Duolingo and Memrise use AI to create personalized learning experiences that match each learner's pace and needs (Tennell & Chew, 2024). These tools make learning endangered languages fun and interactive. In addition, conversational AI assistants allow learners to practice real-time communication, creating immersive learning experiences. Gamified methods, and virtual and augmented reality, bring cultural and linguistic settings to life, making learning enjoyable and meaningful. These technologies are especially effective for younger generations, helping pass on knowledge between generations and supporting the revival of endangered languages (Tennell & Chew, 2024).

4.4 Cultural Content Creation

AI is creating new ways to express culture and share traditional stories. Tools like AI storytelling platforms help turn folktales and oral traditions into digital formats, preserving them as multimedia (Gray, 2023). Text-to-image tools and animated video creators also bring these stories to life visually, making them more engaging and dynamic. These technologies give local communities the power to create and share content that reflects their culture and connects with people worldwide. By combining storytelling and art with AI, endangered languages and traditions can be celebrated and preserved creatively and modernly (Hohenstein et al., 2023).

5. Conclusion

This study has explored the challenges and opportunities of using AI to revitalize and preserve endangered languages in Kenya. The findings indicate that significant barriers remain while AI offers transformative tools for language documentation, education, and cultural preservation. The challenges include a lack of skilled professionals, insufficient research data and infrastructure, limited internet access, weak regulatory policies, and ethical concerns surrounding data ownership and cultural sensitivity. For instance, rural communities with low connectivity and digital literacy face exclusion from AI-driven initiatives, while dominant languages like English and Kiswahili continue to overshadow indigenous ones. There is urgent need for collaborative efforts among stakeholders, including government bodies, technology developers, researchers, and local communities. Clear policies must govern ethical AI use, ensuring cultural sensitivity and equitable data ownership for indigenous groups. Strengthening Kenya's ICT infrastructure and investing in capacity-building programs will be critical for overcoming technical and resource-related challenges.

e-Training With AI Prompts on Preparing Articles for International Academic Conferences and Publication in International Journals

Theerapong Maneepen, King Mongkut's University of Technology Thonburi, Thailand
Narong Mungkung, King Mongkut's University of Technology Thonburi, Thailand
Suchapa Netpradit, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This research aims to create e-training with AI prompts for international academic conferences and publication in international journals. To determine the efficiency of e-training. Find the effectiveness of the Learner's success through improved e-training and find satisfaction with e-training. The methodology used in the research consists of 5 main steps: analysis, design, course development, e-training development, and evaluation and summary, using AI prompts to help carry out each topic according to Interactive Multimedia Computer-assisted Instruction (IMMCAI principles) to find Interval-test/Post-test (E1/E2), effectiveness, and Satisfaction. The sample group consisted of staff and students—faculty of Industrial Education and Technology (FIET), King Mongkut's University of Technology Thonburi (KMUTT), 30 people. The evaluation test results found that the e-training was created with an efficiency of 83.78/81.56 according to the specified criteria, which is 80/80. The training achievement of the trainees increased by 30.78 percent. The content quality score was equal to 4.11 and the participants' satisfaction with the online training was 4.38, which is considered good. It can be concluded that e-training for publishing articles can be used for individual learning and development. There will be a high number and quality results from AI prompts to help work more accurately, conveniently, and quickly.

Introduction

The rapid advancement of computer technology can be seen today computers have played a significant role in business, communication, and even education because every organization, every industry, and every educational institution must use technology. This is because technology facilitates and makes every operation fast and flexible. E-learning is learning through the Internet. The teacher will present information and knowledge for the students to study through the World Wide Web service or website Pairoj Trironthanakol et al. (2011). It may allow interaction (conversation, response, sending news) between each other at any time and any place (Learn for all: anyone, anywhere, and anytime) Pairoj Teeronthanakool. (2001). E-learning can respond to and fit into the lifestyle of students in their teens. Therefore, electronic lessons are another development option that can promote students' self-research skills.

Online training (e-training) has become essential to education and professional development systems. Integrating artificial intelligence (AI) into e-training platforms promises to revolutionize how training programs are designed, delivered, and assessed. This paper explores the intersection between e-training and AI, aiming to identify how AI technologies can enhance e-training outcomes. Specifically, this study examines the effectiveness of AI-enhanced learning paths, automated feedback systems, and adaptive learning technologies.

The e-training field has evolved dramatically with the advent of digital technologies. An early study by Smith and colleagues (2015) highlighted the potential of e-training to provide scalable and flexible learning solutions. More recent research has focused on the role of AI in improving e-training platforms. Johnson and Roberts (2018) showed that AI algorithms can optimize learning experiences, resulting in better learner engagement and retention. However, there are still gaps in understanding the long-term impact of AI on learning outcomes and the specific mechanisms through which AI improves the effectiveness of e-training.

The purpose of the research is as follows: 1. To create and develop an e-training with AI prompts on preparing articles for international academic conferences and publication in international journals, 2. To find the efficiency of e-training with AI prompts on preparing articles for international academic conferences and publication in international journals, 3. The achievement of e-training with AI prompts on preparing articles for international academic conferences and publication in international journals, 4. Study of user satisfaction with e-training with AI prompts on preparing articles for international academic conferences and publication in international journals.

Therefore, the researchers saw that increasing the achievement in the knowledge and skills of personnel and interested persons by using AI to help in important steps to be accurate, fast, and efficient, in line with the set goals, as well as making the work of better quality in order, is an essential function in the current business environment, education, research, and innovation that is constantly changing. To transfer knowledge effectively, we should find a way to make it easier for interested persons to come in and learn and lead to effective practices.

Methods

The methodology used in this research consists of five main steps: analysis, design, courseware development, e-training development, and evaluation and conclusion, as shown in Figure 1.

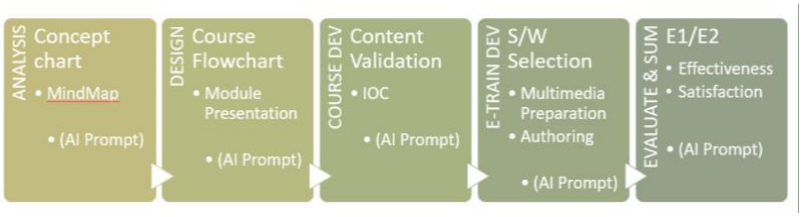

Figure 1: Displays the e-Training With AI Prompt Methods

The details of each step have the following sub-steps (T. Maneepen et. al., 2001):

1. Analysis

Created the initial mind map. This step was to find out all related topics concerned. Created the concept/final mind map. This step was to rearrange and regroup the related topics that will benefit from creating the final mind map.

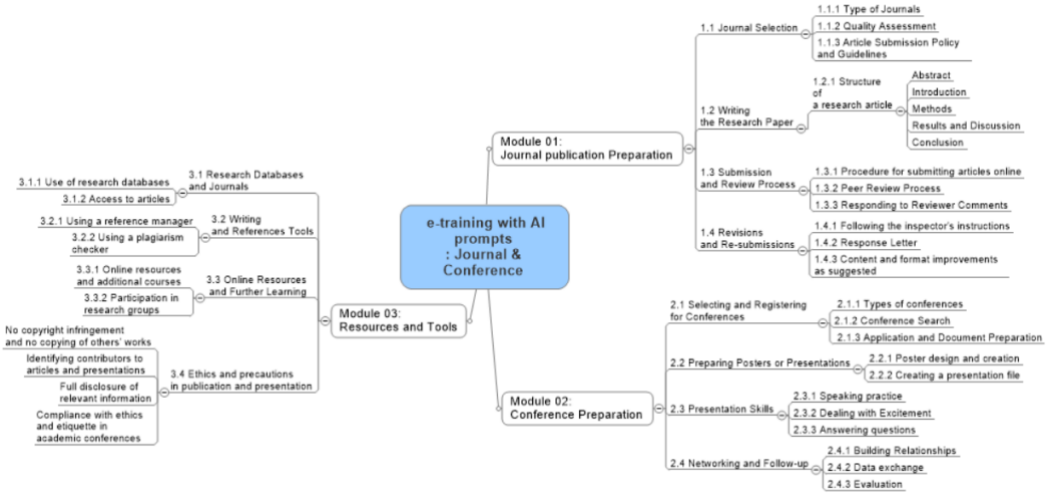

Figure 2: Displays the Mind Map of Contents Analysis

2. Design

Created the strategic presentation plan and behavioral objective for the course curriculum analysis table. Created the module presentation chart. Created the chart for each module according to its importance for best learning effectiveness or achievement.

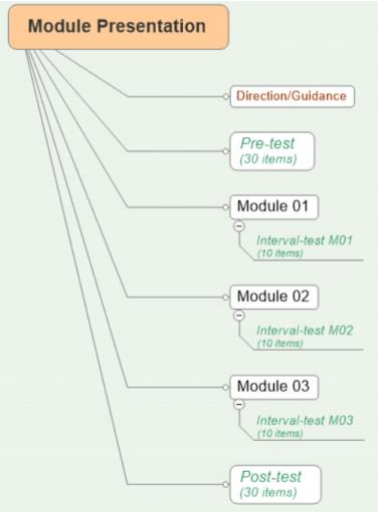

Figure 3: Displays the Module Presentation

3. *Development of Course*

Script development. This step was written according to the plan for each frame using images, colors, graphics, video, etc. Storyboard development. The frames of content were reviewed by experts for content correctness. This step produced the content accuracy and validity which was represented in terms of appropriateness of content as compared with the concept chart according to the subject. Development of Test Items. This step was to analyze the behavioral objective and the contents of test items.

4. *Development of e-Training With AI prompts*

Select an appropriate program. Such as Moodle programs to edit. To select and prepare resources. Such as text, graphics, images, video, animation, etc. The correct content and quality test items. This step was to create a web-based platform. E-training checked by the media's expert. Three experts in media to check the quality.

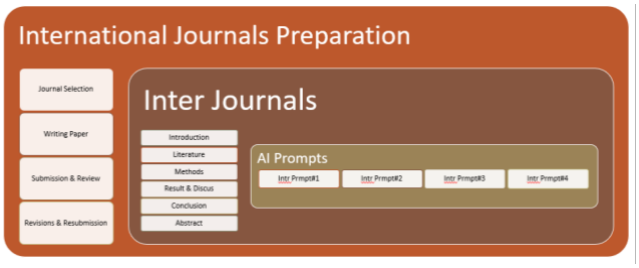

Figure 4: Displays the Content With AI Prompts on the International Journals

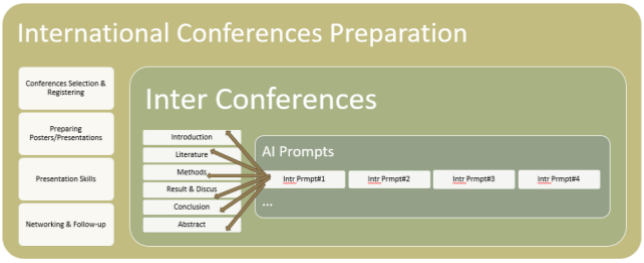

Figure 5: Displays the Content With AI Prompts on the International Conferences

Table 1: Essence Prompt for Research Writing Using Generative AI

Item	Prompt#1	Prompt#1	Prompt#1	Prompt#1
Introduction	Prompt: Write "research background, motivation the important of this research why it is needed" the research topics and information is "……" (add research topic and some more research information	Prompt : Generate the paragraphs to address the " research gap " using "advantage, disadvantage and draw back of the following article "……" (Search for 3-5 closely relate article, summarize Advantage disadvantage , drawback by using other AI tools such as "chatwithanypdf, Scispace, paper digest".	Prompt : Re write the previous information to "Pin out more clear research gap of this research (has to directly follow the previous prompt)	Prompt : Generate the paragraphs to explain the "research contribution and expected implication " using the following information "……" (add the result from the first two prompts in "introduction section (background and research gap))
Relate Literature	Prompt : Use the following information "……" (add the introduction section of the research) to organize the "literature review section and also suggest me the sub-topics that I should integrate in this section.	Prompt : Find 5-7 articles form your own knowledge using "scholar AI plug in" to discuss in direction of "……" (the direction obtained from sub topics of the previous prompt) [4.0]	Prompt: Generate the paragraphs to discuss in direction of "…." (add detail of selected sub topics). The information and detail of researches that you can use is as follow " …" (add summary of research here). Please cite the article in "intext" citation form [3.5]	
Method	Prompt : Use the following information to Organize the "Research Method section" of this research ,the information of this research is as follows "……" (information need :Introduction, relate literature)	Prompt : Generate the paragraph to explain detail of the following topic " " (add topic that you need information), write the paragraph in academic English for research paper writing and make it smooth to read and easier to understand.	Prompt : If I perform the experiment to test for the effectiveness of the my method and model which as the following detail "……" (add detail of experiment), could you please suggest the "Performance measure metrics for this experiment" and guide me how to collect the data for these KPIs.	Prompt :could you please design the questionnaire to use to survey to reveal the "SUS-score" of the system that has following detail "……" (add detail of the developed system)
Result	Prompt : Use the following information Organize the "result section" of this research (information need :Introduction, relate literature, method)	Prompt : Generate the paragraph to explain more detail about "……" (add the topic information)	Prompt : Generate the paragraph to write introduction to the reader to know about the experiment that has result shown in the following information "……" (add Table)	Prompt : Generate the paragraphs to write "in-dept analysis and result interpretation focusing on "……" (add direction of discussion), and the is shown as follows "……" (add result table)
Discussion	Prompt : Please use the following information to organize or suggest the discussion sub topic for this research paper "……"(information uploaded with this prompt: Introduction, relate literature, method, Result)	Prompt: Discuss in dept, and rational discussion of this research paper in direction of "…." (this part add direction generated from sub topic) when you cite the article please cite the articles in "intext citation", and cite only the references cited in "introduction, literature review and research methodology of this research. Detail of this research is as follows (This part added introduction, literature review and methodology), result of this article is as follows "…." (this part add result)	Discuss every sub topics , each sub topics each time	
Conclusion	Prompt: Generate paragraphs explaining the conclusion of this research paper, covering the following elements: (1) research motivation and problem restatement, (2) detailed research methodology, (3) significant results, (4) important findings, (5) research implications, and (6) potential future research directions. (information uploaded with this prompt ; Use all "introduction", "literature review, Research method, Result, discussion)			
Abstract	Prompt: Generate paragraphs elaborating on the 'abstract' of this research paper, covering the following elements: (1) research motivation and problem restatement, (2) detailed research methodology, (3) significant results, (4) key findings, and (5) research implications. (information needed to be update with this prompt: Upload whole article from Introduction to conclusion; or only conclusion)	Prompt : Rewrite the information using a total of 200-250 words		
Title	Upload whole research paper then Prompt : Please suggest a research title for the uploaded research paper to be published in the journal " Expert systems with applications" (information uploaded with this prompt: Whole article and "title of target journal)			Prompt : Rewrite the title to make it more concise
General Prompt for Research	Prompt: Generate the paragraph of "…." (generate new paragraphs for specific topics)	Prompt: To ensure the overall content flows smoothly and coherently, both between paragraphs and sentences, rewrite the following information to make it more smooth to read.	Prompt : Re write this information in paragraphs manner (when the AI provides you result that look like bullet points)	Prompt : Re write the following information to make it more smooth to read, To ensure the overall content flows smoothly and coherently, both between paragraphs and sentences. (use when you need to paragraphs more than one paragraphs)

From Table 1 This prompt is applicable for ChatGPT, Claude, Gemini, and Perplexity.

5. *Evaluation and Summary*

Determine efficiency. To make a pilot test with a small group representation from the sample. Test efficiency with the sample. E-training was conducted on staff who were

interested in Article preparing, FIET, King Mongkut's University of Technology Thonburi.

Results and Discussion

1. e-Training With AI Prompt

The results of e-training development are as follows:

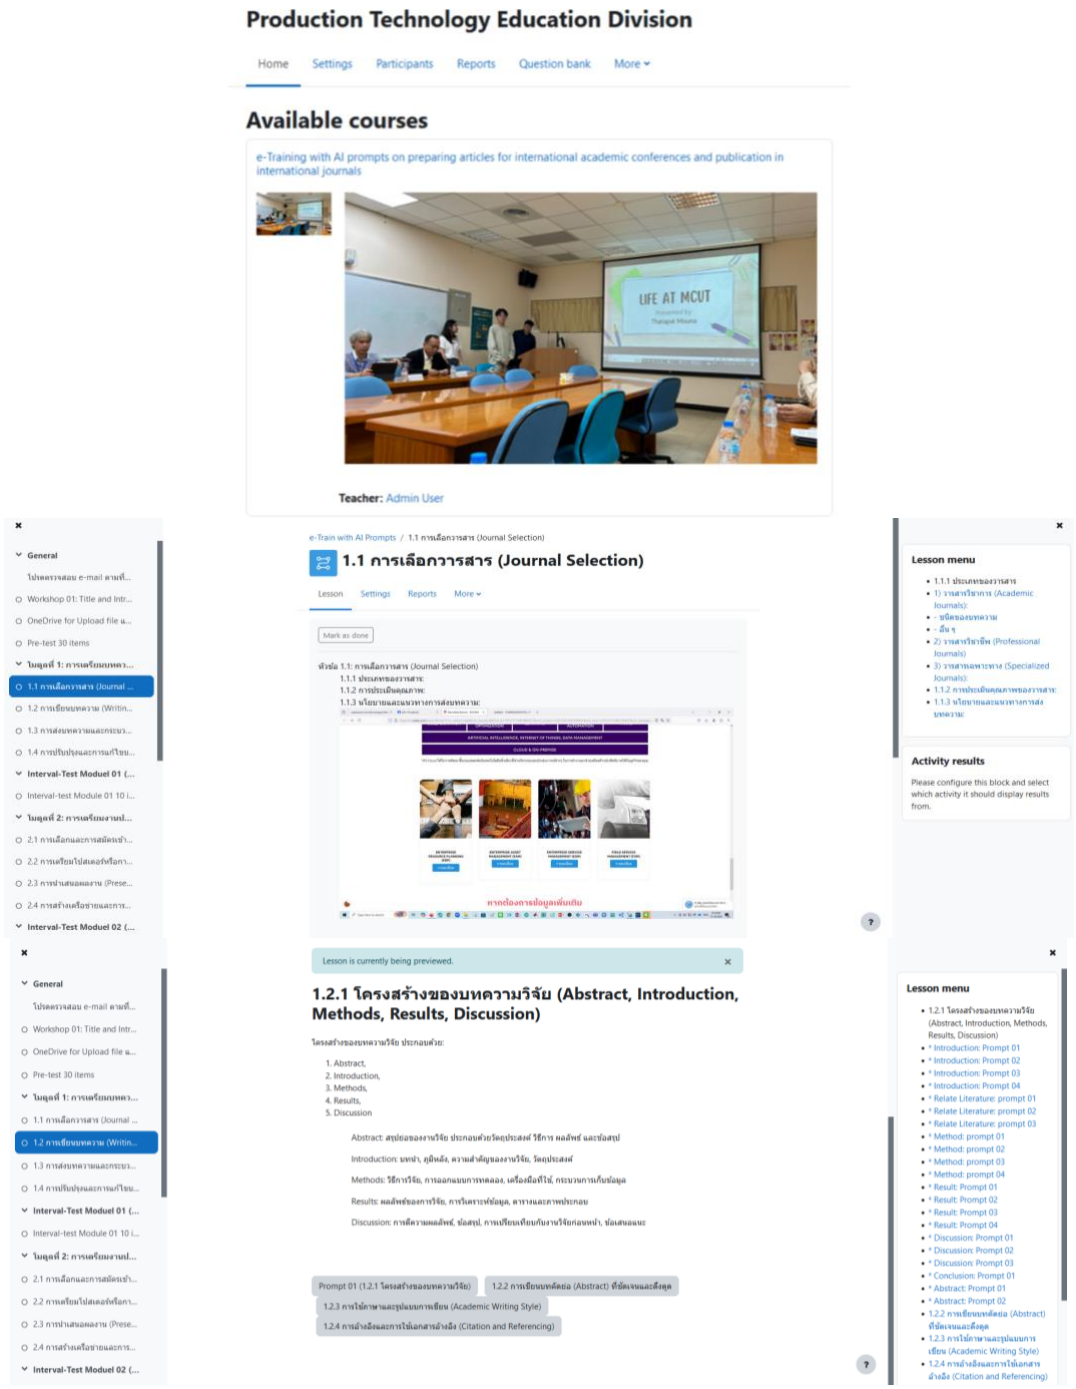

Figure 6: Displays e-Training With AI Prompt: Module 1 for Example

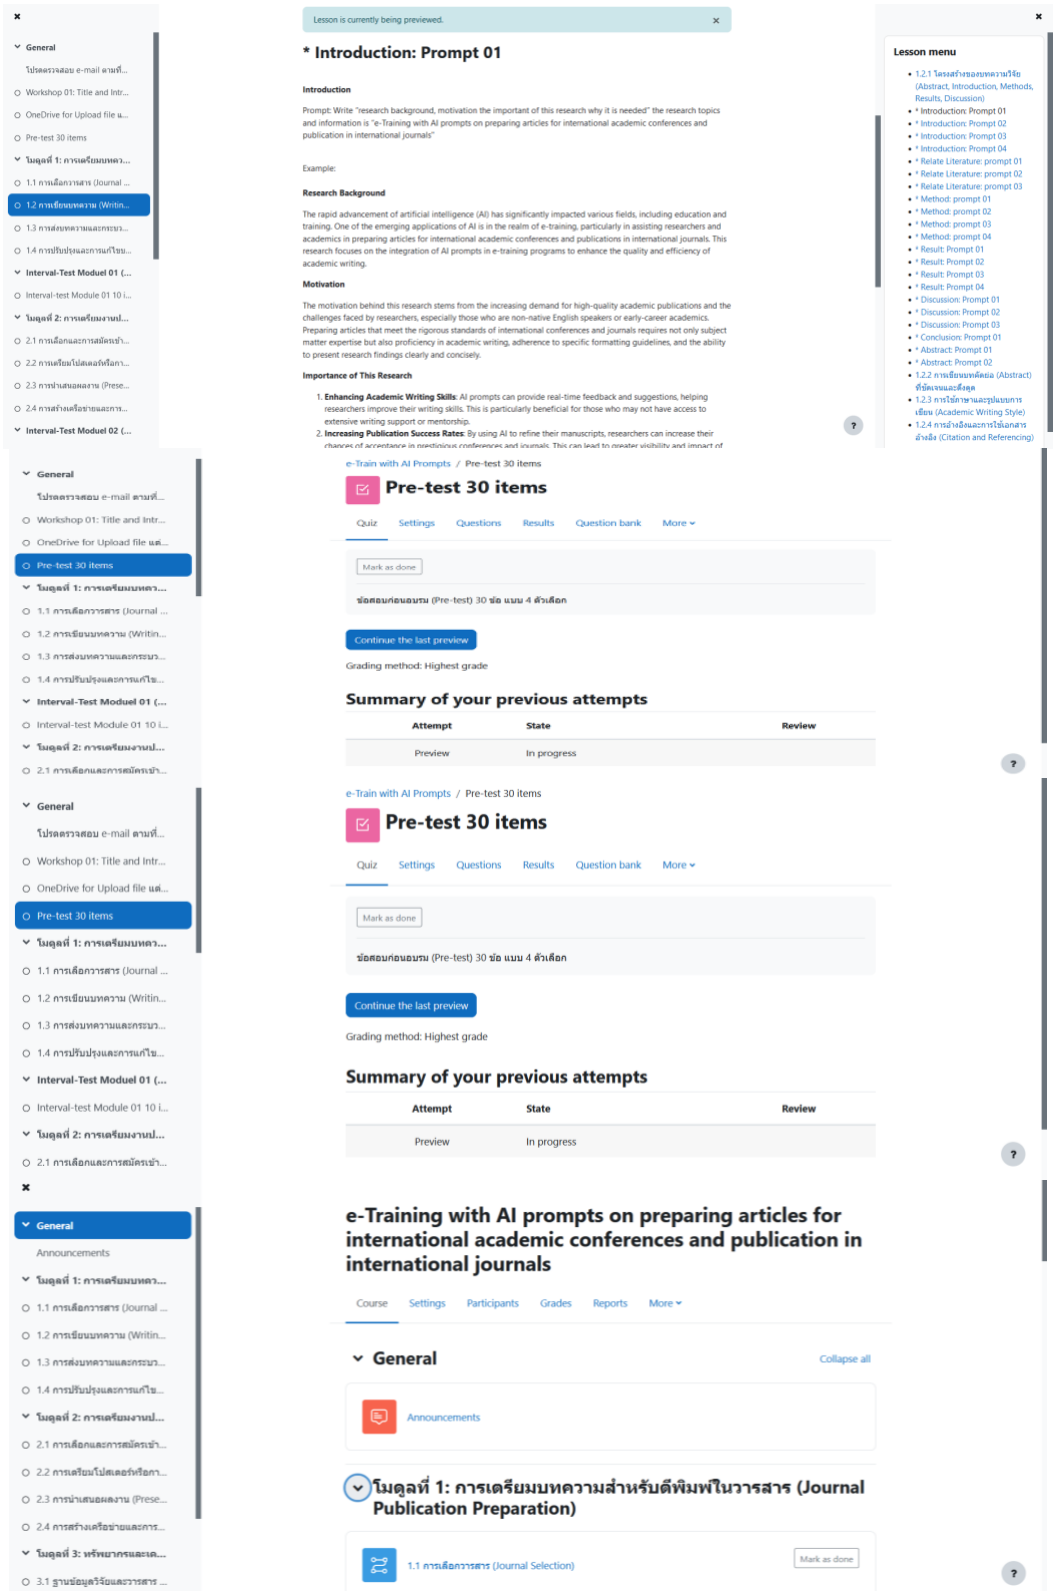

Figure 6: Displays e-Training With AI Prompt: Module 1 for Example. (Cont.)

2. Contents and Media Quality

Table 2: Result of Contents Quality by Experts

Item	Person 1	Person 2	Person 3	Satisfaction level Average	S.D.
1. The content is consistent with the objectives and topics.	4	5	4	4.33	0.58
2. The content is presented in a way that is easy to remember and understand.	5	4	4	4.33	0.58
3. The content can make trainees understand the process in real life.	4	5	4	4.33	0.58
4. Sequencing and continuity of content.	4	4	4	4.00	0.00
5. Completeness of content.	4	5	4	4.33	0.58
6. Accuracy of content according to academic curriculum.	4	4	5	4.33	0.58
7. The content is complete according to academic principles.	4	5	4	4.33	0.58
8. The content is consistent with the picture.	3	3	4	3.33	0.58
9. Content is appropriate for the purpose.	4	3	4	3.67	0.58
SUM(∑)				37.00	4.62
Average(X)				4.11	0.51

When considering the quality level in the assessment that the 3 experts assessed, the average value was in the Good range, with a score of 4.11. It can be used to create e-training lessons. When considering the quality of the lesson, Therefore, it can be concluded that the e-training lesson for use is good quality and suitable for testing with the target group.

3. e-Training Satisfaction

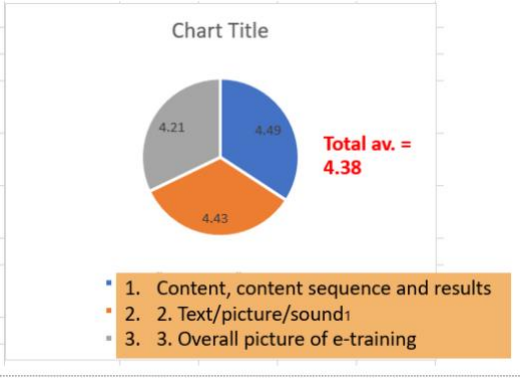

Figure 7: Displays Satisfaction of e-Training With AI Prompt

The learners' satisfaction with the lessons showed that the results of the evaluation of the media quality of the learners at the attitude level were at a high level. In the assessment of the quality of the content, the learners have a high level of satisfaction, with an average value of 4.38.

4. e-Training Efficiency and Effectiveness

Table 3: Shows the Average of the Pre-test, Interval Test, and Post-test

Item	Pre-test (D)		Interval test (E1)		Post-test (E2)	
	Point	%	Point	%	Point	%
Total	457	1523.33	754	2513.33	734	2446.67
Average	15.23	50.78	25.13	83.78	24.47	81.56
S.D.	4.00	13.32	2.08	6.93	2.70	9.00

The efficiency result of e-training with AI prompts was shown at 83.78/81.56, higher than the standard requirement set at 80/80. Finally, the effectiveness of learners who studied the e-training with AI prompts was shown at 30.78%. (Table 1)

Conclusions

The conclusion of the research follows:

1. Evaluation of the content and media quality of e-training lessons. The results from the evaluation by 3 content experts had a total average of 4.11, considered a good evaluation result. The content evaluated by experts can be used to create online lessons.
2. Efficiency of lessons. The results of the e-training lessons in the test during the learning were 83.78 percent and the post-learning test was 81.56 percent. Therefore, the efficiency of the online lessons was 83.78/81.56, which is in line with the criteria set at 80/80, which is effective enough to be used.
3. The learners' satisfaction with the lessons showed that the results of the evaluation of the media quality of the learners at the attitude level were at a high level. In the assessment of the quality of the content, the learners have a high level of satisfaction, with an average value of 4.38. Therefore, it can be concluded that the learners' attitudes are at a good level.
4. The learning achievement of the learners who passed the e-training lesson is 30.78, the achievement value of the pre-test is 50.78 percent and the achievement value of the post-test is 81.56 percent. After studying each module, it resulted in knowing the results of their development.

The next development suggestion is to track the productivity, and results from individual development according to the agreed goals and performance Agreement to achieve the mission and future objectives.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Developing soft skills in the teaching profession students is important for teachers to facilitate the learners to learn to live together peacefully in the society. This research aims to investigate the soft skills in a multicultural society of the teaching profession students in the southern border provinces of Thailand through a qualitative method using the phenomenological approach. Data was collected by the researcher through in-depth interviews with 10 stakeholders including educational supervisors, school directors, university lecturers, psychologists, teachers and guidance counselors in the southern border provinces. and through content analysis. The results were found and classified into four main themes: (1) Communication and relationship building consisting of speaking, writing, and body language used to communicate and build relationships with people in a multicultural society; (2) Working with other people, consisting of co-working with others, joining together, taking initiative, coordinating, helping, and supporting other people in a multicultural society; (3) Adaptation consists of changing one's own ideas, feelings, and behaviors to suit the environment in the society of different cultures; (4) Accepting cultural diversity consists of learning the cultures of other people by showing respect for their differences. The results of this study provided an understanding of the development of soft skills among teaching profession students in a multicultural society. The conclusion and application of research results for educators, researchers, and counseling psychologists to promote the development of soft skills leading to quality teacher development are discussed and presented in this article.

Introduction

In the provision of education in the 21st century, educational institutions play an important role in developing students in both core subjects and other skills needed for future careers. "Teachers" are therefore like "creators," who have a primary role in transferring knowledge and facilitating the learning process until the learners are able to discover their true potential and have the skills necessary for employment and living (Paengthai, 2019; Wangsrikoon, 2014). Therefore, the Faculty of Education is one important unit of an institution that aims to produce “teaching profession students with four desired characteristics: 1) professional skills, 2) soft skills, 3) citizens and citizens of the world, and 4) entrepreneurs or job creators of career skills (Office of Higher Education Policy and Planning, 2018). The desired characteristics of "soft skills" are one of the skills that are important for the development of teaching profession students to become qualified graduates and teachers who will advance to higher professional status.

The southern border provinces have their own cultural identity that are different from other provinces in terms of culture, race, religion, language, dressing, and way of life, which is considered a “multicultural society.” This region consists of Narathiwat, Pattani, Yala, Songkhla, and Satun provinces, serving as the center of educational resources because there are up to seven institutions that focus on producing teachers and promoting the academic standing of local teachers in a multicultural society (Suwanvong, 2017; Thongmark1 et al., 2018). This results in the flow of many multicultural students from all provinces in the south of Thailand into this area to study (Augnoil et al., 2020).

Therefore, developing teaching professional students to adopt soft skills is an important mission for educational institutions that produce quality teachers (Gonzalez et al., 2018; Malykhin et al., 2021). especially the teaching profession students in the multicultural society context who will serve as facilitators for learners to have a learning process for living together, respect the rights of others, appreciate human dignity and prestige, cultivate conscious mind and awareness of cultural identity of oneself and others, and connect them to create understanding under the differences (Watthanabut, 2021). This is in line with the study by Capella University (2018), which indicated that soft skill is a characteristic of teachers of a new era. Thus, it is necessary and important to prepare teaching professional students to become "professional teachers."

The researchers realize the importance of developing soft skills in a multicultural society in order to understand the meaning and the components of soft skills in a multicultural society based on experiences of stakeholders who are involved in educational management, guidance, and psychology in the context of a multicultural society. This is done through group discussions about the components of soft skills in a multicultural society, leading to the development of soft skills for students in the southern border provinces in the future.

Methodology

This study was conducted with a phenomenology qualitative research design, as detailed below.

Participants

Participants were 10 stakeholders involved in educational management, comprising educational supervisors, school directors, university professors, psychologists, teachers, and guidance counselors in the southern border provinces chosen through the purposive sampling.

The criteria for selecting key informants for group discussions were specified as follows:

1) Have knowledge and understanding about teaching and learning conditions for teaching professional students in southern border provinces within the context of a multicultural society.
2) Have either a doctoral degree or master's degree in education, counseling psychology, or guidance.
3) Have work experience in research, supervision, providing psychological counseling services, guidance, educational administration, textbook writing, trainer or speaker for psychological and educational work in the southern border provinces within the context of a multicultural society.
4) Be capable of conveying experiences well.
5) Be willing to participate in their research, serving as key informants, signing a letter of intent. to participate in their research and joining 2–3-hour group discussions. Details are shown on the table below.

Table 1: Key Informants

Participant	Gender	Career	Education level
1	Male	School director	Doctor's Degree
2	Female	Educational supervisor	Doctor's Degree
3	Male	Educational supervisor	Master's degrees
4	Male	University lecturer	Doctor's Degree
5	Female	University lecturer	Doctor's Degree
6	Female	University lecturer	Doctor's Degree
7	Female	Psychologist	Master's degrees
8	Female	Psychologist	Master's degrees
9	Male	Guidance counselor	Master's degrees
10	Female	Guidance counselor	Master's degrees

Instruments

Research tools include**:**

1. The researcher is considered an important tool for qualitative research. This is because the researcher is the person who observes, builds up relationships with informants, records information, and runs data analysis. Therefore, the researcher will prepare himself/herself well in terms of knowledge and understanding of a qualitative research method to carry out research efficiently.
2. Sample questions for group discussions include:
   a. "How important do you think soft skills are for the teaching profession students in a multicultural society in the southern border provinces?"
   b. "What is the meaning of soft skills in multicultural society for students in the teaching profession in the southern border provinces? What aspects or elements are there in soft skills, and what does each aspect or element mean?

c. “Do you think which aspect or element of soft skills in a multicultural society is the most important or necessary for teaching profession students in the southern border provinces?" Please prioritize the said elements.”

3. The record of the interview is for recording general information about the informants and that obtained from group discussions, such as conversation atmosphere and behaviors of the informants that occurred during the group discussions.
4. Audio and image recording equipment The Microsoft Teams program is used for group discussions.

Data Analysis

After verbatim transcription of the interview tapes, the scripts were analyzed by coding messages with similar meanings together. Then those with the same themes were grouped into subcategories and categories. The trustworthiness of the validity of the analysis, interpretation, and summary of supportive data were achieved through external auditing conducted by an expert on qualitative research.

Results

Four main themes emerged from the findings as detailed below.

From the interviews with key informants, it was concluded that soft skills in a multicultural society referred to skills of teaching professional students, both internal and external skills, which were related to interactions and collaborations between teaching profession students and students, school personnel, local community networks, and religion leaders. These skills included thoughts, emotions, feelings, and behaviors under cultural diversity in the southern border provinces, which were used to improve oneself in communication and relationship building, teaching and learning, collaborative promotion, development, prevention and solving problems of the students, adaptation, and acceptance of cultural diversity, and living happily in the multicultural society context in the southern border provinces. There were 4 elements: communication and relationship building, working collaboratively with others, adaptation, and accepting cultural diversity, as described below.

Theme 1: Communication and Relationship Building

Communication and relationship building are important skills that teaching profession students must have in themselves. They consist of self-disclosure and healing, choosing effective communication methods, listening carefully and attentively, honoring yourself and your interlocutors, understanding others sympathetically and without quick judgement, and solving communication problems appropriately. Details are as follows.

1. Self-disclosure and tuning in. It is an expression of sincerity, building good relationships with each other, revealing emotions, feelings, and exchanging stories, and public mindedness, especially to students and communities, through different forms of communication, including verbal communication, body language, smiling, showing good friendliness, and understanding each other.

   “Teaching profession students must speak professionally, have good human relations with others, be broad-minded and sincere, have good personality, good mood, and care for others. This is because a person who has good human relations is able to get

along with others easily, which becomes a characteristic of a person that strengthens interpersonal relationships very well." (ID10)

"Being a teacher, a person needs to have a sense of giving help to students and good communication skills in working with communities, parents, and religious leaders. If anyone has this skill, he/she will be able to make connections and reconcile with people and the communities." (ID5)

2. Choosing effective communication methods is the action of using the language that suits the local context. Either the use of a local dialect to make the "we-group conversation or a straightforward and polite way is acceptable. We can use tones that indicate sincerity and show facial expressions that do not cause misunderstandings and conflicts.

"Teaching profession students should know how to use the language that corresponds to the spatial context, words that do not cause conflict and violence. They should show their humility to each other—both the people of the same religion and those of different religions and cultures." (ID3)

"The languages that teachers should use in communication could be body language, facial expressions, gestures, spoken language, and the use of a polite tone of voice, speaking logically, and speaking with the tone that indicates sincerity." (ID10)

3. Listening carefully, attentively and respecting yourself and your interlocutor in a multicultural society, being a good listener is important and necessary because of the differences in cultural context. The teachers should understand their interlocutors of other religions through attentive listening, paying attention, and respecting interlocutors.

"The relationship is a matter of value. Appreciation, regardless of conflicts, respect and honor each other, flexible adjustment for involvement in the society where cultures are different and unfamiliar." (ID3)

"Listening is an action that is shown outwardly. Everyone can notice this behavior. Therefore, the communication that comes in the form of listening respectfully is a good thing that helps students in the teaching profession apply it in their work in general, in teaching and learning, and in their harmonious coexistence in a multicultural society." (ID 4)

Theme 2: Working With Other People

Working with other people is an important skill that teaching profession students must have. This skill includes a willingness to work with people and communities of diverse cultures, sharing opinions, listening to other people's views, showing a sense of being equally important, understanding each person's roles and responsibilities, and unity and coordination with agencies both inside and outside the school.

1. Willingness to work with other people is the action when a person shows that he is open-minded and accepts the diversity of the people in the community in which he

lives. Adjusting the mind or behavior of the teaching profession students is therefore important.

"Start from yourself. You must be ready for adjustment, have flexible thoughts, and know how to control your own emotions when you work with other people like parents and communities, not school staff only." (ID2)

"In working together, we have to be open-minded. We must listen to other team members or to the community. We have to welcome diverse ideas and opinions. If the said matters can be resolved, the work will be easily accomplished because it comes from the cooperation of all parties." (ID8)

2. Understanding the roles and responsibilities of each person and cooperating in goal setting means the ability to understand own roles and responsibilities, the state of having skills when serving as a leader or a follower, and the ability to cooperate in goal setting or guidelines for working together.

"Teaching profession students should have a good human relationship in persuading other people to do things that serve the set goal and work collaboratively in goal setting with other team members based on mutually set criteria." (ID3)

"First, teaching professional students must have a clear behavior in terms of understanding their own roles and responsibilities when serving as a leader or a follower, knowing how to set goals of thoughts and life. When you have a clear goal or clear direction, you will be able to encounter various obstacles and will have the determination to face them. Being farsighted will make cooperative work go smoothly." (ID6)

3. Coordination with agencies both inside and outside the school is the action of working in a multicultural area under good coordination and relationships with the communities or outsiders and networks. There are also plans to prevent and solve problems.

"Among the diversity of a multicultural society, from a psychological point of view, it might be that teachers must have their mental processes in terms of thoughts. Their thoughts and emotions need to be appropriately managed when coordinating with agencies both inside and outside the school. Problem solutions should be direct to the points." (ID 4)

"Students in the teaching profession must have a good verbal communication manner and know how to work together in harmony, leading to mutual cooperation and coordination within the school and with the communities surrounding the school." (ID 10)

Theme 3: Adaptation

Adaptation is an important skill for teaching professional students. It includes flexibility in thinking, sensible analytical thinking, controlling and expressing emotions and feelings appropriately, as well as participating in various activities of the schools and communities.

1. Having flexibility in thinking means knowing how to adjust oneself to suit one's role and duties, knowing how to be kind to others, and being considerate, for example.

   "Teaching profession students in the context of a multicultural society should adjust themselves peacefully according to roles, duties, responsibilities, and the time frame context without causing trouble to others." (ID3)

   "Adjusting oneself and to be accepted that I am like this, you are like this, and what is the middle part between us? What topics can we not touch on? What topics can we warn each other about? We have good relations, and we help each other in order to adjust ourselves." (ID9)

2. Sensible analytical thinking is the state of having good judgment in living in an area of diversity, knowing how to think over cultural differences to be able to understand the real world.

   "To be able to live together happily in a multicultural society, those who want to be teachers must learn how to live together in the society with judgment and how to think analytically and logically amidst the differences that are unfamiliar in order to cope with self-adjustment and work." (ID1)

   "Being calm, mindful, still, and knowing how to think reasonably amidst cultural differences. Accept and understand your own attitudes and those of others well." (ID10)

3. Participating in various school and community activities is the action of modifying one's own behavior in participating in activities in the Buddhist community, Muslim community, or Christian community, listening to opinions or criticisms and applying them in self-adjustment in living together in the community.

   "The action shows that he can listen to criticism and different opinions. When he is in the community, he can adjust himself to participate appropriately in school or community activities." (ID7)

   "Changing one's own behavior; for example, if one goes to live or do activities in a Buddhist Thai community, a Muslim community, or a Christian community, one must behave accordingly, adjust himself to interact with students, teachers, colleagues, or the community, or understand the nature, conduct, customs, behavior, and differences of each culture." (ID8)

Theme 4: Accepting Cultural Diversity

Accepting cultural diversity is an important skill that teaching profession students must have. It includes adjusting their views and leading their lives relevant to the cultural context, appreciating the value of other cultures, showing respect in doing all actions, no insulting, no offending other cultures, and seeing the differences and similarities of one's own culture and other cultures.

1. Adjusting views and conduct following the cultural context is the action showing understanding what other people are doing in different environments and self-conduct

following the principles of one's own religion to understand the limitations and conditions of the people of other religions, resulting in being able to become open-minded and learn more about the differences.

"Differences and diversities are everywhere. We will have to learn to understand other people's actions. Especially in the teaching profession, students who are going to teach schoolchildren have to attentively and deeply understand the way of life and differences of cultural context." (ID1)

"Firstly, in the teaching profession, students must understand the differences among people by adjusting their own views. Let's say we have to work in another province and must stay in a provided residential area in the school. However, we can't accept why we must go there. Why do we follow the others? If we cannot accept the local context of the school, it could be a hard time." (ID5)

2. Appreciating the value of other cultures is an acceptance of the differences of other cultures that are different from our own and knowing how to learn the ways of life of other cultures. This will make you understand other people more, especially valuing the culture of each area.

"We must accept. In addition to understanding, you must also accept and realize that the cultural behavior practiced by others is something different from what we already are. For example, in the southern border provinces, Muslims have their own way while Buddhists have another way, and so do the Chinese." (ID2)

"We know that when teaching profession students are in school, it is necessary for them to observe and learn about other cultures that are different, including organizational culture. And I personally think that organizational culture is something they must learn, especially the issues regarding gender diversity, diversities in classes, ages, and culture that interact with one another in order to understand more about work." (ID3)

3. Showing respect, no insult, and no violation of other cultures is an expression of respect to the values of other cultures, no insult, no abuse, listening to beliefs and applying them with understanding. Never argue with other people's opinions that are different from our own one.

"An important thing about being a teacher is never argued against other people's opinions that may be different from your own. However, the differences should be taken as advantages, strengths, and focuses of learning to create interactions with each other in the form of expressing respect for each other's opinions in living together in diverse cultures." (ID4)

"The teaching profession students must have the skills to learn different cultures that they are not familiar with since their birth and learn to accept that culture without insults nor violation. Accept beliefs in order to develop yourself." (ID8)

Discussion and Conclusion

This study reflects the important soft skills that teaching profession students should have in working within the context of a multicultural society in the southern border provinces of Thailand. The informants reflected those soft skills in a multicultural society consisted of 4 skills: (1) communication and relationships, (2) working with other people, (3) adaptation, and (4) accepting cultural diversity. The details are as follows:

1. Communication and relationship-building skills include self-disclosure and healing behaviors that require the disclosure of emotions and stories to be exchanged with one another, selecting the communication method that suits the local context, learning local dialects, listening attentively and carefully, and honoring the interlocutor by being a good listener. These matters will become a foundation for empathy and without quick judgments of the people who have different views or cultures, leading to living together in a positive atmosphere. The results of the study on this issue are consistent with the study by Mailool, Retnawati, Arifin, Kesuma, and Putranta (2020), which investigated teachers' experiences teaching soft skills in professional courses in Indonesia. It was found that communication skills are very necessary that every teacher must have because teachers must use many communication skills together to organize learning so that learners will have knowledge, skills, and desirable characteristics as specified. In addition to teaching, teachers will have to do other jobs in the school. Teachers' work requires communication skills, which consist of listening, reading, speaking, and writing, especially when working with culturally diverse individuals.
2. Skills for working with other people consist of a series of behaviors that reflect willingness to work with diverse community members, both inside and outside the school, starting from being open-minded to accept the diversity of individuals and communities we are interacting with and sharing opinions in a democratic way. Everybody is equally important, and all reasons are welcome. These actions will lead to unity in the future. The results of the study in this issue are consistent with the study of the characteristics of teachers that students are satisfied with (Chananil, Chaisawat, Konchalard, & Chanapan, 2020), which found that students expected that teachers were their good role models. The learners would develop good learning behavior using teachers as role models. Therefore, if teachers showed they honored other people, helped each other, and knew their own roles and responsibilities, the learners would absorb and imitate such desired behaviors. In addition, Ağçam and Doğan (2021) had suggested that the important skills in working together with others were the ability to work with a variety of people (not just the people you agreed with) and a willingness to find new perspectives regarding various issues. A recognition of other people's skills and experience and understanding that you don't have them should be beneficial to the project or the team in finding the best solution.
3. Adaptation skills consist of behaviors that are flexible in thinking, controlling, and expressing emotions appropriately. It includes participating in various activities of community schools in the area and paying serious attention to religious activities that are different from one's own for a good adaptation to living together in a diverse cultural context. Arias, Sancho, Vergara, & Barrientos (2021) had studied the soft skills of American university professors' self-perception. An interesting finding from this study is that teachers should have emotional and mental flexibility and have an attitude that is open to growth. Open to learning new challenges. Be open to opinions that are beneficial to yourself. Always be ready to change, adapt, and develop yourself. Under a peaceful multicultural society, with reliance, respect, and non-

violation of each other's rights. Because if teachers are able to adapt and create equality in multicultural classrooms, these things will be the beginning of an open society full of equality where everyone has rights and freedom under the uniqueness of each person, so that students have the opportunity to learn from each other and accept differences. This is why adaptability skills are so important.

4. Skills in accepting cultural diversity consist of the behavior in adjusting ideas and attitudes and the practice in the cultural context. Teachers have to understand the action performed by people from different cultures or religions, including seeing the value of learning ways of life and the conducts that reflect respect, no insult, no infringe on other cultures that are different from one's own, and without using one's own thoughts to judge, in line with the study by Cinque and Kippels (2023), which found that teachers with positive attitudes toward multicultural classrooms are the person who can promote peaceful coexistence by promoting students to live together, think together, and realize that no matter what race or religion, these differences are not barriers to friendship. In living together and being successful in life, the teacher must be the one who initially introduces the exchange of cultural understanding of the students in a classroom or even in the communities on basic matters such as language, dressing, way of life, or working together in order to encourage students to understand and accept differences without the feeling of being separated. The cooperation in building up unity in diversity by encouraging children to do activities together with their parents to expand the children's society. In the event that a problem is encountered, the teacher should give advice to the students to solve the problem in a peaceful way. For respect, culture, humility, and open-mindedness, in a small society like a multicultural classroom, the teachers are the ones who encourage and provide guidance in learning to understand and live with people who are different, including sharing, caring, and openness. These elements will be a good foundation for students to go out and create an open society in the future.

Therefore, self-development for teachers of today is not only the preparation for classroom teaching and constructing the body of knowledge, but also the ability to cope with fluctuation and the changing diverse society. The ability to understand the meaning and the skills the teachers should develop in themselves is important and necessary because they are the skills that the teachers can be trained to foster. These skills are not only beneficial to the teaching job but also to the teachers themselves.

Development of the Multimedia Modules for Interactive Online Learning to Enhance Understanding of Principles of Graphic Design on Packaging

Suchapa Netpradit, King Mongkut's University of Technology Thonburi, Thailand
Tanatorn Tongsumrith, King Mongkut's University of Technology Thonburi, Thailand
Worawimon Bunlungsup, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Currently, the packaging industry is experiencing a shortage of graphic designers and the lack of interactive learning materials about graphic design. The purpose was to design motivational videos and audio in 7 modules to enhance understanding of graphic design using Adobe Illustrator. Each video clip for few minutes duration was produced with Adobe Premiere Pro and uploaded to the Google Classroom platform to be accessed by QR code scanning. The qualities of the multimedia were evaluated by three content experts and three media experts using a 5-point rating score. The learning effectiveness was observed using a specific focus group of 30 undergraduate students in the Printing and Packaging Technology program at KMUTT. The pre-tests and post-tests for each module were created with Google Forms using ten optimal multiple-choice questions in a module with IOC and difficulty level analysis. The qualities of the content and the media were rated as good with the mean score of 4.01 and 4.37, respectively. The learning efficiency, determined from the total post-test scores (E1) to the mean score of the final exercise (E2), was 84.2/88.14, which was higher than the expected criteria. The mean of post-test score was 48.24% increasing from the pre-test score which was significantly difference at the 0.05 level. Learners' satisfaction with the content was high ($\bar{x}$=4.47), and satisfaction with the multimedia was the highest ($\bar{x}$=4.54). The results suggested that this multimedia modules could be effectively applied to improve understanding of graphic design on packaging using Adobe Illustrator.

Introduction

Due to the COVID-19 situation, there have been changes in lifestyles, leading to a "New Normal" where people interact less closely. As a result, many have sought to start their own businesses to increase income, which requires the use of packaging for product wrapping and safety. Packaging also helps maintain product quality and simplify transportation, aligning with the creative design for motivation. However, the packaging industry is experiencing a shortage of graphic designers and a lack of interactive learning materials about graphic design.

As technology advances and Internet accessibility improves globally, more students and educators are embracing digital platforms for learning and teaching. This shift has also been further accelerated by the COVID-19 pandemic, which forced educational institutions worldwide to adapt to remote learning models rapidly. With the rise in online learning, educational media must also adapt to become a valuable tool in modern education, offering flexibility and variety to meet the needs of learners. The computer, tablet, or mobile phones can easily access resources for everyone's self-learning anywhere and anytime by connecting via the Internet.

In the meantime, micro-credentials: short, module or focused online courses leading to skill development (Upskill/Reskill) are becoming increasingly popular for many occupations. Modular learning is a teaching and learning approach that breaks down a course or curriculum into smaller ones. The self-contained modules can incorporate interactive elements such as quizzes and multimedia resources to enhance engagement and retention. Adobe Illustrator is the most popular program for graphic art creation such as logos, illustrations, graphics, line, etc. This work aimed to design motivational multimedia containing videos and audio in 7 modules to enhance understanding of graphic design with Adobe Illustrator on the folding box packaging.

Methodology

The interactive online learning entitled "Principles of Graphic Design with Adobe Illustrator on Folding Box Packaging" of 7 modules with each video clip for 2-3 minutes duration was produced with Adobe Premiere Pro and uploaded to the Google Classroom platform to be accessed by QR code scanning. The Google Classroom is a free web-based learning platform developed by Google, where teachers can run a class online, create curriculums, and share assignments with students by logging in with a Gmail address to access the Google Classroom.

The quiz for pre-tests and post-tests of each module was created with Google Forms using ten optimal multiple-choice questions for a module with IOC and difficulty level analysis as (1):

$$\textit{Difficulty Index } (P) = R/T \tag{1}$$

(Where R is the number of correct responses,
and T is the total number of responses in the sample group)

The appropriate difficulty is 0.20-0.80 because the exams that were too difficult (<0.20) or too easy (>0.80) were unable to classify the learning outcome.

The multimedia qualities were evaluated by three content experts and three media experts with work experience related to design and teaching media for not less than 2 years, selected by purposive sampling using a 5-point rating score. The learning effectiveness was observed using a specific focus group of 30 undergraduate students in the Department of Printing and Packaging Technology at King Mongkut's University of Technology Thonburi. The sample group consisted of the second and the third year students of a 4-year program in the academic year 2023, selected by convenience. The samples had to take a pre-test before self-learning each module and then a post-test.

After completing seven modules, the learners took a final test and questionnaire to evaluate their satisfaction using a 5-point rating score, as shown in Table 1. The learning efficiency was determined from the total post-test scores of each module as the efficiency of the process during class (E1) to the average score of the final exercise as the efficiency of outcome after all classes (E2), which was set E1/E2 at 80/80.

Table 1: The Criteria of the 5-Point Rating Score for Evaluation

Scale	Scale Interval	Opinion for Quality	Description for Satisfaction
5	4.50-5.00	Excellent	Very Satisfied
4	3.50-4.49	Good	Satisfied
3	2.50-3.49	Average	Neutral
2	1.50-2.49	Poor	Dissatisfied
1	1.00-1.49	Very Poor	Very Dissatisfied

Results and Discussion

The learners can use computers, notebooks, mobile phones, tablets, or iPads to access the Google Classroom which can be downloaded for either Android or IOS anywhere that Internet availability, as Fig. 1 (a). In this Google Classroom, there are seven codes to enter each lesson module or scan the QR Codes of each lesson, as Fig. 1 (b). The topic, learning objective, and video clip duration of each lesson are shown in Table 2.

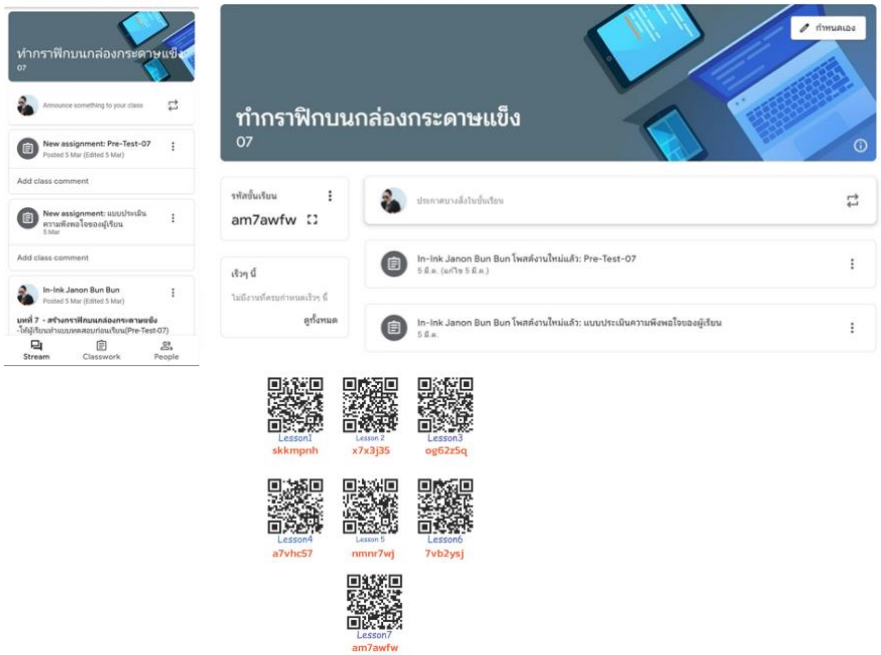

Figure 1: Displaying in a Google Classroom on Electronic Devices (a) and QR Codes for Access 7 Lesson Modules

Table 2: Lesson Modules of the Interactive Online Learning

Module	Topic	Learning Objective	Period (min)
1	Introduction to Basic Principles of Art	To improve the basics of art for learners.	02:07
2	Objectives of Packaging Design	To provide learners with an awareness of basic packaging design objectives.	01:57
3	Basic Application of Adobe Illustrator	To make learners understand the essential tools of Adobe Illustrator.	22:43
4	Additional Techniques for Adobe Illustrator	To support learners applying additional techniques for Adobe Illustrator.	09:54
5	Recommendation of resources for workpiece preparation	To guide learners aware of the source of additional resources for creating products.	08:21
6	Layout and Die Line for Folding Box Structure Design	To enhance learners building the folding box themselves.	09:11
7	Graphic Design and Creation on Folding Box	To enhance learners creating the graphics on the folding boxes.	08:54

The multimedia learning material of each module includes graphics, pictures, video, and audio to provide knowledge about the graphic design program Adobe Illustrator. They were produced using the Adobe Premiere Pro and uploaded in the Google Classroom platform. The examples of pictures captured from the multimedia are shown in Fig. 2.

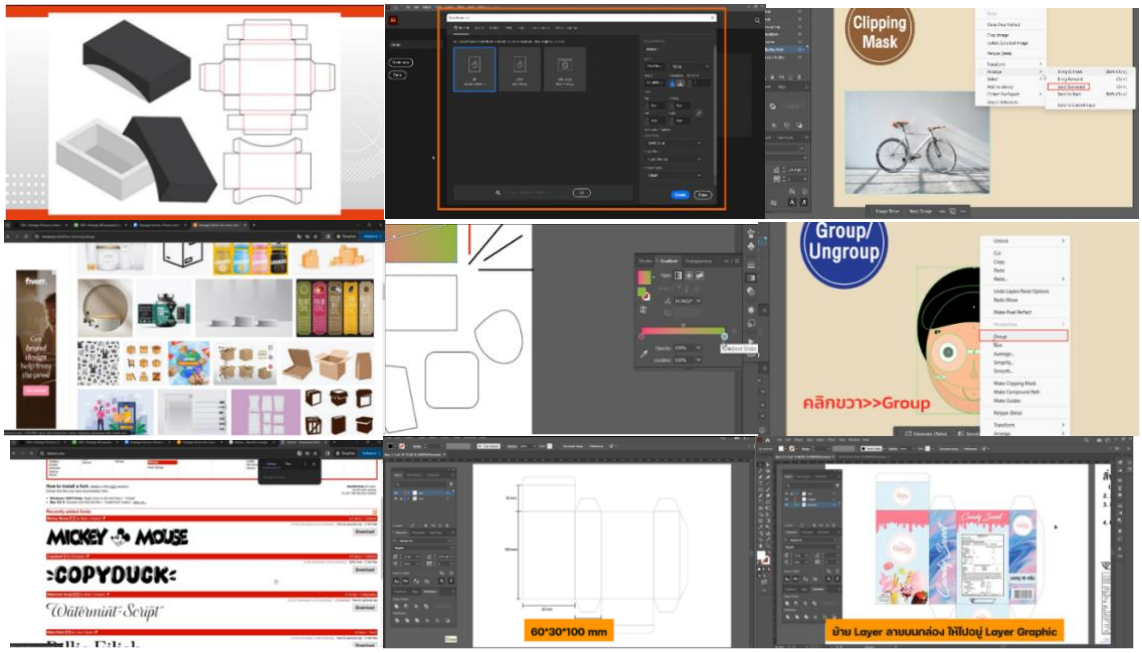

Figure 2: Examples of Picture Captured From the Created Multimedia

For the evaluation by 3 content experts and 3 media experts, the qualities of the content were rated as good ($\bar{x}$=4.01) from 10 evaluation topics and the qualities of the media were rated as good ($\bar{x}$=4.37) from 10 evaluation topics, as shown in Tables 3 and 4.

Table 3: The Quality Evaluation of the Content of the Interactive Online Learning

Item	Evaluation Topic	Mean	SD	Definition
1	Appropriateness of the content to the learning objectives	4.0	1.0	Good
2	Accuracy of content	4.3	1.2	Good
3	Appropriateness in arranging content	4.3	0.6	Good
4	Modernity of content	3.7	0.6	Average
5	Categorization of content	4.3	0.6	Good
6	Appropriateness of the amount of content	3.3	0.6	Average
7	Appropriateness of the sentences used in the content	4.0	1.0	Good
8	Content suitable for the target group	3.7	0.6	Average
9	Content completeness	3.7	0.6	Average
10	Suitability of illustrations and graphics with content	4.8	0.6	Excellent
	Total mean score	4.01	0.74	Good

Table 4: The Quality Evaluation on the Multimedia of the Interactive Online Learning

Item	Evaluation Topic	Mean	SD	Definition
1	Appropriateness of the use of background colors	4.3	0.6	Good
2	Appropriateness of the font style and size	4.7	0.6	Excellent
3	Appropriateness of the font color	4.3	0.6	Good
4	Suitability of elements on the screen	4.7	0.6	Excellent
5	Appropriateness of the sound effects	4.0	1	Good
6	Consistency of illustrations with content	4.7	0.6	Excellent
7	Sharpness of images and clarity of sound in video	4.3	0.6	Good
8	Solution of scores summarize in exercises	4.0	1	Good
9	Interesting and engaging learning of lesson	4.0	0	Good
10	Suitability for dissemination of lessons learned	4.7	0.6	Excellent
	Total mean score	4.37	0.62	Good

There were some topics should be improved for the content such as modernity, amount, suitable for the target group and completeness. For modernity, many updated programs should be recommended. The content amount of each module should be of similar length. The content should be adjusted to be appropriate for adult learners and added design examples to make the content more complete. For the media, the experts suggested that interactive online learning should be made into a website, including YouTube or a Learning Management System (LMS), for easy access and user data collection.

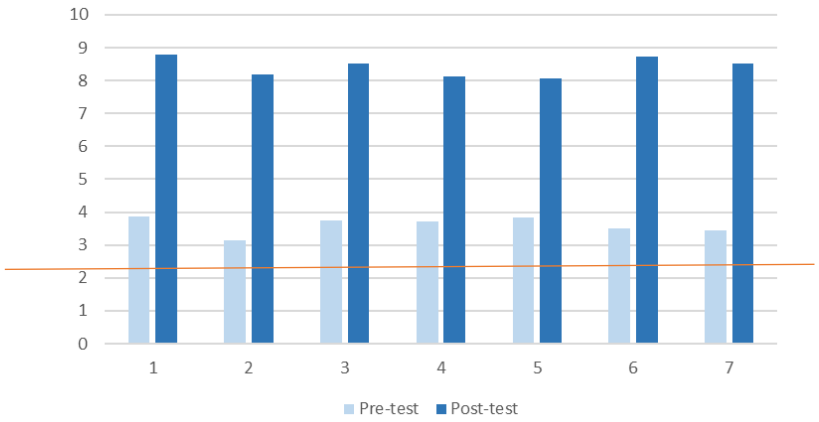

Figure 3: Average Scores of Pre-test and Post-test for Seven Modules

To investigate the learning effectiveness of the learners, the average scores of pre-test were compared to the average scores of post-test for seven modules, as shown in Fig. 3. The result showed that each module's content was consistent with each module's questions. The learning materials were so good that the learners gained a greater understanding. The average score of the sample group before learning the lesson was 3.60 points, while the average score after learning the lesson was 8.42 points, meaning that the average score increased by 48.24%. Comparative result of learning achievement was analyzed using one-way ANOVA with the Tukey method. It was found that the average score after learning all seven modules was higher than the average score before learning, with a statistically significant at 0.05 level.

The average score in the percentage of the final test, which was 10 appropriate questions by the sample of respondents after learning all 7 modules is shown in Table 5. The learning efficiency, determined from the total average post-test scores as the efficiency of the process during class (E1) to the average score of the final exercise as the efficiency of outcome after all class (E2), was 84.2/88.14, which was higher than the expected criteria of 80/80.

Table 5: Scores of the Final Test After Learning All 7 Modules

Question No.	1	2	3	4	5	6	7	8	9	10	Average
Point (%)	100	65.6	75	100	81.3	93.8	87.5	87.5	93.8	96.9	88.14

For the satisfaction of the sample group of 30 learners with the learning media, the results are shown in Tables 6 and 7. It was found that the learners were satisfied with the content ($\bar{x}$=4.47), and very satisfied with the multimedia ($\bar{x}$=4.54).

Table 6: The Satisfaction Level of the Sample Group with the Content of the Interactive Online Learning

Item	Evaluation Topic	Mean	SD	Definition
1	Appropriateness of the content to the learning objectives	4.55	0.51	Very Satisfied
2	Accuracy of content	4.5	0.51	Very Satisfied
3	Appropriateness in arranging content	4.5	0.61	Very Satisfied
4	Modernity of content	4.45	0.51	Satisfied
5	Categorization of content	4.5	0.51	Very Satisfied
6	Appropriateness of the amount of content	4.5	0.51	Very Satisfied
7	Appropriateness of the sentences used in the content	4.4	0.6	Satisfied
8	Content suitable for the target group	4.5	0.51	Very Satisfied
9	Content completeness	4.25	0.64	Satisfied
10	Suitability of illustrations and graphics with the content	4.5	0.61	Very Satisfied
	Total mean score	4.47	0.74	Satisfied

The mean score for satisfaction of sound effects was the lowest (4.15) which might be caused by the subtitles where some words were not pronounced clearly. Some learner samples complained that there were too many exercises before and after class of each module for seven lessons which may cause learners to waste time for their self-learning.

Table 7: The Satisfaction Level of the Sample Group With the Multimedia of the Interactive Online Learning

Item	Evaluation Topic	Mean	SD	Definition
1	Appropriateness of the use of background colors	4.8	0.41	Very Satisfied
2	Appropriateness of the font style and size	4.75	0.44	Very Satisfied
3	Appropriateness of the font color	4.7	0.47	Very Satisfied
4	Suitability of elements on the screen	4.6	0.5	Very Satisfied
5	Appropriateness of the sound effects	4.15	0.67	Satisfied
6	Consistency of illustrations with content	4.4	0.5	Satisfied
7	Sharpness of images and clarity of sound in video	4.4	0.6	Satisfied
8	Solution of scores summarized in exercises	4.6	0.6	Very Satisfied
9	Interesting and engaging learning of the lesson	4.4	0.5	Satisfied
10	Suitability for dissemination of lessons learned	4.6	0.5	Very Satisfied
	Total mean score	4.54	0.52	Very Satisfied

Conclusion

The online learning multimedia contained graphics, photos, videos, and audio to provide knowledge about using the Adobe Illustrator program. There were seven modules created by Adobe Premiere Pro through the Google Classroom platform accessed with seven unique codes or QR codes. The content qualities rated as good with a mean score of 4.01 and the media qualities also rated good with a mean score of 4.37.

The experiment was conducted with a sample of 30 undergraduate students of the Department of Printing and Packaging Technology in the academic Year 2023 at King Mongkut's University of Technology Thonburi, Thailand. There were a pre-test and post-test for each module with ten multiple choice questions, created in Google Forms.

The mean post-test score was 48.24% higher than the mean pre-test score, with a significant improvement at the 0.05 level. The learning efficiency, based on post-test (E1) and final exercise (E2) scores, was 84.2/88.14, exceeding the expected criteria (80/80).

The learners were satisfied with the content with a mean score of 4.47 and very satisfied with the multimedia with a mean score of 4.54. The study suggested that this multimedia modules could be effectively applied to improve understanding of graphic design on packaging using Adobe Illustrator program.

Acknowledgements

We would like to express our sincere gratitude to King Mongkut's University of Technology Thonburi and the Faculty of Industrial Education and Technology for their financial support, enabling us to attend and present our research at the 16th Asian Conference on Education (ACE2024) in Tokyo, Japan.

Abstract
Motor rewinding skills are one of the practical skills of an electrician. Generally, it will be organized as a vocational certificate program, emphasizing practical training in disassembly and reassembly motors, form coils of copper wire and electrical circuit connections. Over the course of the last few years, there has been a there has been a decline in learning and proficiency in practice capabilities due to the pandemic. Utilizing media technology in the classroom facilitates practice by letting students' study and work through material independently. As a result, the Addie model is used in the research to create multimedia materials for motor rewinding. The results of the study found that: 1) Develop multimedia to enhance skills in three-phase induction motors according to the ADDIE Model concept. The multimedia was examined by three experts, and 2) results of finding the quality of developing multimedia to create skills in three-phase induction motors according to the ADDIE model. Regarding the appropriateness of the contents of disassembling a three-phase induction motor, the experts had a high overall opinion ($\overline{X}$=4.11, S.D.=0.93). The overall development of learning outcomes from the content structure of three-phase induction motors was rated highly ($\overline{X}$=4.5, S.D.=0.56). The psychomotor domain was at the skill movements level, while the cognitive domain was at the comprehension level. In the development of multimedia media to increase learning skills regarding three-phase induction motors according to the ADDIE Model can be used as teaching media and can also allow students to study outside of class time appropriately, which will affect their learner development according to the ADDIE Model.

Introduction

Currently, where digital technology is a big part of our everyday lives, creating engaging and effective learning materials is crucial. Consequently, the deployment of simple-to-understand media technology, which combines words, images, sounds, and videos for independent training and practice, can enhance learning. The earlier reports (Ye, 2000) exemplify the utilization of multimedia in teaching to enhance students' understanding and engagement, be it in business models, science, engineering, or any other subject (Doni, 2023; Gabriel, 2023; Pramudita, 2018). Multimedia is often applied to technically complex subjects where learners have little ability to understand the lesson and practice, and multimedia is often created about practical skills that make the skill more proficient, such as the technique of winding a 3-phase induction motor, which is considered one of the most important practical skills of all electricians and requires extensive training. Focusing on the fundamentals of motor winding, motor disassembly, winding copper form coils, installing coils in the stator motor, connecting the motor's electric circuit, and assembling the electric motor, particularly in the group of vocational certificate students grouped in the practical electrical machine subject. Nevertheless, the epidemic has made it impossible to exercise practical skills in the laboratory in recent years. Students may receive no practice, only online instruction, a change in the structure of instruction, or none at all, leaving them without any practical skills. These skills have declined as a result of a learning regression.

Since induction motors are the key components that drive the machinery and manufacturing processes in the industry, education and training in induction motor winding are vital. Numerous industrial sectors, including manufacturing, energy, transportation, and electrical appliances, employ induction motors. Consequently, it is critical to ensure the motors operate safely and effectively. Because winding an induction motor includes several intricate and exact processes, each of which is crucial to the motor's operation, it is a procedure that calls for specific knowledge, experience, and extreme caution. Any errors might lead to the motor breaking down or performing poorly. Thus, systematic motor winding training equips students with the information and abilities needed for real-world work, which is crucial for advancing professional talents and enhancing the working capacities of engineers and electricians (Masoumi, 2022). Possessing the right information and abilities for motor winding also lowers the possibility of mishaps and equipment damage, which boosts productivity and lowers maintenance and replacement expenses. Furthermore, high-quality education and training may help to develop skilled workers who can produce new inventions and technologies for the industry. In the long run, developing these employees will support the industry's growth and competitiveness.

One of the techniques that can be used to design and develop multimedia in the motor winding process for efficiency is the ADDIE (Analysis, Design, Development, Implementation, and Evaluation) technique, which is an instructional design process that emphasizes analysis, design, development, implementation, and evaluation (Aldoobie, 2015). Because it offers a precise and organized framework that makes learning media creation efficient and student-centered, the ADDIE model is one of the most well-liked and often applied instructional design models globally (Sahaat, 2019; Spatioti, 2022). Every stage of the model—which includes analyzing learners and their content learning needs, designing and planning instruction, choosing tools and technologies, producing and testing multimedia content, setting up equipment, overseeing and assisting instruction, assessing instruction, and refining the quality of the media—contributes significantly to the creation of high-quality learning materials (Budoya, 2019). Therefore, this article focuses on using the ADDIE Model

concept to develop multimedia for teaching three-phase induction motor winding. This model enables the creation of learning media that are systematic and effectively respond to learners' needs. The developed media will help learners understand and learn complex subjects more effectively and interestingly. The design focuses on responding to learners' specific needs and continuous improvement.

This research presents a study on the development of multimedia materials for motor winding using the ADDIE model, which consists of five steps in designing and developing learning processes through multimedia. The aim is to enhance learners' understanding and align with 21st-century skills (Binkley, 2012). The multimedia integrates visual, auditory, and explanatory elements to improve the learning and comprehension of motor winding. The study evaluates the impact of the developed multimedia on learners in three areas: 1) professional skills, 2) learning skills, and 3) positive attitudes. Additionally, it compares the multimedia-based learning process with teacher-centered methods that focus on motor-winding content. The research highlights the creation of effective tools for both teachers and students, enhancing understanding of motor winding processes, which will significantly benefit future industrial and technological development.

ADDIE Model

The ADDIE Model allows for continuous adaptation and development, ensuring effective learning that aligns with learners' needs. The ADDIE model is popular because of its flexibility and the freedom it gives instructors in designing and developing web-based teaching (McGriff, 2000). This model consists of five key stages:

Analysis: The first stage focuses on gathering and analyzing information about learners, as well as the content and potential issues. Instructors must understand the target audience, including their prior knowledge, interests, and learning goals.

Design: Instructors use the information from the analysis to design the lesson. Instructors will define lesson objectives, structure content, and create learning activities. They will also select appropriate teaching media to help learners achieve the goals.

Development: This stage entails the creation of the designed content and instructional materials. It includes writing scripts or storyboards, creating graphics, audio, and video elements, followed by testing and refining to ensure the lesson works effectively.

Implementation: After development, we put the lesson into practice. This could include testing it with students or using it in a real-world setting to assess its effectiveness.

Evaluation: The final stage assesses the effectiveness of the lesson. It includes formative evaluation during development to make improvements and summative evaluation after implementation to gather data for future development.

The entire process is adaptable, allowing for modifications as needed to ensure that teaching is efficient and meets the specific needs of learners in various contexts

Designing Multimedia on Induction Motor Winding Based on the ADDIE Model

Due to issues observed during practical induction motor winding, where students often failed to plan the winding sequence properly, causing delays and missed deadlines, this research

employs Kruse's (Kruse, 1999) design and development principles. These principles follow the systematic ADDIE Model, which consists of five stages, as outlined below:

Analysis: This stage concentrates on analyzing learner information and requires alignment of the multimedia content with the target audience and learning objectives. Examples include:

- Target learners: Electrical engineering students or those working in the electrical field.
- Prior knowledge: Students should have a basic understanding of induction motor operation.
- Objectives: Learners should understand how to wind an induction motor and perform the task correctly.
- Challenges: While learners may understand the theory, they often lack practical skills, so the media should emphasize hands-on practice.

Design: This stage involves structuring and designing multimedia content.

- Learning objectives: Focus on ensuring learners understand and follow the motor winding process.
- Content layout: Start with an explanation of induction motor theory, followed by motor winding procedures.
- Learning Activities: The multimedia should include virtual motor winding simulations for learners to practice.
- Media selection: Use graphics, instructional videos, and audio narration to explain each step.
- Presentation plan: Structure the lesson from theory to practical application.

Development: At this stage, the design plan guides the development of the actual multimedia content. Scripting is the process of writing scripts and creating storyboards for each content section.

- Multimedia creation: developing graphics, videos, and interactive simulations for learners, integrating visuals, audio, and text.
- Alpha testing: testing the multimedia with experts to identify and fix any issues.

Implement: This phase involves the use of multimedia with actual learners.

- Teaching and usage: Students use the multimedia to learn and practice motor winding.
- We check the effectiveness and make the necessary adjustments.

Evaluation: At this stage, the success of the multimedia is evaluated.

- Learner assessment: Evaluate through both theoretical and practical exams.
- Feedback: Gather input from students and instructors to improve the multimedia for future use.

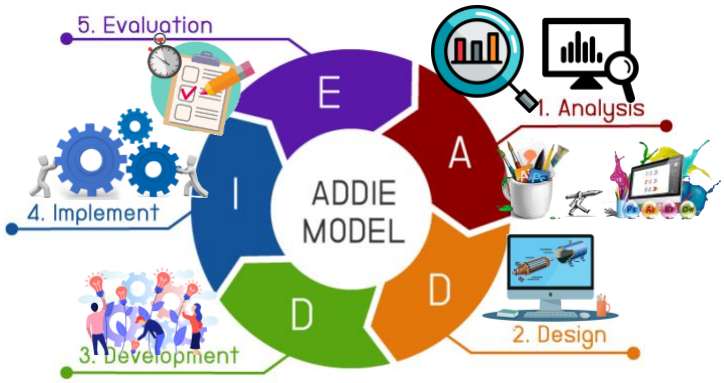

Figure 1: Using the ADDIE Model to Design Multimedia on Induction Motor Winding

Results of Teaching Design in Three-Phase Induction Motor Using ADDIE Model

The presentation of instructional design principles for three-phase induction motor rewinding following the ADDIE model requires effective implementation through systematic analysis, design, development, implementation, and evaluation. The outcomes for each step are as follows.

Analysis Results Using ADDIE Simulation Approach for Three-Phase Induction Motor Winding

In recent years, the pandemic has caused a decline in hands-on skill training, leading to gaps in practice. Furthermore, universities and educational institutions that offer practical courses in motor rewinding have reduced the number of practice hours due to the introduction of new courses. Mismatched schedules between instructors and students have resulted in frequent changes to class times, giving students less time for learning and practice. To address this issue, the use of multimedia technology can enhance the effectiveness of teaching and learning. Students can access and benefit from course content anytime and anywhere, allowing them to learn independently before engaging in actual hands-on practice.

In terms of learner analysis, the target group consists of undergraduate students in Electrical Engineering Education who already have basic electrical knowledge. This allows for the development of foundational lessons specific to electrical work that can help students review and practice three-phase motor rewinding, as well as test their learning outcomes after completing the course.

Design Results Using ADDIE Simulation Approach for Three-Phase Induction Motor Winding

We divide the learning objectives into terminal objectives and enabling objectives. The terminal objectives refer to what students should achieve after the teaching process, while the enabling objectives indicate what students gain during the study of the lesson. The content must follow proper procedures. As for the media used in teaching, the content, students' needs for learning resources, and the specific requirements for the “Electrical Engineering Skill” subject were considered. Problems identified during the process led to the development of multimedia using the ADDIE model. This process led to the creation of an animation video, which starts by demonstrating the steps involved in dismantling the motor's end caps, removing the rotor from the stator, extracting the coil from the motor's frame, inserting insulation paper into the motor slots, winding of 12 form coils, installing the coil sets into the stator, connecting the wiring, and reassembling the motor. This multimedia content is 6 minutes and 3 seconds long, featuring animations and graphics with narration.

The content must align with the learning outcomes of the "Electrical Engineering Skill" subject, and the terminal objectives are set for students to learn and practice induction motor rewinding. Moreover, they should be able to apply this knowledge in their daily lives.

The learning management plan emphasizes enabling students to perform motor rewinding according to the step-by-step learning process from the multimedia lesson on three-phase induction motor rewinding. Students are encouraged to learn in advance before engaging in hands-on practice. This approach helps students plan and perform motor rewinding in a

shorter period. We found that rewinding a motor without multimedia support took 7 hours, while using multimedia reduced the rewinding time by 4 hours.

The age of students is a factor affecting motor rewinding practice. The first-year Electrical Engineering Education students consist of two groups: vocational students and general education students, each with different levels of specialized knowledge. Therefore, it is essential to design detailed lessons that enable all students to follow the multimedia motor rewinding steps.

Regarding motor rewinding exercise, the students have favorable attitudes and confidence. As a result, students like their work, feel comfortable expressing themselves, make judgments without worrying about making a mistake, and prepare methodically.

Development Results Using ADDIE Simulation Approach for Three-Phase Induction Motor Winding

The design and production of multimedia materials, lessons, and content fall into eight main categories: 1) remove a cover motor, 2) removing the rotor from the stator, 3) taking out the coil from the motor's stator frame, 4) folding and inserting insulation paper into the motor slots, 5) winding of 12 form coils, 6) installing the coil sets into the motor's stator, 7) connecting the wiring, and 8) reassembling the motor. We incorporate each part of the content into a narrative format that narrates the story of motor rewinding. This step is crucial because the lesson's appeal and ability to stimulate student interest in learning depend on how the designer presents the material and selects appropriate media for the lesson's content. Following this, the designer invites experts and students, who are the end users, to provide their feedback on the materials for further enhancement and development.

Implementation Results Using ADDIE Simulation Approach for Three-Phase Induction Motor Winding

A group of undergraduate students in the Electrical Engineering Education program trialed the use of multimedia materials in teaching to identify potential errors and gather suggestions for improvements. Initially, the instructor should conduct one-on-one evaluations, allowing individual students to consider any issues they encounter while using the lesson. The instructor can interview students or ask them to express their opinions while engaged with the lesson, using the problems identified to enhance it. Next, conduct a small group assessment with 3-5 students to test the created lesson and observe their interaction and assistance needs. The instructor will use the gathered information to refine the multimedia lesson on motor rewinding and forecast its effectiveness for larger groups in the future.

This evaluation will involve having all students in the class participate in learning using the improved lesson. Students can learn from the created lesson by integrating ongoing assessments into the teaching process. After the lesson, students must take a quiz to determine whether they have met the learning objectives. If there are any shortcomings in achieving the objectives, we can use that information to improve and enhance the web-based teaching for better effectiveness. This research focuses on the development of multimedia learning materials on three-phase induction motor rewinding using the ADDIE process for media development. The sample population consisted of 97 first-year Electrical Engineering Education students from King Mongkut’s University of Technology Thonburi. The study included the entire population, with the inclusion criteria being: 1) students enrolled in the

"Electrical Engineering Skill" subject during the second semester of the 2023 academic year, and 3) students who could participate in the project throughout its duration. The exclusion criteria were: 1) failure to complete the practical sessions and knowledge tests, 2) incomplete or insufficient data responses, and 3) illness during the project at its conclusion.

Evaluation Results Using ADDIE Simulation Approach for Three-Phase Induction Motor Winding

This study checks and measures outcomes in two areas: the quality of multimedia materials about taking apart three-phase induction motors and the growth of learning outcomes based on the motors' structural content. Evaluators include experts in electrical engineering from technical colleges and specialists directly involved in motor rewinding (motor winders), as well as students who take knowledge assessments to improve learning outcomes.

1) Evaluation Results of the Quality of Developing Multimedia to Create Skills in Three-Phase Induction Motors

We used the ADDIE process to evaluate the multimedia materials for the disassembly content of three-phase induction motors, with a focus on the following criteria:

- Content Accuracy and Relevance
- Clarity of Presentation
- Aesthetics and Visual Appeal
- Audio and Visual Quality
- Accessibility
- Alignment with Instructional Principles
- Usability and Functionality

The evaluation of the quality of multimedia materials for the content on disassembling three-phase induction motors revealed that, overall, experts rated the quality of the materials highly, with an average mean score of 4.11 and a standard deviation (S.D.) of 0.93. Particularly in the area of content accuracy and relevance, the highest score was 4.4, with a standard deviation of 0.83. This indicates that the content is reliable and aligns with academic standards, making it suitable for the students' knowledge level. The content follows a clear sequence that aligns with the learning objectives.

Table 1: Results of the Quality Evaluation of the Multimedia Content of the Disassembly of Three-Phase Induction Motor

Quality of Multimedia Content	$\overline{X}$	S.D.	Opinion Level
Content Accuracy and Relevance	4.40	0.83	High
Clarity of Presentation	4.12	0.91	High
Aesthetics and Visual Appeal	4.00	0.92	High
Audio and Visual Quality	4.30	0.90	High
Accessibility	3.90	0.93	High
Alignment with Instructional Principles	3.80	0.96	High
Usability and Functionality	4.30	0.95	High
Average	4.11	0.93	High

However, alignment with instructional principles received the lowest score of 3.8, suggesting that further improvements are necessary in this area to better match teaching principles.

Generally, practical courses emphasize hands-on experience for first-year students, leading to a lack of connection between theory and practice.

2) Evaluation Results of Learning Outcomes From the Content on the Structure of Three-Phase Induction Motors

In this research, the quality of the content of the multimedia materials on winding three-phase induction motors was tested using the ADDIE development process. The content includes disassembling the end caps of the motor, removing the rotor from the stator, taking out the windings from the stator frame, folding and inserting insulation paper into the motor slots, winding of 12 form coils, installing the coil sets in the motor stator, connecting wires, and assembling the motor frame. For each content area, students were required to take a post-test after using the multimedia materials to evaluate the quality and understanding of the content related to three-phase induction motors, as shown in Table 2. We divided the learning content into eight topics to assess students' understanding, providing a clear view of the learning outcomes in the psychomotor domain (6 topics) and the cognitive domain (2 topics), specifically the winding of 12 form coils and the wiring.

Table 2: Results of the Evaluation of the Development of Learning Achievement Fromthe Content of the Structure of Three-Phase Induction Motor

Content of Three-Phase Induction Motor Winding	$\overline{X}$	S.D.	Opinion Level
Remove a cover motor	4.4	0.56	High
Removing the rotor from the stator	4.6	0.58	High
Taking out the windings from the stator frame	4.8	0.51	High
Folding and inserting insulation paper into the motor slots	4.5	0.56	High
Winding of 12 form coils	4.3	0.61	High
Installing the coil sets in the motor stator	4.1	0.61	High
Connecting wires	4.6	0.60	High
Assembling the motor frame	4.8	0.48	High
Average	4.5	0.56	High

From the evaluation of the development of learning outcomes based on the content regarding the structure of three-phase induction motors, the overall average learning achievement was found to be 4.5, with a standard deviation of 0.56, indicating a “high” level of opinion. This aligns with the results of the quality assessment of the multimedia content for disassembling three-phase induction motors, demonstrating that students can develop learning outcomes in the psychomotor domain at the level of skill movements and in the cognitive domain at the level of comprehension (Begam, 2018). This was measured based on the topics of winding 12 form coils and wiring. There was variability in the levels of achievement, with standard deviations of 0.56 and 0.60, respectively, in skill movements. This indicates that the difficulty in practice, particularly in the processes of folding paper and inserting insulation paper, may require precision and accuracy, as the dimensions should not exceed the slots. Therefore, students felt that these tasks were more challenging compared to other content areas.

Conclusion: Summary of Results

This study focused on the development of multimedia resources to enhance skills in winding three-phase induction motors by utilizing the ADDIE Model for media creation. The quality

of the multimedia content for disassembling three-phase induction motors was assessed by experts, highlighting the appropriateness of the content, which received an average score of 4.11 (S.D.=0.93). This indicates that the content is suitable and meets the objectives of disassembling three-phase induction motors. The average score for the development of learning outcomes from the content on the structure of three-phase induction motors was 4.5 (S.D.=0.56), indicating that students were able to develop learning outcomes in the psychomotor domain, specifically in skill movements, and in the cognitive domain, specifically in comprehension. Therefore, motor winding skills are essential for electricians and are typically taught at the vocational certificate level and within electrical education programs, which emphasize hands-on training. However, the integration of multimedia technology into the learning process can serve as an effective tool for training and learning. The developed multimedia resources not only enable students to learn motor winding skills during class time but also allow them to study further outside of class. This will enhance their understanding and proficiency in practical work.

Development of Training Curricula to Improve Engineers' Learning Capacity in Manufacturing Facilities Using the Production Support System Based on DAPOA

Chamnan Ratsame, King Mongkut's University of Technology Thonburi, Thailand
Pakpoom Chansri, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
To provide training experience for engineers working in industrial plants, this research developed and evaluated a training model for industrial production support systems using the DAPOA learning framework. The five steps of the DAPOA project learning model were used to organize teaching and learning for the academic year 2023–2024. These steps are topic identification, analysis, planning and design, implementation, and evaluation. The study of the production support system combined theoretical and practical teaching approaches. The study used a sample group of 20 plant engineers who expressed interest in participating in the experiment. We examined classroom and workplace skills and assessed the trainees' abilities. The results showed that the DAPOA project learning framework was moderate-to-highly appropriate. Following the training, the establishment's air compressor system engineers demonstrated significantly higher knowledge and practical abilities. This training course design also worked because the DAPOA learning model worked well. It gave an average result (E1/E2) of 80.45/83.95 percent, which showed that engineers were better at analyzing data in industrial compressed air systems. Although some parts of the training steps for energy analysis of compressed air systems were deemed appropriate by experts, all assessments were carried out by experts about energy use standards for industrial production support equipment and the standards were found to be appropriate. The practical training manual of the sample group had the highest satisfaction ($\bar{x}$=4.45) according to the evaluation results.

Introduction

At present, the industrial sector is facing technological changes. Developing energy management systems (El-Fawair et al., 2023) in the production process is a crucial factor that can enhance efficiency and reduce costs. One such system is the compressed air system, a high-energy system that plays a significant role in industrial production. Without effective management, the compressed air system will affect the organization's competitiveness. However, international guidelines such as ISO 50001 (Chaves et al., 2020) have certified appropriate energy management, emphasizing efficient and sustainable energy use. Past research has revealed that lecture-based learning (LBL) (Dutta et al., 2022) offers benefits such as time and resource savings in teaching and learning but also suffers from a deficiency in skill training. The demonstration learning model, also known as Simulation-Based Learning (SBL) (Pratumsuwan et al., 2020), suffers from a lack of continuous training in evaluation skills and process improvement, and it cannot cover all situations that may arise in real-world scenarios. The project-based learning model (PBL) (Honglin et al., 2022) enhances problem-solving skills in real-world scenarios, such as fostering analytical thinking, planning, and teamwork. However, the evaluation process may be unclear as the results may not demonstrate complete success. This research presents a learning model that combines process-based learning and the DAPOA (Determination, Analysis, Plan, Operate, Assess) process. Process-based learning focuses on learning that emphasizes clear process understanding and systematic steps to follow, while DAPOA process steps enhance skills in planning, evaluation, and continuous process improvement. Therefore, combining these two approaches will enhance important skills in energy management processes in industrial engineers.

Overview of Research

Process-Based Learning and Training Processes in DAPOA Model

Process-Based Learning (PBL) (Heng et al., 2024; Li et al., 2024) is a theory of learning that emphasizes learning through actual practice, making it suitable for training on air compressors. We will teach learners through activities that align with their learning content, enabling them to solve problems in real-world scenarios. This training will help increase experience and confidence in deep, sustainable learning. It also helps as a guideline for energy use in production, especially using air compressor systems according to energy management standards that focus on improving energy efficiency. This research will introduce a learning management model based on the DAPOA principle, a training model for knowledge creation that prioritizes the practical application of scientific processes and problem-solving techniques, as illustrated in Figure 1. The model is divided into five steps as follows:

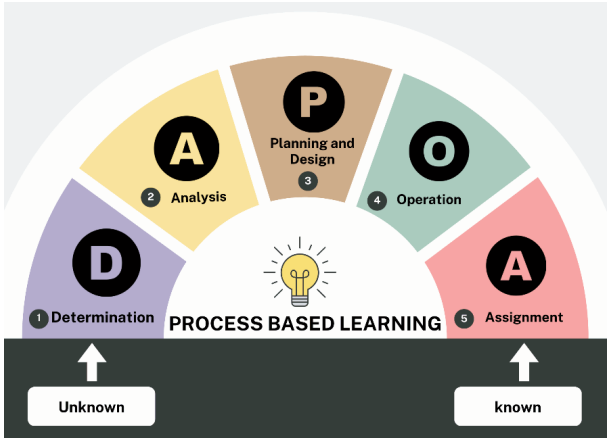

Figure 1: The DAPOA Process-Based Learning Model

Determination: The process of determining the goals and objectives of the training content.
Analysis: The process of analyzing relevant theoretical data to help trainees gain a deeper understanding of the problem.
Planning and Design: This refers to strategizing enhancements by outlining specific steps and methods for implementation in the laboratory to compile an analysis of evaluation criteria that impact the compressed air system (Thabet et al., 2020; Kasprzyk et al., 2023).
Operation: The process of implementing the plan that requires continuous improvement and monitoring of progress in each of the trainee's establishments.
Assignment: The process of evaluating the results and evaluating the learning efficiency to summarize the results of improving the production process.

Learning and Teaching Processes

Research Design.

This research is experimental. Production engineers comprise the research population, who are in charge of using air compressor systems in industrial plants. The sample group was selected by purposive sampling from 20 establishments. Figure 2 illustrates the training of air compressor systems using the DAPOA principle in the process-based learning model. The target data will be related to the efficiency of air compressor use and the skills of the trainees will be collected and analyzed both before and after the training.

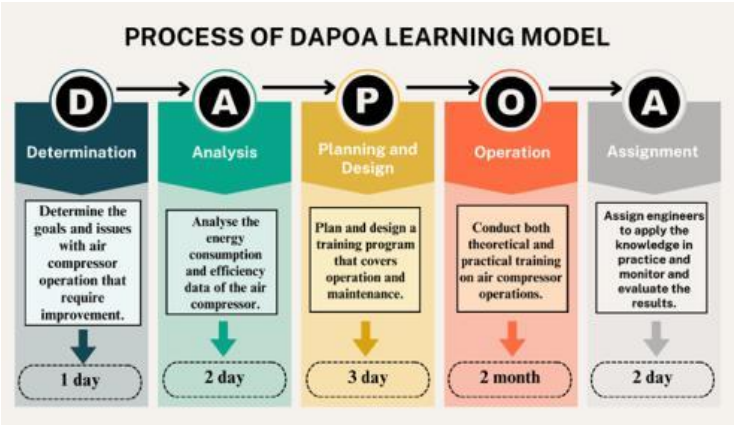

Figure 2: The Process-Based Learning of DAPOA Learning Model

Research Procedures.

Determination Stage (D): The initial process begins with defining the training objectives and goals, which is a crucial step that directly affects the success of air compressor training. Consistency with workplace problems and needs and the desired expectations for trained engineers are crucial for practical training. Examples include,

- Establishing training objectives involves determining the knowledge and understanding that trainees must possess and their ability to analyze and evaluate after training. Examples of training objectives in this regard include increasing knowledge and understanding of air compressors. Developing skills in using compressed air systems. Reducing energy consumption in compressed air systems.
- The objectives of theoretical training are what is desired to be achieved after the training is completed. These objectives can be used as indicators of the success of training and the development of the trainees' potential. The objectives of this training will focus on increasing the efficiency of air compressor usage and reducing energy costs in the production process in the organization.
- Setting key performance indicators (KPIs) is important in evaluating training results that can be used in this case, including trainee satisfaction level.

Analysis Stage (A): Data analysis is an important step after defining training objectives and goals, as shown in Fig. 3. This step collects data related to compressed air system usage, along with additional data from the determination step, to analyze the efficiency of compressed air system usage.

Figure 3: Analysis Process

- Data Collection: Analysis of the data obtained can be used to evaluate the efficiency of air compressor usage and plan training, such as Energy Efficiency Analysis. Analyzing the energy use of air compressors is an important step in finding ways to reduce energy consumption and improve efficiency.
- Conclusion: The presentation of the conclusions obtained from analyzing each issue will be important information for designing training content consistent with specific training problems and needs.
- Evaluation: This analysis will lead to the design of training content that is precise and responsive to the problems encountered in the air compressor operation process, to the evaluation of learners' progress after training, to the training achievement.

Planning and Design Stage (P): Two days of practical theoretical training on air compressor systems. Figure 4 shows the training program on appropriate and sustainable electric energy-

saving techniques of air compressors. After completing the contents according to the specified objectives, an experiment worksheet will be organized.

Figure 4: Planning and Design Process

Operation Stage (O): In this phase, learners will participate in the training according to the plan, focusing on learning through actual practice in a safe environment. In the practical phase, learners will try to use the actual air compressor with an expert instructor to guide and answer questions. The practical training will commence with a simulated air compressor room demonstration and actual practice. The design of the content and preparation of training documents are based on the data obtained from the previous analysis step. Divide into groups of 5 people and test the operation of the 22 KW electric air compressor to identify the variables that influence the energy consumption of the air compressor in the upcoming section.

- Testing of flow rate adjustment using valve of air compressor system.

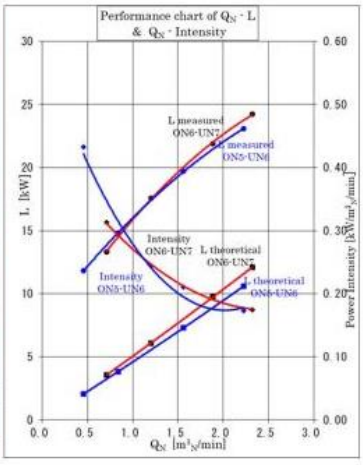

Figure 5: Summary of Data That Illustrates the Correlation Between Flow Rate and Electrical Power During the Test

Figure 5 summarizes the experimental results. Higher compressed air flow rates due to valve adjustments result in higher load and lower drain conditions. For example, the experimental log shows that at a flow rate of 1.461 m3N/min, we measured 29.110 kW of electrical power in the load phase and 10.058 kW in the working phase, with a working period of 15 seconds and a stopping period of 23 seconds. Therefore, the average electrical power of the compressor in this operating condition is 17.57 kW.

Table 1: Results From the Graph Showing the Relationship Between Average Electrical Power and Compressed Air Flow Rate

Flow rate		**Electrical power**		**Period**		**Power Average**	**Saving percentage**	
m^3N/min	%	Load (KW)	Unload (KW)	Load (Sec)	Unload (Sec)	(KW)	(KW)	%
0.925	35.83	29.20	8.36	12.00	36.00	13.57	10.65	43.97
1.461	56.57	29.12	10.04	15.00	23.00	17.57	6.64	27.45
2.142	82.98	28.68	12.96	22.00	16.00	22.06	2.15	8.91
2.581	100.00	28.90	13.42	30.00	13.00	24.22	-	-

From Table 1, the higher the air flow rate, the higher the average power. Therefore, the correct use of an air compressor must consider the appropriate amount of air demand. The experiment results show that adjusting the flow rate to 1.461 m3N/min can reduce the valve to 56.579%, resulting in an average power reduction of 6.64 KW, or 27.45% of the power required to open the valve at 100%.

- Pressure loss testing in various pipe sizes of compressed air systems

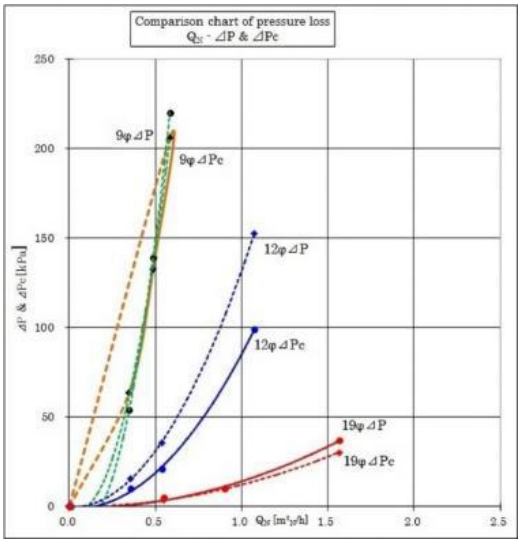

Figure 6: Summary of Pressure Loss Data in Various Pipe Sizes of Compressed Air System

A summary of the pressure loss test results in various pipe sizes of the air compressor system is shown in Figure 6. When considering the test result recording table and the obtained graph, it was found that when the pipe is small, the pressure loss in the pipe is more significant. At the same time, if the airflow rate is greater, the pressure in the pipe is more significant. Therefore, selecting the appropriate pipe size is another way to save energy. Usually, the pipe size is selected from the velocity of compressed air flowing in the pipe, which will be between 25 and 40 meters per second.

- Air leakage loss test of the compressed air system.

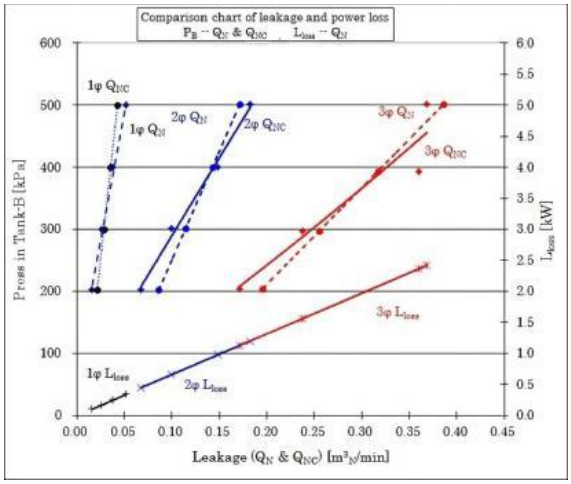

Figure 7: Data Showing Air Leakage Loss Test Results of the Compressed Air System

From the test results in Figure 7. The test of air leakage loss of the compressed air system, when considering the graph comparing the loss of different size holes with the lost electrical power to be a straight line.

Assessment Stage (A): In order to measure the success of the training program in this research, the trainees were required to return to their work on the energy use of air compressors project. They were instructed to use the PDCA (Xu, 2020) energy management planning principle to evaluate their performance, enabling them to plan, operate, inspect, and improve systematically. The following case study summarizes the operation steps.

- The planning process involves gathering data on electricity usage for product production.

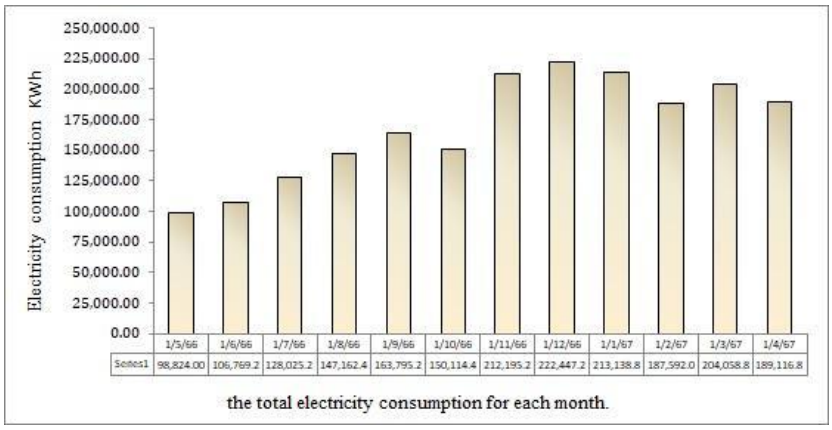

Figure 8: Graph Showing Electricity Consumption Data and Production Before Operation

Figure 8. It was found that the average electricity usage per month was 168,603.27 kilowatt hours., with 39,502 products produced. The average electricity usage trend per shot was 4.25 KWh. This data will be used for analysis to create a regression model equation to predict the amount of electricity usage appropriate for the production process. Then, another experiment was conducted to collect data according to the planned data under the regression equation that was compared with the data before and after the improvement of the project, along with a summary of the results of the operation.

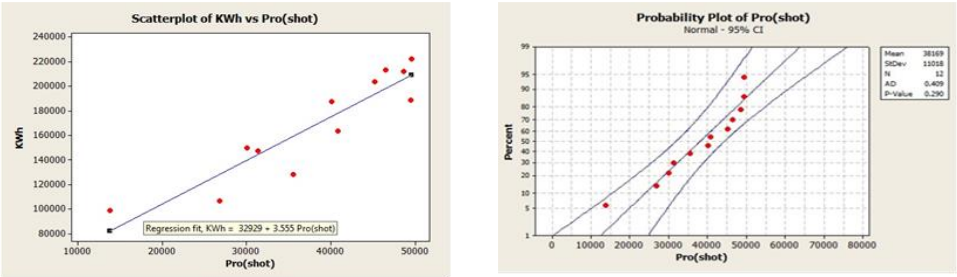

Figure 9: Scatter Plot Between Electrical Energy and Monthly Output

From the analysis of the prediction equation between electrical energy and monthly production, shown in Figure 9, it was found to be equal to KWh=3.55 Pro(shot)+32929, where R-Sq(adj)=82.9%, meaning that the production volume can predict the electrical energy consumption by 82.9%. The remaining 17.10% is influenced by other factors, with a P-value of 0.00. For the form of the normal probability plot of a residual graph.

- Methods for collecting data on air compressor systems from preliminary assessments.

Figure 10: Measurement of Usage Before the Improvement

Table 2: Data Obtained from the Measurements

Data obtained from preliminary measurements to calculate Free Air Delivery (FAD comp)	
Compressed air storage tank size V_{tank} (m^3)	12
Time taken to compress air into the tank from minimum to maximum pressure (sec)	153.04
Maximum test pressure (bar_g)	8.00
Minimum test pressure (bar_g)	7.00
Total size of pipe before distribution to use V_{pipe} (m^3)	0.97
Absolute atmospheric pressure, P_{atm} (bar)	1.013
Electrical power (KW)	39.98

- The results of the obtained data are analyzed to improve energy efficiency.

The calculation of free air delivery efficiency (FAD comp) (Mei et al., 2020) of an air compressor uses the following calculation equation:

$$FADcomp = \frac{(P_{2g}-P_{1g})(V_{Pipe}-V_{tank})}{(P_{atm})(t)} \quad (1)$$

Summary of the results from Table 2. The efficiency value (FAD comp) of the air compressor from the calculation of equation 1. is equal to 5.020 m3/min or 0.084 m3/sec.

Therefore, the specific energy consumption value when the machine is under load (KW on Load/FAD) is equal to 7.966 KW/m^3/min. When comparing the performance and efficiency and electrical energy in air compression according to the standard 1/sec/KW at a value of 0.45, it was found that the efficiency of the machine is equal to 94%.

- Analysis and calculation of energy leakage rate of a compressed air system.

Data from monitoring and data collection can be used to calculate the compressed air leakage rate of the system using Equation 2.

$$\mathrm{FAD_{leak}} = \left(\frac{\mathrm{t_{onload}}}{\mathrm{t_{onload}+t_{unload}}}\right)\mathrm{FAD_{comp}} \quad (2)$$

The results from the test were summarized and calculated according to the theory. When the compressor was working (onload) 171.30 sec, stopped working (unload) 193.60 sec, the efficiency (FAD comp) of the air compressor was 0.074 m^3/sec. The leakage of compressed air was found to be 0.035 m^3/sec, which is a leakage rate of 12.50% or the electric energy of the air compressor that was reduced by 24,336 KWh/year.

- Analysis and calculation of pressure reduction

Data from the monitoring and data collection can be used to calculate measures to reduce the pressure of the compressed air system using Equation 3.

$$\mathrm{KW_{th}} = 1.205\left[\mathrm{T_1} - \mathrm{T_{1adj}}\right]_1\left[\left(\frac{\mathrm{P_2}}{\mathrm{P_1}}\right)^{0.286} - 1\right](\mathrm{FAD})_{\mathrm{com}} \quad (3)$$

Summarize the results from the test and calculate according to the theory. When setting the operation of the air compressor, starting from reducing the level of the low value from the original 7 bar down to 6 bar and reducing the maximum value of 8 bar down to 7 bar, the absolute temperature value is 308 Kelvin and the efficiency value of the air compressor (FAD) comp is 0.091 m3/sec. The calculation will find that the electrical energy value before reducing the pressure is equal to 29.49 KW. After reducing the pressure, the electrical energy used will be equal to 27.39 KW, which is an energy reduction rate of 7.12%, or the electrical energy of the air compressor that is reduced will be equal to 15,120 KWh/year.

- Analysis and calculation of suction temperature of air compressor.

$$\Delta\mathrm{W_{isen}} = \frac{ik\mathrm{R_w}\mathrm{T_1}-\mathrm{T_2}}{k-1}\left[\left(\frac{\mathrm{P_2}}{\mathrm{P_1}}\right)^{\left(\frac{k-1}{i*k}\right)} - 1\right] \quad (4)$$

$$\mathrm{KW} = \Delta\mathrm{W_{isen}} * \mathrm{Da_{(kJ/kg)}} * \mathrm{FAD_{(l/sec)}} * \%\mathrm{L_{DU}} \quad (5)$$

where,

D_a = Densities of Air, 1.225×10^{-3} kg/liter
L_{DU} = Fraction of Onload status
i = Stage Compressor
K = Isentropic of Air Constant
R_w = Gas Contant at T_1
T_1 = Air inlet Temperature Before Improving
T_2 = Air inlet Temperature After Improving

Summarize the results from the test and calculate from equation 4,5. When reducing the working temperature of the air compressor from the original 40 degrees Celsius and adjusting to reduce the air intake to 35 degrees Celsius, the low-pressure value is 7 bar and the highest value is 8 bar, and the efficiency of the air compressor (FAD) is 0.091 m^3/sec. It can be seen that the electrical energy value before reducing the pressure is equal to 29.49 KW. After adjusting to reduce the suction temperature into the air compressor by 5 degrees Celsius, the electrical energy used will be equal to 28.63 KW, which is an energy reduction rate of 2.91% or the electrical energy of the air compressor that is reduced equal to 6,192 KWh /year.

- Summary of operating results

This assessment of the project trainers was done by collecting data on compressed air systems to determine the performance and efficiency of the air compressors. Three measures were implemented, and it was found that the total electrical energy usage could be reduced by 45,648 KWh/year. When comparing with the data before the implementation of the preliminary data for 12 months, it was found that the electrical energy cost was reduced by 2.25%, with the average electrical energy usage trend per product value being 4.17 KWh/shot.

Research Results

In summary, The IOC (Index of Item-Objective Congruence) evaluation results are based on the 5-level evaluation principle of Lickel (Guo et al.,2023) of the air compressor training content, both in theory and practice, with 5 experts from higher education institutes and the Ministry of Energy as content experts. The criteria for considering the content consistency value are +1 means appropriate, -1 means inappropriate. The summary of the evaluation results of the consistency value is between 0.67 and 1.00, with values higher than 0.50 considered to pass all criteria, with an average value of 4.30 and a standard deviation of 0.55. The evaluation of the quality of satisfaction uses a 5-level evaluation scale: very satisfied, satisfied, moderately satisfied, slightly dissatisfied, and extremely dissatisfied. Overall, the experts evaluated the quality at a good level, with the evaluation results as shown in Table 3.

Table 3: Results of Evaluation of Air Compressor Training Content in Theory and Practice

Topics of theoretical training content	$\bar{X}$	**S.D.**	**Opinion Level**
Working principle of an air compressed system	4.50	0.65	Excellent
Air compressed system efficiency	4.62	0.51	Excellent
Safety of air compressor systems	4.23	0.52	**good**
System stability and reliability	4.30	0.47	**good**
Maintenance and care of air compressor systems	4.12	0.58	**good**
Environmental impacts	3.98	0.56	**good**
Responding to user needs	4.30	0.45	**good**
Average	**4.29**	**0.53**	**good**
Training content topics in practical section	$\bar{X}$	**S.D.**	**Opinion Level**
Study of air compressed systems and components	4.40	0.43	**good**
Pre-testing system check	4.42	0.57	**good**
Setting parameters for testing	4.51	0.52	Excellent
Performance testing	4.53	0.62	Excellent
Air compressor safety testing	3.95	0.63	**good**
Continuous operation and durability testing	3.92	0.66	**good**
Recording test results and analyzing test summaries	4.43	0.55	**good**
Average	**4.31**	**0.57**	**good**
Average Total	4.30	0.55	good

Results of the evaluation of learners' satisfaction with the developed learning model. The results of the evaluation of learners' satisfaction with the teaching management using the developed DAPOA process-based learning model revealed that the trainees were overall satisfied at a satisfactory level (mean 4.13 and S.D. 0.23). They agreed that the developed learning model focused on learners, promoted diverse learning activities, and clearly integrated many disciplines. In addition, the designed learning media and activities could develop learners to learn by themselves, leading to practical application in the air compressor system. The results of the research are shown in Table 4.

Table 4: Results of the Evaluation of Participants' Satisfaction in Learning Using the DAPOA Process as a Base

Evaluation list	$\bar{X}$	**S.D.**	**Quality level**
DAPOA Model Learning Model.	**3.93**	**0.27**	Satisfied
1. learning format supports the teaching curriculum.	3.87	0.35	Satisfied
2. learning process that focuses on developing the trainees.	4.30	0.41	Very Satisfied
3. Learning processes that are related and continuous.	4.15	0.46	Satisfied
4. Teaching and learning activities are appropriate and sufficient.	3.93	0.88	Satisfied
5. learning format promotes learning appropriately.	3.40	0.51	Satisfied
Teaching and learning activities are organized in a process-based manner.	**4.00**	**0.41**	Satisfied
1. Activities are consistent with the DAPOA Model learning model.	4.35	0.52	Very Satisfied
2. The specified activities can be performed at the specified time.	3.98	0.62	Satisfied
3. Learning activities are diverse and integrated.	4.23	0.52	Satisfied
4. The developed learning activities help the learners to learn by themselves.	3.85	0.56	Satisfied
5. Learners interact/work/do activities together.	3.60	0.51	Satisfied
Process-based teaching management	**4.12**	**0.30**	Satisfied
1. The duration of the event is appropriate.	4.18	0.50	Satisfied
2. Promotion of knowledge competence	3.78	0.51	Satisfied
3. Promotion of practical skills	4.35	0.51	Very Satisfied
4. Promotion of creative thinking skills	4.10	0.57	Satisfied
5. Can manage teaching and learning appropriately.	4.21	0.72	Very Satisfied
Measurement and Evaluation	**4.45**	**0.24**	Very Satisfied
1. Can assess both knowledge, abilities, and skills.	4.28	0.41	Very Satisfied
2. The measurement and evaluation methods are consistent with the learning model.	4.26	0.57	Very Satisfied
3.You can use it to evaluate each step because it is multipurpose.	4.67	0.49	Very Satisfied
4. Evaluation criteria are clear and appropriate.	4.58	0.50	Very Satisfied
5.The measurement method can be used to collect learning data according to the actual training content.	4.56	0.51	Very Satisfied
Overall satisfaction in all aspects.	**4.13**	**0.23**	Satisfied

Efficiency analysis results of the DAPOA process-based training model The evaluation of the effectiveness of the developed learning model used in the compressed air training during the training in the created laboratory and after the training of the project in the workplace of the trainees found that the average value of the process (E1) was 80.45 percent, and after the training of the project in the workplace, the average value of the outcome (E2) was 83.95 percent, which is consistent with and meets the specified standard criteria of 80/80. The results of the research are shown in Table 5.

Table 5: Results of Analysis of the Effectiveness of Training Using a Process-Based Model

Knowledge and skill tests	Score obtained		Average Percentage	Efficiency of learning models
	Full score	Average score		
Laboratory training (Process or E1)	100	80.45	80.45	80.45 / 83.95
Project training in the workplace (Result or E2)	100	83.95	83.95	

Conclusion

The design of the training program on air compressor system learning for engineers working in industrial plants using the developed DAPOA process-based learning model, which consists of 5 steps: 1. Determination 2. Analysis 3. Planning and Design 4. Operation and 5. Assessment found that the learning model emphasizes the participants learning and creating quality knowledge by themselves that can be used to manage the use of air compressors for higher efficiency appropriately. When tested with a sample group of trainees, it was found that the training program method, including knowledge in the content after the practical training, showed that the learning achievement increased, especially in the operation and development of the air compressor system. From the follow-up of the work performance after learning according to the process-based learning model, it was found that the trainees were very satisfied with the training program because they could use their knowledge and work skills to improve the efficiency of the air compressor.

Acknowledgements

I would like to express my deepest gratitude to the Electrical Education Program, Faculty of Industrial Education and Technology, for their valuable advice and encouragement throughout this research. I would also like to thank King Mongkut's University of Technology Thonburi (KMUTT) for their support and participation. I would like to express my special thanks to my colleagues for their useful suggestions and to my family and friends for their unwavering support. Your joint efforts made this work possible, and I am deeply grateful.

Abstract
ChatGPT has become a popular tool because of the ease it offers to obtain a variety of information. However, the decision of users such as students to use ChatGPT in the world of education and increase interest in learning can be influenced by several factors. In this research, researchers want to test variables in the Unified Theory of Acceptance and Use of Technology research model which consists of Performance Expectancy (UTAUT), Effort Expectancy, Social Influence, Facilitating Conditions, Behavioral Intention, and Decision to Use ChatGPT with the aim of determining variables which is a positive influencing factor that supports students to use ChatGPT in education which increases interest in learning. This research was carried out by distributing an online questionnaire in the form of a Google form containing 30 questions with each research variable having 5 indicators which received 322 respondents. The data obtained were analyzed using Smart PLS 3 and the research results found that the use of ChatGPT by students in education to increase interest in learning was most influenced by the Facilitating Conditions variable, but the Performance Expectancy variable was an insignificant variable in influencing students to use ChatGPT in education and increase interest in learning. To help understand the interactions between the variables being tested and find out the factors that influence students to use ChatGPT in education and increase interest in learning, further research is needed that is more in-depth and uses a larger number of respondents to get accurate results.

Introduction

The development of technology has become a means to simplify human life. Lately, there has been a lot of discussion about AI-based chatbot technology because it can facilitate individuals, especially in seeking specific insights. One of the most popular AI-based chatbots is ChatGPT, an acronym for Generated Pre-trained Transformer, discovered and developed by OpenAI. (Kartono et al., 2021). The reason this technology is widely discussed is due to its ease in helping find information. There is a statement suggesting that ChatGPT might surpass Google's search engine in one or two years (Ahuja et al., 2021). ChatGPT can answer user queries in human language, eliminating the need for users to search for keywords. With this convenience, it's not surprising that ChatGPT is widely used in various fields of life, including education. The utilization of ChatGPT in education has its strengths and weaknesses. While ChatGPT can assist learners in finding answers and getting online advice, the data may not be accurate (Li et al., 2020). The existence of these pros and cons underscores the importance of employing the right strategies for ChatGPT in education. Educators and students must understand the limitations of this technology when using it as a tool to provide guidance and insights. It is also essential to validate and scrutinize all information provided. Educators should help students develop critical and analytical thinking skills with ChatGPT so that they can distinguish between right and wrong information. The role of educators in assisting students in using ChatGPT requires an understanding of how ChatGPT operates, ensuring that its usage enhances the learning experience (Cho et al., 2019).

In the digital era where almost every aspect of life has been modernized, education also indicates the need for awareness in utilizing technology for positive impacts on life, to align the fundamental direction of technology development that positively facilitates human life. This can be applied in education with the use of ChatGPT. The presence of ChatGPT, which facilitates its users, including students, in searching for specific information and answers, does not automatically make ChatGPT a tool resulting from technological development that has a positive impact. The existence of drawbacks such as the lack of data validation from ChatGPT requires users to double-check the data generated by using ChatGPT (Madyatmadja et al., 2020).

A. Research Problem

Certainly, the process of data validation assurance can influence the use of ChatGPT, such as its impact on students' learning interests. The possibility exists that the development of ChatGPT could enhance the learning experience, potentially increasing students' interest in learning. However, due to the mentioned drawbacks, ChatGPT may not be sufficiently capable of boosting this interest. In line with this specific research aiming to test ChatGPT in education associated with students' learning interests, the following are the problem formulations in this study:

A. Does Performance Expectancy have a positive effect on Behavioral Intention in the use of ChatGPT regarding student learning interests?
B. Does Effort Expectancy have a positive effect on Behavioral Intention in the use of ChatGPT regarding student learning interests?
C. Does Social Influence have a positive effect on Behavioral Intention in the use of ChatGPT regarding student learning interests?
D. Does Facilitating Conditions have a positive effect on Decision to Use in the use of ChatGPT regarding student learning interests?

E. Does Behavioral Intention have a positive effect on Behavioral Intention to Decision to Use in the use of ChatGPT regarding student learning interests?

B. Research Objectives

The objective of this research is to examine the impact of using ChatGPT in education, specifically on students' learning interest, while testing the following aspects:

A. To understand the impact of Performance Expectancy on Behavioral Intention in the use of ChatGPT regarding students' learning interests.
B. To understand the impact of Effort Expectancy on Behavioral Intention in the use of ChatGPT regarding student learning interests.
C. To understand the impact of Social Influence on Behavioral Intention in the use of ChatGPT regarding student learning interests.
D. To understand the impact of Facilitating Conditions on Decision to Use in the use of ChatGPT regarding student learning interests.
E. To understand the impact of Behavioral Intention on Behavioral Intention Decision to Use in the use of ChatGPT regarding student learning interests.

Background Study

A. Friendship With ChatGPT: A Transformation in Education

ChatGPT is a tool that plays a significant or beneficial role in the field of education. ChatGPT has the potential to assist individuals in the educational realm by personalizing learning development, making it easier by providing specific assessments, feedback, and accuracy that aid in alleviating cognitive load. However, it also has drawbacks and challenges related to plagiarism, which poses a threat to the integrity of education (Gavilan et al., 2020).

B. The Use of ChatGPT in the World of Education for Students

ChatGPT, based on Artificial Intelligence (AI) and developed by OpenAI, is now widely accepted in various fields, including education. Students can learn about ideas and theories using this technology while generating content with ChatGPT (Tandon et al., 2021). ChatGPT provides highly useful benefits in the field of education, particularly in delivering more personalized learning experiences, offering broad and affordable accessibility, providing highly interactive learning resources, and assisting in problem-solving tasks.

C. UTAUT (Unified Theory of Acceptance and Use of Technology)

The Unified Theory of Acceptance and Use of Technology (UTAUT) is one model that aims to understand and examine user behavior toward the use of information technology (Prasetyo, Y. T., 2021). Within UTAUT, there are four core determinants: performance expectancy, effort expectancy, social influence, and facilitating conditions.

D. Performance Expectancy

Performance Expectancy is a measure of an individual's belief in the ability of an information system technology to enhance job performance (He et al., 2018). Based on this explanation, Performance Expectancy is related to users' expectations regarding the use of information system technology, such as AI ChatGPT, to enhance students learning interests.

E. Effort Expectancy

Effort Expectancy is a measure that gauges the level of effort or exertion from users regarding the use of a system or technology. Within this measure, there are two dimensions: complexity and ease of use. Complexity measures the user's perceived level of difficulty in using the technology, while ease of use measures the user's perception of how easy it is to use the technology (Prasetyo, 2021). Effort Expectancy is broadly related to the complexity and ease of use of information system technology, such as AI ChatGPT, in enhancing student learning interests.

F. Social Influence

Social Influence is a measure that assesses the extent to which a user or an individual can influence others to believe and be confident in using a technology, such as AI ChatGPT. Within this measure, there are two dimensions: social factor and subjective norm. Social factor measures how much a person is influenced by others using the technology, while subjective norm is related to the importance and influence of significant others on the user's adoption of the technology (Prasetyo, 2021). In broad terms, Social Influence is about measuring how much an individual user can influence others to believe and trust in using information system technology, such as AI ChatGPT, to enhance students learning interests.

G. Facilitating Conditions

Facilitating Conditions is a measure that assesses the extent to which users believe that the resources and technical infrastructure available in the information system technology can support them in using that technology. Within this measure, there are three dimensions: resource, knowledge, and compatibility. The resource dimension helps identify external sources that can influence the use of the information system technology. The knowledge dimension assesses external sources of knowledge to use the information system technology. The compatibility dimension evaluates the alignment of the system with the technology used by the user (Prasetyo, 2021). In broad terms, Facilitating Conditions are about measuring how much users can trust and rely on the technical infrastructure and resources available in the technology. This, in turn, supports users in using information system technology, such as AI ChatGPT, to enhance students learning interests.

H. Behavioral Intention

Behavioral Intention is a measure that gauges the extent of a user's desire to continue using the technology continuously (Puspita, M. et al., 2020). There are two dimensions: intention and continuation. The intention dimension measures the user's level of willingness to continue using the information system technology, while the continuation dimension assesses how far the user plans to continue using the information system technology (Prasetyo, 2021). In broad terms, Behavioral Intention is a measure of how much users desire to continue using information system technology, such as AI ChatGPT, to consistently enhance students learning interests.

Research Method

This research employs a quantitative method that collects respondent data through an online questionnaire distributed and processed using SMART PLS. The study also utilizes various

previous research journals and articles as literature reviews and a Systematic Literature Review (SLR).

The research model used in this study is the Unified Theory of Acceptance and Use of Technology (UTAUT). UTAUT is one of the frequently used research models to explain or describe user acceptance of technology use. In this research, it tests an information system in the form of AI named ChatGPT. When using UTAUT as the research model, several modifications were made to the original model. Based on research conducted by Dwivedi et al. in 2019, it was mentioned that many studies only use the main concepts because researchers found that previous studies might not have used moderators since no differences were found in adoption and usage contexts (He, et al., 2018). The UTAUT model used in this study includes six main constructs: Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI), Facilitating Conditions (FC), Behavioral Intention (BI), and Decision to Use (DU). The following is the form of our research model:

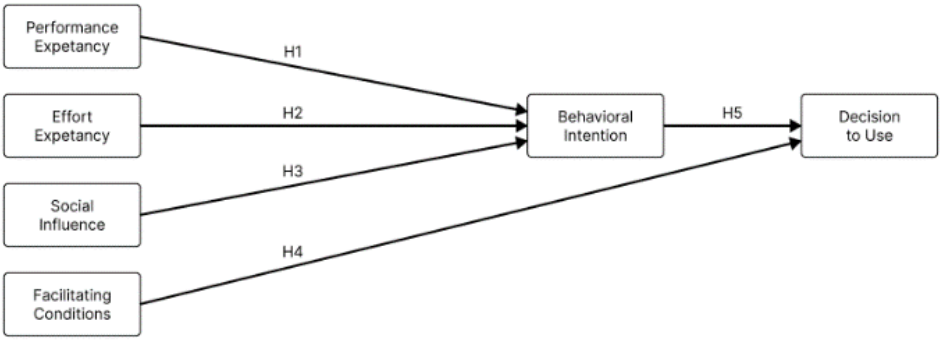

Figure 1: Research Model

A. Hypotheses

1) Performance Expectancy on Behavioral Intention in the use of ChatGPT regarding students' learning interests.

When an AI application of information system technology such as ChatGPT is able to provide a good user experience, it will be able to enhance behavioral intentions about the usefulness of such technology. In this case, behavioral intent refers to the student's desire to behave in a particular way, for the purpose of learning. Based on previous research, Perceived Usefulness Performance Expectancy has a similar relationship with the benefits of a technology. Both are related to the extent to which the use of AI-based information systems such as ChatGPT can help learning (Zhao et al., 2020). From the statement arose the argument that Performance Expectancy could have a positive influence on the Perception of Usability (Perceived Usefulness). To prove the hypothesis, here are the arguments to be tested in this study:

H1: Performance Expectancy positively influences the Behavioral Intention

2) Effort Expectancy on Behavioral Intention in the use of ChatGPT regarding students' learning interests.

The use of AI information system technology such as ChatGPT, should have a good performance and of course easy to access and use by the user, so that the user can directly feel the performance of the information system such as AI such as chatGPT. Based on

research by Menon and Shilpa (2023), if ChatGPT feels comfortable to use, it is likely that users will more often integrate it into their daily activities. This can result in increased use and gain further benefits from such technology (Afrilia, 2018). The argument in the study suggests that Effort Expectancy can have a positive influence on behavioral intentions (Behavioral Intention). To prove the argument, here are the hypotheses that will be tested in this study:

H2: Effort Expectancy positively influences the Behavioral Intention

3) Social Influence on Behavioral Intention in the use of ChatGPT regarding students' learning interests.

When the use of information system technology such as ChatGPT is easy to use by the user, then the technology can surely benefit the user. This can happen because users can explore and exploit it easily. The use of ChatGPT by a person can be influenced socially, especially by young people through social media, because a positive social influence is capable of encouraging a person to use ChatGTP (Lapalelo, 2022). So it can be said that Perceived Ease of Use can have a positive influence on the perception of usability (Perceived Usefulness). To prove the argument, here are the hypotheses that will be tested:

H3: Social Influence positively influences the Behavioral Intention

4) Facilitating Conditions on Decision to Use ChatGPT in the use of ChatGPT regarding students' learning interests.

According to Menon and Shilpa (2023) in the case of ChatGPT, the existence of facilitative conditions such as access to devices with a good Internet connection and adequate technical assistance will have a significant impact on acceptance by users (Afrilia, 2018). Based on this argument, it can be concluded that if access to facilities and technical assistance that a student has sufficient will encourage the intention to use ChatGPT in learning, but otherwise if access is insufficient facilities or technical assistance then it may be an obstacle for students to be able to consistently use the ChatGTP in learning. To prove the argument, here are the hypotheses that will be tested:

H4: Facilitating Conditions positively influences the Decision to Use ChatGPT

5) Behavioral Intention on Decision to Use ChatGPT in the use of ChatGPT regarding students' learning interests.

ChatGPT is a technological development in the field of AI that has many benefits for its users. It does not exclude the possibility of making ChatGPT a friend and more than just a tool to encourage the use of ChatGTP over a long period of time (Maretha et al., 2020). Through the statements of the previous research, the argument arises that the Behavioral Intention has an influence on the decision to use of ChatGPT. To prove the argument, here is the hypothesis tested:

H5: Behavioral Intention positively influences the Decision to Use ChatGPT

Results and Discussion

In our research on the impact of ChatGPT on education: increasing student learning interest, we used SmartPLS 3 to process data collected through online questionnaires. The results of the calculations for the relationship between variables that represent each hypothesis on this study in the research model used:

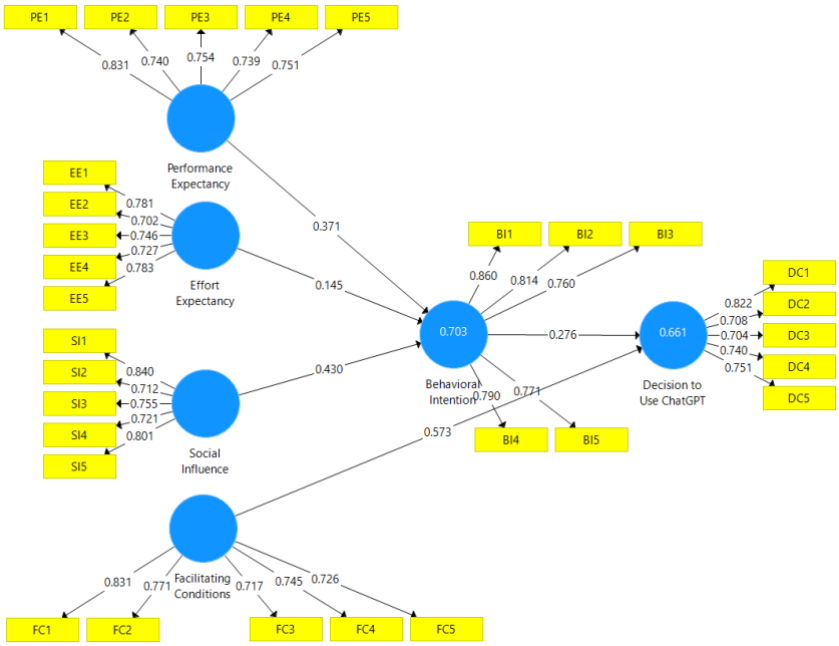

Figure 2: Calculation Result

A. Indicator and Construct Validity

In the process of validation of indicators and constructions, the method used is outer loading. Outer loading exceeding the value of 0.6 indicates that the indicator formed has a high significance and can effectively reflect the design in question. Conversely, if the outer loading value is below the minimum limit, the recommended step is to eliminate the indicator by deleting it. Here are the results of our research that reflects indicator and construct validity.

B. Reliability

To assess the validity of a structure and to measure its reliability, the method that can be used is the Average Variance Extracted (AVE). A structure is considered valid if its AVE value is equal to or greater than 0.50. Meanwhile, to assess the reliability of the structure in the study, it can be done by considering the Cronbach alpha value on each factor. A factor is considered to have good reliability if its Cronbach Alpha value exceeds 0.70 (Prasetyo et al., 2021).

Table 1: Reliability Scores

Variables	Cronbach's Alpha	AVE	Reliability
Performance Expectancy	0,822	0,583	Reliable
Effort Expectancy	0,803	0,560	Reliable
Social Influence	0,824	0,589	Reliable
Facilitating Conditions	0,816	0,576	Reliable
Behavioral Intention	0,859	0,640	Reliable
Decision to Use ChatGPT	0,800	0,557	Reliable

C. Path Coefficients

In path analysis, the calculation of a path coefficient involves the use of original sample data and a p value. A path model is considered significant if its p value is less than 0.05 (Prasetyo et al., 2021). This indicates that the probability of the result being found is due to coincidence less than 5%. The value of the initial sample reflects the extent to which the total variability in the dependent variable can be explained by the set of independent variables in the model.

Table 2: Path Coefficients

Hypotheses	Original Sample	Sample Mean	Standard Deviation	T Statistics	P-Value
BI>DC	0,276	0,279	0,076	3,655	0,000
EE>BI	0,145	0,138	0,100	1,457	0,145
FC>DC	0,573	0,571	0,078	7,387	0,000
PE>BI	0,371	0,375	0,095	3,905	0,000
SI>BI	0,430	0,435	0,077	5,593	0,000

D. Discussion

To evaluate whether a hypothesis can be accepted or rejected, the original sample data and p-values obtained from bootstrapping results need to be examined. This Hypothesis Testing is conducted with the assistance of the SmartPLS 3 application, and the results can be seen in the table showing path coefficients in the previous section.

1) Performance Expectancy positively influences the Behavioral Intention

It tests whether Performance Expectancy can have a positive effect on Behavioral Intention. Based on the test results, the Original Sample Data shows a value of 0.371 and P Values of 0.000. According to these results, it can be considered significant as it has P Values <0.05, so the fourth hypothesis is accepted. This proves that Performance Expectancy can have a positive effect on Behavioral Intention. According to the research findings, Performance Expectancy positively influences Behavioral Intention by 37.1%, related to the use of ChatGPT to enhance students' learning interest. The recommendation is to conduct further research related to the benefits and productivity derived from the use of ChatGPT for students, specifically concerning improving learning interest. Productivity and performance of ChatGPT can be influenced by various factors such as information sources affecting the quality of information provided by ChatGPT to students.

2) Effort Expectancy positively influences the Behavioral Intention

In the second hypothesis, it tests whether Effort Expectancy can have a positive effect on Behavioral Intention. The test results show that the Original Sample Data has a value of 0.145 and P Values of 0.145. These results are considered not significant as they have P Values >0.05, so the second hypothesis is rejected. This indicates that Effort Expectancy cannot have a positive effect on Behavioral Intention when related to increasing learning interest with the use of ChatGPT. The recommendation is to conduct further research on factors influencing Effort Expectancy not having a positive effect on Behavioral Intention, which can be done by changing the research target and adding supportive factors related to the positive influence of Effort Expectancy on Behavioral Intention, such as usage guidelines.

3) Social Influences positively influences the Behavioral Intention

In the third hypothesis, it tests whether Social Influence can have a positive effect on Behavioral Intention. The test results show that the Original Sample Data has a value of 0.430 and P Values of 0.000. These results are considered significant as they have P Values <0.05, so the fifth hypothesis is accepted. This proves that Social Influence can have a positive effect on Behavioral Intention. According to the research findings, Social Influence positively influences Behavioral Intention by 43%, related to the use of ChatGPT to enhance students' learning interest. The recommendation is to conduct further research to identify supportive factors for Social Influence that can strengthen the positive influence on Behavioral Intention in the use of ChatGPT by students to enhance learning interest. Some supportive factors that can be considered include the type of social influence and social experience. The type of social influence relates to the source of influence obtained, and social experience is related to the actual use of ChatGPT, which can socially influence students to use ChatGPT and enhance their learning interest.

4) Facilitating Conditions positively influences the Decision to Use ChatGPT

In the fourth hypothesis, it tests whether Facilitating Conditions can have a positive effect on Decision to Use ChatGPT. The test results show that the Original Sample Data has a value of 0.573 and P Values of 0.000. These results are considered significant as they have P Values <0.05, so the third hypothesis is accepted. This proves that Facilitating Conditions can have a positive effect on Decision to Use ChatGPT. According to the research findings, Facilitating Conditions positively influence Decision to Use ChatGPT by 57.3%. The recommendation is to conduct further research focusing on the long-term use of ChatGPT, considering the ease of obtaining devices or technological facilities that can be used by users, especially students, in using ChatGPT to enhance students' learning interest in the long term.

5) Behavioral Intention positively influences the Decision to Use ChatGPT

In the fifth hypothesis, it tests whether Behavioral Intention can have a positive effect on Decision to Use ChatGPT. The test results show that the Original Sample Data has a value of 0.276 and P Values of 0.000. These results are considered significant as they have P Values <0.05, so the first hypothesis is accepted. This proves that Behavioral Intention can have a positive effect on Decision to Use ChatGPT, meaning that the more someone intends to use something in an activity such as learning with ChatGPT, the more it supports their decision to use it. Based on the hypothesis testing results, it can be concluded that Behavioral Intention positively influences Decision to Use ChatGPT by 27.6%, related to the use of ChatGPT to

enhance students' learning interest. The recommendation is to increase focus on identifying supportive factors for users, especially students, in using ChatGPT to enhance learning interest, such as psychological factors and the impact resulting from the use of ChatGPT in student learning.

Table 3: Hypothesis Testing Results

Hypotheses		Result	Explanation
H1	*Performance Expectancy positively influences the Behavioral Intention*	Original Samples = 0,371 P-Values = 0,000	Accepted
H2	*Effort Expectancy positively influences the Behavioral Intention*	Original Samples = 0,145 P-Values = 0,145	Rejected
H3	*Social Influence positively influences the Behavioral Intention*	Original Samples = 0,430 P-Values = 0,000	Accepted
H4	*Facilitating Conditions positively influences the Decision to Use ChatGPT*	Original Samples = 0,573 P-Values = 0,000	Accepted
H5	*Behavioral Intention positively influences the Decision to Use ChatGPT*	Original Samples = 0,276 P-Values = 0,000	Accepted

In addition to the recommendations that can be given above based on each hypothesis, there are also other recommendations when referring to the results of the test of hypotheses by taking the value of the original sample data with the highest value and the lowest value. The hypothesis that Facilitating Conditions may have a positive influence on Decision to Use ChatGPT is the hypotheses with the highest original sample value of 57.3%. This suggests that a statement that indicates that when a user is a student it is easy to get a device to use ChatGTP then it is the most influential positive factor in determining the use of chatGPT for learning and increasing interest in learning. This hypothesis could be the highest percentage because it could be influenced by the respondents answered by the majority of 19-20 years of age who are a generation of rapid technological developments, so respondents have a habit of using technology in everyday life that also supports the real use of such technology when using it because ChatGPT is part of the latest technological development that uses AI to make it easier for its users to obtain a variety of information simply by writing the questions they want to ask and ChatGTP can provide answers based on the source of information.

Meanwhile, there is a second hypothesis that the Effort Expectancy may have a positive influence on the Behavioral Intention becomes a rejected hypothesis. If linked with respondents to this study, it shows that the ease of using ChatGPT is not significant in supporting the use of ChatGTP in learning that enhances student learning interests. This may be because generally the generation between the ages of 19 and 20 is a Z gene that is still in the adolescent phase and may have a high level of curiosity and competitiveness so that it is more interested in using things that require a more complex process of understanding in their use so that they can adapt well.

Conclusions

In this study, six variables were used, consisting of Performance Expectancy (PE), Effort Expectance (EE), Social influence (SI), Facilitating Conditions (FC), Behavioral Intention (BI), and Decision to Use ChatGPT. (DC). A total of five hypotheses were tested using the SmartPLS 3 application to answer the research question with the following results.

First, to test whether Performance Expectancy can have a positive influence on Behavioral Intention. Based on the results, it was demonstrated that Performance Expected has an influence over Behavioral Intentions, so this hypothesis is acceptable. The result is because students who have a goal or a task feel that using ChatGPT will be more effective and help them in achieving the goal or completing the task.

Second, to test whether the Effort Expectancy can have a positive effect on the Behavioral Intention. The result is because students feel that their efforts in using ChatGPT are not in line with their expectations, in which case they may not want to use ChatGPT and switch to other software like ChatGPT.

Third, test whether Social Influences can have a positive effect on Behavioral Intention. Based on the results, it is shown that social influences can positively influence behavioral intention, so this hypothesis is acceptable. The result is because students gain a strong influence from several things, such as the influence of friends, social media influence, and the student's personal experience in using ChatGPT.

Fourth, to test whether Facilitating Conditions can have a positive impact on Decision to Use ChatGPT. Based on the results, it has been demonstrated that facilitating conditions can positively influence the decision to use ChatGPT, so this hypothesis is acceptable.

Fifth, testing whether Behavioral Intention can have a positive influence on the Decision to Use ChatGPT. Based on the results, it has been shown that Behavioral Intentions have an influence over the decision to use ChatGPT, so this hypothesis is acceptable. The result is because students who are willing and accustomed to using ChatGPT in education encourage the use of ChatGPT in the world of education and increase interest in learning.

Challenges of Language Learning in a Multicultural Context: International Students Learning BIPA (Bahasa Indonesia bagi Penutur Asing) in University Level

Aldian Idris Febrianto, Universitas Negeri Yogyakarta, Indonesia
Joko Priyana, Universitas Negeri Yogyakarta, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study examined the challenges international university students faced learning Bahasa Indonesia bagi Penutur Asing (BIPA) or in English Indonesian for Foreign Speakers. The researcher examined the challenges these students faced from diverse linguistic, cultural, and educational backgrounds. This research used a mixed-methods approach, incorporating quantitative survey data and qualitative interviews to understand these problems. The research sample was 30 international students studying at Universitas Negeri Yogyakarta. Purposive sampling was employed for the questionnaire, which was based on the Likert scale, and random sampling was used for the interviews. The data analysis techniques utilized include thematic analysis to extract meaningful patterns from the collected data. A significant issue identified was the language barrier. The grammar and vocabulary of Bahasa Indonesia differed from the students' native languages, causing them to struggle. Pronunciation and intonation further hindered communication. Additionally, understanding cultural nuances required cultural sensitivity. The students' diverse educational backgrounds affected their preparedness and familiarity with Indonesian university teaching, slowing their learning and comprehension. The findings of the study revealed that teachers need to adapt their methods in multicultural classrooms. Institutions also should provide language labs and cultural orientation programs to help international students overcome these challenges. Additionally, researchers recommend improving teacher training to meet the needs of diverse students. The research informs these proposed solutions by highlighting specific difficulties faced by students, such as linguistic and cultural misunderstandings.

Keywords: BIPA Challenges, Linguistic Barriers, Multicultural

Introduction

The significance of acquiring competence in Bahasa Indonesia bagi Penutur Asing (BIPA) has greatly increased in recent years as a result of the rising worldwide demand for Indonesian language skills. As Indonesia enhances its economic, political, and cultural connections with nations globally, the ability to speak Bahasa Indonesia has become a key asset for both overseas students and professionals (Novera, 2004; Fachri & Saragih, 2020). Universitas Negeri Yogyakarta, a prominent educational institution in Indonesia, has created specialized programs to meet the needs of individuals who are not a native speakers of Indonesian. These programs seek to provide students with the essential language skills required especially necessary to learn in Indonesia educationally and in culture successfully.

The BIPA program at Universitas Negeri Yogyakarta is specifically tailored to cater to the distinct requirements of foreign students, who originate from a wide range of language, cultural, and educational backgrounds. These disparities might have a substantial impact on their learning experiences and results, presenting distinct obstacles that must be comprehended and resolved to guarantee efficient language acquisition. Prior studies have shown that overseas students often encounter several challenges, such as language hurdles, cultural adaptation, and divergent educational expectations. These impediments may impede their academic advancement and overall welfare (Li et al., 2010; Sawir, 2005).

Gaining a comprehensive understanding of the difficulties encountered by these students is essential for devising efficient pedagogical approaches and support systems. Although language limitations are a notable factor, cultural adaptations also have a crucial impact. Students often have difficulties in assimilating to the social and cultural conventions of a foreign nation, which might impede their capacity to actively participate in the educational process. Moreover, the educational systems and teaching techniques in their respective home countries may exhibit substantial differences compared to those in Indonesia, resulting in additional challenges when it comes to adjusting to new academic standards and approaches (Nurhayati, 2018; Sawir, 2005).

This study employs a mixed-methods approach to get a thorough knowledge of these problems. This research seeks to provide a comprehensive perspective on the challenges encountered by foreign students in the BIPA program by integrating quantitative survey data with qualitative interviews. Quantitative data provides a comprehensive understanding of general difficulties, but qualitative interviews explore individual experiences and viewpoints in more detail, offering valuable contextual insights (Creswell & Plano Clark, 2011).

The linguistic difficulties faced by overseas students studying Bahasa Indonesia are often the most immediate and conspicuous hurdles. These issues include obstacles in articulation, syntax, and lexicon assimilation, which may hinder effective communication and understanding. For example, students from diverse linguistic backgrounds may find Bahasa Indonesia's phonetic system strange, which might result in pronunciation problems that may impact their confidence and desire to engage in speaking activities. Furthermore, the distinctive grammatical framework of Bahasa Indonesia, in contrast to several other languages, might provide supplementary difficulties for individuals acquiring the language (Novera, 2004; Putri & Wahyuni, 2019).

Cultural adaptations are another crucial aspect of concern. International students are required to manage both the academic setting and the wider social and cultural context of Indonesia.

The process of adjustment may be intricate and multidimensional, including the comprehension and adaptation to new social norms, beliefs, and behaviours. The cultural aspect of language acquisition is crucial since it shapes pupils' perception and interaction with their unfamiliar surroundings. Instances of cultural misconceptions or a lack of cultural awareness may result in individuals experiencing emotions of isolation and frustration, which can in turn make the learning process more complex (Sawir, 2005; Setiyawan, 2021).

The experiences of overseas students are significantly influenced by educational expectations and practices. The teaching methodologies and dynamics inside Indonesian institutions may vary in comparison to those in the students' countries of origin. For instance, the focus on repetitive learning and memorisation in some educational systems differs from the interactive and engaging teaching approaches often used in Indonesian classrooms. Students who are used to alternative learning and evaluation methods may find this adjustment difficult, since they will need to adjust to new academic standards and expectations (Li et al., 2010).

Moreover, the support systems provided to foreign students play a vital role in supporting their adaptation and educational progress. Universities must ensure that they provide sufficient resources and support services to assist students in overcoming language, cultural, and educational obstacles. Support methods such as language tutoring, cultural orientation programs, and academic advising may significantly contribute to students' academic success. Gaining insight into the efficacy of these support services and pinpointing areas that may be enhanced are crucial for improving the entire student experience (Sawir, 2005; Utami, 2022).

Research Questions

What are the primary challenges faced by foreign students in the BIPA program at Universitas Negeri Yogyakarta, and how can tailored pedagogical approaches and support systems be developed to enhance their language acquisition and cultural adaptation?

Research Objectives

This study aims to address the gap in current literature by thoroughly examining the challenges faced by foreign students in the BIPA (Bahasa Indonesia untuk Penutur Asing) program at Universitas Negeri Yogyakarta. Utilizing a mixed-methods approach, combining qualitative and quantitative research, this study seeks to analyze the multifaceted obstacles foreign students encounter, such as language barriers, cultural adaptation issues, and academic integration. By incorporating up-to-date insights from recent research on language acquisition and intercultural learning, this study will also consider the broader socio-cultural dynamics influencing students' learning experiences. According to the latest studies by Jones & Smith (2022), effective language instruction for non-native speakers requires not only pedagogical adjustments but also the establishment of strong support systems for cultural acclimatization. This research will offer valuable recommendations to enhance both academic performance and the overall well-being of international students. The outcomes of this study will contribute to the development of improved instructional strategies, more effective language support frameworks, and comprehensive welfare systems for non-native speakers, thereby fostering a more inclusive and supportive learning environment. Ultimately, the findings will help shape educational policies that better cater to the diverse needs of international students in Indonesia.

Literature Review

In this section, the authors conducted a comprehensive evaluation of the literature pertaining to intercultural learning.

Multicultural Learning

emerged as a crucial approach to address the diverse needs of students from varying racial, socioeconomic, gender, linguistic, cultural, and ideological backgrounds within the educational sphere (Banks, 2019). It seeks to create an inclusive environment that respects and values the contributions of different cultures to enrich the learning experience for all students. According to Gay (2018), multiculturalism serves as a valuable resource that enhances students' knowledge and understanding of other cultures, thereby promoting empathy and global awareness. These educational programs offer opportunities for learners from all cultural backgrounds to interact and cultivate positive attitudes towards cultural diversity (Nieto & Bode, 2018). They aim to equip students with the necessary skills to thrive in an increasingly pluralistic society. Linguistic diversity plays a significant role in this context, as individuals often utilize their own dialects to express their identity and maintain cultural heritage (García & Wei, 2014). Recognizing and valuing linguistic variety among ethnic groups can foster a more inclusive and supportive educational environment.

Promoting Cultural Diversity

Thought for 43 seconds Promoting Cultural Diversity A fundamental goal of multicultural education is to acknowledge and promote cultural diversity. According to Banks (2019), multicultural education seeks to transform educational institutions so that all students have equal opportunities to learn, regardless of their cultural backgrounds. Nieto and Bode (2018) emphasize that multicultural education provides a platform for students from diverse cultures to actively engage and develop positive attitudes towards cultural diversity. This involvement is crucial in constructing a community that respects and honors cultural differences. Gay (2018) highlights the significance of culturally responsive teaching in promoting cultural diversity. She argues that incorporating students' cultural experiences into teaching practices enhances learning and fosters an inclusive classroom environment. By acknowledging and utilizing the cultural assets that students bring, educators can promote mutual respect and understanding among students from different backgrounds. Furthermore, Ladson-Billings (2021) reiterates the importance of culturally relevant pedagogy in addressing the educational needs of diverse learners. She contends that educators must recognize and utilize students' cultural strengths as assets in the learning process. This approach not only supports academic success but also affirms students' cultural identities. Moreover, international organizations emphasize the importance of promoting cultural diversity in education. The UNESCO (2020) Global Education Monitoring Report highlights that embracing cultural diversity in educational settings is vital for achieving inclusive and equitable quality education for all. Therefore, integrating multicultural education and culturally responsive teaching practices is essential in fostering a community that esteems and honors cultural disparities. By drawing on the latest insights from experts and international educational bodies, educators can create inclusive learning environments that prepare students to thrive in a diverse and interconnected world.

Enhancing Linguistic Diversity

Linguistic variety has a crucial role in the context of multicultural education. Cummins (2021) emphasises that acknowledging and appreciating students' mother tongues and regional speech patterns in the educational setting might enhance their self-confidence and scholastic achievements. By integrating students' language origins into the curriculum, educators may create a learning atmosphere that is more inclusive and supportive.

Research Methodology

This research employed a mixed-methods approach to investigate the difficulties encountered by foreign university students in studying Bahasa Indonesia bagi Penutur Asing (BIPA). A mixed-methods approach integrates quantitative and qualitative methods to provide a comprehensive understanding of the research problem (Creswell et al., 2018). The quantitative component involved a survey administered to 30 international students enrolled in the BIPA program at Universitas Negeri Yogyakarta. This sample size was deemed appropriate for the exploratory nature of the study and is consistent with recommendations for minimum sample sizes in preliminary research (Marshall et al., 2013). Purposive sampling was used to select survey participants, ensuring that only students with relevant experience in the BIPA program were included. Purposive sampling allows researchers to focus on participants who can provide rich and relevant information (Etikan et al., 2016). For the qualitative component, semi-structured interviews were conducted with a subset of participants selected through maximum variation sampling. This strategy ensured a diverse representation of students' backgrounds and experiences, enhancing the depth and richness of the data collected (Patton, 2015). Maximum variation sampling is effective in capturing a wide range of perspectives, which strengthens the credibility and transferability of the qualitative findings (Palinkas et al., 2015).

Data Collection

Quantitative Data Collection

A structured questionnaire based on the Likert scale was designed to collect quantitative data. The questionnaire covered aspects such as linguistic difficulties (grammar, vocabulary, pronunciation, and intonation), cultural challenges, and educational background impacts.

Qualitative Data Collection

Semi-structured interviews were conducted to gather in-depth qualitative data. The interviews aimed to explore personal experiences, specific challenges, and coping strategies employed by the students.

Data Analysis

The data analysis for this study involves both quantitative and qualitative techniques to provide a comprehensive understanding of the challenges faced by international students learning Bahasa Indonesia bagi Penutur Asing (BIPA). Descriptive statistics were used to summarize the survey responses, including frequency distributions (e.g., strongly agree, agree, neutral, disagree, strongly disagree) and measures of central tendency (mean) and variability (standard deviation). Inferential statistics were applied to explore relationships

between specific linguistic challenges (e.g., grammar, vocabulary, pronunciation) and overall language learning difficulty. In addition, thematic analysis, including transcription and coding, was employed to identify recurring themes and patterns from the qualitative data.

Results

Quantitative Analysis

Generally the study found the mean score for “Importance of Cultural Understanding is the highest with 4.23 suggests that students overwhelmingly agree that understanding Indonesian culture is important for effective communication followed by "Grammar significantly different from native language" & “Pronunciation challenges are 3.8, indicating moderate agreement that Indonesian grammar differs from students' native languages and pronunciation is perceived as moderately challenging comparing to students’ natives languages. Table 1 shows the mean score of the five constructs for all respondents of study.

Table 1: Mean Score for All Constructs

	Constructs	Mean Score	Standard Deviation
1	Grammar Differences	3.8	1.1
2	Pronunciation Challenges	3.8	1.1
3	Cultural Challenges	3.4	1.2
4	Grammar vs Vocabulary Difficulty	3.6	1.1
5	Importance of Cultural Understanding	4.2	0.9

Table 2: t-Test Results for 5 Constructs

	Constructs	T-Statistic	P-Value
1	Grammar Differences	3.89	0.0
2	Pronunciation Challenges	4.0	0.0
3	Cultural Challenges	1.75	0.09
4	Grammar vs Vocabulary Difficulty	2.98	0.01
5	Importance of Cultural Understanding	7.87	0.0

Findings

The quantitative analysis underscores several statistically significant constructs, with grammar and pronunciation being the most prominent challenges. The mean scores for "Grammar Differences" and "Pronunciation Challenges" (3.8) reflect a moderate consensus among students that these aspects pose considerable difficulty. The T-test results further affirm this, showing statistical significance for both constructs (p-value=0.0), indicating that the observed differences are not random but are widespread issues across the student cohort.

Moreover, the construct "Importance of Cultural Understanding" has the highest mean score (4.2), highlighting a strong agreement that cultural understanding plays a pivotal role in

effective communication. However, "Cultural Challenges" (mean score of 3.4) was not statistically significant (p-value=0.09), suggesting variability in students' experiences regarding cultural barriers in language learning. While this might imply that some students adapt more easily to cultural nuances, others may find them less relevant or challenging in their learning process.

Qualitative Analysis

Interviews were transcribed literally and analysed using directed Qualitative Content Analysis to describe emerging themes in a systematic way (Mayring, 2000, 2015; Schreier, 2014). The qualitative data, gathered from students' personal experiences, offers a rich, contextualized understanding of the quantitative findings. For instance, while the statistical significance of grammar challenges is evident in the quantitative results, the qualitative feedback provides a nuanced view of how these challenges manifest. Students like P1, who highlighted difficulties with formal grammatical structures, found that constant review and repetitive practice were necessary coping strategies. This reflects a deeper, often frustrating, engagement with grammar that goes beyond mere recognition of its difficulty, pointing to a persistent struggle that requires time and focused effort to overcome.

Similarly, pronunciation challenges, which the quantitative data identifies as significant, are qualitatively illustrated by students like P2, who noted that certain sounds in Indonesian do not exist in her native language (Urdu). The use of specific coping strategies such as flashcards and language apps adds depth to the statistical observation, showing not only the nature of the difficulty but also how students adapt their learning methods to address these phonetic barriers.

When it comes to cultural adaptation, the qualitative data introduces important insights that the quantitative analysis does not fully capture. While the quantitative results indicate variability in students' perceptions of cultural challenges, the qualitative themes reveal that cultural adaptation is an individualized process. P3's experience with "jam karet" (a term reflecting flexible time management in Indonesian culture) and P2's difficulty grasping the indirect communication style showcase that cultural challenges are not uniformly experienced. For some, these challenges require active engagement, such as consuming local media (Indonesian literature or comedy) to better understand social norms and behaviors.

The interviews reveal that grammar is one of the most significant challenges students face, particularly in mastering formal grammatical structures and the use of affixes. P1 shared their frustration with this aspect, stating:

> Indonesian grammar is quite different from my own language. I often struggle with prefixes and suffixes, especially in formal writing. It takes a lot of effort and time to get used to them.

This sentiment highlights not only the inherent complexity of Indonesian grammar but also the mental and emotional toll it takes on learners. P1 copes with this challenge by dedicating extra time to reviewing grammar rules and practicing them in exercises. Their approach of repetitive learning underscores the need for constant exposure and engagement with grammar, indicating that students must go beyond simply learning the rules to truly internalize them through practical application.

Pronunciation

Pronunciation is another area where students experience significant difficulty, especially when dealing with sounds that do not exist in their native languages. P2 described their struggle with pronunciation, stating:

> The hardest part for me is pronouncing sounds that aren't in my native language, like certain vowels. It's really frustrating because I know what I want to say, but it just doesn't come out right.

To cope with these challenges, P2 turned to using flashcards and language apps, tools that helped them to familiarize themselves with the sounds and practice them in context. This coping strategy reflects the importance of technology-assisted learning in overcoming phonetic barriers, particularly for students who encounter unfamiliar sounds that require focused, repetitive practice to master.

Vocabulary challenges, particularly when it comes to idiomatic expressions and slang, are a recurring theme in the interviews. P3 emphasized the difficulty of learning vocabulary that does not have direct equivalents in their native language, sharing:

> What makes learning Indonesian hard is the idiomatic expressions and slang. They don't translate easily, and I often don't understand what people mean when they use them.

To address this, P3 turned to Indonesian literature and conversations with locals to improve their understanding of these expressions. By actively seeking out examples of idiomatic language in real-world contexts, they were able to expand their vocabulary and grasp the deeper cultural meanings behind certain phrases. This suggests that students need more exposure to authentic language use, as relying solely on formal instruction may not adequately prepare them for the colloquial nuances of everyday communication.

Cultural differences play a significant role in students' experiences of learning Indonesian. For some, like P3, adapting to cultural norms such as "jam karet" (flexible time management) posed a real challenge. They explained:

> At first, I found it really confusing when people said they would arrive at a certain time but then showed up late. It took a while to adjust to the idea that time is more flexible here.

This cultural adaptation required them to recalibrate their expectations and understanding of social norms. P3's experience demonstrates how cultural factors can complicate language learning, as students must not only learn the language but also adjust to the cultural practices that shape communication. Similarly, P1 found the use of formal titles challenging, commenting:

> I wasn't used to the formality in addressing people. I had to learn how to use the right titles in different contexts, which was sometimes confusing.

P1 dealt with this challenge by observing local interactions and seeking clarification from instructors, emphasizing the importance of learning through immersion and social observation in navigating cultural differences.

Across the interviews, a variety of coping mechanisms emerged, demonstrating how students adapt to the challenges they face in learning Indonesian. For instance, P1's strategy of reviewing grammar rules and doing extra exercises reflects a methodical approach to overcoming grammatical difficulties, while P2's use of flashcards and language apps highlights the role of technology in addressing pronunciation challenges. P3's reliance on literature and conversations with locals to understand idiomatic expressions shows the value of immersing oneself in the target language's cultural context. These diverse strategies reveal that successful language learning requires not only cognitive effort but also a willingness to engage with the language in practical, everyday situations.

Conclusion

The integration of both quantitative and qualitative data reveals a comprehensive understanding of the challenges faced by students learning Indonesian as a second language. The quantitative results clearly highlight that the most significant obstacles include grammar and pronunciation, both of which are statistically significant with mean scores of 3.8. These findings are complemented by qualitative insights, where students detail their experiences and strategies in overcoming these challenges. For instance, while grammar is quantitatively shown to be a prominent difficulty, students like P1 emphasize the emotional and mental effort required to master complex grammatical structures, revealing the depth of their struggles through personal experiences.

Similarly, pronunciation difficulties identified quantitatively are brought to life through qualitative narratives, such as P2's frustration with sounds that do not exist in their native language. The use of flashcards and language apps as coping strategies shows how students apply technological tools to manage these challenges effectively. The cultural adaptation, which quantitatively shows variability (mean score of 3.4 and a non-significant p-value), is further unpacked in the qualitative analysis. Students like P3 and P2 describe how specific cultural norms, such as "jam karet" or the indirect communication style, add layers of complexity to their language learning. This suggests that while cultural challenges may not be universally perceived as difficult, those who do encounter them must engage deeply with the local culture to succeed. Overall, the combined data illustrates that learning Indonesian is not only a cognitive process but also requires emotional resilience, cultural adaptability, and the use of diverse coping mechanisms. By weaving together statistical trends with individual stories, the discussion captures the multifaceted nature of language acquisition.

Exploring the Effects of Automatic Speech Recognition Technology in EFL Students' Speaking Performance

Hui-Wen Liu, National Taipei University of Technology, Taiwan
Pei-Shan Tsai, National Taipei University of Technology, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study examined the impact of Automatic Speech Recognition (ASR) technology, specifically Sensay, on the speaking performance and anxiety levels of 110 non-English major students, including 86 males and 24 females. Using the Foreign Language Classroom Anxiety Scale (FLCAS), students were grouped into "low anxiety," "medium anxiety," and "high anxiety" clusters. The results showed that low anxiety students initially outperformed the other groups. Furthermore, ASR technology significantly improved fluency across all anxiety levels, highlighting its effectiveness in providing repetitive practice opportunities. Notably, high-anxiety students, particularly those with high levels of Test Anxiety (TA), Fear of Negative Evaluation (FNE), and Communication Apprehension (CA), experienced a reduction in their anxiety levels after using ASR technology. These findings suggest that ASR technology can help reduce anxiety, potentially enhancing performance. The study underscores the potential of ASR in EFL education as a tool for educators to reduce students' anxiety and improve their speaking performance. The study concludes with a discussion of pedagogical implications and recommendations for future research.

Keywords: English Speaking, Automatic Speech Recognition (ASR), Foreign Language Classroom Anxiety

Introduction

English, recognized as the global lingua franca, has become one of the most widely studied foreign languages (Walker, 2021). Its status as a universal medium for communication across varied linguistic and cultural backgrounds underscores the importance of mastering the four key language skills: listening, reading, speaking, and writing. Among these skills, speaking English is particularly valued as it enables immediate and effective communication (Akhter et al., 2020). However, English as a Foreign Language (EFL) learners often face significant challenges in acquiring proficient speaking abilities due to the language's complexity and dynamism. These challenges are further intensified by negative emotions such as nervousness, fear, and anxiety, which are frequently elicited by the daunting task of articulating thoughts and ideas in a non-native language. Such emotions can provoke physiological reactions, like trembling and sweating, indicative of stress, and pose a substantial barrier to language learning. Anxiety is strongly correlated with speaking performance (Fitri et al., 2021); however, Young (1990) highlighted the necessity of considering variables like language skills for a more comprehensive understanding of the relationship between anxiety and learning outcomes. Research has identified several contributors to EFL learners' speaking anxiety, including the fear of making grammatical or pronunciation errors, adverse past experiences, pressure from peers or teachers, and a lack of confidence (Nurilahi & Suhartono, 2022). Pronunciation, in particular, has been emphasized as vital for effective communication, with clear and understandable pronunciation greatly enhancing communication success. The causes of speaking anxiety are diverse, but a common factor among EFL learners is the reported lack of practice. Alnahidh & Altalhab (2020) observed that insufficient speaking practice leads to increased speaking anxiety, underscoring the need for more opportunities to engage in speaking activities within EFL learning environments.

Educators in the EFL field have continuously devoted efforts to instructional methodologies and interventions aimed at alleviating speaking anxiety and enhancing spoken language proficiency among learners. A variety of teaching methods and learning strategies have been employed to create conducive environments for EL speaking practice (Yesilçinar, 2019), supplemented by the introduction of technological tools and resources designed to bolster EFL learners' speaking abilities (Fathikasari et al., 2022). These endeavors highlight the transformative potential of innovative pedagogies and technology-assisted language learning in positively influencing EFL learners' speaking, especially in the fundamental domain of pronunciation. In the pursuit of refining EFL learners' pronunciation, the necessity for targeted pronunciation training is inevitable. Feedback from teachers plays an important role in improvement (Akhter et al., 2020); yet, traditional approaches, often characterized by repetitive listening and speaking exercises without tailored feedback, fall short in fostering learner autonomy and fail to equip them with the ability to independently identify and rectify their pronunciation errors (Cucchiarini & Strik, 2019;). Addressing this challenge, the adoption of Automatic Speech Recognition (ASR) technology, a sophisticated application of Artificial Intelligence (AI) technology based on Machine Learning, has gained acceptance. This innovative approach has illuminated the integration of various ASR-based tools into classroom settings to facilitate EFL speaking training and practice.

This study aimed to investigate the impact of the possible clusters of students' foreign language classroom anxiety on their learning processes and outcomes. Therefore, this study aimed to explore the following research questions: (1) What kinds of foreign language classroom anxiety exist when students participated in AI supported learning activities? (2)

How did the different foreign language classroom anxiety related to the students' learning processes and learning outcomes?

Methods

Participants

The study involved 110 participants, aged 18-19, enrolled in three intermediate-level English classes at a Taiwanese university of technology. Freshman English, a mandatory course, aims to enhance students' language proficiency, focusing on grammar, essential language skills development, and fostering cross-cultural communication, with placement based on English entrance exam scores.

Experimental Procedure

Throughout the 18-week semester, three sections (50 min for each) of each English class were conducted each week, during which participants received lecture-based instruction in line with the university's curriculum and objectives. All three classes were taught by the same instructor, who was also one of the researchers. In the second week, participants were required to take a speaking test as the pre-test, involving video-recording their responses, and subsequently upload these files to Padlet for analysis. Following the pre-test, participants completed the Foreign Language Classroom Anxiety Scale (FLCAS) questionnaire.

Instruments

In this study, the Foreign Language Classroom Anxiety Scale (FLCAS) developed by Horwitz et al. (1986) was utilized. FLCAS is designed to assess the level of anxiety learners experience in foreign language classrooms. The scale consists of 33 items rated on a 5-point Likert Scale, including 24 positively worded and 9 negatively worded statements.

To investigate EFL learners' engagement with technology and their adoption of new approaches, "Sensay," an ASR-based language learning tool, was introduced within a college setting. Sensay employs artificial intelligence to generate audio files and instantly evaluate pronunciation, fluency, and accuracy.

The scores of learning processes result from the evaluation of the learning process It was based on three speaking tasks selected from a total of ten.

Data Analysis

The data analysis of this study was performed in three steps. First, an exploratory factor analysis (EFA) with varimax rotation was performed to clarify the structural validity of the FLCAS questionnaire. Second, a k-mean clustering analysis was conducted to classify the students with similar degree of foreign language anxiety into groups. To compare the three clusters in terms of foreign language anxiety, Kruskal-Wallis tests and Mann-Whitney U Tests were conducted. Finally, the impact of the different clusters' foreign language anxiety on their learning processes and learning outcomes was also examined.

Results

K-means cluster analysis was conducted on the three factors to classify the students with similar degree of foreign language classroom anxiety into homogeneous groups, involving communication apprehension (CA), test anxiety (TA), fear of negative evaluation (FNE). As shown in Table 1, students in cluster 1 (n=27) have lower anxiety in CA and NE than students in other clusters. Students in cluster 2 (n=48) have higher anxiety in CA, TA and NE than students in other clusters. Students in cluster 3 (n=35) have lower anxiety in TA than students in other clusters.

Table 1: Cluster Analysis of Students' Foreign Language Classroom Anxiety

Factors	Cluster 1 (n=27)	Cluster 2 (n=48)	Cluster 3 (n=35)
CA	2.44	3.55	3.16
TA	2.90	4.19	2.87
FNE	2.13	4.18	3.60

Furthermore, the results of Mann-Whitney U tests showed that significances existed in the CA, TA, FNE except in the following case: the TA factor (cluster 1 vs. cluster 3). In sum, these indicated that the degree of CA and FNE in cluster 1 are significantly lower than those in other clusters. It is thus proposed to label cluster 1 as "low anxiety." On the contrary, the degree of CA and FNE in cluster 2 are significantly higher than those in other clusters. It is thus proposed to characterize cluster 2 as "high anxiety." The degree of CA and FNE in cluster 3 are significantly lower than those in cluster 2 and higher than those in cluster 1. Hence, cluster 3 was labelled as "medium anxiety."

To examine whether the students had similar speaking skills among the three clusters before participating in the ASR-supported learning activities, Kruskal-Wallis tests and Mann-Whitney U tests were employed in this study. The results revealed that the students had similar speaking skills among the three clusters, including F (χ^2 (2, N=110)=2.19, p=0.33), P (χ^2 (2, N=110)=0.30, p=0.86), and I (χ^2 (2, N=110)=1.73, p=0.42). Pairwise Mann-Whitney U tests also revealed that three were no differences among the three clusters in all comparisons. Thus, it may be inferred that students in the three clusters had similar speaking skills before they joined in the learning activities.

Furthermore, Kruskal-Wallis tests and Mann-Whitney U tests were also employed to investigate whether the students attain different scores of learning outcomes among the three clusters. the results showed significant effects of the three clusters on the learning outcomes in the dimensions of P (χ^2 (2, N=110)=60.90, $p < 0.05$), of I (χ^2 (2, N=110)=10.57, $p < 0.01$). Pairwise Mann-Whitney U tests indicated significant differences between "low anxiety" and "high anxiety" in the dimensions of P (U=429.50, z=-2.51, $p < 0.05$), and of I (U=377.00, z=-3.13, p <0.001). Significant differences between "low anxiety" and "medium anxiety" in the dimensions of P (U=328.50, z=-2.12, p <0.05), and of I (U=303.00, z=-2.54, p <0.05). These findings revealed that student with "low anxiety" outperform than those students with "medium anxiety" or "high anxiety" in the dimensions of P and I. However, there is not significant difference among the three cluster in the learning outcomes of F (χ^2 (2, N=110)=5.68, p=0.06). This finding showed that ASR-based technology help students with "medium anxiety" and "high anxiety" attain scores in dimensions of fluent as well as those with "low anxiety."

Conclusion

The study offers empirical evidence that ASR technology aids in reducing anxiety. It was observed that students with high levels of anxiety experienced a reduction in their learning anxiety during ASR speaking tasks, covering CA, TA, and FNE. This indicates a decrease in overall anxiety levels for this group, notably in communication anxiety. Such results suggest that students who started with higher levels of anxiety saw a significant reduction in their speaking-related anxiety, thanks to the intervention. This underscores the effectiveness of ASR technology in mitigating speaking anxiety, particularly CA, in students with initially high anxiety levels. This outcome aligns with research showing that ASR technology can alleviate speaking anxiety and that technology assistance enhances EFL learners' oral performance (Bashori et al., 2022; Tai & Chen, 2023) and offers a flexible learning environment to cater to diverse learning styles. These features lead to more effective and personalized learning outcomes (Hsu, 2016; Liu et al., 2022). As mentioned above, communication apprehension, or anxiety, is a major barrier that makes learners more reluctant to speak in a foreign language context; therefore, the deployment of ASR-based tools emerges as a promising solution to reduce this anxiety, creating a more relaxed and supportive environment for communication among EFL learners (Tai & Chen, 2023).

Profiling English Language Learning Anxiety of Selected Rural Area Secondary School Students in Kedah: A Case Study

Aini Syahira Jamaluddin, Albukhary International University, Malaysia
Aina Yasmin Mohd Amin, Albukhary International University, Malaysia
Nurul Huda Hassan Bakri, Albukhary International University, Malaysia
Asri Karolina, Universitas Islam Negeri Raden Fatah Palembang, Indonesia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study investigated the phenomena of English Language Learning Anxiety among six secondary school students in Baling, the rural area of Kedah in Malaysia. It studied the relationship between two anxiety English language skills, listening and speaking, and their correlations. A quantitative survey was administered to 866 rural secondary school students using a composite questionnaire that adapted multiple language learning anxiety scales, mainly the Foreign Language Anxiety Scale, English Language Listening Anxiety, and English Language Speaking Anxiety. Descriptive analysis and Pearson Correlation analysis were utilized to extract the required information regarding the English language learning anxiety among secondary school students in Kedah. The result showed the students in all six schools experience moderate levels of anxiety in learning the English language inside the classroom. A positive and significant relationship was also discovered between English listening anxiety and English speaking anxiety from the data collected. These findings point to the fact that language learning anxiety occurs inside the classroom, even in rural area secondary schools in Kedah, and it is debilitative to the student's acquisition of the English language. The correlation of anxiety between the two language skills paves the way to simultaneously formulating methods to solve the problem. This research aims to provide additional information to the existing literature by focusing on rural secondary schools, which need more coverage regarding English language anxiety.

Introduction

It is undeniable that English is the most widespread and significant language globally. Consequently, English is the second language in Malaysia, serving as a unifying tool among the country's diverse ethnic, linguistic, cultural, and religious groups. Within the Malaysian education system, English is a compulsory subject for all students, designed to produce graduates proficient in effective communication in English. Education in Malaysia recognizes the significance of the English language (Azirah, 2004; Thirusanku & Yunus, 2012). As a result, English serves as the second language (L2) for Malaysians, given that Malaysia is among the Asian countries that implement bilingual education (Ali, 2000; Darmi & Albion, 2013). However, challenges hinder students from achieving high proficiency in spoken English. Consequently, the nuances of the English language are evident in the speech of Malaysians, who are exposed to English throughout their primary and secondary education, accumulating eleven years of learning English as a mandatory subject in public schools (Yamat et al., 2014).

The decline in English proficiency among Malaysians has drawn increased attention to the factors contributing to this issue despite 11 years of formal English education in national schools (Musa et al., 2012). This deterioration is particularly concerning as it adversely affects the employability of graduates, who are often rejected for positions due to their insufficient English language skills (Ali, 2000; Hashim, 2004; Ratnawati, 2004) despite achieving high Grade Point Averages in their university studies (Guan, 2016). Previous research on second language anxiety focused more on the tertiary level. Moreover, study in this field is fairly tiny in Malaysia. In the present study, however, the researcher would like to focus on Form 1, 2 and 4 students' English language anxiety. Thus, this research aims to investigate the level of anxiety in English as a second language among secondary school students in selected schools in rural Kedah, Malaysia, to find a correlation between listening anxiety and speaking anxiety in the English language and to see the relationship between listening and speaking anxiety among Form 1, 2 and 4 students in selected rural schools of Kedah.

Anxiety and Language Learning

In Malaysia, where Bahasa Melayu is the national language, and English is widely used as a second language, students often face unique challenges in language acquisition that can lead to anxiety. Numerous studies had been conducted focusing on the language anxiety level among students, particularly in speaking (Miskam & Saidalvi, 2018; Kayaoglu & Saglamel, 2013). The English language requirement as a compulsory subject to pass in Malaysia's education system shows the importance of mastering the language.

The Ministry of Education has made many efforts to improve students' English. Back in 2002, the government re-introduced the teaching and learning of Science and Mathematics in English; later, they introduced MBMMBI; focusing on upholding the Malay language and strengthening their command of English and in 2009, a program to improve students' English proficiency as the second language in Malaysia (Miskam & Saidalvi, 2018; Rokiah @ Rozita Ahmad et al., 2012). However, Malaysian graduates still struggle to master English, especially when using the language for communication. In 2011, the Education Blueprint underwent a significant shift to ensure Malaysian graduates are equipped with fluent communication skills upon graduating (Malaysian Educational Blueprint, 2011).

Among the factors that triggered this situation is anxiety. Anxiety leads to poor communication in the English language among graduates. According to Brown (1994), language anxiety influences language learning. Brown added that when a learner acquires a second language, a complex process, the learner becomes anxious. Speaking covers many processes involving pronunciation, pronunciation, word recognition, meaning, and grammar rules. This process can overwhelm learners (Khusnia, 2016).

English Language Anxiety Among School Students in Malaysia

Research conducted by Lian and Budin in 2014 revealed that Malaysian Form 4 students have a moderate level of English language anxiety and significant differences between genders in English language anxiety. A study by Nasir and colleagues. (2023) found that the level of English language anxiety among Malaysian Siamese students attending national and national type-secondary schools is low. A study by Idrus and Hamid (2021) examined 311 non-examination students and indicated students in rural area secondary schools experience moderate to high levels of anxiety inside the English language classroom. In addition, a study by Kamaruddin in 2009 involving 120 secondary school students found that in terms of the manifestation of anxiety, participants showed both physical and psychological signs of anxiety. Some symptoms were stutter, palpitation, shaky, trembling, shortness of breath, and restlessness. Some psychological symptoms were avoiding volunteering and being demotivated to complete the given tasks. A study by Chin (2020) consisting of 10 Form 2 students of the respective school who have been identified as students who possess language learning anxiety revealed that the factors of language learning anxiety in ESL classrooms are language barrier, low self-confidence, and fear of negative evaluation. A study by Tachinamutu and Shah 2018 involving 100 lower secondary students from a national school indicated that English learning anxiety impacted learning motivation differently depending on proficiency level.

English Language Anxiety

Second/Foreign Language Anxiety (SLA/FLA) is a significant issue in the English as a Second/Foreign Language (ESL/EFL) field and has been widely researched over the past decade. The concept was pioneered by Horwitz, Horwitz, and Cope (1986), who developed the Foreign Language Classroom Anxiety Scale (FLCAS), a functional tool for measuring learners' anxiety levels in language classrooms. The FLCAS has since become a standard instrument in ESL/EFL research, and its reliability is well-established. Horwitz and colleagues (1986) defined anxiety as feelings of apprehension, nervousness, worry, or tension experienced by learners, which activate the nervous system. This definition is distinct from Test Anxiety, which Sapp (1993) described as anxiety arising from intense emotions that affect both the emotional and physiological state of the learner. The distinction is important because test anxiety occurs in any situation where a learner's knowledge and performance are evaluated. In contrast, Foreign Language Classroom Anxiety, as defined by Horwitz and colleagues (1986), generally arises within the context of a second/foreign language classroom, which is non-native to the learners. McIntyre and Gardner (1994) further elucidated the relationship between anxiety and language learning using Tobias' (1986) cognitive model, which posits that anxiety inhibits language learning by interfering with both language input and output.

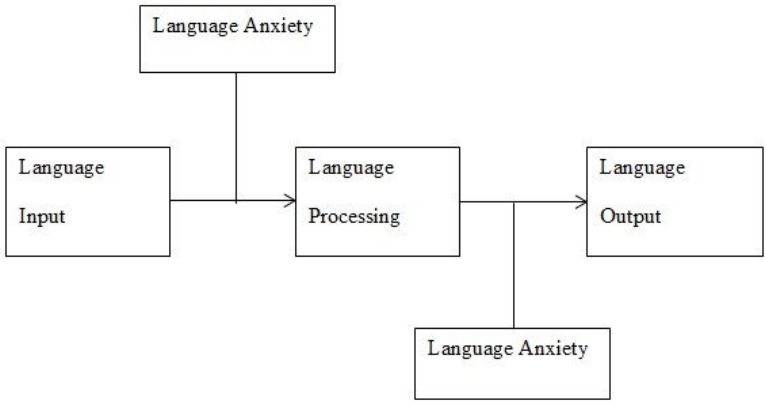

Figure 1: Intrusion of Language Anxiety in the Language Learning Process

Anxiety interferes with both the language input and output of learners in second/foreign language classrooms, in contrast to test anxiety, which occurs only during the performance evaluation of any subject matter. McIntyre and Gardner (1993) further reinforced this understanding by demonstrating how anxiety disrupts the language learning process, affecting both input and output in the classroom. This interference may also be present during listening (input) and speaking (output) activities in rural secondary schools in Kedah.

Methodology

According to statistics from Pejabat Pendidikan Daerah (PPD) Baling, there are 78 schools in Baling district, 62 primary and 16 secondary schools. This investigation utilized stratified random sampling to answer the research questions. Stratified random sampling ensures that each subgroup of a given population is adequately represented within the whole sample population of a research study. A total of 900 questionnaires were distributed to six different schools in three different rural area districts in Baling, which is a considerable sample size and representative of the population (N=6282) with a 5% margin of error and 95% confidence level as calculated by Raosoft.com, an online sample calculator. Only 866 questionnaires were collected at the end of the data collection stage. Therefore, this method seemed appropriate to the purpose of the study. The sample of this study is secondary school students who are not involved in any national exam in their year of study from five different schools in Baling, a rural area in the state of Kedah, Malaysia. The six schools selected had the highest and lowest achievement of English subjects in their National Malaysian Certificate of Education, a national examination for all fifth-form secondary school students in Malaysia. The students were not involved in the national examination, which included Forms One, Two, and Four (aged 13, 14, and 16, respectively). This ensured the sample was not affected by test anxiety, a different form of anxiety (Sapp, 1992) from Foreign Language Classroom Anxiety. The instrument employed in this study was a questionnaire based on two separate linguistic anxiety scales adopted and adapted from English Language Listening Anxiety, Kimura (2008) and English Language Speaking Anxiety, adapted from Mak (2011). A total of two sections were provided in the questionnaire: the Listening Section with 12 items and the Speaking Section with six items. The composite questionnaire was in dual language to ensure intelligibility, and items were evaluated using a 5-point Likert scale. A pilot research was done on 144 students from SMK Teloi Kanan to determine the questionnaire's validity and reliability. The Cronbach Alpha analysis yielded a value of 0.86, which is considered acceptable in social science research. According to Baharuddin (2009), students are categorized into three levels of anxiety. Table 1 shows a mean of 1.00-2.33 (low

language anxiety LLA), a mean of 2.34-3.66 (moderate language anxiety MLA), and a mean of 3.67-5.00 (high anxiety level HLA).

Table 1: Students' Mean Level of English Language Anxiety

Language Anxiety	Mean
Low	1.00 – 2.33
Moderate	2.34 – 3.66
High	3.67 – 5.00

The data collected were analyzed using SPSS, and the sum score for each response was calculated. The scores will be calculated according to their respective language skills, listening and speaking skills, and then categorized into three categories: low anxiety, moderate anxiety, and high anxiety. Descriptive statistics were computed to determine the Standard Deviation (SD) and mean scores of each section's responses to sort the highest and lowest mean score items for analysis. To determine the relationship between listening anxiety and speaking anxiety across different forms, a Pearson product-moment correlation was computed, and the result is as shown in the Findings.

Findings

Results of English Language Anxiety Among Form 1, 2 and 4 Students

The data was gathered and tabulated. Table 1 summarises the results of the level of English language anxiety in terms of listening among Form 1, 2 and 4 in rural area secondary schools students in Kedah and their corresponding anxiety levels as low, medium, or high. Table 2 reflects the level of English Language Anxiety in Terms of Speaking Among Form 1, 2 and 4 students.

Table 2: Level of English Language Anxiety in Terms of Listening Among Form 1, 2 and 4 Students

Class	n	SD	Mean	Levels of Listening Anxiety Skills
Form 1	200	0.56	2.92	Moderate
Form 2	257	0.48	2.84	Moderate
Form 4	225	0.53	2.89	Moderate
Overall	682	0.04	2.88	Moderate

Table 3: Level of English Language Anxiety in Terms of Speaking Among Form 1, 2 and 4

Class	n	SD	Mean	Levels of Speaking Anxiety Skills
Form 1	200	0.49	3.03	Moderate
Form 2	257	0.43	2.96	Moderate
Form 4	225	0.47	2.49	Low
Overall	682	0.03	2.98	Moderate

Correlation Analysis Between Listening and Speaking Anxiety Among Form 1, 2 and 4 Students

A Pearson product-moment correlation was run to determine the relationship between listening anxiety and speaking anxiety across different forms, with the results shown in Table 3. There was a moderate, positive correlation between listening anxiety and speaking anxiety with Form 1, which was statistically significant (r=.500, n=200, p=.001).

Similar scenario to Form 2, where students exhibited a moderately significant correlation between listening and speaking anxiety (r=.403, n=257, p=.001). From 5 also showed a moderate correlation between listening anxiety and speaking anxiety (r=.488, n=225, p=.001), which further supports the findings in Form 1 and 2.

Table 4: Pearson Correlation Analysis of Speaking Anxiety and Listening Anxiety Across Different Forms

Class	Variables	Speaking Anxiety	Listening Anxiety
Form 1	Speaking Anxiety	1.00 (200)	
	Listening Anxiety	.500** (200)	1.00 (200)
Form 2	Speaking Anxiety	1.00 (257)	
	Listening Anxiety	.403** (257)	1.00 (257)
Form 4	Speaking Anxiety	1.00 (225)	
	Listening Anxiety	.488** (225)	1.00 (225)

Note: ** $p < .001$.

Research Hypotheses Testing

Table 5: Simple Linear Regression Analysis: Predicting Speaking Anxiety From Listening Anxiety Across Different Forms

Hypothesis	Variables
Hypothesis 1	There is no significant relationship between listening anxiety and speaking anxiety among Form 1 students.
Hypothesis 2	There is no significant relationship between listening anxiety and speaking anxiety among Form 2 students.
Hypothesis 3	There is no significant relationship between listening anxiety and speaking anxiety among Form 5 students.

Speaking Anxiety					
Class	B	SE	β	t	Sig.
Form 1					
Constant	1.752	.159	-	11.046	<.001
Listening Anxiety	.436	.054	.500	8.126	<.001
Form 2					
Constant	1.941	.147	-	13.200	<.001
Listening Anxiety	.359	.051	.403	7.035	<.001
Form 4					
Constant	1.284	.195	-	6.573	<.001
Listening Anxiety	.549	.066	.488	8.354	<.001

Note: Dependent Variable: Speaking Anxiety.

For Form 1 students, the analysis revealed a statistically significant relationship between listening anxiety and speaking anxiety (β=0.500, p<.001). The coefficient of determination (R^2=0.250) suggests that 25% of the variance in speaking anxiety can be explained by listening anxiety. Similarly, Form 2 students displayed a significant positive association between listening anxiety and speaking anxiety (β=0.403, p<.001). The coefficient of determination (R^2=0.163) indicates that 16.3% of the variance in speaking anxiety is accounted for by listening anxiety. Form 4 students also exhibited a significant positive relationship between listening anxiety and speaking anxiety (β=0.488, p<.001). The coefficient of determination (R^2=0.238) suggests that 23.8% of the variance in speaking anxiety can be explained by listening anxiety.

Across all three forms, the findings suggest that higher levels of listening anxiety are associated with higher levels of speaking anxiety among secondary school students. However, the strength of the relationship varies slightly between forms, with Form 1 demonstrating the highest coefficient of determination (R^2=0.250). Consequently, across all forms, null hypotheses are rejected.

Conclusion

Secondary school students in rural areas of Kedah experience anxiety in the classroom, compounded by inadequate facilities, materials, and unsuitable learning conditions. This situation exacerbates the disadvantages faced by these students, even though the federal government allocates the same amount of funding to all schools (Azmi & Sham, 2018). Controlling anxiety levels in English language classrooms within rural secondary schools could enhance students' English learning experiences. This improvement could lead to more effective lessons despite the deficits in facilities, materials, and learning conditions, which are critical for better English language education and an improved learning environment.

The correlation between English listening anxiety and English speaking anxiety suggests that anxiety in a language learner may exist before engaging in a particular language skill, potentially stemming from apprehension in another language-related situation. Reducing anxiety in one language skill may also mitigate anxiety in another, enhancing the learning experience. Teachers can monitor and manage anxiety levels in one class with the understanding that this may reduce anxiety in other language classes, thereby creating more efficient learning environments. Students may perform better in subsequent language lessons by implementing strategies to reduce anxiety in one language skill. However, further research should be conducted across diverse demographics and samples to enhance the validity of these findings and to establish a solid foundation for experimental studies on the interrelationship between anxiety in different language skills. English proficiency levels in Malaysia are declining, and recent studies have highlighted the impact of affective components on language learning, noting that these can be either debilitating or facilitative. While the debilitative effects of anxiety have been extensively explored, with numerous studies presenting similar findings, there are exceptions where anxiety has been shown to facilitate language learning. Anxiety in Malaysian classrooms has been documented at both secondary and tertiary levels. However, there has been a lack of research on rural students in a developed state like Kedah. This study addresses this gap by investigating language anxiety among secondary school students in rural Kedah, thereby contributing to the broader understanding of language anxiety in Malaysia. As research on this phenomenon increases, greater focus can be directed toward addressing English language proficiency issues in Malaysia. Consequently, more efforts can be devoted to integrating the affective component of the classroom into pedagogical practices.

However, further research should be conducted, especially among secondary school students, to obtain a better understanding of the extent of English language anxiety inhibiting the English language classroom in Malaysian schools, which could play a part in contributing to the declining English proficiency among Malaysians.

Acknowledgments

We would like to thank Albukhary International University (AIU) and AIU Centre of Excellence in Socio-Economic Development and Innovation (ACE-SEDI) for the short-term grant awarded to us for this project.

The Foreign Language Writing Anxiety of Japanese University Students

Lidija Elliott, Kwansei Gakuin University, Japan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This paper aims to explore foreign language writing anxiety among non-English major students enrolled in an English academic writing course in Japan. The study used questionnaires to survey 25 second-year university students to evaluate the challenges causing anxiety while writing academic papers. Results revealed that there are six primary causes of students' anxiety over their writing: time pressure for writing tasks, low self-confidence, writing rules, the presence of competitiveness, concerns about accuracy, shame, and emotional isolation. Based on the findings, the author suggests possible solutions for motivating students in the classroom. These activities may help students mitigate feelings of anxiety, which may lead to greater self-confidence, thereby potentially increasing learning results and decreasing the dropout of high-risk students in EFL settings.

Introduction

The majority of educational institutions in Japan require students to take English classes as English language proficiency is a critical skill for academic success. This is due to its application in various academic writing genres, including conference presentations, research proposals, theses/dissertations, or journal articles, (Ho, 2016). Many English language learners often express feelings of stress and anxiety when speaking or writing in English. Students with high anxiety levels end up skipping lessons and would rather not enroll in English writing courses (Cheng, 2002). Therefore Academic writing is considered to be a complex task for many ESL (English as a second language) and EFL (English as a foreign language) writers because of its intricate nature coupled with the lack of vocabulary in the writers' repertoire and the handicap in their grammatical knowledge of the English language (Sabhi et al., 2019). The study aims to investigate the challenges students face while taking English writing courses, and it further proposes solutions for overcoming the obstacles and improving their writing skills.

Literature Review

English language learners tend to experience writing anxiety, characterized by feeling worried about writing in a language they are still learning. Anxiety, alongside other sentimental variables, has the potential to influence the students' writing in the classroom significantly. In academic literature, writing anxiety is synonymous with writing block, writing apprehension, or composition anxiety (Onwuegbuzie et al., 1999). A study by Qadir, Bostanci, and Kurt 2021, showed that students at all levels of English proficiency struggle with writing anxiety in English as a foreign language. Prior research was initially focused on speaking anxiety, neglecting other relevant skills, including writing (Hislop, 2021; Horwitz, 2001). However, recent research has concentrated on writing anxiety. Studies have shown the high potential for students with writing anxiety to lack the motivation to write, have a negative disposition towards writing tasks, have poor impressions of their writing, produce subpar papers, and evade situations that involve writing (Cheng, 2002, 2004; Latif, 2007; Sanders-Reio et al., 2014). Studies have also explored various sources of anxiety while writing (Cheng, 2004; Choi, 2013), including idea organization and development during the process of writing (Jawas, 2019), low writing competence (or the perceived lack, including poor academic vocabulary and grammatical knowledge) (Yu, 2020), and the fear of negative feedback from teachers or peers (Hislop & Stracke, 2017) and the inability to get past previous negative experiences. Despite the extensive research, there was no consensus in the literature regarding if there was a change in the student's anxiety following observable academic progress (Qadir et al., 2021).

Research questions

This study aims to address the research questions as follows:

RQ1. What are the challenges students face while writing in English?

RQ2. What are the possible causes of these challenges?

RQ3. What are some recommendations for overcoming these challenges and improving the writing skills of EFL students?

Following the questionnaire, data analysis was performed on the response, which revealed six primary sources of writing anxiety: Low self-confidence, time pressure, competitiveness

(frequently comparing with peers), poor writing ability, shame, emotional isolation, and fear of making mistakes.

Methodology

Participants & Setting

Participants consisted of 25 second-year non-English majors, at a Japanese university. Classes met once a week and lasted 100 minutes. A typical session begins with freewriting, conducted in a ten-minute time interval, followed by group discussions before the teacher introduces the lesson. Workshops were often held during the second part of the instructional period. At the end of each semester, the students wrote two essays.

At the start of the semester, students completed the first questionnaire. The questions included were designed to make general inquiries about the student's views on academic writing and what they expect in the forthcoming semester. Following a review of the responses, it was observed that many students expressed anxiety. Consequently, another questionnaire was distributed at the end of the first semester, focusing on their concerns about English writing during the academic writing class.

Data Collection

A qualitative questionnaire, written in English was developed as the instrument for data collection. To ensure honest feedback, student participation was completely voluntary and anonymous.

Challenges

Writing Anxiety

EFL students who are given academic assignments often struggle with writing anxiety. This can potentially lead to debilitating effects, as reported in a study by Khattak et al. (2011), which hinders students from reaching their goals. In addition, anxiety often manifests as feelings of worry, helplessness, and unease, especially with non-English speakers. Despite the numerous possible anxiety-inducing parameters, the following were commonly reported by EFL students:

Low Self-Confidence

Learning English as a foreign language is often considered challenging, making EFL students feel uncertain about their fluency and ability to express themselves in academic English writing. As one of my student noted "*I am terrible in English writing. I make a lot of mistakes.*" A study by Rose (1984) identified negative self-talk as the root cause of writing blocks. According to Pajares & Johnson, (1994), this low self-confidence directly and negatively influences stress levels, particularly with non-native English students confronted with tasks that require demonstration of their abilities. Hence, students with the necessary writing skills who still struggle to perform are expected to address their writing anxiety. Cheng (2004) proposes a practical approach to enhance student confidence and decrease frustration with the writing process by helping them set real attainable goals, which build self-confidence through repeated successful experiences.

Time Pressure

It was shown that students often run out of deadlines because in the writing process, students need to brainstorm ideas, organize ideas, draft, re-read their writing (Hedge, 1988, as cited in Alfaki, 2015). Insufficient time to finish a writing exercise has been associated with the feeling of excessive worry among EFL students. This often causes an inability to complete assignments or tasks that reflect their true abilities. The instructors tend to give EFL students similar deadlines or timeframes as to native English-speaking students without recognizing the added stress that this action imposes on the student's academic performance. The time limitation and feeling overwhelmed by 'temporal overload' leave students anxious and eager to find shortcuts (Ylijoki & Mäntylä, 2003).

Competitiveness

University-level students often experience an underlying sense of rivalry that exacerbates anxiety. Comments like these frequently appeared in the reflections: "*My friends are better than me at grammar*", "*Especially, I am lack of vocabulary*" and "*My classmates know more more vocabulary"*. This classroom competition could also be detrimental to students' well-being, including their performance in writing. This pressure, whether self-imposed, from classmates, or from family expectations of outperforming others (both perceived or real) could negatively affect their self-efficacy should their results not align with their expectations (Murray, 2019) Failure to meet expectations can hurt their mental well-being, as well as their writing performance. Students were continually comparing their writing abilities and progress with classmates. Surprisingly, this was a belief shared among both higher and lower-level students.

Poor Writing Ability

A majority of students reported frustration and confusion with the transition in writing rules and guidelines between secondary and higher education levels. This includes inflexible writing rules, proofreading prematurely in the writing process, improper planning, having a negative attitude toward writing, or incorrect evaluation. Moreover, some students who gain confidence in academic writing are often confronted by a new set of complex and confounding rules. Some students reported struggling with balancing their perceived abilities with the fast-evolving expectations of academic English writing.

Shame and Emotional Isolation

According to the findings of questionnaires, students often mention experiencing feelings of isolation about their concerns with academic writing, "*My friend is better write*" or "*I don't know writing*" etc. The students did not attempt to discuss these feelings with one another. In addition to the instructors' comments, the shame experienced was increased, when the participants felt alone in their struggle to write in the English language. A study by Hashemi (2011) highlighted that a participant using terms like 'losing face' associated language anxiety with concepts like "face" in certain cultures – particularly in the Asian context. Similarly, a veteran female teacher noted, "*It is not just anxiety about language but differences in cultural practices*."

The Fear to Make Mistakes

EFL students feel ashamed or embarrassed when discussing their writing with peers and teachers, fearing inaccuracies in their work. The teacher has noticed more anxiety when mistakes are shared with the whole class compared to a private discussion between a student and a teacher. In addition, word selection and vocabulary are as crucial as organization, grammar, and spelling. As reported by Hislop (2021), students studying English as a foreign language are concerned about making grammatical errors, improper word use, and making mistakes in APA citations. Since having a firm grasp on these concepts proves to be challenging for non-English speaking students, submitting written assignments for assessment becomes particularly stressful. The prospect of their abilities being scrutinized adds another layer of anxiety. Students often wrote that they lacked the ability to write in academic English and some students wrote that their main goal was to develop native-level English academic writing skills.

Solutions

The circumstances of overwhelmed EFL students feeling anxious about academic English writing can be improved using the recommended solutions as follows:

Additional Time Allowances (Time Limitation)

Providing EFL students additional time to complete writing tasks, can help reduce the anxiety experienced inside and outside the learning environment. This approach can also be applied to pre-writing assignments like researching, brainstorming, outline creation, and drafting. Breaking down writing assignments into smaller, more manageable segments with extended deadlines can significantly reduce anxiety for EFL students. Additionally, providing advanced notice of timed writing exercises in the classroom allows for better preparation, ultimately increasing their chances of success.

Another strategy is providing students with extended time frames at the start of the term and progressively reducing the allotted time as students get used to writing academic papers under time pressure.

This approach does not mean students should not be accountable for meeting deadlines. Deadlines are expected to reflect appropriate expectations for EFL students. This flexibility aims to encourage students to produce their best work, and not to procrastinate.

Segmented Writing Practices

Many students reported significant levels of anxiety when asked to write single-draft assignments, therefore splitting the process of writing into several classes and steps is potentially useful to increase students' understanding of the intricacies of academic writing. Providing clear, detailed instructions and a chance to get feedback during each step–from brainstorming ideas, creating the outlines, text organization, and writing several drafts to improve the work–can significantly boost student confidence while writing in English.

Peer and Group Writing Exercises

Group exercises and peer projects reduce stress levels for EFL students taking academic writing courses. There has been an upsurge in these forms of student-focused activities following the publication of seminal research by Elbow (1968). This study paved the way for increased interest in investigating students' beliefs about peer review as well as its effectiveness. Kurihara (2016) indicates that peer feedback could improve student writing abilities in EFL classrooms.

Students expressed the significance of collaborating with peers whether during the brainstorming process or while editing. Through this approach, the student's perspective expands, and it heightens an awareness of the fact that other students struggle as well in this regard. Furthermore, the capability to work collaboratively is strengthened, inciting the potential for students to think analytically about writing. Teachers can model giving positive feedback and lastly fostering a supportive environment where classmates are viewed as colleagues rather than critics or competitors also helps students feel less anxious and isolated.

Confidence-Building and Corrections Practices

EFL students often complain about instructors using a red pan to point out their mistakes. This frequently contributes to greater writing anxiety. The method adopted to identify and correct errors also potentially affects the students' anxiety levels, although rectifying mistakes is an anticipated requirement. According to a report by Krashen (1982), error rectification is to be considered “a serious mistake” (p. 74). This is because “the practice of correcting errors has the potential to immediately make students defensive” (p. 75).

A possible strategy to alleviate the fears associated with corrective action is to acknowledge student accomplishments before identifying the areas in need of improvement. Furthermore, pessimism and hopelessness after grading are possibly eliminated by showing students the areas they have made progress. As a form of positive introduction, the instructors are in a position to help students through the process of identifying key areas to develop, serve as a model in defining realistic and attainable goals, and aid in developing an action plan required for skills acquisition, particularly for the skills needed to refine academic writing. In addition, feedback is not designed to deter EFL students, as reported in a study by Al-Bashir, Kabir, and Rahman (2016). Evidently, paying attention to aspects of the coursework that are not as effective is crucial, nonetheless, instructors have to exercise caution when delivering any form of ‘negative feedback.’ The approach of providing feedback constructively makes it possible for teachers to augment the learning environment.

Participating in Activities Aimed at Improving Fluency

The engagement of EFT students in less stressful activities geared towards increasing fluency is another method of reducing writing anxiety instead of reinforcing accuracy via consistent revision of high-stakes projects. Furthermore, practicing with frequent writing exercises independent of scoring systems reduces the overwhelming pressure students face. This further allows space for exploration and improvement in fluency with time through a process devoid of fearful experiences, worry, or concerns about being penalized.

Students and instructors may benefit greatly from engaging in daily or periodical journaling, participating in question-and-answer sessions, and writing exercises based on reading. In

addition, students are encouraged to express themselves better when excused by the pressures of grading and criticism, thus, enabling the instructors to more precisely evaluate their writing ability and identify areas in need of further development.

Emotional Support

A significant reduction in the effect of stress associated with writing may be achieved by providing EFL students with emotional support. This approach facilitates stress management, particularly with mentorship from peers learning English as a foreign language and getting feedback from instructors in an empathetic way. Teacher emotional support could directly influence college students' engagement (e.g., Crawford, 2018; Xu et al., 2020), create a supportive atmosphere, and cultivate students' sense of belonging and affinity to the classroom. When students receive teachers' emotional support that can meet their psychological needs in the learning process, they will have the internal motivation to continue to complete the given learning task (Ryan & Deci, 2020). Students who perceived high levels of emotional support from the teacher reported that the teacher made eye contact and smiled at them in class (Shen et al., 2024).

Study Limitations

The current research presented several shortcomings that need to be addressed. First, the limited study size. Second data was collected at the beginning of the course and again at the end of the semester. Regular questionnaires throughout the writing process may have revealed at what stages students experience higher levels of anxiety. Third, all questions and answers were written by students in English. If they wrote in Japanese it would ensure more effective communication.

Recommendations for Further Study

Based on personal teaching experiences and practical English course instruction, researchers are encouraged to develop several methods with the potential to help students of foreign languages improve their writing skills and overcome challenges. In addition, further studies focused on the connections between anxiety, language learning methodologies, self-esteem, and personalities are essential to gaining a deeper knowledge of anxiety experienced by EFL students and improving English writing course quality.

Conclusion

This study showed that students are anxious about writing activities. In addition, students are concerned about time limitations for writing tasks, low self-confidence, writing rules, the presence of students' competitiveness, concerns about accuracy, as well as shame and emotional isolation. One of the significant modifiers of stress levels in EFL students is providing flexible timelines. This allows students to collaborate on writing, editing, and correcting their projects more effectively. In addition, other approaches to alleviate stress include inspiring confidence through corrective practices, integrating exercises that build fluency, and providing sufficient emotional support. Helping students to become self-confident while writing in English, potentially reduces their anxiety level.

Although the classroom environment will never be anxiety-free and students are expected to be accountable for their academic achievement, an awareness of the activities that cause the

most anxiety can help instructors try to mitigate these anxieties and make a better learning environment in the classroom.

Development of a Learning Model Integrating Service-Learning and Experiential Learning in the Educational Communication Technology Curriculum

Punsa Ekpornprasit, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The purpose of this research was to develop the Service-Learning and Experiential Learning model, Implement the LMISEL model and Study the satisfaction of students with the LMISEL model in the Communication Technology in Education Curriculum. The experimental research samples were 100 Students, Simple Random Sampling. The instruments used in this study were LMISEL model and Satisfaction Assessment of students with the LMISEL model. The research findings were as follow: 1.The LMISEL process typically involves the following steps; Preparation, Service-Learning Experience, Analysis, Application, and Assessment, 2. Implement the LMISEL model into curriculum design for the Knowledge Management course for 4th year students in the Educational Communication and Technology program, King Mongkut's University Technology of Thonburi. Students undertake knowledge management by creating an Electronic book for the Royal Thai Police Office. Learning Outcomes: Apply concepts and principles of knowledge management to develop easily understandable and informative learning materials. Teaching and Learning Activities were as follow: Theoretical Instruction, Collaboration with Office of Police Forensic Science, Student Project Development, Project Presentations and Implementation. and 3. The LMISEL model satisfaction assessment was overall at the highest level. The feedback from students found that it was a very good experience to have the opportunity to work with large organizations and learn the work processes, gaining more understanding of the work of CSI Thailand and inspiring future careers. This project greatly developed their learning.

Keywords: Service-Learning, Experiential Learning, LMISEL

Introduction

Thai society currently faces numerous challenges, one of which is educational inequality. A significant portion of the population lacks access to quality education, hindering their potential for self-development and career advancement. The Communication Technology in Education Curriculum aims to produce graduates equipped with the knowledge, skills,and competencies necessary to design, develop, and apply communication technology for educational purposes. However,traditional teaching methods that emphasize lectures and rote memorization may not adequately meet the needs of contemporary learners.

Experiential Learning (EL) is a pedagogical approach where students learn by actively engaging in hands-on experiences and reflecting on their learning process. This method enhances comprehension and enables students to apply their knowledge in real-world settings. Service-Learning (SL) is a learning process where students utilize their academic knowledge and skills to serve and assist the community. It not only fosters academic development but also cultivates life skills, social responsibility, and teamwork. The integration of Service-Learning (SL) and Experiential Learning (EL) is a popular contemporary learning model.These approaches emphasize active student engagement, exposure to real-world problems and situations, and the development of critical thinking, problem-solving, teamwork, and communication skills. Students learn through practical application in community-based projects, enhancing their communication, problem-solving, and teamwork abilities while fostering a sense of community and social responsibility.

Therefore the research on "Developing a Learning Model Incorporating Service-Learning and Experiential Learning in the Communication Technology in Education Curriculum" holds significant value in studying and developing learning models that effectively prepare students to navigate the challenges of the modern world. This approach enables students to learn from real-world experiences, promoting sustainable learning and the application of knowledge in real-world settings. It cultivates essential life skills such as critical thinking, problem-solving, teamwork, and communication. Students gain awareness of societal issues and develop a sense of social responsibility. Graduates of the Communication Technology in Education Curriculum, equipped with the skills developed through Service-Learning and Experiential Learning, will serve as crucial assets in national development in the future.

Purpose of Study

1. To develop the Service-Learning and Experiential Learning model in the Communication Technology in Education Curriculum.
2. To implement the Service-Learning and Experiential Learning model in the Communication Technology in Education Curriculum.
3. To study the satisfaction of students with the Service-Learning and Experiential Learning model in the Communication Technology in Education Curriculum

Population

450 students from the Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi. 1st Class of the academic year 2022.

Sample Groups

100 students from the Department of Educational Communications and Technology, Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi, 1st Class of the academic year 2022, Simple Random Sampling, Using lottery selection.

Research Methodology

Review of Related Theories and Research

I. Review of Service-Learning: This will involve examining literature on the theoretical underpinnings, principles, and implementation strategies of Service-Learning as a pedagogical approach.
II. Review of Experiential Learning: This will entail exploring the theoretical foundations, principles, and instructional methods of Experiential Learning as a teaching and learning strategy.
III. Review of the Communication Technology in Education Curriculum: This will involve analyzing the curriculum's objectives, structure, content, and teaching methodologies to understand its context for integrating Service-Learning and Experiential Learning.
IV. Review of Research on Learning Models: This will involve examining relevant research studies that have investigated the development, implementation, and evaluation of various learning models.
V. Review of Research on Satisfaction: This will entail reviewing research literature on the measurement and assessment of student satisfaction in various educational contexts.

Implementation of the Service-Learning and Experiential Learning Model

The developed Service-Learning and Experiential Learning model will be implemented in the Communication Technology in Education Curriculum. This will involve:

I. Curriculum Integration: Incorporating Service-Learning and Experiential Learning activities into the curriculum's content, teaching methodologies, and assessments.
II. Instructor Training: Providing training and workshops for instructors to enhance their understanding and implementation of the model.
III. Student Support: Establishing support systems to assist students in their Service-Learning and Experiential Learning experiences.

Evaluation of Student Satisfaction

Student satisfaction with the Service-Learning and Experiential Learning model will be evaluated using a mixed-methods approach.

I. Surveys: Administering structured questionnaires to gather quantitative data on students' perceptions of the model's effectiveness, engagement, and overall learning experience.
II. Focus Groups: Conducting focus group discussions to collect qualitative data on students' in-depth experiences, challenges, and suggestions for improvement.
III. Interviews: Conducting individual interviews with selected students to gain deeper insights into their individual perspectives and experiences.

The collected data will be analyzed using appropriate statistical and qualitative analysis techniques to identify key themes,patterns, and areas for improvement. The findings will be used to refine and enhance the Service-Learning and Experiential Learning model for future implementation.

Results

Service-Learning and Experiential Learning Model in the Communication Technology in Education Curriculum

The Learning Model Integrating Service-Learning and Experiential Learning (LMISEL) is an educational approach that combines two powerful learning methods: Service-Learning and Experiential Learning. This model aims to enhance students' learning experience by providing them with opportunities to engage in hands-on activities that address real-world problems while also contributing to the community. The LMISEL process typically involves the following steps:

I. Preparation: Students are introduced to the theoretical foundations and concepts related to the course or subject matter. They learn about the community or organization they will be working with and the specific challenges or needs that need to be addressed. Students develop a plan for their service-learning project, including goals, objectives, and expected outcomes.
II. Service-Learning Experience: Students engage in hands-on service activities within the community or organization. These activities are designed to address real-world problems or challenges, allowing students to apply their theoretical knowledge to practical situations. Students work collaboratively with community partners, gaining valuable experience in teamwork, communication, and problem-solving.
III. Reflection and Analysis: Throughout the service-learning experience, students are encouraged to reflect on their experiences, observations, and the impact of their actions. They analyze the connections between the theoretical concepts learned in the classroom and the practical applications encountered during their service activities. Reflection activities may include journaling, group discussions, presentations, or other forms of critical analysis.
IV. Integration and Application: Students integrate the knowledge and skills acquired through the service-learning experience with the theoretical concepts covered in the course. They apply their newfound understanding to solve real-world problems, develop new ideas, or propose solutions to the challenges they encountered during their service activities. This integration process reinforces the connection between theory and practice, enhancing students' learning and understanding.
V. Evaluation and Assessment: Students' learning outcomes and the impact of their service activities are evaluated and assessed. This evaluation may involve self-assessment, peer assessment, and assessment by instructors or community partners.

The evaluation process helps to determine the effectiveness of the LMISEL approach and identify areas for improvement.

The LMISEL model provides students with a holistic learning experience that combines academic knowledge, practical skills, and community engagement. By integrating Service-Learning and Experiential Learning, students not only deepen their understanding of course content but also develop valuable life skills, such as critical thinking, problem-solving, teamwork, and social responsibility.

The learning model incorporating Service-Learning and Experiential Learning in the Communication Technology in Education Curriculum commences with theoretical instruction to equip students with a comprehensive understanding of the course content and knowledge. Subsequently, students receive real-world projects from partnering organizations to gain practical experience. Throughout the process, they are guided and supported by faculty instructors and mentors from the respective organizations. Upon completion of their projects, students present their work for the first round to receive feedback for improvement. Finally, they present their refined projects in the final round before implementing them in real-world settings and engaging in reflective debriefing.

The debriefing process involves key questions that encourage students to contemplate their take aways from the Service-Learning project: What did they learn about the project itself? What did they learn about themselves? What differences did they observe upon project completion?

This reflective exercise fosters critical thinking skills and enables students to synthesize their experiences for future career applications.

Evaluation of the Service-Learning experience involves a multifaceted approach, engaging all stakeholders: Self-Assessment by Students: Students reflect on their personal benefits throughout the project, from ideation and design to implementation and completion. Project Evaluation by Community Members/Organizations: Individuals or communities that have directly benefited from the project's activities provide feedback, offering both formative and summative assessment insights. Instructor Evaluation: Faculty instructors evaluate various aspects of the project, including the written proposal, project content (course activities, PR materials, learning materials), and oral presentations.

This comprehensive assessment approach ensures a holistic evaluation of the Service-Learning experience, fostering student growth and project effectiveness.

Implementation of Service-Learning and Experiential Learning in the Knowledge Management Course

Course: Curriculum Design and Instruction (ETM363) Knowledge Management

Target Students: Fourth-year undergraduate students majoring in Technology and Communication Education at the Faculty of Industrial Education and Technology, King Mongkut University of Technology Thonburi.

Learning Outcomes: Apply concepts and principles of knowledge management to develop easily understandable and informative learning materials.

Collaboration: Office of Police Forensic Science Division, Royal Thai Police

Project Objectives: Manage existing knowledge in both document and individual forms. Organize and present this knowledge in an accessible, user-friendly, and durable format. Develop various learning materials such as online courses, E-books, and Videos.

Teaching and Learning Activities

1. Theoretical Instruction: Provide lectures on knowledge management concepts and principles.
2. Collaboration with Police Scientific Evidence and Identification Division:
    I. Discuss project details, including challenges, needs, and objectives.
    II. Facilitate student interactions with police officers to gather information.
3. Student Project Development:
    I. Divide students into groups to develop knowledge management materials (e-books or other learning media).
    II. Provide ongoing guidance and consultation from instructors and police officers.
    III. Encourage students to utilize questioning techniques to extract knowledge from individuals.
    IV. Guide students in recording demonstrations or interviews to capture knowledge.
4. Project Presentations:
    I. Preliminary presentation: Students present their project drafts for feedback and improvement.
    II. Final presentation: Students present their refined projects to the class and police officers.
5. Real-World Implementation:
    I. Selected student projects are implemented within the Police Scientific Evidence and Identification Division.
    II. Due to the practical nature and partial confidentiality of the knowledge, some projects cannot be publicly disseminated.
    III. Examples of implemented projects include electronic manuals for police officers on firearm examination,crime scene investigation, fingerprint analysis, DNA testing, and blood examination.

Lessons Learned

The project effectively addresses the challenge of knowledge loss upon police officers' retirement. Student-developed knowledge management materials enhance the organization's efficiency and reduce training costs. The modern, user-friendly, and engaging nature of the materials is highly appreciated by the police division.

Conclusion

The implementation of the Service-Learning and Experiential Learning model in the Knowledge Management course has proven to be a valuable learning experience for students and a beneficial contribution to the Police Scientific Evidence and Identification Division. The model has successfully addressed the organization's knowledge management challenges and provided students with real-world problem-solving opportunities.

The Results of the Students' Satisfaction Assessment Towards the Learning Model of Social Service Combined With Experiential Learning in the Educational Technology Program

Table 1: Summary Table of Student Satisfaction Assessment of LMISEL Model

Satisfaction Areas Level	Mean	Percentage	Satisfaction
Service or Coordination			
1. Able to request information within responsibilities	4.56	91.78	Highest
2. Staff had knowledge and could explain well	4.54	90.71	Highest
3. Overall satisfaction with activity	4.56	91.18	Highest
Total	4.55	90.71	Highest
Consulting and Advising			
1. Project team provided good consulting and guidance	4.55	90.71	Highest
2. Course instructors provided good consulting and guidance	4.58	91.65	Highest
Total	4.57	91.02	Highest
Working			
1. Media production equipment suitable	4.58	91.34	Highest
2. Obstacles in media production	4.43	87.56	Highest
3. Filming/production location suitable	4.57	91.02	Highest
4. Everyone worked fully as assigned	4.57	91.02	Highest
Total	4.54	90.55	Highest
Submission			
1. Production time period suitable	4.63	92.60	Highest
2. Submission channel suitable	4.54	90.55	Highest
Total	4.59	91.80	Highest
Benefits Received			
1. Applied for self-development	4.61	91.97	Highest
2. Applied for career choice	4.56	90.87	Highest
3. Applied knowledge correctly	4.61	91.81	Highest
4. Able to explain to others	4.60	91.81	Highest
5. Produced beneficial media for community	4.61	92.13	Highest
Total	4.60	91.81	Highest
Overall Satisfaction Score			
Total	4.57	91.02	Highest

From the analysis of the satisfaction assessment summary table for the media production project to raise awareness for CSI Thailand, it was found that all assessed items across the 5 areas of 1) Service or Coordination e.g. able to request information, knowledgeable staff, overall satisfaction 2) Consulting and Advising e.g. good guidance from project team and instructors 3) Working e.g. suitable equipment, obstacles, location, everyone worked fully 4)

Submission e.g. suitable time period, channel and 5) Benefits Received e.g. applied for self-development, career, knowledge, able to explain, produced beneficial media, had an overall mean satisfaction score of 4.57 at the highest level. 1) Service or Coordination had a mean satisfaction of 4.55 at the highest level. Section 2) Consulting and Advising had a mean satisfaction of 4.57 at the highest level. Section 3) Working had a mean satisfaction of 4.54 at the highest level. Section 4) Submission had a mean satisfaction of 4.59 at the highest level. Section 5) Benefits Received had a mean satisfaction of 4.60 at the highest level.

The summary of reflecting on the learning outcomes found that the benefits occurred not only for the students who could apply it for self-development in their future careers or further studies. The feedback from students found that it was a very good experience to have the opportunity to work with large organizations and learn the work processes, gaining more understanding of the work of forensic police officers and inspiring future careers. The work was fun and informal. They had new experiences such as learning the DNA testing process step-by-step and gained more understanding about personal and property safety. They felt more engaged and understood the lessons better by having to learn from information not commonly available, requiring a deep understanding of the rare and unfamiliar content, so this project greatly developed their learning. They got to work with others, learn real work experience, learn formal working methods, and work together with police officers, exchanging knowledge - an invaluable experience. They felt very fortunate to learn from the police officers, never thinking they would get to see and do things like this. It was fun and challenging their abilities.

The benefits for external organizations were receiving promotional media or educational media for communicating with the public or between agencies that matched the problems and needs of the organizations, and were modern and economical without incurring costs and budgets for knowledge management.

The benefits for the instructors were providing academic services to society, communities, and external agencies, and learning teaching methods by working together with students and staff teams from various agencies to improve and make the teaching most effective. There was another target group that benefited from this teaching model, which were the service recipients, meaning the general public, communities, and society who watched the promotional media or educational media to understand and access quality and modern state services.

Discussion

Creating a Learning Model Through Social Service Combined With Experiential Learning in the Educational Communication Technology Program: Service Learning

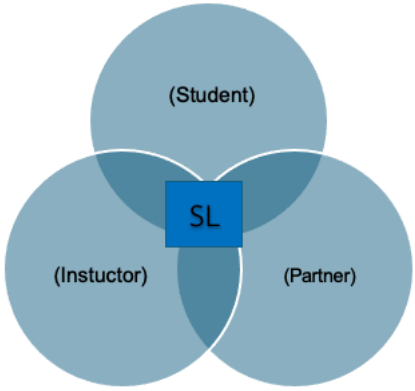

Figure 1: The Elements of Service-Learning (The Science Education Resource Center, 2018)

Service-Learning is a form of learning that integrates classroom education with community service activities. The objective is for students to apply the knowledge and skills they have learned to solve real problems in the community or for community development. At the same time, they gain additional experiences and knowledge from practical implementation. This type of learning usually emphasizes student participation, development of social skills, and fostering a sense of social responsibility. The key elements of Service-Learning include meaningful community service, linking to education, reflection, and evaluation. Service-Learning is considered an effective way of learning because students learn from practical experience, develop social skills, and cultivate a sense of participation and responsibility towards society.

The Experiential Learning model means learning occurs through the work cycle of students collaborating with others, and the reflective outcome is that students gain deeper skills and understanding about the real needs of the community. Service-learning instruction is a flexible form of teaching that can be used in both classrooms and diverse communities. The main drivers are the students, the community where students implement their projects, and the instructors, working together to develop effective learning projects and service activities. Learning is linked to the course content, with clearly defined learning goals. Service activities with meaning that respond to the needs identified by the community help students learn from real experiences. In organizing projects, students enjoy working in teams and dedicate time fully to learning the course lessons, as they recognize technology's important role in the work. Service-learning allows students to develop connections between theoretical education, research, and actual practice in the community - a broader perspective than just classroom learning. Aligning with Mehra's (2004) research, service-learning helps empower students, leading to calls for schools to incorporate it into curricula to instill consciousness in students for participating in participatory action research (PAR), service learning, and community informatics monitoring (CI). Clearly and tangibly linking PAR, CI and information and communication technologies (ICTs) in the networked information society will enhance community empowerment and social equity. In library and information science education in the US, there have been joint efforts by department instructors and universities to support PAR and create CI curricula at the graduate level to facilitate and model connecting students

with community stakeholders through service learning. This approach leads to 1) establishing social justice, 2) systematic library and information science education coupled with community development research, 3) raising awareness and credibility of the library/information profession as a community representative, and 4) learning about equity and empowering people to coexist through mutual learning projects (Gurstein, 2000).

Service-learning combined with Experiential Learning sets clear goals for learning and community engagement. The learning management process is as follows:

Figure 2: The Learning Process of LMISEL Model

This aligns with Furco (1996), who stated that purposeful Experiential Learning uses an academic context to design service projects, learning through service activities. Such learning occurs when both the service provider and recipient benefit from the activities. Eyler & Giles (1999, p.5) stated that in the experiential education model, learning takes place through the work cycle of students collaborating with others, and the reflective outcome is that students gain deeper skills and understanding about the real needs of the community. Osman & Petersen (2013, pp. 4-7) stated that student-centered teaching, participatory teamwork, hands-on practice, communication dialogues, finding suitable spaces for engaging with diverse communities allow students to see different perspectives and use independent reasoning in decision-making. This teaching approach enhances student effectiveness, producing quality graduates and good global citizens.

Service-learning instruction is a flexible form of teaching that can be used in both classrooms and diverse communities. The main drivers are the students, the community where students implement their projects, and the instructors, working together to develop effective learning projects and service activities. Learning is linked to the course content with clearly defined learning goals. Service activities with meaning that respond to the needs identified by the community help students learn from real experiences in organizing projects.

The Science Education Resource Center (SERC) at Carleton College (2018) summarizes that service-learning is purposeful, real Experiential Learning that designs service projects linked

to the course content being studied. The projects are evaluated periodically, and students, community, instructors and those involved all learn and benefit from the community service projects.

Summary

Importance of Community Service and Experiential Learning

I. Integrating community service and Experiential Learning allows students not only to learn theory, but also to practice, providing beneficial experiences that can be applied to their future work life and daily life.
II. Community service helps foster social responsibility and makes students feel more connected to the community.
III. Impact on Future Teaching and Learning
IV. This learning model can serve as a model for other curricula to adopt and enhance the effectiveness of teaching and learning.
V. It can help reduce rote learning problems and increase hands-on learning, equipping students with comprehensive skills to take on future challenges.

Recommendation for Future Research

I. Further research should evaluate the long-term impacts of this learning model on student skill development.
II. This learning model should be continuously improved and developed to align with changing technologies and societal needs.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The teaching of quantitative research design in the social sciences is crucial, but learners' learning motivation are limited and there is a lack of more case studies and timely diagnostic guidance. Utilizing case scenarios and giving scaffolding guidance helps to address these limitations. In this study, we designed an educational game that combines case studies and progressive guidance on the Generative AI (GAI) scaffolding. This study develops an innovative scaffolding guidance module for GAI scripts. When a player asks a question, the player will not be told the answer directly. Instead, it gradually guides the player to find the research design problem and think in the direction of appropriate analytical methods. Learners play the role of an anxious graduate student facing a research bottleneck. For a limited time, he can have a discussion with the scaffolding guide to the NPC played by GAI. A total of 18 people participated in the empirical evaluation of this study. The study found that learners had high flow, low anxiety, found the game fun during the game, and had a desire to play again. (All scores are significantly higher than 3, i.e., the median of the scale.) Learners felt that this game enhanced research design thinking more than the conventional curriculum. 72% of the participants felt that the game helped in understanding the concepts of the research design. 78% of the participants felt that the NPC characters would give guiding hints to help learners find the information they need to solve problems online.

Introduction

The teaching of quantitative research design and statistical learning in the social sciences is critical to the development of researchers. In terms of quantitative research design, students and academics often find the units of quantitative research methodology not only challenging but also anxiety-provoking. In a study by Navodya and colleagues (2022), difficulties in writing research papers and deficient statistical knowledge were shown to be the two main reasons for learners' poor performance. In the study of statistics, there is now a greater demand for statistics teaching and expertise in higher education than ever before, but there is a general lack of motivation among students to learn and a feeling that they do not have the necessary skills (Bromage et al., 2021). In addition, there are other limitations, such as limited teaching time, lack of more case studies and timely diagnostic guidance. Many studies have indicated that the use of game-based learning is an effective teaching strategy (Chien et al., 2024). Generative AI is characterized by Large Language Models (LLMs), which are progressive and adaptive to generate interactive conversations. This advantage is combined in the teaching strategy of contextualized games, and then with the use of case scenarios of story scripts, not only can the Generative AI as a scaffolding for immediate feedback, but also guide learners to discover the problem and search for knowledge, resulting in a flow status, which is expected to improve the learning motivation and learning effectiveness.

However, if learners are passive and get their answers directly from the scaffolding, students will not have the opportunity to think cognitively at a high level and select appropriate analytical methods. According to Limbach and Waugh (2010), active learning, appropriate questioning techniques, and structured feedback enable students to higher level thinking and enjoy it. Chien and colleagues (2024) suggest that Generative AI can provide more realistic scaffolding feedback and guidance if it is used as an NPC (Non-Player Character) in role-playing educational games with contextualization. In this study, we design a Generative AI educational game that combines contextual cases with feedback scaffolding. When players ask questions in the game, the Generative AI will not directly tell the players the answers, but rather progressively guide the players to find the questions in the research design and think in the direction of appropriate analytical methods.

Methods

A total of 18 participants were involved in the initial empirical evaluation of this study. The participants were master's degree students from different universities in Taiwan, and they were all over 22 years old. As shown in Figure 1, learners play the role of an anxious graduate student facing a research bottleneck. For a limited time, he can discuss a flawed research design with the scaffolding guide to the NPC played by GAI, then propose a modified research proposal on Google Forms and pass the professor's assessment. As shown in Figure 2, the NPC will not give the player the answer directly, but is only responsible for the role of guidance, the player needs to go to the Internet to check, find the correct information and then confirm with the NPC, the player will get more feedback and confirm the thinking. In this game, players must also utilize their communication, data search and problem solving skills to learn statistical knowledge related to quantitative research design until the end of the game.

Figure 1: GAI Contextualized Game Platform and Google Form Interactive Feedback Mechanisms

Figure 2: Generative AI Progressively Guided Conversations With Feedback Scaffolding

Results and Discussion

Participants in this study completed post-test questionnaires after the completion of the game, including questionnaires on flow status (Table 1), activity anxiety, game acceptance, usefulness and ease of use, and elements of the game (Table 2), and qualitative analyses, and descriptive statistical analyses were conducted using a single-sample t-test. Table 1 shows the descriptive statistical analysis of the learners' flow status after completing the task. The overall flow (M=4.07, SD=0.65) is significantly higher than the median of the scale (i.e., 3). Flow antecedents (M=4.05, SD=0.75), flow experience (M=4.08, SD=0.73), and other flow average dimensions are all high at a median of the scale (i.e., 3). Most of the sub-dimensions had mean scores higher than 4. In the sub-dimension of flow status, learners scored higher on the items of control (M=4.36), playability (M=4.31) and autotelic experience (M=4.31). This indicates that the contextualized design of the GAI educational game enables the learner to have a high sense of self-control and sufficient playability, in addition to which the player is able to participate in the activity from the heart and will feel that the activity itself is sufficiently satisfying to constitute a reward, and will be immersed in the game in order to actively participate in the game tasks and complete the goals.

Table 1: The Mean and Standard Deviation of Learners' Flow

(n=18)

	M	*SD*	*Z*	Sig.
Overall Flow	4.07	0.65	3.57^{***}	0.000
Flow antecedents	4.05	0.74	3.42^{***}	0.000
Challenge-skill balance	3.61	1.12	2.09^{*}	0.037
Goals of an activity	4.19	0.89	3.40^{***}	0.000
Unambiguous Feedback	3.78	1.07	2.58^{*}	0.010
Control	4.36	0.87	3.51^{***}	0.000
Playability	4.31	0.82	3.47^{***}	0.000
Flow experience	4.08	0.73	3.51^{***}	0.000
Concentration	4.15	1.11	3.00^{**}	0.003
Time distortion	4.14	0.94	3.28^{**}	0.001
Autotelic experience	4.31	0.62	3.64^{***}	0.000
Loss of self-consciousness	3.44	1.25	1.46	0.145

$^{*}p < 0.05$, $^{**}p < 0.01$, $^{***}p < 0.001$

Table 2 shows the descriptive statistical analysis of learners' game anxiety, game acceptance and game elements. Overall anxiety (M=2.29, SD=0.91) was lower than the median of the scale (i.e., 3) and reached significance. Moderately low anxiety is an important indicator of sustained flow during gaming activities. In addition, overall game acceptance (M=4.20, SD=0.50), game usefulness (M=4.21, SD=0.61), game ease of use (M=4.19, SD=0.70), and game elements (M=4.16, SD=0.85) were also significantly above the median (i.e., 3) of the scale.

Table 2: The Mean and Standard Deviation of Learners' Game Anxiety, Game Acceptance, and Game Elements

(n=18)

	M	*SD*	*Z*	Sig.
Game Anxiety	2.29	0.91	-2.63**	0.009

Game Usefulness	4.21	0.61	3.60***	0.000
Game Ease of Use	4.19	0.70	3.59***	0.000
Game elements	4.16	0.85	3.40***	0.000

Conclusion and Limitations

"Senior Sister Help Me" is an educational learning game developed by this study that lets the player take on the role of an anxious graduate student through the use of GAI progressively real-time feedback and case scenario simulation, with an emphasis on training in research methodology and statistical analysis. It also allows learners to use their communication, information-seeking and problem-solving skills to complete tasks and develop higher-level cognitive thinking skills. The study found that learners had high flow, low anxiety, found the game fun during the game, and had a desire to play again. (All scores are significantly higher than 3, i.e., the median of the scale.) Learners felt that this game enhanced research design thinking more than the conventional curriculum. 72% of the participants felt that the game helped in understanding the concepts of the research design. 78% of the participants felt that the NPC characters would give guiding hints to help learners find the information they need to solve problems online. Future research could increase the sample size and include a control group to compare and analyze the progressively scaffolding-oriented NPC conversational feedback mechanism with the contextualized game using the GAI mechanism, and to explore more deeply the differences in learning effectiveness and higher-level cognitive thinking skills between the research methods and statistical analyses.

Official Conference Proceedings

Abstract
With the drive for increased internationalization, the Taiwanese government has expanded English as a Medium of Instruction (EMI) courses in higher education. English major students are particularly exposed to these courses. To understand their emotional responses, the authors conducted a survey completed by 200 Taiwanese English major students for the purpose of examining their feelings towards EMI courses and how their past English learning experiences influenced their positive and negative emotional reactions. The findings suggest that participants generally experienced more positive than negative emotions towards EMI. Students who majored in English in senior high school and had previous EMI course experience perceived EMI more positively and less negatively compared to those who did not. Additionally, students who had been taught by native English-speaking teachers showed stronger positive and negative emotions towards EMI than those who had not. These findings have implications for EMI teachers, suggesting they should consider students' past learning experiences to better address their emotional responses.

Introduction

In the context of increasing global internationalization, the acquisition of foreign languages, particularly English due to its role as a global lingua franca, is considered essential for promoting educational internationalization and fostering global citizenship. Consequently, there is a growing global trend toward implementing bilingual or multilingual policies (Fantini, 1991; Singh et al., 2012).

Responding to this trend, the Taiwanese government introduced the “2030 Bilingual Nation Policy Development Blueprint” in December 2018. By September 2021, the Ministry of Education (MOE) launched the "Higher Education Bilingual Learning Program." This initiative seeks to equip students with international expertise in their respective fields, enhancing their ability to communicate, collaborate, and engage with global professionals (National Development Council, 2018).

The program is centered on two key pillars: “Key Cultivation” and “Widespread Enhancement.” It emphasizes strengthening students' English proficiency and expanding English-Medium Instruction (EMI) courses, with the overarching goal of enhancing the international competitiveness of Taiwan's higher education sector (Ministry of Education, 2021).

The expansion of English-Medium Instruction (EMI) in Taiwan is evident in the significant increase in EMI courses: from 16,450 courses in the 2009 academic year to 24,077 courses in 2015 (MOE, Taiwan, 2015, as cited in Tsou & Kao, 2017, p. 11). Many universities have actively promoted EMI programs and courses, creating a trend aimed at advancing English proficiency through EMI pedagogy. This movement is guided by five key principles: "enhancing students' competitiveness in the job market, helping students build foundations for advanced studies, attracting international students, improving the quality of higher education, and fostering a multicultural environment" (Tsou & Kao, 2017, p. 11).

To gain a deeper understanding of how EMI impacts students' learning experiences, this study explores the experiences of local university students in Taiwan when English-speaking foreign instructors deliver courses in English. Specifically, it examines the emotional responses of English majors in EMI courses taught by native English-speaking teachers.

Literature Review

This section reviews previous studies on students' emotional responses to EMI courses across different countries.

Chien and Valcke (2020) found that certain learning activities in EMI courses may induce anxiety and a sense of alienation if the instructor does not clearly communicate the purpose or function of the activities. However, when instructors are friendly and supportive, students tend to feel more at ease, making them more inclined to engage in discussions. Additionally, providing students with more waiting time and pauses during questioning can reduce stress levels in EMI courses. For students with lower English proficiency, the use of their first language (L1) by instructors can also alleviate anxiety and foster greater participation in learning activities.

Huang (2015) identified insufficient English proficiency as the primary source of anxiety among participants. Learning anxiety, motivation, and a sense of achievement were inversely related, with participants experiencing the highest levels of anxiety due to their perceived lack of English proficiency. The study revealed significant differences in anxiety levels between local and international students, with local students reporting higher anxiety levels. This was attributed to difficulties in understanding course content and the pressure of competing with peers, all of which were exacerbated by their perceived lower proficiency in English.

Similarly, Hillman and colleagues (2023) found that students from non-majority language schools and similar linguistic backgrounds frequently experienced feelings of frustration, anxiety, disappointment, shame, and embarrassment in EMI courses due to their inadequate English proficiency. These emotions also affected their sense of belonging in the university environment. Conversely, students from EMI schools and higher socioeconomic backgrounds felt more confident in their EMI experiences. On the other hand, students from Nepali-medium schools and lower socioeconomic backgrounds expressed a lack of confidence in English, which led to feelings of frustration, disappointment, and embarrassment.

Yuan and colleagues (2023) explored the emotional experiences of graduate students from China enrolled in an EMI teacher education program in Macau. Initially, students felt positive emotions such as hope and excitement as they entered the program with high expectations. However, as time progressed, emotions like anger, boredom, and disappointment emerged, leading to feelings of marginalization and confusion.

Hopkyns and Gkonou (2023) highlighted that EMI courses present both opportunities and challenges, often provoking mixed emotions. Participants reported positive emotions, including confidence and pride, but also negative emotions such as anxiety, guilt, shame, and a sense of (un)belonging. While EMI courses tend to evoke more negative emotions overall, individual experiences vary. In particular, female students, regardless of their performance, identity, or sense of belonging, experienced emotions tied to language use in EMI contexts. While most students expressed neutral emotions towards translanguaging practices in EMI settings, about one-third reported negative feelings toward these practices.

Adamson (2022) identified shame as a predominant emotion among students in EMI secondary classrooms in Tanzania. Fear and shame were commonly experienced, particularly when one student's persistent silence during class led to others becoming reluctant to speak English. In over 50 classroom observations, nearly 30 instances revealed students visibly expressing discomfort through body language. Fear and shame were often discussed together and linked to low self-esteem and confidence, with students indicating that their fear stemmed primarily from the anticipation of shame. It is speculated that this may be due to the public nature of classroom activities, where high visibility may trigger feelings of shame and humiliation.

Based on the above review of relevant literature, it is evident that EMI courses have a substantial impact on students' emotions. These effects may include positive emotions related to language learning, such as confidence, pride, a sense of achievement, and interest. However, EMI courses can also evoke negative emotions, including anxiety, shame, anger, boredom, and a sense of not belonging.

To build upon the existing literature, this study seeks to explore the various factors that may influence English major students' emotional responses to EMI courses taught by native English-speaking teachers in Taiwan. The factors under consideration include gender, academic major, prior EMI course-taking experiences, and previous interactions with native English-speaking teachers. The research questions are as follows:

- RQ1: To what extent do the participants agree with the various emotional reactions experienced in EMI classes taught by native English-speaking teachers?
- RQ2: Does gender (male or female) make a difference in the extent to which the participants respond emotionally to EMI courses?
- RQ3: Does their past major (in English or not) make a difference in the extent to which the participants respond emotionally to EMI courses?
- RQ4: Do their past EMI experiences (yes or no) make a difference in the extent to which the participants respond emotionally to EMI courses?

Methodology

The primary participants of this study were university students majoring in English. The research specifically focused on students who had experienced English instruction delivered by foreign instructors, selected through convenience sampling.

The questionnaire was divided into three sections and collected basic demographic information about the participants. The survey aimed to explore participants' emotional experiences in English-medium instruction (EMI) and examine how their demographics, along with past learning experiences, influenced their emotional responses to EMI courses taught by native English-speaking teachers.

What follows presents the items in the survey:

1. Gender：□ Male □ Female
2. Was your senior high school major applied foreign languages? □ Yes □ No
3. Did you have classes taught by foreign teachers before university? □ Yes □ No

Ranking to indicate the extent of agreements	1	2	3	4	5
4. I feel proud in the classroom.					
5. I feel confident in the classroom.					
6. I look forward to the next class in the classroom.					
7. I am satisfied with the EMI course.					
8. I find the EMI course interesting.					
9. I feel scared in class.					
10. I feel ashamed in class.					
11. I feel confused in class.					

12. I feel frustrated in class.					
13. I feel uncomfortable in class.					

The survey items were distributed as an online questionnaire to the participants who were approached on social media platforms popular with Taiwanese university students, namely, Dcard in February, 2024. 150 valid questionnaires were successfully collected.

An independent sample t-test is a statistical method used to compare whether there are statistically significant differences in the means between two independent groups. In this study, we have two independent samples composed of different participants, such as males and females, those who majored in English and those who did not. Through this test, the researcher can assess whether there are statistically significant differences in the extent of emotional responses to EMI courses between these groups. This is an appropriate choice because it allows for comparisons in the study and determines if there are significant differences between different subgroups.

Findings

Findings for RQ1: To what extent do the participants agree with the various emotional reactions experienced in EMI classes taught by native-speaking instructors?

As shown in Table 1, participants generally expressed stronger agreement with positive emotional responses compared to negative ones, as indicated by the respective mean values. The average mean for positive emotions was 3.38, while the average mean for negative emotions was 2.59.

In terms of positive emotional responses, participants showed the highest agreement with the emotion "Satisfied" (Mean=3.65), followed by "Interested" (Mean=3.62), and "Looking forward to the next class" (Mean=3.42). The least endorsed positive emotion was "Confident" (Mean=3.09).

Regarding negative emotional responses to EMI courses, the emotions ranked highest by participants were "Scared" (Mean=2.72), followed by "Confused" (Mean=2.69), and "Frustrated" (Mean=2.55). The least chosen negative emotional response was "Uncomfortable" (Mean=2.24).

Table 1: Emotional Reactions Towards EMI Classes

Descriptive Statistics				
Emotions		N	Mean	Average
Positive Emotion	Satisfied	150	3.65	3.38
	Interested	150	3.62	
	Looking forward to the next class	150	3.42	
	Proud	150	3.11	
	Confident	150	3.09	
Negative Emotion	Scared	150	2.72	2.59
	Confused	150	2.69	
	Frustrated	150	2.55	
	Ashamed	150	2.38	
	Uncomfortable	150	2.24	

Findings for RQ2: Does gender (male or female) make a difference in the extent to which the participants respond emotionally to EMI courses?

As indicated in Table 2, independent-samples t-tests revealed no significant differences in participants' emotional responses to EMI courses based on gender.

However, in terms of mean values, male students showed slightly higher endorsement than female students in two positive emotions: "Proud" (Mean for males=3.22; Mean for females=3.04) and "Confident" (Mean for males=3.17; Mean for females=3.03), as well as in two negative emotions: "Ashamed" (Mean for males=2.43; Mean for females=2.34) and "Uncomfortable" (Mean for males=2.25; Mean for females=2.23). Despite this, the average mean values of positive emotions were identical for both genders (Average Mean for males=3.38; Average Mean for females=3.38).

Conversely, female students showed slightly higher endorsement than male students in three positive emotions: "Looking forward to the next class" (Mean for females=3.46; Mean for males=3.37), "Satisfied" (Mean for females=3.70; Mean for males=3.57), and "Interested" (Mean for females=3.66; Mean for males=3.57). Additionally, females reported higher levels of three negative emotions: "Scared" (Mean for females=2.80; Mean for males=2.60), "Confused" (Mean for females=2.82; Mean for males=2.50), and "Frustrated" (Mean for females=2.66; Mean for males=2.40). In terms of the average mean values for negative emotions, females demonstrated slightly higher levels of negative emotional responses compared to males (Average Mean for males=2.44; Average Mean for females=2.57).

	Uncomfortable	Male	60	2.25	0.110	148	0.913
		Female	90	2.23			
Average Mean of negative emotions for male: 2.44 Average Mean of negative emotions for female: 2.57							

Findings for RQ3: Does their past major (in English or not) make a difference in the extent to which the participants respond emotionally to EMI courses?

As shown in Table 3, independent-samples t-tests revealed several significant differences in emotional responses based on whether students' past major was English or not.

In terms of mean values, students who had majored in English during senior high school generally exhibited stronger endorsement of positive emotions and lower endorsement of negative emotions compared to those who did not major in English. For example, the average mean value for positive emotions among students who had previously majored in English was 3.45, while it was 3.29 for those who did not. Similarly, the average mean value for negative emotions was 2.35 for students who had majored in English, compared to 2.71 for those who had not.

Table 3 also highlights that students who majored in English in senior high school differed significantly in their emotional responses to EMI courses compared to those who did not, particularly in relation to four negative emotions: "Scared" ($t(148)=-2.294$, $p=0.023$*), "Ashamed" ($t(148)=-2.937$, $p=0.004$**), "Frustrated" ($t(148)=-2.370$, $p=0.019$*), and "Uncomfortable" ($t(148)=-2.412$, $p=0.017$*).

The mean values further indicated that students who had previously majored in English showed significantly lower endorsement of negative emotions towards EMI courses. For instance, the mean values for "Scared" (2.55), "Ashamed" (2.19), "Confused" (2.55), "Frustrated" (2.38), and "Uncomfortable" (2.08) were lower compared to those who did not major in English, whose mean values were "Scared" (2.91), "Ashamed" (2.60), "Confused" (2.86), "Frustrated" (2.76), and "Uncomfortable" (2.43).

Findings for RQ4: Do their past EMI experiences (yes or no) make a difference in the extent to which the participants respond emotionally to EMI courses?

As suggested in Table 4, students with experience in EMI courses showed positive emotions to a greater extent than those without, given the relative average mean values: 3.48 for those with EMI experience vs. 3.01 for those without. Conversely, students with experience in EMI courses showed negative emotions to a lesser extent than those without, given the relative average mean values: 2.40 for those with EMI experience vs. 2.96 for those without.

The results from independent-samples t-tests on this question showed several significant differences in emotional responses based on the experiences of taking EMI courses. Specifically, students with experience in EMI courses demonstrated significantly different endorsement levels of emotional responses compared to those without such experiences, in terms of five positive emotions: "proud" $t(148)=2.768$, $p=0.006^{**}$; "confident" $t(148)=3.526$, $p=0.001^{***}$; "looking forward to the next class" $t(148)=2.952$,$p=0.004^{**}$; and "interested" $t(148)=2.345$, $p=0.02^{*}$.

Among the aforementioned significant differences in endorsement levels of emotional responses, the relative mean values suggested that those with EMI course-taking experiences endorsed the following positive emotions to the following levels: means for "proud"=3.21; means for "confident"=3.21; means for "looking forward to the next class"=3.53; means for "satisfied"=3.73**;** and means for "interested**"=**3.70**.** All of these means are significantly higher than the corresponding mean values observed in those who did not have experience with taking EMI courses: means for "proud"=2.75**;** means for "confident"=2.63**;** means for "looking forward to the next class"=3.03**;** means for "satisfied"=3.34**;** and means for "interested"=3.31**.**

Table 4 also indicates that students without experience in EMI courses demonstrated significantly higher endorsement of five negative emotional responses, according to the independent-samples t-tests: "scared" $t(148)=-2.897$, $p=0.004^{**}$; "ashamed" $t(148)=-3.485$, $p=0.001^{***}$; "confused" $t(148)=-2.577$, $p=0.011^{*}$; "frustrated" $t(148)=-3.357$, $p=0.001^{***}$; and "uncomfortable" $t(148)=-2.995$, $p=0.003^{**}$.

The corresponding mean values observed in those without experiences in EMI courses are listed as follows: means for "scared"=3.16; means for "ashamed"=2.84; means for "confused"=3.09; means for "frustrated"=3.06; and means for "uncomfortable"=2.66. In contrast, the corresponding means for those who have experience with taking EMI courses are as follows: means for "scared"=2.60**;** means for "ashamed**"=**2.25**;** means for "confused"=2.58; means for "frustrated"=2.42; and means for "uncomfortable"=2.13**.**

Discussion and Conclusion

What comes next summarizes the main significant differences identified in this study in terms of the emotional responses demonstrated by different kinds of survey participants.

First, it appears that participants of the two genders held similar preferences for EMI courses, as no significant differences were found in independent-samples t-tests. However, in terms of the Mean values, females tended to feel more negative towards EMI courses than males, while both genders demonstrated positive emotions to the same extent.

Second, those who did not major in English in senior high school felt significantly more scared, ashamed, frustrated, and uncomfortable than those who did. Overall, those without English major experiences in senior high school felt more negative towards EMI courses than positive.

Third, those who had taken EMI courses felt significantly more proud, confident, interested, satisfied, and looked forward to the next class more than those without such learning experiences. Conversely, those who had no experience with EMI courses felt significantly more scared, ashamed, confused, frustrated, and uncomfortable than those who had taken EMI courses. In general, those with EMI course experiences felt more positive towards EMI than those who didn't, while those without EMI course experiences felt more negative towards EMI than those who did.

To compare the findings derived from this thesis to those in relevant studies in existing literature, it is found that this study identified similar patterns. For instance, the findings of the present study align with Hillman (2022) in terms of positive emotions, such as pride, in taking EMI courses. As seen in the present study, participants enrolled in EMI courses tended to feel prouder compared to those who weren't. The findings of the present study regarding participants not taking EMI (English-Medium Instruction) courses feeling more ashamed than those enrolled in EMI courses align with the studies conducted by Hillman and colleagues (2023) and Hopkyns and Gkonou (2023). Hillman and colleagues (2023) delve into the emotional impacts of educational settings, particularly focusing on negative emotions such as frustration and stress experienced by students in EMI in higher education. Hopkyns and Gkonou (2023) explore the complex emotional experiences of stakeholders in EMI, highlighting a range of emotions such as pride, confidence, anxiety, guilt, shame, and feelings of (un)belonging.

Furthermore, the findings of this study emphasize the importance of participants' EMI-related experiences and their non-EMI background in high school, which can profoundly influence their emotional reactions to EMI in college. As shown in the survey responses, participants with experiences of taking EMI courses felt more positive towards EMI than those who didn't. Conversely, those without experience in EMI courses felt more negative towards EMI than those who did. These findings resonate with prior research indicating that students' high school background and their unfamiliarity with EMI (e.g., not majoring in English or not being taught by foreign teachers in high school) serve as significant challenges during their transition to college-level EMI (e.g., Aizawa & Rose, 2020; Zhou & Rose, 2021).

Understanding these dynamics can provide valuable insights into the emotional journey of students navigating the shift to EMI environments, thereby informing strategies to support adjustment and well-being. It emphasizes the importance of understanding students' backgrounds in terms of their previous learning experiences to accommodate them appropriately and to be more aware of potential emotional responses, such as anxiety or fear. By recognizing and addressing these emotional aspects, educators and institutions can create a more supportive and conducive learning environment for all students.

Moreover, this study contributes to the existing literature by delving into the dimension of gender. The examination of gender differences reveals intriguing insights into the emotional responses of participants towards EMI courses. Specifically, the findings indicate that females tended to exhibit more negative emotions concerning EMI courses compared to their male counterparts. This gender discrepancy in emotional reactions underscores the need for a nuanced understanding of how individuals from different gender backgrounds perceive and engage with EMI learning environments. Furthermore, while females demonstrated a tendency towards negative emotions, it is noteworthy that both genders displayed positive emotions within EMI courses.

This finding suggests that despite potential gender differences in emotional responses, EMI environments have the capacity to evoke positive sentiments among students regardless of gender. Understanding these gender dynamics enriches our comprehension of the complex interplay between individual characteristics and emotional experiences in educational settings. In essence, the exploration of gender in this study not only expands upon existing research but also highlights the importance of considering gender as a relevant factor in understanding students' emotional responses to EMI courses. By acknowledging and addressing gender-specific emotional needs, educators and institutions can tailor support mechanisms to foster a more inclusive and supportive learning environment for all students, irrespective of gender.

Some limitations must be acknowledged in this thesis, based on which some future research suggestions can be proposed.

Firstly, concerning the survey, there is a possibility of self-report bias: participants' responses to the questions may tend to be more favorable (i.e., positive emotions are preferred), leading to potential bias in the results. It is suggested that future researchers employ a qualitative research approach to examine the same topics. For example, they can conduct interviews to explore potential triggering factors that explain participants' various emotional responses in English-taught courses, such as which particular teaching techniques employed by EMI teachers cause students' anxiety or stress in class.

Secondly, this study did not take into account the relationship between students’ English proficiency levels and their various emotional responses. Future research could collect such information to examine the correlation between students’ proficiency levels and their endorsement of emotional responses.

The Use of Career Awareness Comic Book to Enhance English Language Learning for Primary School Students in the People's Republic of China

Li Yunchun, Rajamangala University of Technology Thanyaburi, Thailand
Metee Pigultong, Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
In China, primary school serves as the initial phase of English instruction and career awareness education. Numerous issues in contemporary English language instruction have resulted in the ineffectiveness of English acquisition. Insufficient career awareness education will result in pupils' deficiency in life goal planning. This research enhances career awareness and English education while promoting English instruction through comic book. The research aimed to: 1) compare the learning achievement scores after using the career awareness comic book. 2) Identify the rate of effectiveness after using the career awareness comic book. The population consisted of 76 students of the 5th grade students of a primary school. Use English for the career awareness comic book. The statistics used to analyze and interpret the data included mean ($\bar{X}$), standard deviation (S.D.), t-test, and effectiveness index. The research result found that 1) the paired t-test of pre-test and post-test showed that there were differences at the statistical significance level of 0.05 (t=42.10, p=0.00). The results also revealed that the effectiveness index was .2205; in other words, the students had higher post-test scores of 22.05 percent of cognitive score improvement.

1. Introduction

1.1 Research Background

Education is the foundation for talent cultivation and social development. In the present day, to cultivate innovative and multi-skilled talent who are able to adapt to global trade, continuous reform of the education system is needed, as well as the promotion of industry-education integration to train technological talent with international communication skills. English plays an important role in international exchange and cooperation, and the development of English education from a minority group's vocational training to universal education has become an important national strategy. However, for many primary school students, there are important difficulties and challenges in learning English well. Comic books, as a form of entertainment media, have attracted the attention of some readers with their strong visual impact and exaggerated artistic editing techniques (Wang & Zhang, 2023). This study focuses on the entertainment value of comic books and aims to explore new ways to promote English learning among primary school students.

1.2 Problem of Population

The difficulties and challenges faced by primary school students in learning English are varied. First, students have a serious exam-oriented education mentality, treating entrance exams as the main purpose of English learning (Hao, 2020). Second, Teachers' teaching strategies are outdated, the teaching content is monotonous, and They attempt to establish a teacher-centered knowledge-providing system. Third, students have not mastered the correct learning methods (Liu, 2021), and the rote learning method hinders students' autonomy in learning English. Fourth, primary School students lack the purpose and interest in learning English. Teachers lack interaction in teaching, and English education is not linked with personal experience. Fifth, this strong self-esteem forces them to avoid making mistakes, and when they do, they flinch. So in English learning, they are ashamed to talk with adults, especially with teachers.

1.3 Solution to Solve the Problems

At present, English teaching is undergoing continuous reform and innovation to make its teaching content closer to people's lives and the needs of social development. Based on the exploration of Wang Xiangping and other scholars on the ladder-style cultivation of students' career awareness (Wang et al., 2022), as well as the successful application of comic books in other subjects (Lin, 2023). This study attempts to design a vocational awareness comic book. based on vocational storylines for English teaching. By experimenting with Fifth-grade students from a primary school, this paper explores whether a career awareness comic book can promote primary school English learning.

1.4 Research Questions

This paper focuses on the following questions:

1) Can a career awareness comic book promote English learning for primary school students?
2) How effective are career awareness comic book in influencing the English learning of primary school students?

1.5 Research Objectives

1) To compare the learning achievement scores after using the career awareness comic book.
2) To identify about the rate of effectiveness after using the career awareness comic book.

2. Research Methods

The research population includes 200 Grade 5 students, the sample group includes 76 Grade 5 students in a primary school. The training time was two months. A questionnaire survey was conducted to conduct pre-training and post-training tests.

2.1 Research Design

This study explores the application of the career awareness comic book in English teaching through review, visit observation, material development, classroom experiments, and questionnaire surveys. To reflect the impact of the career awareness comic book on the English learning of primary school students, this study conducted experimental research using quantitative data analysis methods: the survey before and after the experiment formed a quantitative analysis model, namely pre-test (O_1), experimental (X), and post-test (O_2). The data sources for analyzing the effectiveness of the experimental activities are the tests before and after the experiment. The pre and post-test were conducted through questionnaire surveys of 76 fifth-grade students.

Pre-test	Activities	Post-test
O_1	X	O_2

O_1 Measurement of pre-test score
X Improving primary school students' English learning through the use of vocational awareness comic book
O_2 Measurement of post-test score

2.2 Research Instrument Development

This study divides the design of comic book content into four parts. The first part is about asking for directions, where students interact with traffic police, gain a basic understanding of urban architecture, and become familiar with the working environment of doctors through ambulances and hospitals. The second part is about seeking medical care. Students participate in situational experiences to deepen their understanding of doctors while also developing their communication skills and ability to express requests for help. The third part is our teachers, where students engage in dialogues and stories of teachers' daily lives to enhance their understanding of the teacher's role and develop their communication skills and abilities of the world around them. The fourth part is about the story of famous scientist Yuan Longping's research on hybrid rice, which allows students to learn about the spirit of scientific exploration and the awareness of resource conservation. The comic book page design size is 15CM*20CM, convenient for students to carry and read.

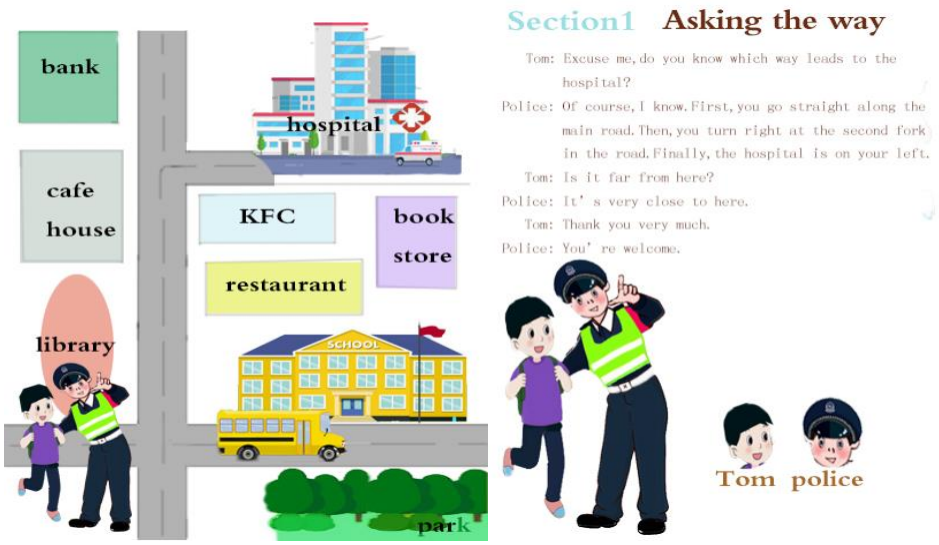

Figure 1: The Example of Career Awareness Comic Book Design

2.3 Implementation Period

The 76 students were divided into two classes, with 38 students in each class. Before the experiment, both classes were given an English test, and both groups were given the same questionnaire. At the beginning of the experiment, a career awareness comic book was used to teach English in two classes for 45 minutes per class, 3 classes per week for 2 months. The teacher dictated 10 words every week. The first 10 minutes of each class are for students' previews and one-on-one Q&A; the next 30 minutes are for teachers' lectures and interactions; and the last 5 minutes are for students' dialogue performances and discussions. If students discuss questions in the last 5 minutes of class, the teacher will answer them one-on-one in the first 10 minutes of the next class. Observe students every two weeks to learn about their classroom experience and to improve the classroom teaching plan. After the completion of the experimental teaching tasks, two classes of students conducted a questionnaire survey. During the experiment, the researcher will control the experimental conditions precisely, ensure the consistency of the experimental environment, teaching content, and teaching method, so as to reduce the interference factors in the experiment. The experimental process is shown in the following figures.

Figure 2: Implement the Teaching Process

Figure 3: Interview Observation

Figure 4: Pre-test Process

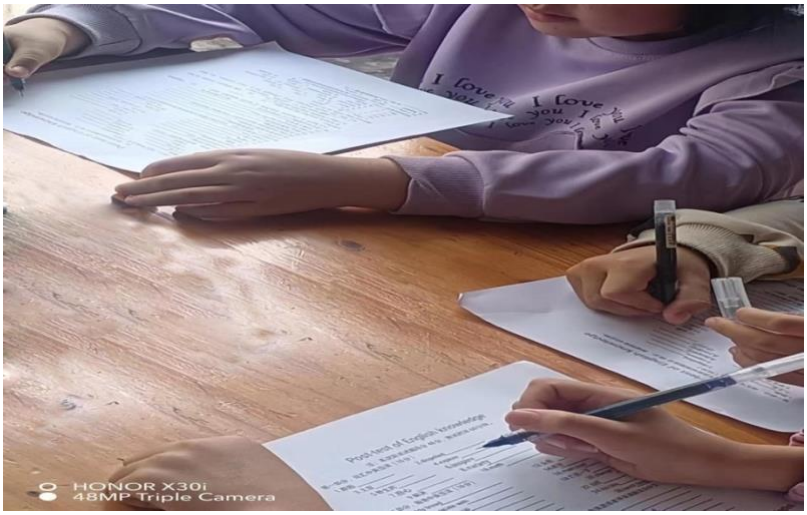

Figure 5: Post-test Process

2.4 Data Collection: Multiple methods are used for data collection, including observation visits, questionnaire surveys, etc., to obtain comprehensive research.

2.5 Data Analysis Method: Quantitative Data Analysis: Use statistical methods to analyze quantitative data on the promotion effect of career awareness comic book on English learning.

3. Research Results

1) Compare the learning achievement scores after using the career awareness comic book.

Table 1: Paired Samples t-Test of the Pre-test and Protest in Experimental Class

Items	Number of students	Difference of Mean	Std.	Std error of Mean	t-Test	df	Sig. (two-tails)
Post-test	76	6.05	1.25	0.14	42.10	75	0.00
Pre-test							

From Table 1, the paired t test of pre-test and post-test showed that there were differences at the statistical significance level of 0.05 (t=42.10, p=0.00), and the mean difference between the two tests was 6.05. This shows that the use of a career awareness comic book teaching model in a primary school grade 5 can indeed promote students' English learning.

2) Identify the rate of effectiveness after using the career awareness comic book.

Table 2: Statistical Table of the Results of Students' Post-test Results

Number of students	Total	P_2	P_1	Effectiveness index
76	3648	2022	1562	0.2205

P_1 = Pre-test
P_2 = Post-test
Total= Number of students × Total question score

From Table 2, the effectiveness index calculated from the above formula is 0.2205, which shows that the students had higher post-test scores of 22.05 percent of cognitive score improvement.

Conclusion

Through experimental teaching tests, it has been shown that the teaching method of the career awareness comic book is an interesting and practical teaching model that is close to students' real lives. It is very effective in cultivating students' interest and autonomy, promoting their English learning, and providing them with relevant professional knowledge experience in the process of learning English. Through experimental observation, it was found that some students are accustomed to reading career awareness comic book alone after class, so their

English learning is no longer limited to the classroom. Proper use of career awareness comic book with professional awareness can improve students' English learning outcomes. Some interviewees expressed that she is no longer afraid of expressing herself improperly and has confidence in learning English well.

Official Conference Proceedings

Abstract
This research was prepared for Promote the ability to think systematically about drawing ladder diagrams in the Mable Logic Control program. The sample consisted of 18 3rd year vocational certificate students. The data collection method was simple random sampling using lots. The experimental research design used in the experiment was a study of a single experimental group. Measured only after the experiment. The single group, posttest-design.The tools used in the research include: Problem-based learning management activities Measurement of systematic thinking ability (after class). Steps for creating it: 1. Study teaching and learning problems in the classroom. 2. Study principles concepts and theories. 3. Determine the structure and steps. Teaching and learning innovation. 4. Create innovation. 5. Create measurement tools. Ready to find the quality of the tools. 6. Take the innovation to be evaluated by experts to check the quality. 7. Take the modified innovation and use it to teach with real sample groups. The results of the research found that it has a mean value of ($\bar{x}$=4.69, SD=0.48) considered consistent with the assumption that it is at the passing level. (Learners passed the criteria of 80 percent or more of all students). The results of the 1st and 2nd systematic thinking ability tests were overall at a better level (with a score of 7 and above). The number of 16 people is 88.88 percent and the number of 15 people is 83.33 percent, which is according to the assumptions made.

Introduction

In an era marked by rapid changes in technology and innovation, systematic thinking skills have become essential for solving complex problems and decision-making processes across various disciplines, particularly in the field of electrical engineering, which necessitates analysis and design. Systems thinking helps students understand and analyze problems structurally, see relationships between system elements, and perform precise and systematic operations. This is because electrical engineering work involves the integration of knowledge from many fields and requires a thinking process that can consider all relevant factors thoroughly and carefully. However, the past evaluation of students' learning outcomes in the electrical engineering program revealed, based on past score statistics, that the programmable logic control course used pre-test and post-test to measure learning achievement. The test revealed an increase in the students' post-test scores. but when the students went out to practice their professional experience, they often had problems applying theoretical knowledge to real situations. They lacked the ability to connect problems and analyze them from various perspectives. These skills are important for the development and maintenance of complex electrical systems. There is a learning management method that emphasizes solving real problems through practice or problem-based learning. Over the past few decades, numerous new learning theories have emerged. However, the most popular learning theory among educators is the constructivist learning theory, which incorporates a concept that aligns with 21st-century education: the learning management model using PBL. The Faculty of Health Sciences at McMaster University initially developed it. Later, this method became a learning model. Teaching using the PBL model has begun to expand to other fields, such as engineering, science, and mathematics. Therefore, such a teaching model is an appropriate approach to developing students' systems thinking skills,as PBL emphasizes students' participation in the learning process through solving problems that are close to real situations. This allows students to practice problem analysis, information search, and knowledge integration to find answers, resulting in deeper and more sustainable learning. This research aims to study the use of PBL activities in the Programmable Logic Control: PLC course to enhance systems thinking skills in electrical engineering students. This course is crucial in training and developing basic knowledge about programming to control the operation of automatic systems, which is one of the essential skills for electrical engineers in the present era.

Based on the aforementioned problems, this research aims to enhance systems thinking skills in electrical engineering students by studying and applying PBL learning activities in the PLC subject, specifically in the sub-units of Writing Ladder Diagrams for Programmable Logic Control (LAB4: Traffic Signal Control, LAB5: Workpiece Distribution Station Control). The focus is on the learning process during the study rather than the traditional pre - and post-test assessment. Therefore, this research measured the development of students' skills during the study by administering two tests, a departure from the traditional assessment method that typically uses a pre-test and a post-test. This research employs a process-based assessment method to monitor the advancement of students' systems thinking throughout the study.

This research aimed to enhance the ability of systematic thinking in terms of analytical thinking and applied thinking by PBL activities in a lesson on writing ladder diagrams for PLC. The PBL learning management effectively and significantly developed analytical and applied skills for electrical engineering students. Furthermore, students can apply the concepts they gained from such activities to their future work.

Overview of the Research

Concepts and Theories of Problem-Based Learning (PBL) Management to Develop Systematic Thinking

Learning using PBL is a process that starts with presenting a problem situation for learners to connect their previous knowledge with new information, leading to knowledge creation and the development of analytical thinking skills. This type of learning emphasizes that learners practice solving problems systematically, searching for information by themselves, and enhancing their academic understanding through real situations instead of teaching by lecturing. In PBL, the teacher will be the facilitator and prepare questions that are consistent with the learning objectives, encouraging learners in small groups to participate in analyzing problems, forming hypotheses, testing, and summarizing new knowledge without providing direct information. There are three main aspects 1. activation of prior knowledge, 2. encoding specificity and 3. elaboration of knowledge. In this regard, teaching should focus on activities that allow learners to express and extend their knowledge.

The learning process using PBL, as illustrated in Figure 1 (Boom et al., 2010) consists of six main steps.

1. **Problem Identification:** The teacher divides students into groups to jointly identify problems and clearly define the scope of the problem according to the assigned task.
2. **Brainstorming:** Students in each group brainstorm, analyze, and break down problems by linking them to their prior knowledge to understand them from various perspectives.
3. **Problem Analysis:** The students analyze problems using reasoning, set learning objectives, and identify additional information necessary to explain them.
4. **Planning:** The students plan their research by dividing tasks and identifying the sources of information they need to use to collect new knowledge and related information.
5. **Learning and Application:** The students apply the new information and knowledge they have gained from their research to solve problems, using related concepts, principles, and theories to find possible answers.
6. **Summary and Report:** The students summarise their knowledge and present the results of problem solving by linking the concepts studied and showing the results obtained from applying the knowledge.

We will use the aforementioned PBL steps to assess learning outcomes, assisting learners in systematically developing critical thinking and problem-solving skills.

Figure 1: Learning Process Using PBL

The Concepts and Related Theories of System Thinking Encompass Both Analytical and Applied Thinking

System thinking refers to the ability to apply knowledge and analysis to solve problems in real situations effectively. This type of thinking allows learners to connect theoretical knowledge with real situations, which deepens applied thinking. In order to develop a problem-solving method that is consistent and appropriate for real situations, applied thinking takes into account both theoretical factors and the context of the problem at hand. For instance, when solving the problem of drawing a ladder diagram in an automatic control system, learners need to apply their knowledge of electrical circuit design and PLC operation to the functioning of a real, complex industrial system. Applied thinking helps learners to evaluate possible outcomes and decide on the most appropriate solution. This research uses system thinking, analytical thinking, and application thinking.

Analytical Thinking.

Analytical thinking, in the context of systems thinking, emphasizes the separation of elements within a system and the identification of relationships among them. This method of thinking enables learners to explore the intricacies of each element and uncover hidden patterns within the system. Analytical thinking also helps learners to consider the structure of the system and the factors that affect its operation systematically. For example, in analysing an electrical system, learners may start by breaking down the elements, such as voltage, current, and conductors, and then study how these elements work together in the system. Analytical thinking also helps learners to identify the causes of problems and the factors that affect their occurrence more clearly, which is an important foundation for effective problem solving.

Applied Thinking.

In the context of systems thinking, applied thinking refers to the capacity to effectively apply knowledge and analysis to solve problems in real-world situations. This type of thinking helps learners to connect theoretical knowledge with real situations, which deepens applied thinking. In order to develop a problem - solving method that is consistent and appropriate for the real situation, applied thinking takes into account both theoretical factors and the context of the problem at hand. For instance, in order to solve the problem of drawing a ladder diagram in an automatic control system, learners must apply their knowledge of electrical circuit design and PLC operation to the functioning of a real, complex industrial system. Applied thinking helps learners to evaluate possible outcomes and decide on the most appropriate solution.

Systems thinking, which combines analytical and applied thinking skills, enables learners to deal with complex problems, see holistic relationships, and carefully evaluate the impact of individual changes in a system. It prepares learners to effectively deal with challenging problems and adapt in an ever-changing environment.

The Process of Learning Management Design Involves Creating Ladder Diagrams With Programmable Logic Control Through PBL, Which Fosters System Thinking

The design of learning management, which is used in teaching the topic of writing programmable logic ladder diagrams using PBL to develop systematic thinking (analytical thinking and applied thinking), follows six steps:

- **Step 1: Problem Identification:** Learners will receive problems related to writing ladder diagrams with PLC for automatic system control, such as "Design a ladder diagram to control an electric motor to work according to specified conditions." The teacher will help explain the importance of writing ladder diagrams with PLC and ask questions to stimulate learners to think further.
- **Step 2: Brainstorming:** Divide into groups and discuss the given problem to understand its details, including the motor's function and various working conditions. Learners can use diagrams or notes to help analyze the problems they receive and the relationship between different devices.
- **Step 3: Problem Analysis:** In this step, learners are required to explore online resources for information on writing ladder diagrams, with the aim of comprehending the working principles of PLC and the structure of ladder diagrams. Learners should focus on studying the differences between devices and different control methods.
- **Step 4: Planning:** After studying and researching, learners must synthesise the obtained data to create a basic ladder diagram. Planning the diagram may involve creating a mind map or diagram flow to clearly illustrate the control steps. It is necessary to consider the relationship and priority of the devices used.
- **Step 5: Learning and application:** In this step, learners are required to summarize and assess the ladder diagram design they have created, either through a written report or a group presentation. Having friends assist in evaluating the correctness and reasonableness of the design fosters participatory learning.
- **Step 6: Summary and Report:** In the final step, each group of learners must present their ladder diagram writing results in front of the class. The teacher may either demonstrate the actual work or use software to simulate the operation of the PLC. The teacher will evaluate both the content and the presentation, including providing suggestions to learners for development next time.We conducted a test twice after organizing the learning of all 6 steps, utilizing problem-based learning to develop a systematic approach to creative and applied thinking, particularly in the area of writing ladder diagrams for programmable logic control.

Analysis of Data Results

The Quality Assessment of Learning Management Plans Yielded Results

Ability to foster systematic thinking through the use of PBL in organizing learning activities related to writing ladder diagrams with PLC as evaluated by three experts. We conducted the quality assessment using the activity quality assessment form, a questionnaire featuring a rating scale for five areas: 1. overall structure of the plan 2. learning objectives 3. learning activities 4. learning media and 5. measurement and evaluation. We analyzed the evaluation values obtained using Likert rating scales (Wratten et al., 2022). The analyzed values consisted of the mean and the standard deviation (SD). We determined the range of the mean values to interpret the meaning into 5 levels (Likert, 1932): (4.50-5.00=Very Satisfied), (3.50-4.49=Satisfied), (2.50-3.49=Neutral), (1.50-2.49=Dissatisfied), and (1.00-1.49=Very Dissatisfied), as shown in Tables 1 to 5.

Table 1: Results of the Study of the Quality of Learning Management Activities in the Overall Plan

Evaluation List	Mean	SD	Opinion Level
1.1 The plan covers all necessary elements.	5	0	Very Satisfied
1.2 The learning management plan is feasible for implementation.	4.67	0.58	Very Satisfied
1.3 The plan is designed to address the needs or solve the problems of learners by enhancing their thinking or higher-level abilities.	4.67	0.58	Very Satisfied
1.4 The plan is easy to understand, allowing others to teach it effectively.	4.67	0.58	Very Satisfied
1.5 Summarize the main ideas in a way that is consistent with the content to be taught.	4.67	0.58	Very Satisfied
Overview of Section 1	4.74	0.48	Very Satisfied

Overall Plan: The overall plan is at a Very Satisfied level: All 5 items are: 1.1 Behavioural objectives, content, teaching methods, materials or media, measurement and evaluation, and post -teaching records are all included. You can put the learning management plan into practice. 1.3 The plan aims to meet the needs of the learners or solve their problems in terms of high-level thinking or abilities. 1.4 The plan is simple to comprehend, allowing others to instruct in its place. Provide a concise overview of concepts that align with the intended teaching content. The average score is ($\bar{x}$=4.74, SD=0.48) for all 5 items, which indicates that the overall quality of the plan is appropriate and of high quality.

Table 2: Results of the Study of the Quality of Learning Management Activities in the Learning Objectives

Evaluation List	Mean	SD	Opinion Level
2.1 The learning objectives adequately cover the content/subject matter.	5.00	0	Very Satisfied
2.2 Learning objectives are derived from indicators.	4.33	0.58	Very Satisfied
2.3 Write behavioral objectives that are clear, measurable, and observable.	4.67	0.58	Very Satisfied
2.4 Learning objectives aim to develop learners' knowledge, skills, and processes that are important in the current era.	4.67	0.58	Very Satisfied
Overview of Section 2	4.67	0.44	Very Satisfied

In terms of learning objectives, the overall quality is at the Very Satisfied level: Three learning objectives are rated as very good, with the highest mean value being as follows: 2.1 Learning objectives cover the subject matter/content with the mean value of ($\bar{x}$=5.00, SD=0). 2.2 Learning objectives are derived from indicators with the mean value of ($\bar{x}$=4.33, SD=0.58). 2.3 Clearly write behavioural objectives that can be measured or actually observed with the mean value of ($\bar{x}$=4.67, SD=0.58).2.4 Learning objectives aim to develop learners in terms of knowledge and skills of processes that are important in the current era with the mean value of ($\bar{x}$=4.67, SD=0.58), which indicates that the learning objectives are appropriate and achieve the objectives.

Table 3: Results of the Study of the Quality of Learning Management Activities in the Learning Activities

Evaluation List	Mean	SD	Opinion Level
3.1 Learning activities are consistent with the objectives.	5	0	Very Satisfied
3.2 Learning activities are consistent with the content.	5	0	Very Satisfied
3.3 Activities are designed to train learners on indicators during the study and relate to the measurement of all indicators after the study.	5	0	Very Satisfied
3.4 Techniques for organizing learning activities are aligned with the behavioral objectives.	4.67	0.58	Very Satisfied
3.5 The plan includes all main steps of the process, clearly defining the introduction, teaching, and conclusion phases.	4.67	0.58	Very Satisfied
Overview of Section 3	4.89	0.23	Very Satisfied

Overall, the learning activities were Very Satisfied level: There was especially good learning in all 5 items: 3.1 learning activities of the program; 3.2 learning activities in the content area; 3.3 training activities for learners to be able to learn related to all outcomes after learning with the same intensity ($\bar{x}$=5.00, SD=0); 3.4 a technique for inheriting learning with a strategic approach; and 3.5 the main steps are detailed according to the original subject, making it clear that the leading step, the teaching step, and the conclusion step are all carried out equally ($\bar{x}$=4.67, SD=0.58). The activities involve learning.

Table 4: Results of the Study of the Quality of Learning Management Activities in the Learning Media

Evaluation List	Mean	SD	Opinion Level
4.1 Media and learning resources are easy to understand and help learners achieve their objectives more effectively.	4.33	0.58	Very Satisfied
4.2 The media used is consistent with the content.	4.67	0.58	Very Satisfied
4.3 The media is engaging and user-friendly.	4.67	0.58	Very Satisfied
Overview of Section 4	4.56	0.58	Very Satisfied

The overall quality of learning media is Very Satisfied level: item 4.2, where the media used is consistent with the content, meets the learning objectives at a very high level. 4.3, the media is interesting and easy to use, with an average value of ($\bar{x}$=4.67, SD=0.58), and item 4.1, the media and learning resources are easy to understand and help learners achieve their objectives more easily, at a good level, with an average value of ($\bar{x}$=4.33, SD=0.58), which indicates that the learning media is of good quality and appropriate for learners.

Table 5: Results of the Study of the Quality of Learning Management Activities in the Measurement and Evaluation

Evaluation List	Mean	S.D.	Opinion Level
5.1 Methods of measurement and evaluation are aligned with the behavioral objectives.	4.67	0.58	Very Satisfied
5.2 The questions for measurement and evaluation are clear.	4.67	0.58	Very Satisfied
5.3 The measurement tools and methods are appropriate for the learners' ability levels.	4.67	0.58	Very Satisfied
5.4 Multiple measurement opportunities are provided to allow learners to improve.	4.67	0.58	Very Satisfied
Overview of Section 5	4.67	0.58	Very Satisfied

In terms of measurement and evaluation, it is at a Very Satisfied level overall, with learning objectives that are at a very good level in all 5 items, namely: 5.1 The methods of measurement and evaluation align with the behavioural objectives. 5.2 The questions for measurement and evaluation are clear. 5.3 The measurement tools and measurement methods are appropriate for the learner's ability level. 5.4 There are multiple measurements that allow the learner to improve. The average values of all 5 areas are equal, with ($\bar{x}$=4.67 and SD=0.58) indicating that the measurement and evaluation aspects are appropriate.

The Results of the Measurement of the Ability to Think Systematically on the Topic of Drawing Ladder Diagrams With PLC

Results of the systematic thinking ability measurement on the writing of ladder diagrams with PLC for 18 electrical engineering students were evaluated using the 5-point rating scale Rubric score. (Wind, 2020) The criteria of the 5-level rating scale for the evaluation of the results include (5=excellent), (4=good), (3=average), (2=poor), and (1=very poor). We will evaluate it after learning through individually designed activities, based on the indicators of systematic thinking ability, analytical thinking ability, applied thinking ability, and overall thinking ability. We divide the results of the systematic thinking ability measurement into two categories: the first post-learning ability measurement (E1) and the second post-learning ability measurement (E2), both of which must pass the 80 percent criterion or receive a score of 4 or higher. The results are shown in Tables 6 and 7.

Table 6: Results of the First Systematic Thinking Ability Measurement

Opinion for Quality		Quantity	Percentage	Opinion for Quality		Quantity	Percentage
1.Analytical thinking ability (5 points)				**3.Applied thinking ability (5 points)**			
Pass	Excellent	18	100	Pass	Excellent	-	88.88
	Good	-			Good	16	
Failed	Average	-	-	Failed	Average	2	11.12
	Poor	-			Poor	-	
	Very Poor	-			Very Poor	-	
2.Ability to think systematically (5 points)				**Total score (15 points)**			
Pass	Excellent	4	77.78	Pass		16	88.88
	Good	9					
Failed	Average	5	22.22	Failed		2	11.12
	Poor	-					
	Very Poor	-					

From Table 6, the first systematic thinking ability measurement yielded results from the initial ability test. From the test results in the first indicator of the analytical thinking ability assessment, analytical thinking ability, there were 18 students in total, all of whom scored at the excellent level, accounting for 100 percent. The percentage of those who passed the criteria in the second indicator, ability to think systematically, had 4 students with excellent scores, 9 students with good scores, and 5 students with average scores. The number of those who passed the criteria was 77.78 percent, and the number of those who did not pass the criteria was 22.22 percent. In the third indicator, applied thinking ability, there were 16 students with good scores, 2 students with average scores, and those who did not pass the criteria were 88.88 percent and those who did not pass the criteria were 11.12 percent. When the scores of all 3 indicators in the first ability test were combined, it was found that 88.88 percent passed the criteria and 11.12 percent did not pass the criteria, as shown in Figure 2. The percentage of those who passed the criteria was consistent with both the hypothesis and the criteria. Significantly defined.

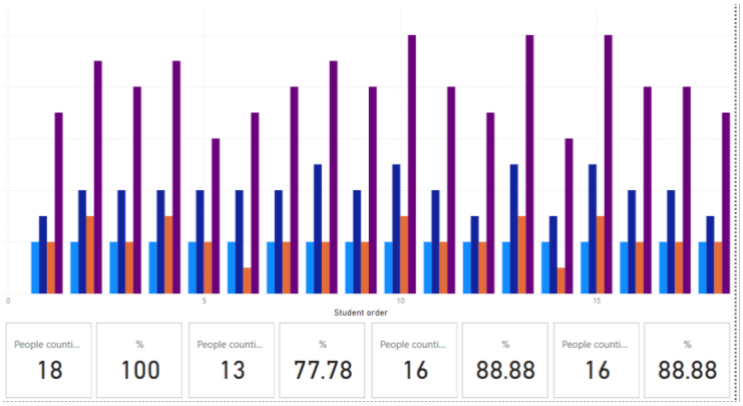

Figure 2: The Results of the First Systematic Thinking Ability Measurement

Table 7: Results of the Second Systematic Thinking Ability Test

Opinion for Quality		Quantity	Percentage	Opinion for Quality		Quantity	Percentage
1.Analytical thinking ability (5 points)				**3.Applied thinking ability (5 points)**			
Pass	Excellent	17	94.44	Pass	Excellent	8	83.33
	Good	-			Good	7	
Failed	Average	1	-	Failed	Average	3	16.67
	Poor	-			Poor	-	
	Very Poor	-			Very Poor	-	
2.Ability to think systematically (5 points)				**Total score (15 points)**			
Pass	Excellent	6	77.78	Pass		15	83.33
	Good	7					
Failed	Average	5	22.22	Failed		3	16.67
	Poor	-					
	Very Poor	-					

From Table 7, results of the first systematic thinking ability measurement from the first ability measurement test. From the test results in the first indicator of the analytical thinking ability assessment, analytical thinking ability, there were 18 students in total, with 17 students scoring at the excellent level and 1 student at the average level, accounting for 94.44 percent who passed the criteria and 5.56 percent who did not pass the criteria. In the second indicator, ability to think systematically, there were 6 students with excellent scores, 7 students with good scores, and 5 students with average scores. The number of students who passed the criteria was 77.78 percent, and the number of students who did not pass the criteria was 22.22

percent. In the third indicator, applied thinking ability, there were 8 students with excellent scores, 7 students with good scores, and 3 students with average scores. When the scores of all three indicators in the second ability measurement were combined, it was found that 83.33 percent passed the criteria and 16.67 percent did not, as shown in Figure 3. The percentage of those who passed the criteria was significantly consistent with the hypothesis. The number of students who passed the criteria was 83.33 percent and the number of students who did not pass the criteria was 16.67 percent.

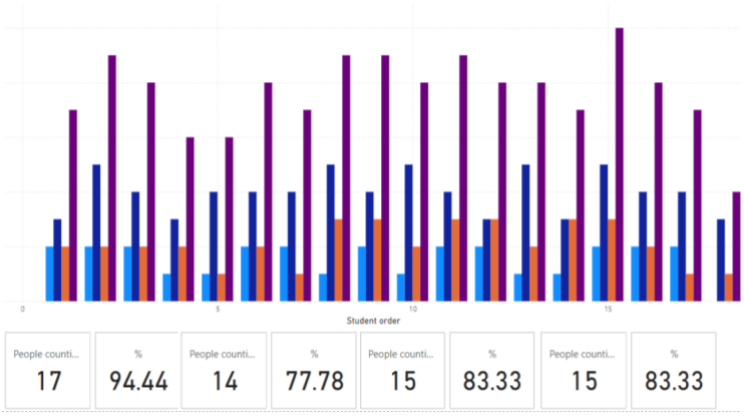

Figure 3: Results of the Second Systematic Thinking Ability Measurement Test

Conclusion

The study focuses on fostering systematic thinking skills in both creative and applied thinking, specifically in the area of ladder diagram creation in PLC, through the implementation of the PBL learning management method for electrical engineering students. The study evaluated the quality of the learning management plan. In the evaluation of the quality of the learning management activities in all five areas, the average evaluation result was ($\bar{x}$=4.69, SD=0.48). This suggests that the quality of the learning management plan is good and appropriate. This is consistent with the hypothesis in terms of learning objectives and learning activities. From the first systematic thinking ability assessment in calculating the total score of all three indicators, it was found that 88.88 percent passed the criteria. From the second systematic thinking ability assessment in calculating the total score of all three indicators, it was found that 83.33 percent passed the criteria, which is in accordance with the hypothesis that In the sample group, there must be those who pass the criteria with a score of at least good level, not less than 80 percent, for both the first systematic thinking ability test and the second systematic thinking ability test. However, the results of both assessments suggest that students can achieve learning objectives in line with the hypothesis and enhance their systematic thinking skills in the PLC subject. These skills will enhance their analytical thinking capabilities and enable them to apply them to real-world tasks in the future.

Acknowledgements

The authors would like to express their deepest gratitude to King Mongkut's University of Technology Thonburi (KMUTT), Bangkok, Thailand, for providing the necessary support and resources to make this study successful. We would also like to acknowledge the cooperation and assistance of the sample group, electrical engineering students, which were crucial to the study. Their support greatly improved the quality and scope of this study.

The Impact of Information Graphics on Fire Evacuation of Chinese Students: A Case Study of Sichuan University of Light Industry and Chemical Technology

Zhang Xia, Rajamangala University of Technology Thanyaburi, Thailand
Metee Pigultong, Rajamangala University of Technology Thanyaburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
With the rapid advancement of technology, ensuring the safety of campus fire evacuations has become a significant focus. This empirical study was conducted at Sichuan University of Light Industry and Chemical Technology. The research aims to: 1. Explore the effectiveness of achievement scores after the use of information graphics for dormitory students. 2. Gather feedback on the use of these information graphics. The population for this study consisted of 50 dormitory students from Sichuan University of Light Industry and Chemical Technology. The research instruments included: 1. Information Graphics on fire evacuation 2. Achievement test papers 3. A questionnaire to assess students' satisfaction with the use of Information Graphics. The statistical methods used in this research included: 1. Mean ($\bar{X}$) 2. Standard deviation (S.D.) 3. Effectiveness index 4. Content analysis technique. The results indicate a comparison of students' pre- and post-test scores regarding fire safety awareness after using the Information Graphics for independent learning. The mean score on the pretest was 32.82, with a standard deviation of 2.26. After using the Information Graphics, students' performance significantly improved, achieving a mean score of 37.48 with a standard deviation of 2.23. The t-test results revealed a significant difference, showing a t-value of -32.229, which is statistically significant at the 0.05 level (t=-32.229, p=0.00). The effectiveness index was 0.38, indicating that students had a 38 percent improvement in their post-test scores. Feedback from students showed a high level of satisfaction with the use of Information Graphics for independent learning, which effectively enhanced their fire safety awareness.

Keywords: Information Graphics, Fire Evacuation, Dormitory Chinese Students, Training Effectiveness

1. Introduction

1.1 Research Background

The training effectiveness of fire evacuation for Chinese students is directly related to their life safety and the quality of campus safety management. With the continuous development of technology, information graphics, as an intuitive and easy to understand tool for information transmission, are widely used in the field of safety, providing new possibilities for evacuation during disasters. The potential threat of fire to student accommodation has aroused deep concern from various sectors of society on how to improve the efficiency of fire evacuation. School administrators, fire departments, and students themselves need to take prompt and effective measures in the event of a fire to minimize potential risks. The application of information graphics as a visual means of conveying information in fire evacuation, especially in the environment of Chinese student dormitories, is a highly concerned topic.

1.2 Problem of Population

Currently, Chinese student fire evacuation faces a series of challenges, including a large number of personnel, complex evacuation routes, and uncertain student behavior. In this context, information graphics, as an intuitive and clear tool for information transmission, have the potential to play a positive role in improving the efficiency of student fire evacuation. However, in response to the actual situation of Chinese students, especially in large-scale student dormitories, there is still some uncertainty in the design and application of information graphics. Student accommodation safety has always been a concern for society and school administrators, especially in emergency situations such as fires, where rapid and orderly evacuation becomes crucial. Chinese universities, such as Sichuan University of Light Industry and Chemical Technology, not only have a large number of students but also complex and diverse student accommodation environments, including student dormitories, apartments, rental housing, etc. Therefore, improving the efficiency of student fire evacuation is crucial for ensuring student life safety.

1.3 Solution to Solve the Problems

Internationally, information graphics have been successfully applied to enhance public awareness and response capabilities in emergency situations. For example, in fire evacuation, clear information graphics can not only guide evacuation directions but also help students understand emergency situations more quickly. This intuitive way of information transmission is widely accepted internationally, providing new ideas and possibilities for improving the efficiency of student fire evacuation. Sichuan University of Light Industry and Chemical Technology, as a typical Chinese university, has a large student population and diverse accommodation environment. In this context, the issue of student fire evacuation is more complex and urgent. By taking Sichuan University of Light Industry and Chemical Technology as an example, we can gain a deeper understanding of the specific situation of fire evacuation among Chinese students, providing specific reference and inspiration for the design and implementation of information graphics. In the current context of student fire evacuation, this study focuses on the role of information graphics in Chinese student fire evacuation. Through a case study of Sichuan University of Light Industry and Chemical Technology, the aim is to explore the practical effects of information graphics on improving

students' fire safety awareness, guiding evacuation directions, and optimizing evacuation processes.

By comparing successful international experiences, feasible improvement suggestions are provided for the actual situation of fire evacuation among Chinese students in order to promote practice and research in the field of student fire evacuation. In this context, this study takes Sichuan University of Light Industry and Chemical Technology as an example to explore the practical impact of information graphics on the evacuation of Chinese student fires. As one of the most populous countries in the world, China has a huge student population. The safety of student accommodation has always been a concern of society, and fires, as a potential threat, pose serious safety hazards to student dormitories. Currently, schools and relevant management departments are committed to improving the safety evacuation ability of students in the event of a fire by establishing firefighting facilities and conducting regular drills. However, in emergency situations, the level of calmness and quick response of students remain key factors affecting evacuation training effectiveness.

1.4 Research Questions

(1) How is training effectiveness after use of the information graphics?
(2) What is the feedback of dormitory students for the next development on fire evacuation?

1.5 Research Objectives

(1) Explore of Training effectiveness after using the Information graphics of dormitory students.
(2) Explore the feedback of using the information graphics.

2. Research Methods

The research population were 50 students from the dormitories of Sichuan University of Light Industry and Chemical Technology. The training time was one month. A questionnaire survey was conducted to conduct pre-training and post-training tests.

2.1 Research Design

Selection of research methods: literature reference method, questionnaire survey method, learning process observation/interview, using independent training method. In the current era of continuous changes in education, independent learning has become an essential ability for students. It not only helps to improve students' comprehensive quality but also allows them to cultivate their innovative spirit in continuous exploration. As an efficient visual expression, information graphics can help students understand complex concepts more easily, thereby improving learning results. Therefore, it is of great significance to guide students to understand information graphics through independent learning.

Pre-test	Activities	Post-test
O_1	X	O_2

O_1 Measurement of pre-test score
X Self-learning and using information graphics
O_2 Measurement of post-test score

Preliminary investigation Conduct an investigation into the current situation of school fire evacuation, including fire equipment, evacuation routes, and past fire drills. And conduct a questionnaire survey on students to understand their understanding and experience of fire evacuation.

The questionnaire survey is mainly based on multiple choice questions. There are 45 questions in total, most of which are Single choice question questions. A small number of questions are multiple choice questions, and each question has 1 point. It covers the knowledge of fire safety awareness, escape self-rescue ability, fire safety psychology, etc.

The survey results show that students have a generally good grasp of fire safety knowledge. Most respondents expressed familiarity with the use of basic firefighting facilities and equipment, such as fire extinguishers, fire hydrants, etc. However, the level of understanding of more professional fire safety knowledge and skills, such as the correct methods of evacuation and escape, and the maintenance of firefighting facilities, is relatively low. This indicates that schools should strengthen their efforts in fire safety education, enhance students' awareness of fire safety and their ability to self-rescue and mutual aid.

2.2 Information Graphics Design and Implementation

Based on the preliminary survey results, design information graphics that are in line with the actual situation of the school. Practical application in key areas such as student dormitories.

In the context of student fire evacuation, the design of information graphics can provide clear evacuation guidelines for emergency situations, enabling students to respond more quickly and orderly. Its visual characteristics enable students to quickly understand evacuation routes and the location of safety exits even under pressure in emergency situations such as fires, thereby improving evacuation efficiency. As shown in the Figure 1.

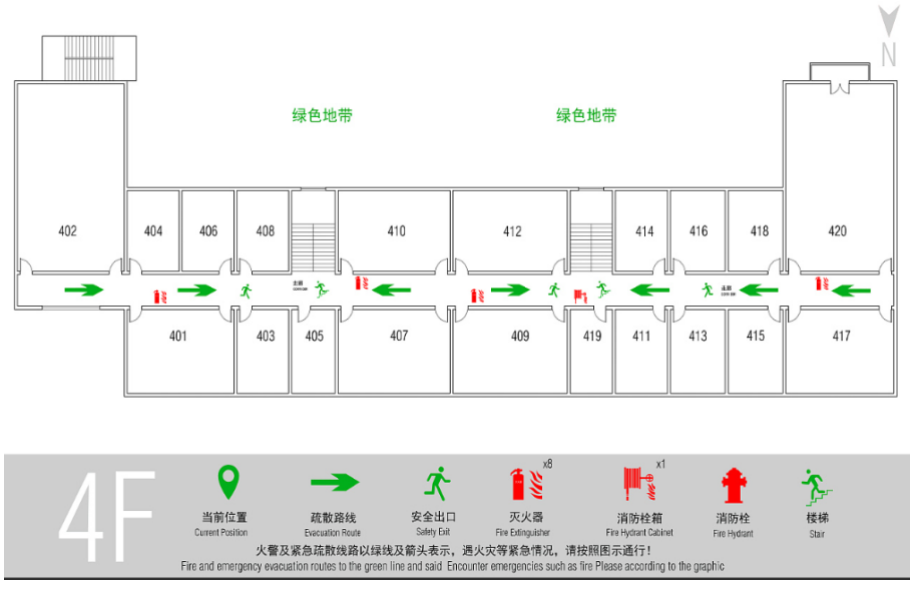

Figure 1: Evacuation Guidelines for Emergency Situations

The correct evacuation steps are crucial in the event of a fire. Here are some key evacuation steps:

- Stay calm: In the event of a fire, staying calm is the first step to successfully escaping. Don't panic, quickly analyze the situation on site and find the best escape route.
- Call the fire alarm number: Immediately call the fire alarm number 119 to report the location and situation of the fire, so that professionals can handle it in a timely manner.
- Determine the escape route: Determine the location of the fire point. If the fire is small, you can put out the fire yourself; if the fire is large, flee immediately.
- Use fire escape routes: Use fire elevators or stairs to escape and avoid using regular elevators as they may experience power outages or malfunctions during a fire.
- Cover your mouth and nose with a wet towel: Cover your mouth and nose with a wet towel, clothing, or other usable fabric to prevent inhaling toxic smoke.
- Low posture escape: Try to move forward in a low posture as smoke and toxic gases often accumulate in the upper part.
- Close the doors and windows that have not escaped: If it is not possible to escape immediately, the doors and windows should be closed, and wet towels, fabrics, etc. should be used to block the gaps between the doors and windows to prevent smoke from entering.
- Escape using ropes: If the escape route is blocked, homemade ropes such as bed sheets and curtains can be used to escape through windows.
- Don't be greedy for property: During the escape process, don't waste time trying to save property. Life safety is always the top priority.
- Seeking help: If unable to escape on your own, you should send out distress signals by tapping objects, waving clothes, etc., to attract the attention of rescue personnel.

2.3 Implementation Period

Conduct a period of practical application to monitor the performance of students during the fire evacuation process.

Through training observation, students are able to correctly use basic facilities such as fire hydrants and fire extinguishers, and their fire safety awareness and self-rescue and mutual aid abilities are gradually improving.

The steps for using a fire extinguisher are as follows:

- Lifting the fire extinguisher: Firstly, it is necessary to lift the fire extinguisher to ensure easy operation.
- Remove the safety pin: Find and remove the safety pin so that the fire extinguisher can be activated.
- Grasp the nozzle: Hold the nozzle with one hand and the handle with the other hand to ensure accurate spraying of the fire extinguishing agent.
- Aim at the root of the flame: Aim the nozzle at the root of the flame, which is the key position for extinguishing the fire and can more effectively extinguish the source of the fire.
- Press down the handle to spray: Finally, press down the handle to spray until the flame is completely extinguished. As shown in the Figure 2.

Figure 2: Using a Fire Extinguisher

2.4 Data Collection

Various methods are used for data collection, including observation records, student feedback, questionnaire surveys, etc., to obtain comprehensive research data.

2.5 Data Analysis Methods

Quantitative data analysis: Using statistical methods to analyze quantitative data on student evacuation efficiency**.** Qualitative data analysis: Conduct qualitative analysis on students' cognition and feedback on information graphics and explore deeper information through thematic analysis and other methods.

3. Research Results

3.1 Training Effectiveness After Using the Information Graphics of Dormitory Students

Achievement papers result as shown in Table 1.

Table 1: Shown the Pre-test and Post-test Scores of Using Information Graphics

Name	Pre-test (P1)	Post-test (P2)
Student 1	36	40
Student 2	30	37
Student 3	32	34
Student 4	29	35
Student 5	31	38
Student 6	33	36
Student 7	30	35
Student 8	35	41

Student 9	29	33
Student 10	30	35
Student 11	33	37
Student 12	32	37
Student 13	37	40
Student 14	33	37
Student 15	34	38
Student 16	32	36
Student 17	36	39
Student 18	30	34
Student 19	35	38
Student 20	32	36
Student 21	33	38
Student 22	32	35
Student 23	36	40
Student 24	29	35
Student 25	33	37
Student 26	32	38
Student 27	34	39
Student 28	34	40
Student 29	35	41
Student 30	30	35
Student 31	37	42
Student 32	33	37
Student 33	33	38
Student 34	34	39
Student 35	35	40
Student 36	30	35
Student 37	34	38
Student 38	36	41
Student 39	29	34
Student 40	32	36
Student 41	32	37
Student 42	35	40
Student 43	34	39
Student 44	33	37
Student 45	33	38
Student 46	32	37
Student 47	36	41
Student 48	31	36
Student 49	35	40
Student 50	30	35
sum	1641	1874

3.1.1 Effectiveness Scores

The calculation is as follows:

$$\frac{P2-P1}{Total-P1} = \frac{1874-1641}{(50\times45)-1641} = 0.38\times100\% = 38\%$$

P1= Pre-test
P2= Post-test

Total= Number of students × Total question score

The effectiveness index was .38 in other words, the students had higher post-test scores of 38 percent.

3.1.2 Comparison of Scores Before and After Testing

Comparison of scores before and after testing result as shown in Table 2.

Table 2: Comparison of Scores Before and After Testing

Items	n	$\overline{X}$	S.D.	t-Test	Sig.(2-tailed)
Pre-test	50	32.82	2.26	-32.229	0.00
Post-test	50	37.48	2.23		

P<0.05

Table 2 Show the comparison of students' fire safety awareness scores before and after test is displayed. The average score of the pre-test is 32.82, with a standard deviation (S.D.) score of 2.26. After using Information Graphics through self-directed learning, students' grades significantly improved, resulting in a high score of 37.48 and a standard deviation (S.D.) of 2.23. The t-test before and after the test showed a significant difference of -32.229, which is statistically significant at the 0.05 level.

3.2 The Feedback of Using the Information Graphics

The feedback of using the Information graphics as shown as Table 3.

Table 3: Satisfaction Assessment of Students Using Information Graphics Through Self-Directed Learning

Statement	Mean	S.D.	Result Interpretation
1. Are you satisfied with self-directed learning?	5.00	0.00	Very satisfaction
2. Are you satisfied with using fire evacuation information graphics?	4.96	0.20	Very satisfaction
3. Are you satisfied with the smooth flow of the safety exits?	4.96	0.20	Very satisfaction
4. Are you satisfied with fire safety awareness education?	4.94	0.24	Very satisfaction
5. Are you satisfied with the completeness of fire protection facilities?	4.92	0.27	Very satisfaction
6. Are you satisfied with the speed of fire response?	4.92	0.27	Very satisfaction
7. Are you satisfied with the school's fire safety management?	4.92	0.27	Very satisfaction
8. Are you satisfied with the effectiveness of the fire drill?	4.90	0.30	Very satisfaction
9. Are you satisfied with the lecture on fire safety knowledge?	4.90	0.30	Very satisfaction
10. Are you satisfied with the clarity of emergency evacuation signs?	4.88	0.33	Very satisfaction
Total	4.93	0.03	Very satisfaction

Table 3 the mean score ranged between 4.88 and 5.00, which was between averages to high levels. The highest mean score (5.00) was the item “Are you satisfied with self-directed learning?”. The lowest mean score (4.88) was the item “Are you satisfied with the claim of emergency evacuation signs?”. This indicates that students are very satisfied with the recognition of using Information Graphics through self-directed learning.

Conclusion

In the information age, Information Graphics, as an intuitive and efficient way of information transmission, have shown great potential in student fire evacuation. By comprehensively considering design principles, student feedback, and actual testing results, we can better apply information graphics to campus safety management, enhance students' self-rescue abilities in emergency situations, and thus better ensure campus safety.

Bruno Silva, Polytechnic of Viana do Castelo, Portugal

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The aim of the research presented in this paper was to observe and record in documentary form the human dimension intrinsic to self-initiated community practices in social neighbourhoods in V.N. Gaia, Portugal. This work was carried out as part of the research project "ECO: Echoing the Community Self". Of the practices identified by the ECO project, Workshop School (WS) was chosen as the object of analysis and intervention in this documentary work. This project adopted an action-research methodology and used audiovisual tools in order to respond to an identified problem: the lack of visibility of the impact that the activity developed by WS has on people. The work was divided into 3 stages: a) fieldwork to diagnose the problem; b) intervention (documentary film aimed at giving visibility to the people who directly benefit from the WS's activity: the trainees); and finally, c) evaluation of the result. In order to observe and diagnose the problem, it was also necessary to adopt an ethnographic methodology, using fieldwork techniques and methods to get closer to the object of study, the most important elements in the creation and development of self-initiated educational practices. This work informed the next stage, in which different mechanisms were adopted to record and construct an audiovisual narrative, based on the testimonies of the people involved in the learning processes mobilised by WS. In order to evaluate the results, they were presented with the intention of contemplating and analysing the reception and perception of the people portrayed in the project.

Introduction

The aim of this work was to observe and record in documentary form the human dimension intrinsic to self-initiated community practices in social neighborhoods in Vila Nova de Gaia. This work was carried out as part of the exploratory research project "ECO: Echoing the Community Self: designing the dissemination and replication of self-initiated practices in underprivileged urban communities in a post-pandemic world". Of the practices identified by the ECO project, Escola Oficina (EO) was chosen as the object of analysis and intervention in this documentary work.

This project adopted an action-research methodology and used audiovisual tools in order to respond to an identified problem: the lack of visibility of the impact that the activity developed by EO has on people. The work was divided into 3 stages: a) fieldwork to diagnose the problem (study of information and informal conversations); b) intervention (documentary film aimed at giving visibility to the people who directly benefit from the EO's activity: the trainees); and finally, c) evaluation of the result (realising how the EO and the people portrayed in the documentary see themselves in it).

In order to observe and diagnose the problem, it was also necessary to adopt an ethnographic methodology, using fieldwork techniques and methods to get closer to the object of study, the most important elements in the creation and development of self-initiated practices: people in general, technicians, managers, students and trainers. This work informed the next stage, in which different mechanisms were adopted to record and construct an audiovisual narrative, based on the testimonies of the people involved in the learning processes mobilised by EO. In order to evaluate the results, they were presented with the intention of contemplating and analysing the reception and perception of the people portrayed in the project. This work sought to mobilise those involved in constructing an identity through documentary film as a memory device.

Main Objectives

The primary goal of this project was to explore the potential of the audiovisual format of documentary film as a tool for collecting and sharing testimonies related to the impact of the Escola Oficina (EO) on people's lives. To achieve this overarching goal, the following specific objectives were outlined:

- Conduct fieldwork to understand the dynamics of EO, recording testimonies from teachers, trainers, technical assistants, managers, and coordinators about their experiences at EO.
- Produce documentary cinema narratives based on the collected testimonies, highlighting their subjective, poetic, and authorial dimensions, distinguishing this genre from journalistic reportage.
- Experiment with various editing models using filmed and recorded sound material, maintaining technical rigor while exploring the experimental potential in interrelating these visual and auditory elements during the narrative construction process.
- Evaluate the impact and outcomes of using audiovisual tools in documentary creation to foster collective perception and recognition of EO's contributions.

The Origins of Documentary Cinema

As a starting point, it is pertinent to provoke more objective enquiries in relation to documentary as a film genre. First of all, even before giving a more detailed overview of the history of cinema, it's worth asking a simple question: what is documentary cinema?

In order to translate what documentary cinema means, we first need to understand how cinema emerged as a language medium. There is no closed consensus on who was able to promote the signature of the first cinematographic experiment, the information is tied to the end of the 20th century and is rather imprecise. What is a pertinent statement in this regard is that cinema was not born out of a purely technical and scientific need, very much due to the path that photography had already travelled in its artistic and conceptual dimension. It is possible to infer that the history of cinema began at the end of 1880, with the invention of the first film camera, and thus developed into an important communication and entertainment tool.

Formally, among Europeans and North Americans, there are more categorical discussions that defend the birth of cinema, as an entertainment tool, from the first known public screening in the world, held on 28 December 1895, by the brothers Auguste and Louis Lumière, at the Grand Café in Paris.

Considered one of the most influential intellectuals of the North American school of cinema today, Bill Nichols suggests that the Lumière brothers were the protagonists of the first popular cinema movement, which gave them the expression of the fathers of cinema (Nichols, 1997).

In its first practical performances, cinema was organised by capturing real images, events, places, objects and situations. According to critic Kristin Thompson, the images were short frames, no longer than two to three minutes, and mostly recorded images of everyday life. According to the author, the documentary was the first film genre to be created in the entire history of cinema (Thompson, 2002).

Given these preliminary considerations about the origins of documentary cinema and its first competences in society, its practical performances and inspirations, it is possible to suggest that cinema was born documentary. From the films of the Lumière brothers to the films of Dziga Vertov, cinema does not emerge as a simple vehicle for narrative transmission; it is born with the artistic purpose of re-signifying the viewer's hitherto unseen gaze on the moving image. It was later that cinema was appropriated as an entertainment tool to lead to other narrative constructions that were more technical, more refined and already heavily invested in.

As the capacity for technical reproducibility developed and consolidated, over the decades cinema was able to accompany a wide range of possibilities for artistic elaboration. Openings arose that were capable of advancing increasingly daring and innovative productions, according to the technological availability of each moment.

Documentary cinema, therefore, is mobilised and characterised through a model of direct narrative communication, comprising a number of codes and languages capable of reaching subjects who share the same impression of the ‘real’ captured by the filmmakers. In other words, documentary cinema proposes a dialogue with the subject being filmed. And it is from

this communication that identity, cultural and ethnographic elements multiply, both in those who are portrayed or observed, and in those who are spectators and perceive themselves as capable of sharing impressions, subjectivities, affections and experiences.

In general, those interested in documentary cinema were, and still are, those who value the connection between a pact of realities as a way of accessing knowledge, whether scientific, empirical, social, practical or technological. The scales at which these realities collide among viewers can work from distant or close points of view, the important thing is that they are realities that are connected by this bond of apparent capture of the imprecise moment, the unscathed and inapprehensible moment.

In its formal dimension, documentary cinema also encompasses an immense range of languages, from more essayistic styles to more objective and didactic systems.

We have therefore come to the conclusion that, when composing a narrative device in documentary cinema, it is advisable to emphasise both the communicative purpose of a documentary piece and the choice of a well-defined form in which to communicate.

The Relationship Between the Director and the Characters

The primary concern in this work, in terms of documentary recording, is the way in which the representations of elements of everyday life are assimilated by the viewer. A crossing that indicates ruptures not only in its narrative structure format, but also in its pact and mediation with the viewer, in its breakdown of expectations and the simulated connections proposed by contemporary mediatisation.

What Free Cinema and True Cinema called the real and put into dispute in the field of film language would therefore be, according to Comolli (2008), a layer of the world that is not apprehended in any narrative, that escapes all narratives that have already been formed. The real, therefore, would be that which demands a new narrative, or challenges the narrative that has already been put forward (Comolli, 2008, p. 100).

In short, the project was guided by a detachment from the more formal rules of narrative construction so common to the environment of journalistic description in order to grasp the elements of what is considered ‘real’ in documentary cinema. The project is evidently detached from these models, not only due to the unequivocal lack of financial resources, but essentially due to the forces of conviction in a cinema that is more aligned with experimental, creative, inclusive and, above all, activist issues.

It was necessary to move away from the journalistic model of representation, which corresponds to a way of constructing facts and subjects that sometimes doesn't hide its modulations of narrative genre according to an almost natural and discriminatory movement of exoticising the elements narrated due to a lack of knowledge of the world that is to be described, acted upon and starred in.

This is also how researcher Ana Clara Roberti ponders, in her doctoral thesis, on the potential of the authorial ethnographic documentary and how it behaves as an effective alternative to this exoticising lens: Writing, speaking or making films about the encounter with the other is different from saying who these others are. Assuming the experience and vulnerabilities of documentary filmmaking in the field, with due care, frees the work from the ethical dilemmas

of ethnographic and documentary science, such as the exoticisation of the object of study and the superiority complex of those who define it as such (Roberti, 2020, p. 42).

It is also important to highlight the work of Brazilian film director Eduardo Coutinho. Based on his cinematographic style, Coutinho doesn't care much if the characters he chooses characters present a testimony that corresponds to a status of truth or lie, fiction or reality, because what is at stake is not so much what is said, but a capacity to convince, a certain peculiar way of knowing how to rely on the memory of the present, mixing reason and sensitivity, revelation and imagination, fact and version (Bezerra, 2013, p. 404).

As a subjective and complementary justification, capable of referencing the intellectual framework of the practical activities to be carried out, the result of this proposed development was essentially characterised by the role of the spectator themselves.

Discussing, reflecting and trying to practice the game of positions where the film processes an exchange relationship, under the gaze of what we can call the emancipation of the spectator. Emancipation as the resumption of a relationship between human beings and themselves, a relationship lost in a process of separation (Rancière, 2011, p. 19).

This work functions as another search movement. An eternal search for human similarities, for linguistic singularities between the relationship with the other through the documentary. The search for a beauty uniquely contained in memory, based on testimony, for a moment of decompression and pact between director, spectator and filmed subject.

The Empirical Work

The first stage of this methodological research model focused on developing an initial action project plan. A document was required to summarise and highlight the primary foundational stages of the activities to be undertaken during the project. This document needed to include the methodological steps and their applications, along with corresponding work schedules aligned with the project's specific timeline.

The methodological guidance stages were structured according to the practical and theoretical design of the project itself. The planning process was, therefore, invaluable in delineating and organising the stages and phases between practical, theoretical, and reflective activities, as well as determining how and when these activities could interconnect.

The planning phase also proved critical in considering the availability of access to locations and individuals interviewed throughout the image capture process. It anticipated logistical interventions based on the availability of suitable dates for video recording at EO and individual interviews. Moreover, it facilitated a realistic temporal framework for drafting this report and allowed sufficient time to gather participants' feedback through a reception questionnaire about the project's results.

The subsequent stage of this empirical work was divided into three phases:

Phase I - Observation/Diagnosis
Phase II - Intervention
Phase III - Evaluation/Reflection

Conclusions

According to the initial objectives of this academic action project, several insights can be highlighted regarding the institutional and social role of self-initiated projects in Portugal, such as the case of EO. The researchers' engagement enabled them to outline the most prominent traits of a social action project that yields substantial benefits for an entire community, as reflected in the testimonies of the individuals interviewed during the process.

The core challenge and goal of this work revolved around the initial question: how could audiovisual media, through its applications and documentary cinema techniques, contribute to the collection and sharing of stories related to EO's impact on people's lives across its diverse layers and dimensions of activity? It is not possible to categorically assert whether the practical outcomes of this work provided definitive and objective answers. The methodologies employed for collecting results from the participants are insufficient to fully capture perceptions and measure the actual impact of this project's interventions. Nevertheless, through its scope and depth, and based on testimonies collected during visits and the feedback interview with participant Manuela Silva, the documentary indeed served as a powerful tool for memory collection and as complementary evidence of the transformative impact EO has had on those involved in its learning processes.

The power of the images, alongside Manuela's testimony about her reception of the film, is recognised by the researchers as unequivocal proof of how EO, as an institution, asserts the participation of these individuals as citizens within a collective whole.

The images function as empirical evidence of how a vocational training school can inspire and mobilise individuals within the social fabric to become protagonists of their own professional actions. They develop technical, social, and intellectual skills through structured and professional interactions with trainers, social action technicians, and mentors, offering a multifaceted and inclusive approach to creating new opportunities in the local labour market.

The images themselves hold layers of subjectivity woven into the complex relationships among trainees, the institution, trainers, physical learning spaces, the methodologies involved in the training processes, the teamwork dynamics developed by the students, and, finally, the interaction between the filmed subjects and the filmmaker.

The sequences captured reveal the richness of detail within these hubs of technical and professional knowledge at EO, which serve as the core of its role as a training entity. EO strives not only to provide professional guidance but also to foster new emotional connections and support individuals in overcoming personal challenges. The institution embraces dialogue with conflicting perspectives, tailors its approach to the personalised aspirations of trainees, and promotes voluntary collaboration as key features of a project that impacts the personal, professional, and subjective dimensions of the lives of all those involved in its various operational layers and phases.

One of the key conclusions of this project is rooted in the observation of how its audiovisual narrative format was capable of conveying the fundamental concept of self-initiated projects. These projects emerge as promising tools in addressing the country's current social realities and the processes deemed most significant in this context.

The practical outputs of this work provide an understanding of the general structural framework of this self-initiated project model, while also offering an opportunity for replication by other entities interested in working within the parameters outlined by the action project defended in this research.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Augmented Reality (AR) offers numerous benefits across various fields by displaying the 3D models of complex structures as real objects in digital information. For improvement of the educational service for many undergraduate students per year at the Applied Computer Science-Multimedia Program in King Mongkut's University of Technology Thonburi, the 3D models in AR for educational equipment were created to improve the equipment borrowing service process. The AR media were made available through QR codes which students can simply scan with their mobile to make visualize understanding better than the 2D picture without the risk of real equipment damage. This approach not only aided in better visualization and understanding of complex equipment but also fosters a more efficient and informed decision-making for equipment selection. The 3D models of real objects were created using the 3D scanner and displayed with AR, which were assessed the qualities by three expert professors. The satisfaction after using AR media of all 3D models was then evaluated with a sample group of 30 undergraduate students in the Applied Computer Science-Multimedia Program, selected by simple random sampling. The tools in this study were the quality assessment form and the satisfaction assessment forms using 5-score rating. This study indicated that the overall qualities of the AR were rated as very good, and the satisfaction level of the sample group was high. Therefore, the implementation of 3D augmented reality media has significantly enhanced the equipment borrowing service for undergraduate students.

Introduction

The integration of immersive technologies like Augmented Reality (AR) has emerged as a transformative approach in various fields, including education. AR blends real-world environments with interactive digital content, providing an enhanced user experience that improves comprehension and engagement. By allowing users to visualize complex structures as 3D models in real-world contexts, AR offers significant advantages in terms of understanding and interaction. This capability makes it an invaluable tool in educational environments where visual learning and practical understanding are crucial.

At King Mongkut's University of Technology Thonburi, the Applied Computer Science-Multimedia Program serves hundreds of undergraduate students annually, many of whom rely on educational equipment for practical coursework and projects. However, traditional equipment borrowing processes often involve inefficiencies and risks, such as insufficient understanding of the equipment's functionality and potential damage due to improper handling. These challenges highlight the need for innovative solutions that enhance the borrowing process while ensuring the longevity of valuable resources.

This research aims to address these issues by developing 3D AR media to support the equipment borrowing service for undergraduate students. By integrating 3D models into AR applications, the project seeks to improve students' understanding of equipment through detailed visualizations that reduce reliance on physical handling. QR codes are employed to provide easy access to AR media, enabling students to scan and view the models directly on their mobile devices. This approach minimizes the risks of equipment damage while offering an interactive and engaging learning experience.

The study focuses on the development, quality evaluation, and user satisfaction assessment of the AR media. High-quality 3D models were created using a 3D scanner, designed to replicate real-world educational equipment accurately. The AR media's quality was evaluated by three expert professors specializing in multimedia and educational technologies, ensuring its effectiveness in meeting educational objectives. To measure user satisfaction, a sample group of 30 undergraduate students was selected through simple random sampling and surveyed using a 5-point Likert scale.

The findings of this study indicate that the developed AR media significantly improves the equipment borrowing service by enhancing students' understanding and decision-making capabilities. The AR models were rated as very good by experts, and the satisfaction level among users was high, demonstrating the effectiveness of this innovative approach. This research not only highlights the potential of AR in revolutionizing educational services but also provides a foundation for future applications of immersive technologies in academic settings.

Objectives

1) To develop 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program.
2) To evaluate the quality of 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program.

3) To assess the satisfaction of the sample with 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program.

Literature Review

Augmented Reality Media

Augmented Reality (AR) is a transformative technology that superimposes virtual elements onto the real world, enhancing the viewer's experience. (Mujumdar, 2022) by providing additional valuable information. It is applied across various fields, including education, to enrich learning through interactive virtual objects (Permana et al., 2023) and improving the educational process for students, making AR a valuable tool in education, marketing, and healthcare (Salmiyanti et al., 2023). Augmented Reality (AR) media has emerged as a transformative tool in educational settings, enhancing engagement and understanding across various subjects. The integration of AR into learning environments allows for interactive experiences that can significantly improve student outcomes (Shi, 2024). Effectiveness in Learning, AR-based learning media has shown substantial improvements in student understanding. AR has been successfully applied in various subjects, including economics, where it simplifies complex concepts, leading to significant learning gains (Panjaitan et al., 2024). In creative fields, AR enhances traditional poster-making by providing interactive elements that enrich the learning experience (Multazam et al., 2024). Technological Integration, the incorporation of AI and computer vision into AR systems allows for more intuitive user interactions, enhancing the overall educational experience. This integration supports real-time data processing and contextual awareness, making learning more personalized (Shi, 2024).

3D Models

3D modeling is a dynamic and essential process in various fields, enabling the creation of virtual representations of objects and environments. This technology encompasses a range of techniques and applications, from animation and gaming to architecture and product design. Fundamental Components of 3D model include Vertices, Edges, and Faces: These are the building blocks of 3D models, forming meshes that define geometry (Ghuge, 2023). 3D models play a crucial role in enhancing Augmented Reality (AR) experiences across various domains, from education to assembly instructions. By integrating real-world imagery with computer-generated models, AR creates interactive environments that engage users in unprecedented ways (Bhuvaneswari et al., 2024). 3D models for equipment borrowing services can enhance user experience and operational efficiency in various contexts. These models facilitate self-service interactions, allowing users to borrow and return items seamlessly (Tu et al., 2021). In this research, 3D models of borrowing equipment play a crucial role in guiding users through the borrowing process.

Equipment Borrowing Service

The equipment borrowing service encompasses various systems and methods designed to facilitate the lending and returning of equipment efficiently. These services leverage technology to streamline processes, enhance user experience, and ensure accountability (Ashar & Iqbal, 2024). The equipment borrowing service in educational institutions is a critical support system that ensures students have access to necessary tools and resources.

Traditional systems often face challenges such as inefficiency, lack of clarity, and user dissatisfaction (German et al., 2021). Incorporating AR and 3D models into the borrowing service can address these issues by providing clear instructions, real-time guidance, and an engaging user interface. Research demonstrates that digital solutions like AR can streamline service operations and improve overall user satisfaction by reducing confusion and enhancing the efficiency of transactions.

Research Method

The researchers divided the research method into 3 phases.

Phase 1 System Development. The system development process follows the ADDIE model that include 5 steps as follows 1) Analysis 2) Design 3) Development 4) Implementation and 5) Evaluation.

1) Analysis: Identify user requirements, challenges in the existing equipment borrowing process, and the feasibility of AR technology in addressing these challenges.
2) Design: Develop storyboards, 3D models, and AR interactions for the system. Key features include a virtual catalog of equipment, step-by-step borrowing guidance, and real-time status updates.
3) Development: Utilize tools or similar platforms to build the AR media system. Incorporate feedback from stakeholders to refine the system.
4) Implementation: Deploy the system in a controlled environment for pilot testing with target users.
5) Evaluation: Assess the system's quality using expert reviews and user feedback.

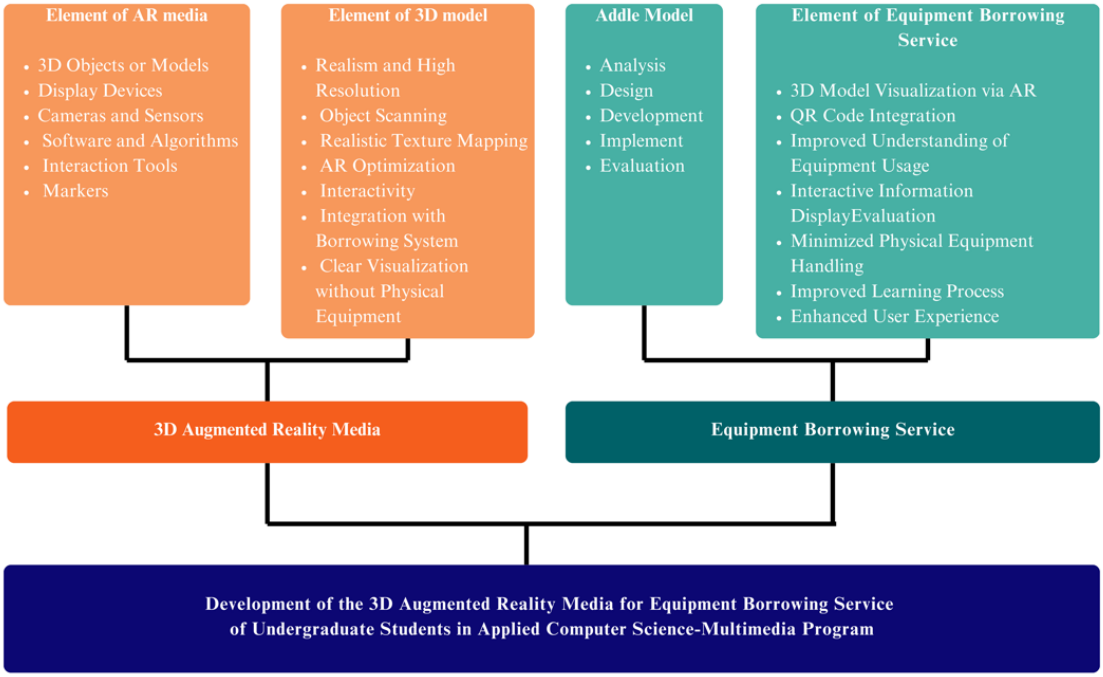

Figure 1: Conceptual Framework

The development of the 3D Augmented Reality (AR) media for the equipment borrowing service is a significant step toward improving the borrowing process and enhancing the educational experience for undergraduate students in the Applied Computer Science-Multimedia Program. This research combines advanced AR technology with 3D modeling to

create a system that is interactive, user-friendly, and highly efficient. The following is an in-depth exploration of the elements and processes involved in this innovative system.

1) Elements of AR Media key elements include 3D Objects or Models, which are used to create realistic and accurate visual representations of the equipment. Display Devices such as smartphones or tablets, which serve as the primary interface for users to interact with AR media. Cameras and Sensors that detect markers or QR codes, facilitating the activation and visualization of AR content. Software and Algorithms that process data and create AR experiences. Interaction Tools allowing users to explore the media interactively. Markers, such as QR codes, that connect the physical and digital worlds, enabling quick access to the AR system. These elements work together to create a robust and efficient system that bridges the gap between physical equipment and digital representation.

2) Elements of 3D Models key elements include the 3D models are designed with realism and high resolution, providing detailed and lifelike representations of the equipment. Object scanning is employed to capture the physical characteristics of the equipment and translate them into digital models. This process is further enhanced by realistic texture mapping, which adds depth and authenticity to the models. To ensure optimal performance, the system undergoes AR optimization, which ensures that the media is responsive and user-friendly. It also supports interactivity, allowing users to engage with the models dynamically. Furthermore, the AR media is designed for integration with the borrowing system, enabling smooth transitions between viewing equipment and completing the borrowing process. Importantly, the system offers clear visualization without physical equipment, reducing the need for students to handle real devices, thereby minimizing potential damage.

3) ADDIE Model for System Development key elements include 5 steps as follow 1) Analysis: Identifying problems in the existing borrowing system and defining user requirements. 2) Creating: a blueprint for the AR media, including the design of 3D models and user interfaces. 3) Development: Building the 3D models and integrating them into the AR system, ensuring functionality and user-friendliness. 4) Implementation: Deploying the system in a real-world setting for users to test and experience. And 5) Evaluation: Assessing the system's performance, identifying areas for improvement, and ensuring that it meets user expectations. This model ensures that the system is well-designed, thoroughly tested, and aligned with the needs of the users.

4) Elements of the Equipment Borrowing Service key elements include 3D Model Visualization via AR, enabling users to view realistic representations of equipment through their devices. QR Code Integration, which simplifies access to AR content and makes the process more efficient. Improved Understanding of Equipment Usage, as the detailed 3D models and interactive displays provide students with better insights into how to use the equipment. Interactive Information Display, allowing users to engage with the content dynamically. Minimized Physical Equipment Handling, reducing the likelihood of damage to real devices. Improved Learning Process, as students can learn about the equipment in a more engaging and interactive way. And Enhanced User Experience, which makes the borrowing process more intuitive and enjoyable.

The second phase involves assessing the quality of the quality of 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program. This is conducted through in-depth interviews with 3 experts specializing in multimedia and information technologies. The process includes detailed

reviews of the steps and methodologies applied during development. Experts evaluate the system using a 5-point Likert scale to determine its alignment with 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program. Basic statistical methods, such as mean and standard deviation calculations, are employed to analyze the feedback from expert evaluations. The quality of the system is evaluated based on ISO 9241-210 focuses on user ease of use, convenience, and satisfaction. 1) Design quality: The scanned object or model is clear, the objects themselves are realistic and interesting, Objects can provide a unique experience from use, The object is easy to use and consistent in use and the objects themselves can help increase awareness and understanding of equipment. 2) Content quality: The content of the object is accurate and reliable, the content of the object is clear and easy to understand, the amount of content conveyed is appropriate, the ordering of content is appropriate and The content of the object can help increase awareness and understanding of the device. Data collection involves expert reviews. Evaluation tools is questionnaires.

The third phase evaluates the satisfaction of the sample group with 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program. The sample comprises 30 undergraduate students from the Bachelor of Science program in Applied Computer Science-Multimedia, selected through voluntary participation. A 5-point Likert scale is used to measure their satisfaction levels regarding the AR media. Basic statistical analyses, including mean and standard deviation calculations, are applied to interpret the feedback from the sample group. The survey assesses as follows 1) Satisfaction with media design: The object or model is interesting to use, The objects are realistic and easy to use, The object can provide a unique experience from its use, The objects have proper interaction and are easy to use, The objects have proper interaction and are easy to use and The object itself can help increase awareness and understanding of the device. 2) Content satisfaction: The content of the object is accurate and reliable, the content of the object is clear, concise and easy to understand, the amount of content conveyed is appropriate, the content order is appropriate and The content of the object can help increase awareness and understanding of the device.

Results

3D Model

In this research, the researcher conducted an experimental process using 3D model to create a realistic 3D model that can be used effectively in the device lending system. The experimental process can be described as follows: 1) Scanning objects with a 3D scanning application on a mobile phone. The researcher began by using a 3D scanning application on a mobile phone to scan real devices used in the lending system, such as cameras or other multimedia devices. 2) Customizing and increasing the clarity of the 3D model After obtaining a basic model from the scan, the researcher imported the model file into a 3D design program to improve the quality to be clear, including editing the textures and increasing the resolution of the model to make it look more realistic and detailed.

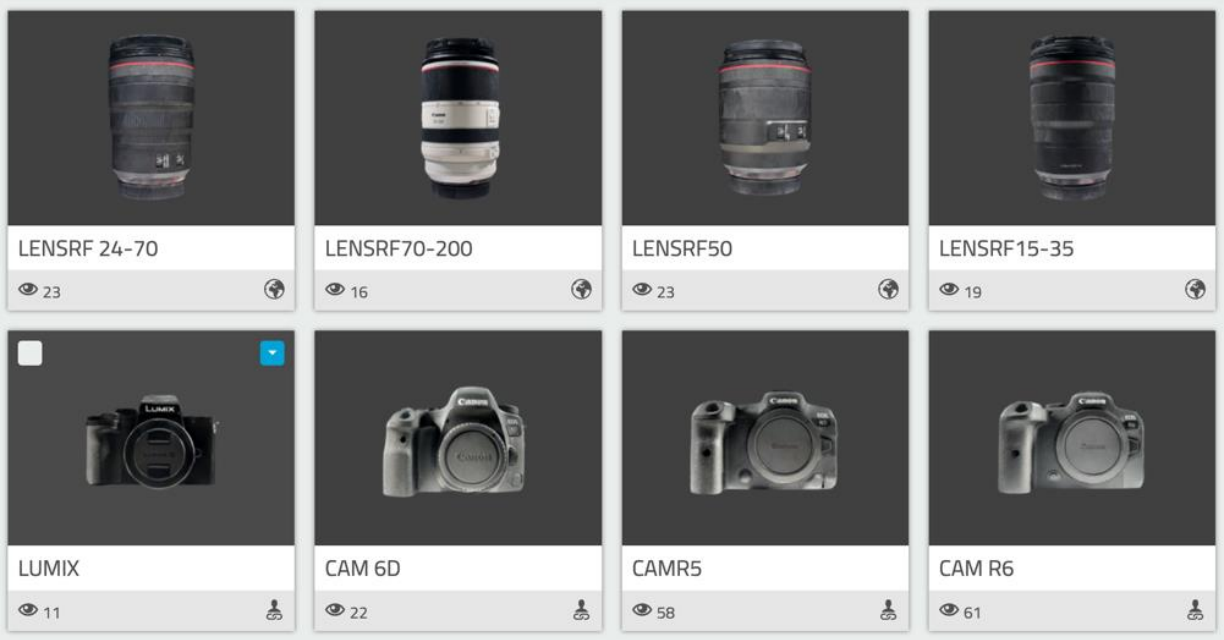

Figure 2: Images of 3D Model Scanning

Augmented Reality

In this research, the researcher conducted an experimental process using AR Augmented Reality to create a realistic AR Augmented Reality that can be used effectively in the device lending system. The experimental process can be described as follows: 1) The completed 3D model is imported into the AR application or platform to create media that displays the 3D model in augmented reality. The AR system is designed to display the 3D model through the smartphone or tablet screen, so that students can see the image realistically. 2) Linking the AR system to the QR Code The researcher created a QR Code linked to the AR model so that students can scan the QR Code and easily access the 3D model via their mobile devices. The use of QR Code reduces the complexity of access and allows students to learn about the information of the device without touching the actual device. 3) Integrating AR into the device lending system AR media is integrated into the device lending system so that students can see details such as the size, structure, and how to use the device before borrowing it, which will help students understand the device more clearly, reduce errors in use, and reduce damage to the actual device.

Figure 3: Images of Augmented Reality Scanning

Results of Media Quality Assessment

The results of media quality assessment by 3 experts in the field of Development of the 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program are as follows:

Table 1: The Results of Media Quality Assessment

Item	**Quality assessment level**		
	X	**S.D.**	**Interpretation**
Design quality			
The scanned object or model is clear.	4.67	0.58	very good
The objects themselves are realistic and interesting.	4.33	0.58	good
Objects can provide a unique experience from use.	4.33	0.58	good
The object is easy to use and consistent in use.	4.00	0.00	good
The objects themselves can help increase awareness and understanding of equipment.	5.00	0.00	very good
Content quality			
The content of the object is accurate and reliable.	5.00	0.00	very good
The content of the object is clear and easy to understand.	4.67	0.58	very good
The amount of content conveyed is appropriate.	4.00	0.00	good
The ordering of content is appropriate.	4.33	0.58	good
The content of the object can help increase awareness and understanding of the device.	5.00	0.00	very good
Total	**4.53**	**0.51**	**very good**

From Table 1, The result of overall quality of the media is at a very good level. The mean was 4.53 and the standard deviation was 0.51. When considering each topic, it was found that the topics The objects themselves can help increase awareness and understanding of equipment, The content of the object is accurate and reliable, the content of the object can

help increase awareness and understanding of the device had a very good level of quality. The mean was 5.00 and the standard deviation was 0.00. Topics: The scanned object or model is clear; the content of the object is clear and easy to understand. The quality level is very good. The average is 4.67, the standard deviation is 0.58. The objects themselves are realistic and interesting, Objects can provide a unique experience from use, The ordering of content is appropriate has a good quality level. The topic has a mean of 4.33 and a standard deviation of 0.58. The object is easy to use and consistent in use, The amount of content conveyed is appropriate has a mean of 4.00 and a standard deviation of 0.00.

Results of Satisfaction Assessment

The Assessment of satisfaction with 3D Augmented Reality Media for Equipment Borrowing Service of Undergraduate Students in Applied Computer Science-Multimedia Program by 30 undergraduate students in the Bachelor of Science program, Applied Computer Science-Multimedia by voluntary selection method are as follows:

Table 2: The Results of Satisfaction Assessment of Students

Item	Satisfaction assessment level		
	X	S.D.	Interpretation
Satisfaction with media design			
The object or model is interesting to use.	4.73	0.45	highest
The objects are realistic and easy to use.	4.77	0.43	highest
The object can provide a unique experience from its use.	4.70	0.47	highest
The objects have proper interaction and are easy to use.	4.60	0.56	highest
The object itself can help increase awareness and understanding of the device.	4.67	0.55	highest
Content satisfaction			
The content of the object is accurate and reliable.	4.87	0.35	highest
The content of the object is clear, concise and easy to understand.	4.57	0.57	highest
The amount of content conveyed is appropriate.	4.70	0.53	highest
The content order is appropriate.	4.57	0.57	highest
The content of the object can help increase awareness and understanding of the device.	4.73	0.52	highest
Total	**4.69**	**0.50**	**highest**

From Table 2, The result of overall satisfaction is at the highest level with an overall mean of 4.69 and a standard deviation of 0.50. When considering each topic, it was found that the topic The content of the object is accurate and reliable had a highest level of satisfaction. Has a mean of 4.87 and a standard deviation of 0.35. Topic: The objects are realistic and easy to use. There is a highest level of satisfaction. The average was 4.77 and the standard deviation was 0.43. The topic the object or model is interesting to use had a highest level of satisfaction. The mean was 4.73 and the standard deviation was 0.45. The topic the content of the object can help increase awareness and understanding of the device had a highest level of satisfaction. The average was 4.73 and the standard deviation was 0.52. The object can provide a unique experience from its use had a highest level of satisfaction. The mean was

4.70 and the standard deviation was 0.47. The topic the amount of content conveyed is appropriate had a highest level of satisfaction. The average was 4.70 and the standard deviation was 0.53. The topic the object itself can help increase awareness and understanding of the device had a highest level of satisfaction. has a mean of 4.67 and a standard deviation of 0.55. The topic the objects have proper interaction and are easy to use has a highest level of satisfaction. It has a mean of 4.60 and a standard deviation of 0.56. And the topic the content of the object is clear, concise and easy to understand, the content order is appropriate had the highest level of satisfaction. has a mean of 4.57 and a standard deviation of 0.57.

Discussion and Conclusion

This research aims to address the challenges associated with the equipment borrowing process for undergraduate students by developing a 3D Augmented Reality (AR) media system. The project integrates 3D models into an AR application to enhance students' understanding of the equipment through detailed visual representation, minimizing the reliance on physical handling. By leveraging AR technology, students can interact with accurate 3D visualizations of the equipment, which helps bridge the gap between theoretical knowledge and practical usage without the risk of damaging real equipment.

The system incorporates QR codes as an easy access point to the AR media. Students can scan these codes using their mobile devices, instantly displaying the 3D models on their screens. This approach not only simplifies the process of learning about the equipment but also fosters a more interactive and engaging learning environment. Additionally, the system serves as a valuable tool for decision-making during the borrowing process, enabling students to better understand the functionality and specifications of each piece of equipment before physical use.

To ensure the practicality and effectiveness of the system, the 3D models were created using advanced 3D scanning technology to achieve high accuracy and realism. The quality of the AR media was evaluated by a panel of expert professors, ensuring it meets educational standards. A user satisfaction study was conducted with a group of 30 undergraduate students selected through simple random sampling. The evaluation focused on both the quality of the AR media and its usability in improving the equipment borrowing process.

The findings indicated that the AR system significantly enhanced the borrowing service, providing students with a better understanding of the equipment while reducing the risk of misuse and damage. Moreover, the interactive nature of the AR media encouraged higher engagement and satisfaction among users. The research demonstrates that 3D AR media is not only an effective educational tool but also a practical solution for resource management in educational institutions.

Can Individuality Be Taught? The Paradox of Self-Identity and Autonomy in a Pragmatic Society

Venus Ke Xin Pei, Nanyang Technological University, Singapore
Xin Er Lin, Nanyang Technological University, Singapore

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Can individuality be taught? This paper explores the paradoxical relationship between Singapore's holistic education model and the culture industry's impact on Singapore in today's digital age. Education in Singapore has evolved from a largely pragmatic curriculum in the nation building years to a more holistic framework in recent years. Even though this is the case, does holistic education necessarily mean a less pragmatic one? This holistic approach encompasses the nurturing of character, creativity, and critical thinking skills alongside strong academic foundations. However, how much of our holistic education system focuses on cultivating a strong sense of self and identity among students? This paper investigates how these seemingly contrasting forces– a holistic education system and a commercially-driven pragmatic society and the pervasive influence of the digital age – coexist in Singapore and the potential impact this has on young minds. Rigid definitions of success limit individuals' critical thinking skills, binding them to conform to uniformity, stunting creativity in the long run. The paper concludes with recommendations for enhancing the current educational landscape. It advocates strategies that promote individual autonomy in critical thinking and foster a sense of ownership in students' learning journey, thereby creating dynamic learning spaces where creativity flourishes.

Introduction

Individuality and pragmatism have been falsely pitted against one another as antonyms. The idea that creativity cannot exist in the realm of pragmatism is a logical fallacy. Yet, when one thinks of Singapore's education system, some may think of pragmatism and academic achievement rather than a knack for promoting deeply introspecting students who are creative and have a strong sense of self (Hardy et al., 2021). This is unsurprising given that Singapore is ultimately a collectivist society. Nonetheless, the Singapore education system has introduced a system of holistic education to respond to the needs and demands of the 21st century (Lee & Low, 2013). Given that digitisation is at the forefront of our globalised world, it is of utmost salience that Singapore's education system remains relevant and rigorous in meeting the demands and needs of the global economy. Given that human capital is the most lucrative resource that supports our economy (Lee & Low, 2013), the value of individuality, thus takes a backseat in relation to developing a holistic education system in comparison to the produced value generated by students when they eventually enter the workforce.

Contextualising Holistic Education in Singapore

While there are studies which focus on the holistic learning and educational policies of Singapore, they largely focus on the costs of education training and the upgrading of skills such that these skills can later be monetised rather than focusing on the personal development of each student, which helps to shape one's sense of self, identity and autonomy. The idea of pragmatism is deeply ingrained in the way policies are crafted in Singapore, education is no different. Schleicher (2013) posits that "education policy needs to respond by improving the quality of learning outcomes, putting the premium on skills-oriented learning throughout life instead of qualifications-focused education upfront. This is about fostering demand-sensitive and relevant learning." and "However, skills development will be far more effective if the world of learning and the world of work are linked." (p. 46). These insights show an inherently pragmatic way of viewing the design of educational policy. This can be problematic to the personal growth of individuals as they are taught to hit targets set for them. The shift from academic focus to skill-based educational policies can help to shape students into better workers, however, true introspection may not be given enough room in the equation. This is because it makes more sense for the curriculum to be standardised such that we meet the country's need to produce a more economy and work oriented educated populace, after all, "Singapore is a small country with limited resources. Our people are our most important resource, and we invest heavily in building up our human capital in order to secure Singapore's future" (Lee & Low, 2013).

In fact, the framework of holistic education is largely based on skill rather than the promotion of discovering oneself. The need for measurable outcomes is often prioritised (Hardy et al., 2021). Another evidence of holistic education being based on monetizable skills rather than focusing on individualism is how the holistic education framework is created based on 21st Century Competencies which are essentially a list of skills a student is expected to develop alongside five or more academic subjects at the secondary level. Lee and Low (2013) have written that "An in-depth review of 21st century competencies (21CC) became topical when governments began to map education outcomes to workforce skills and competencies.". It is notable that many of these skills and competencies are directly related to the development of an individual and by extension, their self-identity.

The Supposed Paradox of Holistic Education and Pragmatism

Holistic education, with its emphasis on personal growth, critical thinking, and well-rounded development, often juxtaposes the commercial culture industry, which is driven by profit maximisation, consumerism, and standardised content. In today's digital age, this paradox becomes even more pronounced due to the pervasive influence of social media, advertising, and digital entertainment on young minds. Yet, Singapore's holistic education framework weaves in the skills required of students. Ng (2017) posits that Singapore, a nation of constant evolution, upholds certain core values to anchor its people amidst rapid change. While deeply committed to a meritocratic system, the country is also striving to support students who face challenges in achieving academic success within its highly competitive environment. As discussed earlier, personal growth, critical thinking and well-rounded development are only important to the extent that it makes them viable human capital and assets in the country's economy. Although this version of holistic education helps to promote the development of in-demand skills among students, it may not give them space necessary to explore their individuality beyond the confines of a future career path. Hung and Johannis (2023) assert that "learning cannot be divorced from self-identity", which would entail that regardless of what subjects and activities undertaken by students in the process of learning, one's identity would be shaped. Yet, if the programmes in school are largely standardised and curriculum is mostly designed with students as human capital in mind, the process of meaning-making would be confined to how one can monetise the skills they have picked up or become a second thought after the need to excel academically. To address this tension, it is essential to reconsider the role of critical thinking and creativity within Singapore's holistic education framework and how it shapes an individual's mindset and sense of self. While these skills are undoubtedly valuable for the workforce, they can also empower students to challenge societal norms, question dominant narratives, and develop a more nuanced understanding of the world and allow for more introspection that can help them navigate the challenges, both personal and otherwise that they may face in the digital age.

Why Does Individuality Matter?

This question will be discussed in two ways: firstly, why does individuality matter, in terms of the goals of Singapore education? Secondly, why does individuality matter for the students?

Individuality can be understood as personal identity formed by one's constant reflection upon experiences in life and external influences, such as societal traditions, surrounding the individual (Hinchman, 1990, p. 759). Individuality "imports ethical being" (Lindsay, 1920, p. 423), signalling its importance since it precedes agency and autonomy. The Ministry of Education has listed "self-awareness" and "responsible decision-making" as two out of five "social-emotional competencies" students should acquire under the 21st Century Competencies framework (MOE, 2022a), suggesting that the education system recognises the importance of students understanding that they are individuals so that they can make responsible choices. However, as mentioned above, they are not given the space to explore their individuality beyond what makes them a contributing member to the community. Co-Curricular Activities (CCAs) in school are used to emphasise what the students have contributed to the school, as seen in the measures to evaluate students' abilities by having School Graduation Certificates include "non-academic achievements" and "broadening" CCAs to acknowledge student efforts in "student-initiated… and community-based activities" (MOE, 2022b). Students are expected to make an impact during non-academic activities, like

representing the school in national tournaments or initiating projects to provide community service. Arguably, the success of a student's time in school can be perceived through these certifications and testimonials for their character and contributions to the community. Although the system encourages students to do this in order to build strong character, Singapore's high-stress and highly competitive culture has turned "non-academic achievements" into one of the criteria for success, on top of academic achievements.

Rather than on why individuality matters, the question derived from the framework for holistic education thus becomes: how am I disadvantaged if I do not showcase my individuality in terms of non-academic contributions and achievement? Singapore is known for kiasu culture: a colloquial term that means "fear of losing out". A study was conducted on kiasuism among Singapore undergraduate students to conceptualise the term (Bedford & Chua, 2017). The study's findings determined kiasu to indicate behaviour that is perceived to be motivated by the fear of losing out to others. Kiasu behaviour is characterised by constant comparison with others, and the perception of needing to gain something that others are getting despite not actually caring for it. The two mindsets discussed in the study apply: not wanting to "miss out on a potential benefit or common good" and not "fall(ing) behind peers academically". Certificates including non-academic achievements become another measure for comparison between peers, even if the original intentions behind initiating a community project, for example, came from a genuine desire to help others. The value of the project becomes quantifiable; it becomes a question of how much more this student has done for the community as compared to others. The idea of missing out on a potential benefit could spur students to take up leadership roles in CCAs not for the valuable experience of being a leader, but instead, for the title held and having it listed as an achievement. When the majority of students work hard to add to their list of non-academic achievements, the pressure to showcase one's individuality and contribution to the community for a better chance at entering a good school or finding a good job in future increases. In this case, individuality becomes a by-product of one's activities and experiences, what makes them stand out as an individual becomes a metric to pit themselves against their counterparts in a web of limited opportunities. Individuality matters to the extent that it can demonstrate why one is a better candidate than others, rather than simply being a unique individual.

This brings the discussion to the second question: why does individuality matter for the students? On a philosophical level, individuality is seen as the foundation of "all practical interest" (Jordan, 1921, p. 566). This means that one's personal identity, which is separate and distinguishes the self from the others, gives reason for action. However, kiasuism places the distinguishing of self from others as *the* reason for action. When the notion of individuality is centred around comparison with one's peers, the pressure to succeed can become overwhelming. In recent years, there has been rising concern for the mental health of Singapore's youths. The Institute of Mental Health (IMH) conducted the first National Youth Mental Health Study, which found about one in four youths felt "severe or extremely severe" anxiety symptoms, particularly those who are in the 15 to 24 age group as compared to those aged 30 to 35 (2022). Excessive use of social media is cited as a reason, whereby youths are exposed to "constant comparisons" (Verma & Subramaniam, 2024) with what they see on the screen. Not only that, academic stress stems from the students' "own expectations" and expectations from parents and teachers (Tan, 2022). This suggests that students in Singapore form their sense of self through comparing themselves with their peers, which parallels the findings from studying kiasuism. A person's worth is hinged upon one's achievements in comparison to their peers'. Individuality then, as the notion that it provides reason for action, matters because individuality conceptualised via kiasuism has led to poorer mental health

amongst youths in Singapore. In encouraging students to gain a sense of individuality beyond their value for the workforce, they may feel less of a need to compare themselves to and compete with their peers in order to get a better job or higher pay.

How Is Individuality Taught?

In Singapore's education system, the first primary school Character and Citizenship Education (CCE) syllabus that is based on the 21st Century Competencies framework lists "Identity" as one of the Three Big Ideas, and the curriculum attempts to teach students how to have "perception of self". The focus centres around "Being who I am and Becoming Who I can be" (MOE, 2012, p. 13). However, guiding students to form a conception of the self as an individual is subsidiary to the greater objectives of the CCE curriculum, in which students are to form a sense of responsibility for the greater society. Identity is discussed mainly because being "good individuals" must come before becoming "useful citizens" (p. 1). In teaching critical thinking skills for students to be "inquisitive learners" and "critical thinkers" (Sng, 2023), students are indeed provided the space to maintain, in Dewey's words, "healthy scepticism" (1909). According to a paper from NIE, creative and critical thinking push students to apply and adapt knowledge to problem-solve, and sometimes it is done by breaking "established symbolic rules and procedures" (Chiam et al., 2014, p. 35). In encouraging students to judge a problem and find alternative ways to resolve problems, it provides them the space to think for themselves and break away from the uniformity of previously established rules. This is limited to problem-solving, however, and ultimately gears students towards becoming useful citizens and talents in the nation's workforce. Arguably, individuality is not being taught in the way that gives students a sense of their worth as true individuals, but rather, an individual whose identity is valued only as part of the larger construct of society. That said, schools do have time and available resources to enable students to find their sense of individuality.

Recommendations and Conclusion

It is important to recognise that individuality and collectivism are not mutually exclusive. While Singapore's collectivist culture emphasises harmony and cooperation, it does not necessarily suppress individual expression. However, the way that individuality is treated as a by-product or an innate result of holistic education is one that does not lead to students becoming more in tuned with their needs and sense of self. While students are given plenty of opportunities to partake in various activities to cultivate interests and skills, as well as take up multiple enrichment classes within the holistic framework of education, individuality as a concept is more of an educational by-product than a goal in and of itself. More emphasis should therefore be placed on encouraging individual expression, as a strong sense of self-identity helps students gain a clearer understanding of themselves, and thus they become more likely to be motivated and engaged in their studies (Johannis & Hung, 2023). Instead of solely focusing on learning subject matter and seeking immediate opinions, schools should prioritise self-discovery through activities like exploring hobbies and interests. This provides them with the space to explore what they like to do within imposing boundaries based on what the school is able to provide the student. Some hobbies may not be readily accessible to students; however, this should not limit them from learning more about the subject matter through resources available such as the school library and the internet, which democratises a large amount of information regarding a diverse array of hobbies. Search activities and guidelines can be issued to students to ensure that they stay on track in terms of viewing and accessing content which is age appropriate. Even if they are not able to carry out their activity

of interest first hand, learning about components of the hobbies can help students understand themselves better, not for the sake of pursuing a plausible career out of their discovery (even though, this can be a part of their search for an interest or hobby). The core of this approach is stemmed in the discovery of the self. This approach allows students to develop a stronger foundation for understanding themselves before engaging with external knowledge. Moreover, schools can consider including a monthly check in in terms of understanding how well students are coping. Currently, the issues of mental health, although greatly de-stigmatised as compared to a decade ago, continues to be a sensitive issue that schools have to skirt around. This is evidenced by how youths in Singapore tend to associate terms of "mental illness" with pejorative words (Pang et al., 2017). Even though there are helplines and resources available for students, they may not feel comfortable to seek out these resources themselves and may not know how to go about approaching their emotions. To ensure that students are well-adjusted given the rise in symptoms of poor mental health, schools must do more to normalise the expression of one's emotions through regular check in sessions. The issues of societal pressures can be discussed openly rather than swept under the rug, so students are more likely to open up about their troubles and relate to one another, providing effective peer support (Richard et al., 2022) given their shared experience of learning in a high-stress and competitive environment. This not only allows students to become more empathetic towards one another, it helps them to reconcile their emotions of stress and uncertainty, which when left unchecked may lead to detrimental outcomes for the overall mental health of the student population. Through a more extensive curriculum that focuses on the core of self-discovery for self-discovery's sake and a more introspective approach in dealing with issues of mental health, students can better manage stress, build resilience, and develop healthy coping mechanisms that leads to a more holistic assessment of the self, thus enriching the learning experiences of students in Singapore. Future studies can look into how educators can create a learning environment where students feel empowered to express their unique ideas and perspectives around topics which require a higher level of introspection and sense of self. Individuality, as we have discussed, cannot be taught. It ought to be discovered through consistent introspection and participating in activities of interest. The notion of individuality remains at the heart of what makes a person, and within the ten years of compulsory education in Singapore, students should be provided the space to ascertain what makes them who they are.

Abstract
Nowadays, many products require box packaging to protect them during transportation, handling, and storage, making mass production for many industries. To provide important knowledge for paper box production, online learning using VDO media should be created to enhance understanding for the relevant persons. The objective of this project was to develop video learning media, especially for staffs and customers on the paper box packaging production process as the requirement of a manufacturer. The video materials of five learning modules were created using the InShot program and the qualities of online video learning material were then evaluated. The learning effectiveness and satisfaction of the sample group were assessed using 25 learner participants, including new staffs of the manufacturer, undergraduate students of a packaging program, and interested persons. The tools included a quality assessment form, a pre-test and post-test consisting of 20 multiple-choice questions, and satisfaction evaluation form using 5-score rating. The results indicated that the overall content quality was good (mean=3.96) and the media quality was good (mean=4.37). The learning effectiveness determined from the test scores showed that the post-test was 44.2% higher than the pre-test, statistically significant at the .05 level. The average normalized gain (N-gain) was 0.64, indicating as a medium level of learning effectiveness. The sample group expressed a high satisfaction with the learning materials (mean=4.12). Therefore, this learning material can effectively be applied to provide an online learning platform for the manufacturer to improve the packaging production process and company marketing.

Introduction

Many products require packaging to protect them during transportation, handling, and storage, making mass production for many industries. The demand for sustainable and Eco-friendly packaging solutions has surged, leading to a significant rise in the popularity of paper box packaging. The paper boxes are biodegradable, recyclable, and made from renewable resources, making them an excellent choice for businesses aiming to reduce their carbon footprint. The production of a paper packaging box is a meticulous process that requires careful attention to detail at every step. From initial design considerations to the final quality check, each stage plays a crucial role in creating a packaging solution that meets industry standards and customer expectations. To control the qualities of products, the manufacturer must provide the learning media for upskilling or training process that helps employees develop new or higher-level skills to improve their work performance. It can also help employees prepare for new opportunities within their company.

The advancing technology and improved internet access increased use of online learning which significantly enhance learning engagement and motivation. Since the digital devices such as computers, tablets or smartphones allow easy access to resources for self-learning, online learning becomes flexible and enable learning in anytime and anywhere. To provide important knowledge for paper box packaging production, online learning using VDO media should be created to enhance understanding for the relevant persons. The objective of this project was to develop video learning media, especially for staffs and customers on the paper box packaging production process as the requirement of a manufacturer (UL Printing and Packaging Co., Ltd.).

Methodology

The online video learning media on the paper box packaging production process were created as the requirement of UL Printing and Packaging Co., Ltd. as an offset printing house using the InShot program. The online learning unit in the model of VDO included of 5 units was applied to provide knowledge especially for staffs and customers of the company.

The qualities of learning media on contents and design were evaluated by 6 experts, 3 experts in contents and 3 experts in media. The learning achievement and satisfaction of the sample group were assessed by new staffs of the manufacturer, undergraduate students of a packaging program, and interested persons. The tools of a quality assessment form was 5-point rating scale using the Google Form. The learning achievement of the learners was determined from a difference of pre-test scores and post-test scores and normalized gain with 20 multiple-choice questions. The satisfaction evaluation form was also used with 5- point rating scale created in the Google Form. The Criteria of 5-point rating scale for evaluation are shown in Table 1.

Table 1: The Criteria of 5-Point Rating Scale for Evaluation

Scale	Scale Interval	Opinion for Quality	Description for Satisfaction
5	4.50-5.00	Excellent	Very Satisfied
4	3.50-4.49	Good	Satisfied
3	2.50-3.49	Average	Neutral
2	1.50-2.49	Poor	Dissatisfied
1	1.00-1.49	Very Poor	Very Dissatisfied

The quiz for pre-tests and post-tests of each unit was created with Google Forms using optimal multiple-choice questions for a module with IOC and difficulty level analysis as Eq. 1.

$$\text{Difficulty Index (P)} = R/T \quad \text{(Eq. 1)}$$

Where R is the number of correct responses and T is the total number of responses in the sample group

The appropriate difficulty is 0.20-0.80 because the exams that were too difficult (<0.20) or too easy (>0.80) were unable to classify the learning outcome.

The learning achievement was analyzed by comparison between the average scores of pre-tests and post-tests before and after self-learning the VDO media and using t-statistics (T-test dependent samples) with statistical significance at the 0.05 level. The normalized gain (N-gain) was also found and analyzed, as shown in Table 2.

Table 2: The Classification of Normalized Gain Values

Gain Score	Interpretation
$g > 0.7$	High
$0.3 < g \leq 0.7$	Medium
$g \leq 0.3$	Low

Results and Discussion

The topic, learning objective and video clip duration of each unit are shown in Table 3.

Table 3: Lesson Modules of the Online VDO Learning

Unit	Topic	Learning Objective	Duration (min)
1	Process of Producing Foldable Paperboard Packaging	To gain more knowledge for learners about special coating techniques, paper selection for boxes and graphic design.	01:52
2	Pre-press process	To gain more knowledge for learners about preparing work files, lay-out of the box, plates, die-cut, boxes, paper cutting for print, etc.	01:07
3	Press process	To gain more knowledge for learners about paper loading into the press, ink system and print quality inspection.	0:49
4	Post-press process	To gain more knowledge for learners about die-cutting of printed sheets, quality checking of workpieces, gluing the box and Packaging	01:17
5	Consideration for Producing Foldable Paperboard Packaging	To gain more knowledge for learners about design, packing products into boxes, choosing to use a different type of paper, distribution, import-export, and special color selection	01:34

The examples of pictures capturing from 5 unit of the learning media which create as multimedia are shown in Fig. 1-5.

Figure 1: The Examples of Video Media in Unit 1

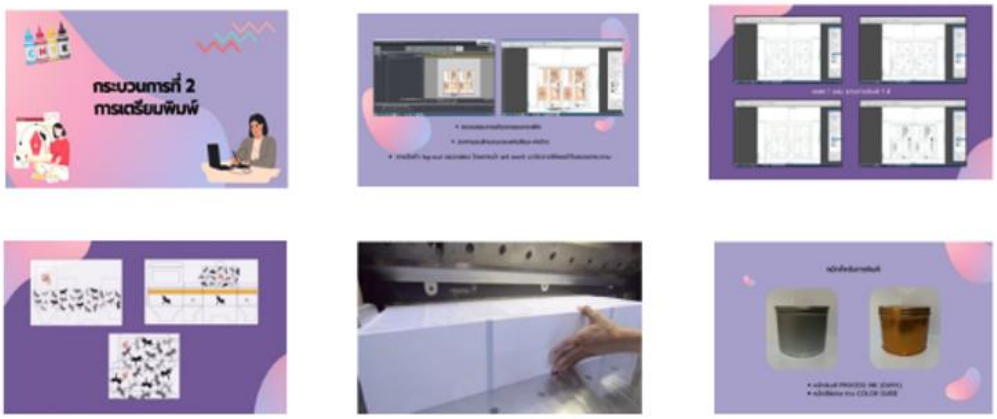

Figure 2: The Examples of Video Media in Unit 2

Figure 3: The Examples of Video Media in Unit 3

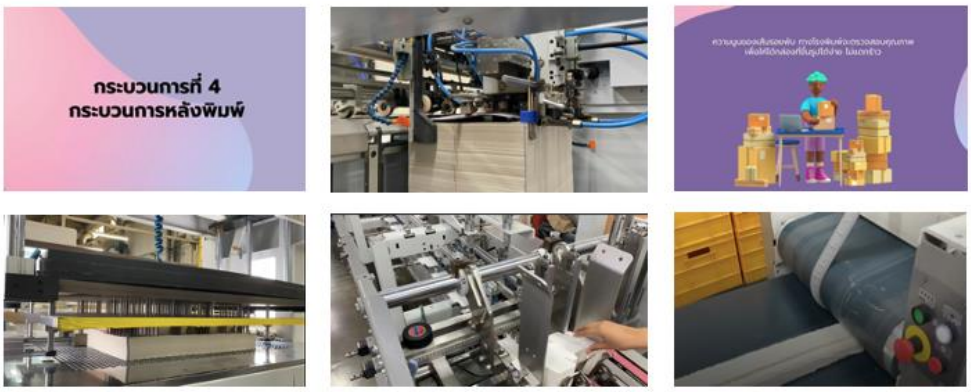

Figure 4: The Examples of Video Media in Unit 4

Figure 5: The Examples of Video Media in Unit 5

The quality of the video learning media was assessed by 6 experts, 3 experts in contents and 3 experts in media. The content quality assessment results of video production show in Table 4. The results of media quality assessment of video production show in Table 5.

Table 4: The Quality Assessment for the Content of Video Media

Appropriateness Evaluation	**Evaluation Results**		
	Mean Score	**S.D.**	**Level**
1. Alignment with objectives	4.00	1.00	good
2. Accuracy	4.00	1.00	good
3. Appropriateness of arrangement	3.67	0.58	good
4. Relevance and currency	4.00	1.00	good
5. Categorization	4.33	0.58	good
6. Appropriateness of amount	3.67	0.58	good
7. Appropriateness of sentence used	4.00	0.00	good
8. suitability for the target learners	4.00	1.00	good
9. Matching of Illustrations or video	4.00	0.00	good
Total Average Scores	3.96	0.41	good

The overall content quality was at good level. The standard deviation is at a level where the differences are small (M=3.96, S.D.=0.41). A total of 9 items, the content categories achieved the highest quality level. The appropriateness of content organization, the appropriateness of the content volume achieved the lowest quality level.

Table 5: The Quality Assessment for the Design of Video Media

Appropriateness Evaluation	**Evaluation Results**		
	Mean Score	**S.D.**	**Level**
1. Background color	4.33	0.58	good
2. Font style, color, and size	4.00	1.00	good
3. Screen layout and composition	3.67	0.58	good
4. Background music	4.00	1.00	good
5. Illustrations align with the content	5.00	0.00	Very good
6. Visibility of Illustrations and videos	4.67	0.58	good
7. Loudness and clarity of Audio	5.00	0.00	Very good
8. Learning engagement and promotion	4.33	0.58	good
9. Suitable for distribution	4.33	0.58	good
Total Average Scores	4.37	0.36	good

The overall media qualities were at good level. A standard deviation indicating minimal differences (S.D.=0.36). Illustrations were consistent with the content and the audio in the video was clear, achieved the highest quality level or very good. The screen layout and composition got the lowest quality level. and the total qualities were at good level.

The total sample group of learners for evaluation of learning achievement consisted of 25 persons divided into three groups, as follows:

Group 1. Company Employees for 14 persons.
Group 2. Students studying printing and packaging for 5 persons.
Group 3. General Students Interested in Packaging for 6 persons.

Table 6: Learning Achievement Outcomes of 25 Learners

Quiz	**Sample number**	**Scores**	**Total scores**	**Mean**	***X***	**S.D.**	**t**	**Sig. (1-tailed)**
Pre-test	25	20	141	5.54	5.64	1.38	33.95	0.0000
Post-test			399	15.96	15.96	1.79		

For Pre-test, the learners have an average score of 5.64 points=28.2%. For Post-test, the learners have an average score of 15.96 points = 79.8%. It indicated that the score increased by 51.6%, with N-gain=0.72, which was at the moderate level. Results of the satisfaction evaluation of the sample group consisted of 25 persons regarding the video media are shown in Table 7.

Table 7: Results of the Evaluation of the Sample Group's Satisfaction with the Video Media

Appropriateness Evaluation	**Evaluation Results**		
	$\overline{X}$	**S.D.**	**Level**
1.The content is understandable for learning.	4.16	0.75	good
2. The content is arranged in an easy-to-understand order	4.20	0.65	good
3. The language used is appropriate to the content	3.69	0.84	good
4.The illustrations are consistent with the content.	4.32	0.69	good
5. The picture and sound in the video are clear.	3.92	0.86	good
6. The video media is interesting and engaging for learning.	4.16	0.75	good
7. The video media is appropriate for distribution	4.12	0.83	good
Total Average Scores	4.12	0.08	good

It was found that viewers were highly satisfied. The standard deviation is at a level where the differences are minimal (M=4.12, S.D.=0.08). The illustrations are highly consistent with the content, The level of satisfaction is very high. The language used is appropriate for the content, The lowest level of satisfaction.

Conclusion

The video media on paper box packaging production process of 5 units has been produced with good content qualities which can be used for online learning or training. The Illustrations were consistent with the content and the audio in the video was clear, achieved the highest quality level or very good. The learning effectiveness determined from the test scores showed that the post-test was 51.6% higher than the pre-test, statistically significant at the .05 level. The N-gain was 0.72, which was within the medium level of learning achievement. The sample group has a high level of satisfaction with the produced video media, the illustrations are consistent with the content. Therefore, this learning material can be applied to provide an online learning platform for the manufacturer to improve the packaging production process.

Acknowledgments

We would like to express our sincere gratitude to UL Printing and Packaging Co., Ltd., for supporting this project, King Mongkut's University of Technology Thonburi and the Faculty of Industrial Education and Technology for financial support, enabling us to attend and present our research at the 16th Asian Conference on Education (ACE2024) in Tokyo, Japan.

Suchapa Netpradit, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
To provide a good curriculum for producing valuable graduated students as technician teachers, the specific skills in engineering, professional teaching ethics, and teacher certification were integrated as the requirements of stakeholders. This study focused on the gap analysis for competency of undergraduate students in the 4th year of Bachelor of Industrial Education program in Electrical Engineering at KMUTT. The questionnaire for self-evaluation with 4-level rubric scales was created to determine the qualitative and quantitative data in 3 domains for a sample group of 39 students For the first domain, teaching management skills with 8 indicators showed that the average scores were at a moderate level (mean=3.13), with weaknesses in competencies of lecturing/explaining, learning outcome assessment and problem-solving which needs to be urgently improved. The second domain related to specific electrical engineering skills with 19 indicators showed that the current competencies were below the expected levels in some skills (mean=2.95) but the students were very good in problem identification. The third domain was related to some important characteristics and professional ethics for teachers with 15 indicators. The students' current competencies were at a good level (mean=3.46), with strength points in honesty and professional responsibility but the areas for improvement were leadership and emotion control. Therefore, the gap of student competencies determined with radar charts were effectively applied for curriculum improvement by applying outcome-based education module (OBEM) and create short courses to match the competencies you want to enhance in various skills.

Introduction

In the 21st century, the Thai population is experiencing rapid changes in politics, the economy, resources, communications, and industrial technology. These developments are happening continuously and play a significant role in our daily lives. They are also key factors in driving the economy toward meeting national development goals. People widely recognize the need to improve and develop education to equip graduates with skills that match the competencies demanded by the labor market and workplaces. Skills gained from vocational or higher education are an important element in determining the structure of the country's workforce. The process of producing and developing industrial labor skills comes from education management, especially vocational education under the Office of the Vocational Education Commission, Ministry of Education. As the main force in education management that focuses on producing personnel by providing knowledge and practical skills to be tools for future careers, it is also a group of labor that the industrial sector needs a lot. Therefore, there is an education management policy to promote more learners in vocational fields, such as organizing dual education programs in collaboration with the industrial sector, enhancing skills in integrating learning with work. Upon graduation, they can immediately work in the workplace, reducing the time spent on teaching and selecting new employees with experience for the workplace. In addition, there is a guideline for developing teaching content to be consistent with the production and development of manpower according to the country's needs. Therefore, industrial teachers are an important cog in the mechanism for producing industrial technicians with sufficient competence to work in the industrial sector. Therefore, technical teachers must have good academic quality, meet standards according to the professional standards of vocational teachers and teacher competence, be knowledgeable in basic skills, specialized skills and being a teacher, which will lead to the effective transfer of knowledge and practice to students in their own educational institutions when they enter the real workforce. Based on the significance and background of the problem, this research aims to study the capability gaps of industrial technical teachers by analyzing the competencies and skills of fourth-year students in the Bachelor of Industrial Education (B.I.Ed.) program, majoring in Electrical Engineering. The study employs McKinsey's Three Horizons of Growth concept, which divides learner competencies into three time periods: Horizon One (current state), Horizon Two (gap between present and future), and Horizon Three (future goals).

The research utilizes questionnaires/interviews to assess students' current competencies and expected competencies, targeting three groups: 1) Fourth-year B.I.Ed. students majoring in Electrical Engineering at KMUTT, and 2) Teachers from the Electrical/Power Engineering departments under the Office of Vocational Education Commission (OVEC).

The research instruments are categorized into three areas consist of core competencies, functional competencies, and discipline, morality, ethics, and professional conduct. Experts validate the instruments' quality through content validity assessment before collecting data from the sample groups.

Upon obtaining the results of current student competencies and expected competencies, a 'competency gap' will be identified, which refers to the distance between the current state and the desired state. The gap analysis begins with setting target goals for development. Next, the current status is analyzed by collecting relevant data through various methods such as questionnaires and interviews.

Once the current and future competency results are obtained, this leads to explaining the gaps that emerge and the factors causing these gaps. Finally, this information is used to formulate recommendations, leading to planning and enhancing the development of personnel capabilities. The goal is to ensure strong academic knowledge that meets vocational education teacher professional standards and teacher competencies.

This involves the development of educational management approaches, the design of training curriculum content, and the creation of student development activities, among other essential tasks for industrial technical teachers. The ultimate goal is to enhance potential through the filling of competency gaps, resulting in the development of authentic knowledge for performing duties as high-quality technical teachers who can propel the nation forward.

Methodology

Beginning with the study of the Bachelor of Industrial Education program in Electrical Engineering (5-year program), the 2020 revised curriculum focuses on specific curriculum content such as philosophy, significance, objectives, and program-level learning outcomes. Two online questionnaires were designed: Set 1 for fourth-year students to self-assess their current competencies and Set 2 for vocational institution teachers to evaluate expected competencies of program graduates, selected through purposive sampling from schools where students practice teaching and who work closely with students (such as mentor teachers and department heads). This is crucial as program graduates will be key intermediaries in developing a workforce (vocational students) for future labor markets. After tools were validated (IOC) by experts using a 4-level rubric scale and analyzed through radar charts, three competency areas were evaluated: 1) Teaching management (8 indicators), 2) Electrical engineering-specific skills (19 indicators), and 3) Essential characteristics for teacher professional ethics (15 indicators), with scoring criteria and interpretations.

Table 1: Quality Assessment Criteria and Descriptions

Scale	Opinion for Quality	Description	
4	Excellent	You should be a role model and expect the most	Should set an example, strive for excellence, integrate your knowledge, tackle intricate issues, instruct others, or offer guidance to others.
3	Good	Expect a lot	Analyze or distinguish, visualize connections, practice, and solve simple problems
2	Fair	Expect moderate	Use your knowledge to solve problems, practice, and adhere to the methods and steps independently.
1	Need to develop and improve	Expect very little	Be mindful, keeping in mind your previous studies or experiences. Organize knowledge to be easy to understand, follow the methods and steps clearly, and be supervised.

When analyzing the stakeholder group consisting of 39 fourth-year students and 23 vocational institution teachers, the capabilities were categorized into subgroups as follows:

Interm of teaching management is divided into 2 subgroups:
1. Teaching design and management
2. Assessment and teacher development

Interm of electrical engineering professional skills, divided into 3 subgroups:
1. Basic Electrical and Electronics
2. Computer & Technology
3. Professional Skills and Problem Solving

Interm of essential characteristics for teacher professional ethics:
1. Teaching and Learning Management
2. Professional Ethics and Conduct
3. Collaboration

Result and Discussion

The analysis of competency gaps among fourth-year Industrial Education students in Electrical Engineering revealed significant findings across three areas: teaching management, electrical engineering professional skills, and professional ethics. Through comprehensive data analysis utilizing radar charts and statistical methods, several notable patterns emerged regarding students' current competencies and stakeholder expectations.

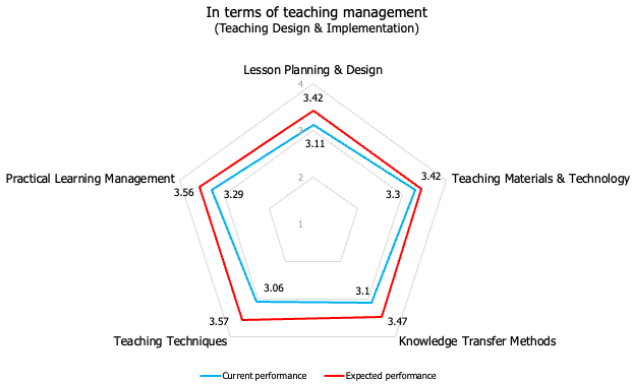

Figure 1: Teaching Design and Management

As shown in Figure 1, the radar chart analysis of teaching design and management competencies reveals distinct patterns between current and expected competencies. The data demonstrates that students exhibit the strongest performance in media/technology usage (3.30) and practical learning management (3.29). However, the most significant gap appears in teaching skills, where current competency (3.06) falls notably below the expected level (3.57), resulting in a gap of 0.51. This visualization effectively highlights areas requiring immediate attention in the curriculum.

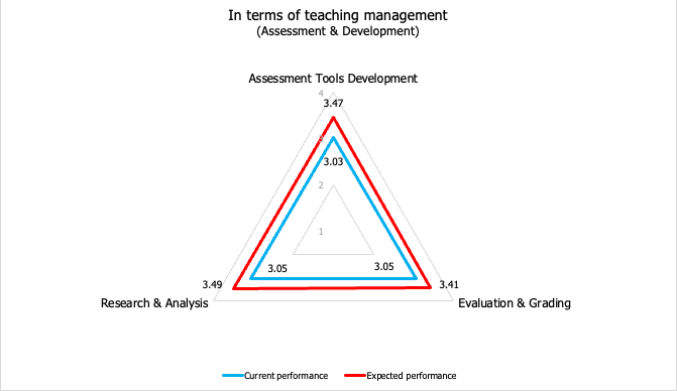

Figure 2: Assessment and Teacher Development

Figure 2 illustrates the assessment and teacher development competencies, where the average current competency (3.04) falls below the teaching design metrics. Notably, while students show relative strength in assessment result analysis (3.05), they demonstrate lower proficiency in assessment tool development (3.03). The radar chart particularly emphasizes the substantial gap in research and analysis capabilities.

In teaching management, the study revealed that students demonstrated generally satisfactory performance with a mean score of 3.17, which fell short of stakeholder expectations (mean = 3.49). Within this domain, students exhibited particularly strong capabilities in media and technology usage (3.30) and practical learning management (3.29), suggesting the successful integration of modern educational tools into their teaching practice. However, a significant gap emerged in fundamental teaching skills (0.51), indicating a need for enhanced pedagogical development. The assessment and teacher development component showed lower overall performance (mean = 3.04) compared to teaching design, with research and analysis capabilities presenting the most substantial gap (0.52).

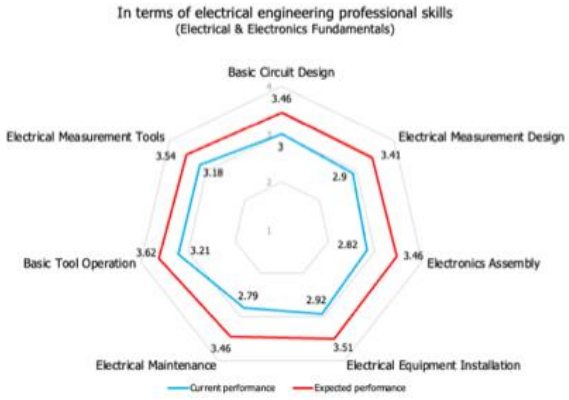

Figure 3: Basic Electrical and Electronics

In Figure 3, the analysis of basic electrical and electronics skills presents a concerning pattern. The visualization clearly shows that while students demonstrate competency in basic tools usage (3.21) and electrical measurement tools (3.18), there is a significant weakness in maintenance skills (2.79). The radar pattern suggests a need for enhanced practical training in equipment maintenance and handling.

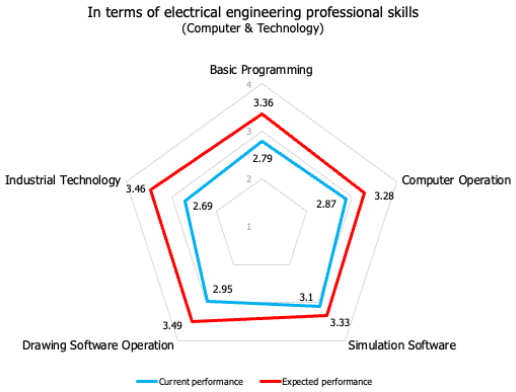

Figure 4: Computer and Technology

Next, figure 4's representation of computer and technology skills indicates a current competency average of 2.88, with virtual program usage emerging as a relative strength (3.10). The chart effectively demonstrates the gap between current capabilities and industry expectations, particularly in advanced industrial technology applications.

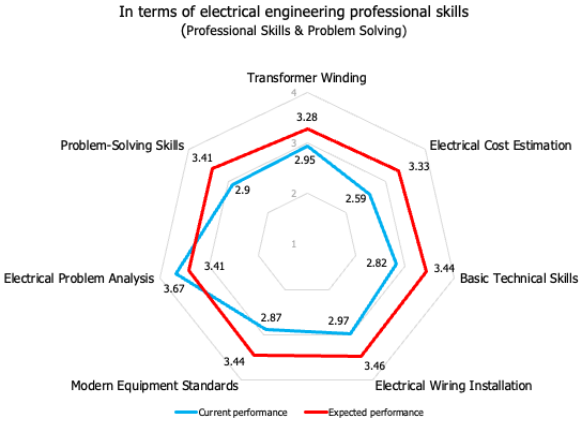

Figure 5: Profrssional Skill and Problem Solving

As depicted in Figure 5, professional skills and problem-solving competencies show an interesting distribution. The radar pattern highlights exceptional performance in problem identification (3.67), while revealing significant gaps in blueprint reading and cost estimation (gap: 0.74). This visualization effectively demonstrates the disparity between analytical and practical implementation skills.

The evaluation of electrical engineering professional skills revealed more concerning gaps in technical competencies. Basic electrical and electronics skills showed a current competency mean of 2.97 against an expected level of 3.49. While students demonstrated proficiency in basic tools usage (3.21), equipment maintenance skills (2.79) fell significantly below stakeholder expectations. Computer and technology skills presented a similar pattern, with a current competency mean of 2.88 against expected levels of 3.38. Notable strength was observed in virtual program usage (3.10), though advanced industrial technology applications showed substantial room for improvement.

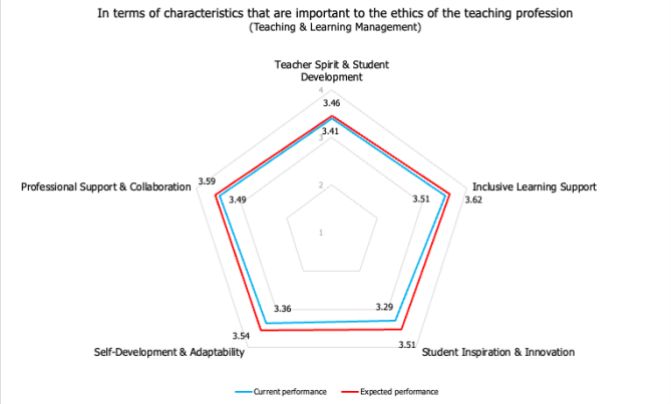

Figure 6: Teaching and Learning Management

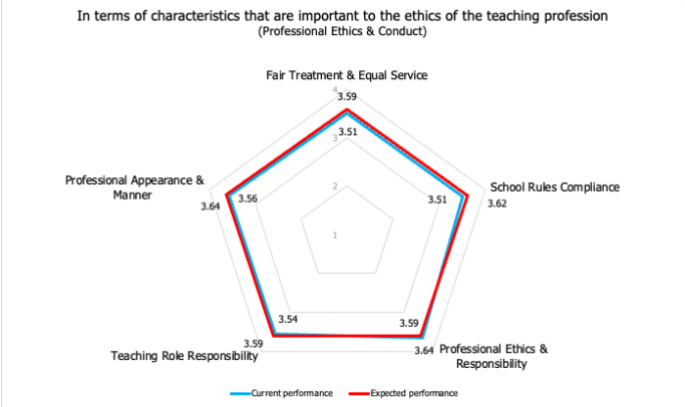

Figure 7: Professional Ethics and Conduct

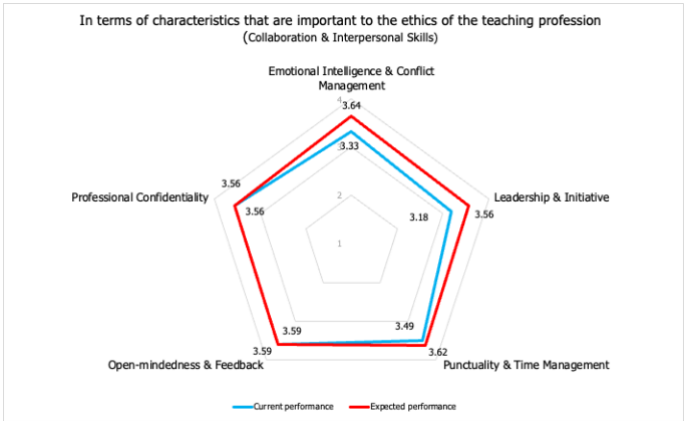

Figure 8: Collaboration and Interpersonal Skills

Figures 6, 7, and 8 present the analysis of professional ethics and characteristics, revealing the strongest overall performance among all domains. Figure 6 demonstrates that teaching and learning management competencies ranged from 3.26 to 3.51 (mean=3.41), with particularly strong showings in learning promotion and diversity acceptance. The radar pattern in Figure 7 displays notably high performance in professional ethics and conduct (mean=3.55), while Figure 8 illustrates strong collaboration skills with some room for improvement in leadership capabilities. Professional ethics and conduct demonstrated the highest performance (mean=3.55) with the smallest gap (0.06) between current and expected competencies, highlighting students' strong foundation in professional integrity and ethical

practice. Collaboration and leadership skills showed robust development (mean=3.48), with particular strength in receptiveness to opinions (3.59), though leadership capabilities presented growth opportunities (gap=0.38).

Conclusions and Implications

The comprehensive analysis of student competencies has revealed a clear hierarchical pattern in performance levels, with professional ethics emerging as the strongest domain (mean=3.55), followed by teaching management (mean=3.17), and technical skills (mean=2.97) requiring the most significant development. This pattern suggests that while the program has successfully instilled strong professional values and basic pedagogical capabilities, technical skill development requires additional attention in the curriculum.

Based on these findings, the curriculum revision implements an Outcome-based education module (OBEM) framework structured around four key components. The Technical Skills Enhancement Module focuses on developing mastery in basic operations, maintenance, and advanced technological applications through intensive laboratory practice and industry-based learning experiences. The Industrial Technology Integration Module addresses the need for modern industrial system understanding and digital transformation competencies through industry collaboration projects and technology simulation exercises.

The implementation of these modules is supported by a robust assessment framework that emphasizes authentic evaluation methods, including practical demonstrations, project-based assessments, and industry partner feedback. This comprehensive approach ensures that assessment practices align with both academic standards and industry requirements.

Needs Analysis of English Skills Development for Agripreneur of Thai Students in Higher Education

Alisa Injan, Maejo University Phrae Campus, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Over the past decade, agripreneurship has emerged to increase the potential of agricultural sector. Many universities have advanced the vision of agripreneur development for students. There is still a limited number of English for agripreneur textbooks worldwide. The aim of this study was to critically investigate the needs analysis of Thai students in higher education to develop English language skills for agripreneur. This study was carried out on a group of thirty agricutural students at Maejo university, Phrae campus, in Northern Thailand. The research instruments included a questionnaire and interviews for developing the six skills of English language learning. Descriptive statistics and the modified Priority Need Index (PNImodified) were used for the needs assessment. The results indicated that the students had moderate level of English language proficiency. Most students ranked reading as their best skill ($\bar{X}$=3.13) and grammar as their weakest skill ($\bar{X}$=2.53). Another important finding was that the students extensively needed to improve the English skills, especially in speaking, with pitching identified as the most critical task to be an agripreneur (PNImodified=1.70). This was followed by listening, writing, vocabulary, and reading, respectively. An unanticipated finding was that the students still rated grammar as the least skill needed, particularly regarding relative pronouns (PNImodified=0.52). The results of this study will contribute to the course syllabus for the development of an English for agripreneur textbook tailored to the needs and knowledge of Thai agricultural students with Thai-context culture, enhancing sustainable learning in English for specific purpose.

Introduction

In the World Digital Competitiveness Ranking 2023, published by the International Institute for Management Development, Thailand ranked 30th out of 64 countries for overall performance (IMD, 2023). Notably, Training and Education ranked even lower at 52nd. A deeper analysis of Thailand's educational performance revealed that the country consistently occupies lower-tier rankings, particularly in English language skills tailored to meet the demands of employers. This finding aligns with a report by the Thailand Productivity Institute (2015, as cited in Pinkaew & Sirinuphong, 2017), indicating that Thai officers had very low English proficiency and needed to improve their English skills. This has raised the need for undergraduate students to acquire English for Specific Purpose (ESP) in order to prepare themselves to enter the workforce. ESP aims to equip learners with the ability to use English effectively in academic and professional areas, underscoring the necessity for course developers to understand learner needs (Basturkmen, 2006, 2010; Brown, 1995; Dudley-Evans & St. John, 1998; Hutchinson & Waters, 1987; Rahman, Ming, Aziz, & Razak, 2008, as cited in Chatsungnoen, 2015). Higher education institutions have thus recognized the importance of enhancing the quality of graduates to meet labor market demands (Mansakorn, 2007). This awareness has highlighted the necessity of ESP instruction, aiming to produce graduates equipped with English language skills that align with professional standards.

Furthermore, students in Thailand, both at the basic and higher education levels, often face obstacles in learning English that do not align with practical objectives or meet employer expectations. One significant issue is the reliance on textbooks or materials from renowned international publishers that, while adhering to global standards, are not designed to address the specific needs of various professional contexts. This observation is consistent with Griffiths & Keohane (2000), who stated that textbooks frequently failed to achieve a meaningful level of engagement from learners; education should not be limited to the classroom with set textbooks and exercises. Suntornsawate (2018) also noted that most English instruction in Thailand focuses on everyday communication rather than workplace-specific applications. Learners must therefore acquire English tailored to their particular professional purposes.

In recent years, there has been an increasing interest in entrepreneur around the world. As a result, Maejo University where has the renown for agriculture in Thailand has advanced the vision in agripreneurship development for students and community. Throughout this research, the term agripreneurship will be referred to entrepreneurship in agriculture. Entrepreneurship is a concept that encompasses transforming an idea or vision into a "new business or new venture creation, or the expansion of an existing business, by an individual, a team of individuals, or an established business" (Reynolds et al., 2000). Quite similar, Agripreneur is an individual who starts, organizes and manages a business venture focusing on the agricultural sector (Mukhopadhyay, 2020). To keep pace with contemporary needs, the university has revised its ESP curriculum, introducing new courses, namely English for Creative Agripreneurs. Jordan (1997) indicated that needs analysis is the initial step in course design, teaching methodologies, and the development of relevant educational materials. This aligns with Chatsungnoen (2015), who stated that ESP programs often lack clear course objectives due to the absence of a prior needs analysis. Only a small portion of these have involved in agripreneurship and investigated the link between the needs of English skills development and agripreneurs. In light of these challenges, the researcher, as a lecturer, is responsible for teaching fundamental English courses and designing ESP courses at Maejo University Phrae Campus. To ensure effective and efficient development of English skills in

alignment with the university's mission, the research team has adopted the theoretical framework of Needs Analysis (NA) to identify the English skills necessary in accordance with the attributes of agripreneurs.

Therefore, due to the absence of research on the needs analysis for English skills development specifically for agripreneur, this study aimed to explore this need based on the perceptions of agricultural students. In order to address this question, the needs analysis of English skills development for agripreneur of Thai agricultural students will be discussed in detail. The research results will contribute to the course syllabus for the development of an English for Agripreneur textbook, tailored to the specific needs and knowledge of Thai students at Maejo university Phrae campus, and as related programs in institutions offering courses for agripreneurs to enhance sustainable learning in English for Specific Purposes.

Research Methodology

This study employed mixed methods between qualitative and quantitative techniques. Purposive sampling was employed to select 30 student participants. They were the sophomore students enrolling in the English for Creative Agripreneur subject in the academic year 2023. Data were collected through questionnaire surveys for the quantitative component. The participants were asked to complete four tasks, as follows:

1. Background Information
2. Self-assessment of English proficiency level
3. The needs of English skills development for Agripreneur
4. Suggestion

According to the self assessment questions, a 5-point Likert scale was used, ranging from low competency (1) to high competency (5). For the need questions, a 5-point Likert scale was also adapted ranging from the least needed (1) to the most needed (5). The data were then analyzed using descriptive statistics and Modified Priority Needs Index ($PNI_{modified}$). The $PNI_{modified}$ was used to compare the differences between the needs level and the existing state using formula as presented in Eq. (1):

$$PNI_{modified} = (I-D)/D \quad (1)$$

Where I refers to the needs level, and D refers to the existing state (Wongwanich, 2007).

Additionally, the participants were interviewed using a semi-structured format in focus groups, lasting approximately 30 minutes to 1 hour, to collect qualitative data. The interviews were conducted with two low-achieving, two medium-achieving, and two high-achieving students regarding to their grades in the Fundamental English course. Content analysis was prepared by adapting the procedure outlined by Chatsungnoen (2015).

Findings and Discussion

This section discusses the results obtained from both questionnaire surveys and semi-structured interviews conducted with Thai agricultural students regarding their needs for developing six English skills essential for agripreneurship: speaking, listening, reading, writing, grammar, and vocabulary.

Questionnaire Surveys

The students' self-assessment of English proficiency was at a moderate level. When ranked according to average scores from highest to lowest, the results revealed that reading skills had the highest average score of 3.13. Following this, writing and vocabulary were determined to have equivalent average of 2.90, while speaking, listening, and grammar recoreded average scores of 2.80, 273, and 2.53, respectively. Moreover, the survey findings concerning students' need to enhance their English language skills indicated a significant need, with eighty-eight percents expressing a strong desire for improvement. The primary focus for development was on speaking, followed by listening, writing, vocabulary, reading, and grammar, in that order. It is of particular interest that Thai students exhibited the lowest proficiency in grammatical knowledge; however, they rated grammar as the least needed skill. It has been argued that effective communication in English relies primarily on a strong understanding of grammar, as it enables the clear and comprehensible construction of sentences (Kumduang, 2019). This situation was further examined through interviews, as indicated in the following excerpts:

> We don't need to be perfect in grammar, as long as we can communicate what we want, it should be fine. (Excerpt from medium-achieving student)
>
> If it's speaking, we don't need to worry too much about grammar. (Excerpt from low-achieving student)

Most Thai undergraduate students had the same voice that grammar was difficult to understand due to their struggles with its complex structure. They frequently gave up on learning. This led them to focus more on speaking to facilitate communication rather than comprehension (Carrió-Pastor & Mestre Mestre, 2014). Except for high-achieving students, they indicated that the more difficult grammar was perceived to be, the more they felt the need to improve.

In addition, another finding related to students' needs for the development of English sub-skills relevant to agripreneur. The findings are illustrated in Table 1 to Table 6 from the most needed skill to the least needed skill.

Table 1: The Needs for Speaking Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. Pronunciation	4.33	2.97	0.458	7
2. Daily speaking	4.37	2.63	0.662	3
3. Asking and answering questions	4.30	2.83	0.519	6
4. Stating opinions or ideas	4.23	2.67	0.584	5
5. Giving a presentation	4.67	2.80	0.668	2
6. Pitching	**4.23**	**2.53**	**0.672**	**1**
7. Negotiating	4.20	2.53	0.660	4
Total	4.33	2.71	0.603	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

The results show the 30 agricultural students rank the speaking tasks from "the least needed" to "the most needed", with no additional speaking tasks suggested. According to the

$PNI_{modified}$ values as presented in Table 1, the prominence of "pitching" is striking, with a rating of 0.672. This result is consistent with a study by Rimkeeratikul (2022), who reported that a sales pitch was identified as a critical skill, which distinguished it from a general presentation in English for International Business course. Most students express an extensive need for "giving a presentation", followed closely by "daily speaking", and "negotiating" at the rate of 0.668, 0.662, and 0.660, respectively.

In contrast, the tasks of "stating opinions or ideas", "asking and answering questions", and "pronunciation" are perceived as the least needed, with the scores of 0.584, 0.519, 0.458, respectively.

Table 2: The Needs for Listening Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. Listening for gist	4.30	2.80	0.536	2
2. Listening for details	4.27	2.87	0.488	4
3. Listening to discussions	**4.17**	**2.63**	**0.586**	**1**
4. Listening to conversation	4.23	2.90	0.459	5
5. Listening to social media	4.20	3.00	0.400	6
6. Receiving spoken instructions	4.03	2.67	0.509	3
Total	4.20	2.81	0.496	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

As demonstrated in Table 2, the highest $PNI_{modified}$ value is attributed to "listening to discussions", which received a rating of 0.586. This result is in line with Tham-ngarn & Chaiwong (2020), revealed that most students preferred the teacher used English as a medium language in class to practice their listening skills. Besides, The students express the greatest need to develop "listening listening for gist", "receiving spoken instructions", and "listening for details", with $PNI_{modified}$ values of 0.536, 0.509, and 0.488, respectively. Conversely, the students indicate a lower need to improve "listening to conversation" and "listening to social media", with ratings of 0.459 and 0.400, respectively.

Table 3: The Needs for Writing Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. Mind mapping	4.27	2.80	0.525	7
2. Writing product descriptions	**4.27**	**2.47**	**0.729**	**1**
3. Writing brief business descriptions	4.27	2.63	0.624	5
4. Writing Agribusiness canvas	4.27	2.53	0.688	2
5. Writing for pitching	4.30	2.63	0.635	4
6. Creating pitch deck	4.17	2.60	0.604	6
7. Writing instructions	4.27	2.60	0.642	3
Total	4.26	2.61	0.635	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

The $PNI_{modified}$ value obtained for the writing needs evaluation from Table 3 is 0.635, which is the highest score of all tasks. This is due to the significant gap between the current level of

English proficiency and the needs of the students. Thus, writing skills represent an urgent need for improvement to enhance overall performance. "Writing product descriptions" has the highest $PNI_{modified}$ value of 0.729, ranking as the top priority. This concurs with the findings of Chatsungnoen (2015), who mentioned that the ESP course should teach language functions related to business English such as writing product descriptions or e-mails. The second highest priority is "writing an agribusiness canvas", with a value of 0.688. This is followed by "writing instructions", "writing for pitching", "writing brief business descriptions", and "creating a pitch deck", with $PNI_{modified}$ values of 0.642, 0.635, 0.624, and 0.604, respectively. The lowest priority is "mind mapping", which has a $PNI_{modified}$ value of 0.525. In contrast, Yunus and Chien (2016) found that undergraduate students in Malaysia employed mind-mapping strategies in their writing planning, which not only helped them gain a deeper understanding of the topic but also fostered creativity in their written work.

Table 4: The Needs for Vocabulary Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. General Vocabulary	4.13	3.17	0.303	3
2. Agribusiness Vocabulary	**4.23**	**2.73**	**0.549**	**1**
3. Guessing Vocabulary in context	4.20	3.00	0.400	2
Total	4.19	2.97	0.417	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

Table 4 outlines the needs for vocabulary sub-skills by the agricultural students. The students identifies a need to develop "agribusiness vocabulary" ($PNI_{modified}$=0.549), as the highest priority, followed by "guessing vocabulary in context" ($PNI_{modified}$=0.400) and "general vocabulary" ($PNI_{modified}$=0.303), respectively. Fraser (2005) emphasized that technical vocabulary can be vast and should not be neglected in ESP instruction. It is essential to support learners in navigating and understanding unfamiliar technical terms.

Table 5: The Needs for Reading Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. Searching the Internet English Resource	4.27	3.00	0.423	6
2. Reading for gist	4.27	2.93	0.457	5
3. Reading for specific details	4.23	2.83	0.495	4
4. Inferential reading	4.33	2.83	0.530	2
5. Reading case study of successful agripreneur	**4.30**	**2.57**	**0.673**	**1**
6. Reading product descriptions	4.27	2.83	0.509	3
Total	4.28	2.83	0.515	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

The needs for reading sub-skills are provided in Table 5. The highest priority within this category is assigned to "reading case study of successful agripreneur", with $PNI_{modified}$ values of 0.673. It has been observed that applying case studies in instructions can increase students' engagement both their academic performance and sense of belonging within the learning community. (Ni Chochlain, 2021). This reading sub-skill is expected to be developed in an undergraduate programme to offer students comprehensive understanding of agripreneurship, while also drawing inspiration from the success stories of prominent individuals in this field.

The second highest priority is "inferential reading", with a value of 0.530. This is followed by "reading product descriptions", "reading for specific details", and "reading for gist", which received ratings of 0.509, 0.495, and 0.457, respectively. The lowest priority is given to "searching the internet English resources", which has a $PNI_{modified}$ value of 0.423.

Table 6: The Needs for Grammar Tasks of 30 Agricultural Students

Tasks	Importance (I)	Degree of success (D)	PNImodified = I-D/D	Rank
1. Verb tenses / Modal Verb	4.23	2.67	0.584	2
2. Relative pronouns / Relative clause	4.27	2.80	0.525	4
3. Conditional Sentences	4.17	2.70	0.544	3
4. Comparative Structures	4.23	2.67	0.584	2
5. Business Phrasal Verb	**4.17**	**2.60**	**0.604**	**1**
Total	4.21	2.69	0.568	

Note: "I" may refer to the needs level, while "D" refers to the existing state. Both variables vary from 1 (the lowest) to 5 (the highest).

The majority of students, as shown in Table 6, express a strong need to improve their understanding of "business phrasal verbs" as the grammar sub-skill, with a $PNI_{modified}$ value of 0.604. Besides, the students identify a need to develop "verb tenses/modal verbs" and "comparative structures", both of which share a $PNI_{modified}$ value of 0.584. Next, "conditional sentences" and "relative pronouns/relative clauses" are considered as the lower need to improve, with ratings of 0.544 and 0.525, respectively. These results further support the idea that relative clause has been identified as one of the most problematic and difficult areas of English learning for ESL/EFL learners (Marefat & Rahmany, 2009). As mentioned above, the participants in this study negatively need to learn the difficult or complex construction. According to some studies, relative clauses were found avoidance strategies when non-native speakers produced English relative clauses; Japan (Miura, 1989), Korea (Park, 2000), China (Chang, 2004), and Bangladesh (Maniruzzaman, 2008).

Interviews

The six participants who responded to the questionnaire were invited to an interview based on the needs analysis model. The most compelling finding was they all extensively needed to develop the English skills for Agripreneur. The overall response to the importance of English language was similar. A common view amongst interviewees was that English serves as a bridge for communication and appears in textbooks of core subjects. Only one high-achieving students highlighted its significance in conducting research and surfing the cutting-edge information. The next session focused on the difficulties in learning each of the six English skills. Beginning with listening and speaking, students lacked of opportunity to communicate with native English speakers and lacked of consistency in their practice. Low-achieving students also struggled with the speed and varying accents as illustrated in the following excerpt:

> I think it quite challenging to understand foreigners due to their accents, and sometimes they speak too fast. Each country has its own accent. When I cannot get what they said, I find it difficult to speak as well.

In terms of reading and writing skills, the students indicated that they were involved with reading only in students' workbook, while writing occurred solely in the classroom. They

predominantly relied on Google Translate for assistance outside the classroom. Furthermore, the low achievers reported that they could read but they faced difficulties translating texts into Thai, as reflected in the following excerpt:

> I can read but translate only word by word. I cannot connect phrases or translate in complete sentences. If I cannot read the passage thoroughly, I struggle to express what I want to write.

Regarding grammar knowledge, every participant indicated that it was the most challenging skill of all. The primary reason is owing to the complex structure of English, which differs significantly from Thai sentence structure, as can be seen in the following excerpts:

> Grammar is difficult because of its complex structure, and I, myself, have limited basic knowledge in this area. (Excerpt from high-achieving student)

> There are twelve sentence structures and each sentence is not fixed. For example, in responding to questions, one can provide both short and long answers. Subject-verb agreement is also confusing. (Excerpt from medium-achieving student)

> I never understand grammar. I am always confused by verb tenses. In Thai, we don't change verbs according to subjects; we simply use other words to indicate time expressions. (Excerpt from low-achieving student)

When discussing vocabulary knowledge, high achievers reported having a limited range of lexical items and exerting less effort to acquire new vocabulary. In contrast, medium achievers indicated that certain words lacked clear associations in Thai culture, making it difficult for them to form mental images of their meanings. This often led to the belief that the words were difficult to learn, resulting in poor retention. Low achievers, on the other hand, mentioned that some polysemous words left them uncertain about which meaning is appropriate in a given context. The last session focused on addressing these challenges by designing classroom activities aimed at enhancing English skills acquisition. High achievers preferred both collaborative group work or independent tasks to unleash their potential. They also needed out-of-class activities that facilitate direct engagement with the language or teaching by example. Meanwhile, one medium achiever favored out-of-class activities and group brainstorming sessions to develop effective ideas. Another medium achiever required interactive games and opinion sharing in class. Low achiever demonstrated a preference for group work and examination to revise lessons. Another low achiever requested fieldwork and agripreneurial workshops. In short, all students shared common needs for out-of-class activities and group work. These results are in accord with Guo (2011) studies suggesting that an out-of-class activity can enhance students' exposure to English in familiar and real contexts. Besides, Active student engagement in group work is a crucial learning objective for all higher education courses (Elgort et al., 2008).

Conclusion and Suggestion Implication

Since agripreneur is a groundbreaking career, the study of English for Agripreneur is still remains limited. This research paper has provided an overview of Thai agricultural students' needs in developing English language skills for agripreneur in tertiary education. The proposed syllabus for an "English for Agripreneur" course should include the following key components: 1) Pitching skills 2) Listening to discussions 3) Writing product descriptions 4)

Acquiring agribusiness vocabulary 5) Reading a case study of successful agripreneur and 6) Mastering business phrasal verbs. Additionally, supplementary contents for each English skills are recommended as follows: 1) Delivering presentation and daily conversation 2) Listening for gist and instructions 3) Designing agribusiness model canvas and instruction 4) Guessing Vocabulary in context 5) Product descriptions and Inferential reading and 6) Using comparison, verb tenses, and modal verbs accurately. Classroom activities which meet the needs of the students are group work and out-of-class activities, emphasizing the importance of collaborative and experiential learning opportunities in enhancing English language acquisition.

This finding has important implications for those who are engaged in enhancing students' development and utilize these results to design a specific course relevant to agripreneurship for their institutions to foster undergraduate students' English skills that are essential for the future workforce. More broadly, future research is also needed to explore effective instructional models tailored to the development of each English language skill required for agripreneurship. A further study could apply this research methodology to identify necessary language skills in other fields, thereby contributing to the design of more targeted English curricula across various disciplines.

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
In the rapidly evolving landscape of education, the integration of computational thinking (CT) into STEM (Science, Technology, Engineering, and Mathematics) curricula has emerged as a pivotal strategy for enhancing educators in teaching and learning and preparing future generations for the demands of the 21st-century workforce. This study investigates the impact of the Magnetcode application on enhancing computational thinking (CT) skills among educators in Zambia. Open-ended interview, pre-test and post-test designs were employed to measure the impact and the effectiveness of computational thinking in agricultural STEM-based projects to Zambian educators in terms of knowledge and understanding of CT elements, basic design coding, circuit simulation, and the application of Magnetcode Microcontroller in STEM project. The results demonstrated significant improvements in all assessed areas. The percentage improvement ranges from 1.31% to 2.5%, with the highest improvement observed in the application of the Magnetcode microcontroller. The mean for the pre-test was significantly different from the test value of 0, with a mean difference of 27.69 and a 95% confidence interval of 25.39 to 29.99, supported by a t-value of 25.66 ($p < .001$). Integrating computational thinking and coding into STEM educational curricula can enhance teachers' understanding and skills in implementing STEM education in Zambia.

Introduction

Computational thinking has become a vital skill in education, especially in the fields of science, technology, engineering, and mathematics (STEM)(Kong & Abelson, 2019; Thissen, 2022). With the increasing demand for digital literacy and problem-solving abilities, educators need to integrate computational thinking into their teaching practices (Ezeamuzie, 2023).

The African Union's Agenda 2063 emphasizes the critical role of STEM (Science, Technology, Engineering, and Mathematics) and ICT (Information and Communication Technology) in driving socio-economic transformation across its member states. The Southern African Development Community (SADC) countries have held multiple forums to identify areas of cooperation aimed at enhancing the status of STEM education for the collective benefit of all member states. This collaborative approach is essential for fostering innovation and economic growth across the region [5].

The development of the STEM Education curriculum in Zambia commenced in December 2019, following the Ministry of General Education's receipt of cabinet approval to implement the curriculum in 52 pilot secondary schools (Oliver et al., 2022). A transitional curriculum was designed based on the 2013 Zambia Educational Curriculum Framework. The primary rationale for establishing STEM schools in the contemporary education system and industry is that it provides students with holistic worldviews, fosters innovation, and drives the creation of new products and processes crucial for economic sustainability. According to Phiri (2022), STEM education is crucial for facilitating economic development, enhancing international competitiveness, and fostering innovation. By emphasizing hands-on experimentation, STEM education enables learners to transition from abstract concepts to real-world applications (Oliver et al., 2022; Phiri et al., 2022).

The current state of STEM education in Zambia is not ideal, with limited resources and trained professionals. Many educators struggle to engage students in these subjects, leading to a lack of interest and poor academic performance (DeGhetto et al., 2016). This has created a demand for new and innovative teaching methods that can make STEM education more accessible and engaging for students (Imms & Kvan, 2021) . According to Oliver (2022), teachers in Zambia have improper training in STEM curriculum and a lack of understanding of how to integrate teaching and learning materials such as coding and programming in STEM education (García-Peñalvo, 2018).

Therefore, integrating computational thinking into STEM education is essential for helping teachers develop critical skills needed for success in a technology-driven world. According to Mulenga and Kabombwe (2019), Zambian teachers are willing to participate in STEM curriculum training development and a need for more inclusive processes in STEM curriculum development to ensure effective implementation and teacher engagement (Mulenga & Kabombwe, 2019). This includes skills such as logical reasoning, algorithmic thinking, and problem-solving, which are crucial in STEM fields such as engineering, computer science, and data analysis (Meseguer & Serrano, 2024; Rabiee & Tjoa, 2017). Therefore, this research aims to investigate the impact of the Magnetcode application on enhancing computational thinking skills among Zambian educators and to understand its effectiveness in integrating computational thinking into STEM education.

Research Objective

To evaluate the impact of the Magnetcode application on enhancing computational thinking skills among Zambian educators and to understand its effectiveness in integrating computational thinking into STEM education.

Research Question

How does the use of the Magnetcode application influence the computational thinking skills of educators in Zambia, and how effective is it in facilitating the integration of computational thinking into STEM education?

Literature Review

Computational thinking (CT) skills involve systematically solving sub-problems through decomposition, allowing for efficient abstraction, planning, and coding processes that follow a linear path towards a solution (Shute et al., 2017). The Magnetcode application utilizes block-based programming languages, enabling users to design programming algorithms by dragging and dropping program chunks, known as blocks (Weintrop & Wilensky, 2015). Through the process of learning programming and coding, educators can expose students to computational skills that involve critical thinking and creative problem-solving. Coding is widely believed to enhance problem-solving abilities, especially in STEM projects (Grover & Pea, 2017; Thissen, 2022; Voon et al., 2023). According to Matsuzawa and colleagues (2017), block-based languages offer an advantage in understanding text-based languages, allowing teachers to encourage students to focus more on high-level algorithm creation using coding. By improving their knowledge of computational thinking (CT) skills, teachers can better guide students in developing these essential abilities in teaching and learning.

Figure 1 illustrates the consolidation of the integration of computational thinking skills in an Agricultural STEM-based project, highlighting a process that educators in Zambia can employ. It begins with identifying a complex problem within the agricultural STEM domain. This problem is then addressed through the process of abstraction and decomposition, which involves simplifying the problem by focusing on its essential features and iteratively breaking it down into more manageable sub-problems. This spiral process of abstraction and decomposition helps in systematically understanding and approaching the problem.

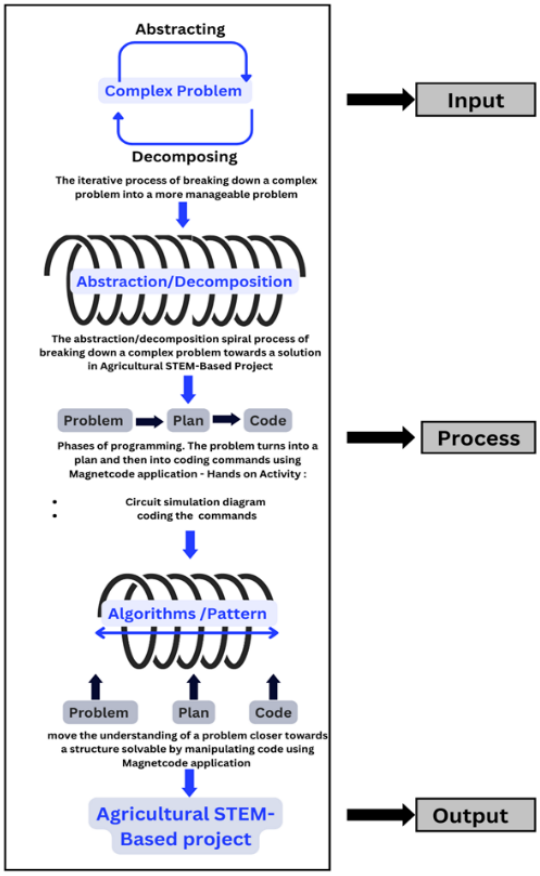

Figure 1: Consolidation of the Integration Computational Thinking Skills in Agricultural STEM-Based Project

The problem-solving phases are divided into three steps: defining the problem, developing a step-by-step plan, and translating the plan into actionable commands or code. Tools like Magnetcode can be used for practical hands-on activities such as circuit simulation and coding commands. Figure 2 shows the flow chart to recognize patterns and develop algorithms to solve the problems. In this phase, the educators are involved in continuous refinement and iteration of the problem-solving process to enhance understanding and find effective solutions.

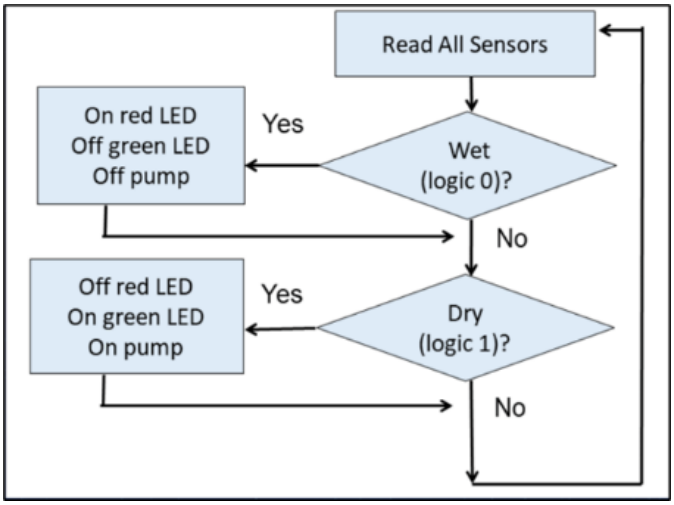

Figure 2: Smart Irrigation Flow Chart

The process of abstraction and decomposition involves simplifying a complex problem by focusing on its essential features and then iteratively breaking it down into more manageable sub-problems. The coding process using Magnetcode applications using block-based language is easy to use (Wan Nurlisa et al., 2023). The block-based language has a lower barrier to programming compared with text-based language (Glushkova, 2016). The block-based command for agricultural STEM-based projects is shown in Figure 3.

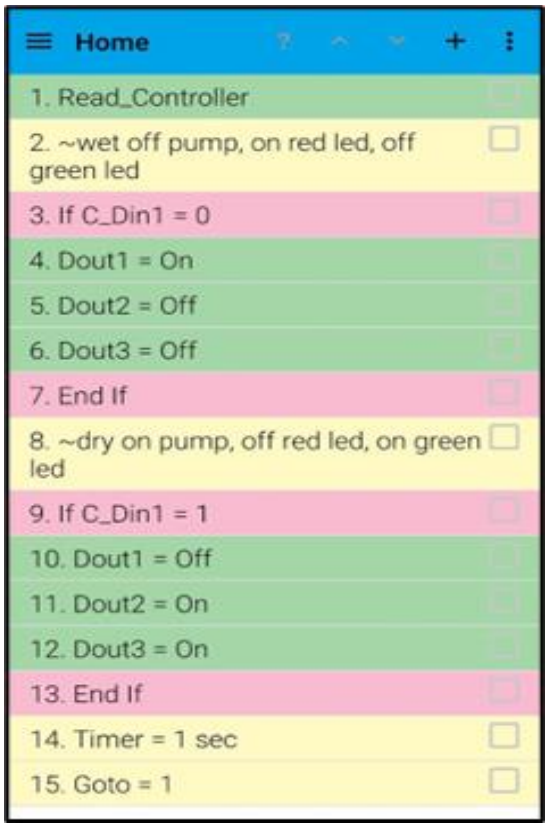

Figure 3: The Coding Command for Smart Irrigation System in Agricultural STEM-Based Project

This spiral approach in Figure 1, allows for a systematic and comprehensive understanding of the problem. The problem-solving phases within this process include defining the problem clearly, developing a detailed plan or strategy to address it, and translating the plan into a simulation diagram in Magnetcode application. Figure 4 shows the circuit simulation and command coding for the whole system of the smart irrigation system project. Through this iterative cycle of abstraction, decomposition, planning, and coding, complex problems become more approachable and solvable and suitable for the integration of computational thinking in STEM education.

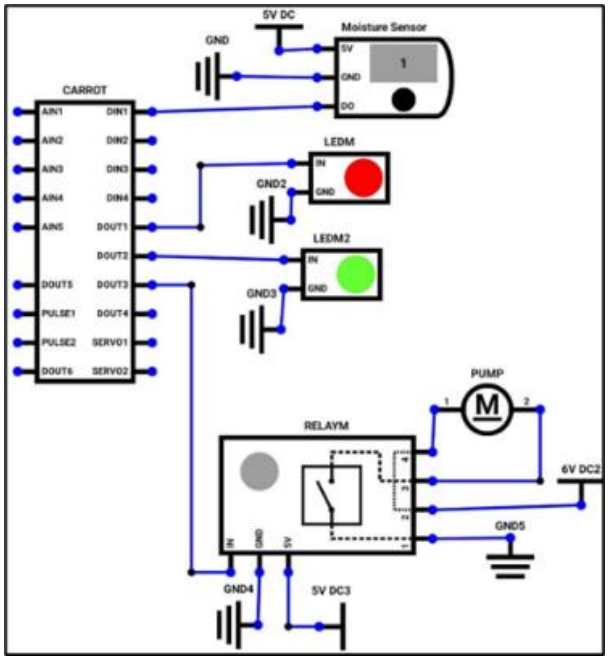

Figure 4: The Circuit Simulation for Smart Irrigation System in Agricultural STEM-Based Project

Methodology

This study used a quantitative and qualitative approach with a case study design. The researcher employed a one-group pre-test and post-test design and open-ended interview to evaluate the effectiveness of the Magnetcode application in enhancing computational thinking skills among educators at Malcolm Moffat College of Education. The researcher used purposive sampling to select 16 educators who teach STEM subjects, ensuring the participants are directly involved in the areas most likely to benefit from the integration of computational thinking. The intervention consists of a workshop focused on the practical application of coding and programming through Magnetcode for agricultural STEM-based hands-on projects.

To assess the impact of integration CT using the Magnetcode application, the researcher measured the computational thinking skills of the educators before and after the workshop using standardized pre-tests and post-tests. Five-point Likert scale was used to gather the mean for the pre-test and post-test. The analysis of the data involved calculating the percentage difference between the pre and post-test results to quantify the improvement in knowledge and skills. The researcher also applied one sample t-test to these results to determine if the observed changes were statistically significant. The open-ended interview was employed to measure the impact and effectiveness of the Magnetcode application in integrating computational thinking into agricultural STEM-based projects in STEM education.

Findings and Discussion

This study investigates the impact of the Magnetcode application on enhancing computational thinking (CT) skills among educators in Zambia**.** The findings ought to answer the research objective and research question in this study. Table 1 shows the findings from

the pre-test and post-test related to the knowledge and understanding of computational thinking in STEM projects using the Magnet code application.

Table 1: Knowledge and Understanding in Computational Thinking in STEM Project Using Magnetcode Application

Knowledge and understanding	N	Mean Pre-Test	Standard Deviation (SD)	Mean Post-Test	Standard Deviation (SD)	% Difference
1. Computational Thinking elements in teaching and learning.	16	2.44	0.89	3.75	0.75	1.31
2. Basic design coding in teaching and learning for STEM activities.	16	1.94	0.77	4.00	0.73	2.06
3. Circuit simulation through Computational Thinking Skills with STEM activities.	16	2.00	0.73	3.81	0.83	1.81
4. The application of Magnetcode Microcontroller in STEM projects.	16	1.56	0.63	4.06	0.77	2.5
5. The application of Magnetcode in pedagogical strategies for STEM projects.	16	1.94	0.77	4.06	0.77	2.12
6. The application of Magnetcode in teachers' activities for STEM projects.	16	1.00	0.00	4.06	0.93	3.06
7. The application of Magnetcode input Transducer (Sensor) for STEM projects.	16	1.00	0.00	3.56	0.89	2.56
8. The application of Magnetcode Output Transducer (Actuator) for STEM projects.	16	1.00	0.00	3.56	0.81	2.56

The results indicate substantial improvements in educators' understanding and application of CT elements, basic design coding, circuit simulation, and the use of microcontrollers. These enhancements are crucial for integrating CT into STEM education in Zambia. A strong foundation in CT allows educators to design and implement STEM projects that foster critical thinking, problem-solving, and algorithmic reasoning. Figure 5 shows STEM educators applying basic coding in agricultural STEM-based projects using the Magnetcode application, sensor and actuator.

Figure 5: STEM Educators Applying Computational Thinking Skills Using the Magnetcode Application, Sensor and Actuator in Agricultural STEM-Based Project

The findings also illustrated the notable increase in basic design coding skills, from the mean value of 1.94 to 4.00, underscores the application's effectiveness in providing practical coding experience, which is vital for creating engaging and interactive lessons. Figure 6 illustrates the outcome of the workshop in coding and circuit simulation diagrams. The STEM educators are able to design their own circuits using the Magnetcode application before they create the real project.

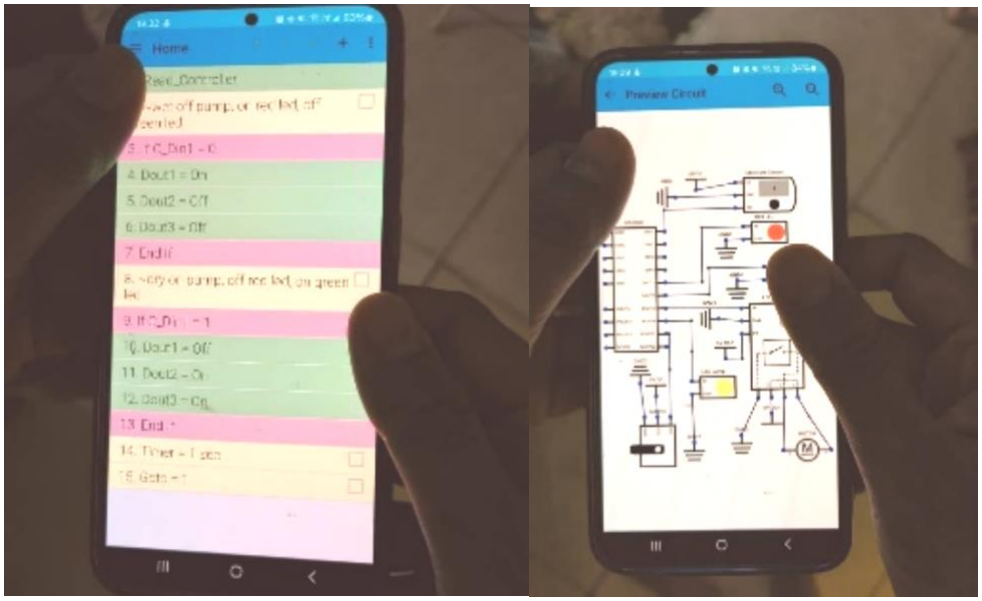

Figure 6: Coding and Circuit Simulation Diagram for Smart Irrigation Project

Furthermore, the improvement in circuit simulation skills, with mean value rising from 2.00 to 3.81, equips educators to better prepare students for real-world engineering and technology challenges. The most significant gain was in the application of the Magnetcode Microcontroller, with value increasing from 1.56 to 4.06, indicating a substantial boost in hands-on experience and confidence in using advanced STEM tools. Figure 7 shows the outcomes from the workshop where the STEM educators were able to integrate computational thinking skills in their agricultural STEM-based project using the Magnetcode application.

Figure 7: Functioning Prototype for Smart Irrigation Project

The researcher also analyses the results of the workshop with one sample t-test. Table 2 shows the result obtained.

Table 2: One-Sample t-Test

	t	df	Significance		Mean Difference	95% Confidence interval of the Difference	
			One-Sided p	Two-Sided p		Lower	Upper
Mean Pre-Test	25.66	15	<.001	<.001	27.69	25.39	29.99
Mean Pre-Test	30.40	15	<.001	<.001	48.69	45.27	52.10

The t-test results indicate a significant impact of the integration of computational thinking in agricultural STEM-based projects among Zambian educators. The mean for the pre-test was significantly different from the test value of 0, with a mean difference of 27.69 and a 95% confidence interval of 25.39 to 29.99, supported by a t-value of 25.66 ($p < .001$). These results indicated that before the workshop, educators had a moderate understanding of computational thinking and integration of the Magnetcode application in the agricultural STEM-based project. However, the mean for the post-test shows an even larger difference of 48.69 with a 95% confidence interval of 45.27 to 52.10, supported by a t-value of 30.40 ($p < .001$). Both one-sided and two-sided p-values for both tests are less than 0.001, indicating that the results are statistically significant. These results indicate the Magnetcode application had

a profound impact on enhancing the educators' computational thinking skills especially for the integrating the STEM project into subject-based contents.

The open-ended interview findings also supported the impact and the effectiveness of computational thinking in agricultural STEM-based projects using Magnetcode application as summarized in Figure 8.

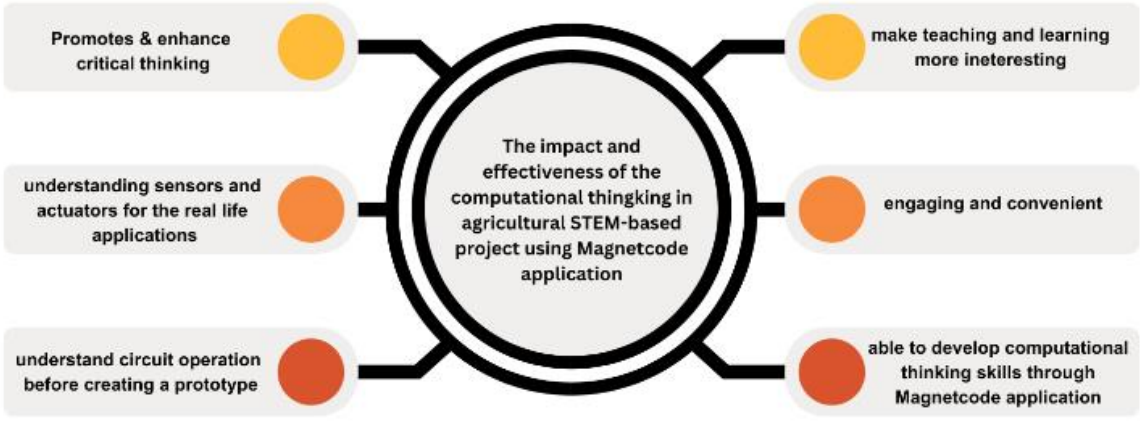

Figure 8: Findings From the Open-Ended Interview

The open-ended interview findings showed that the Magnetcode application in agricultural STEM-based projects can promote and enhance critical thinking especially in understanding circuit operation before creating a project. The indicators reported from open-ended interviews for Respondent 1, Respondent 2, Respondent 3 and Respondent 4 as stated below:

> *R1: "Magnetcode promotes critical thinking"* ***Interview: 26.02.24***
> *R2: "It's enhances critical thinking"* ***Interview: 26.02.24***
> *R3:* ***"****Magnetcode simulation is interested in that it enables students understand the operation of the circuit before the prototype is made"* ***Interview: 26.02.24***

The findings imply that the participants agreed the Magnetcode circuit simulation in Agricultural STEM-based project activities had an impact on their knowledge and skills in computational thinking. Thus, the findings illustrated that integrating computational thinking in agricultural STEM-based projects promotes critical thinking and makes teaching and learning more interesting.

The effectiveness of integrating computational thinking in Magnetcode features was also reported from the indicators from open-ended interviews from R1, R2, R3 and R4 as below:

> *R1: "enables me to understand the impact of transducers in everyday life"* ***Interview: 26.02.24***
> *R2: "to understand the real life application of various examples of transducers"* ***Interview: 26.02.24***
> *R3: "enables learners to develop the skills of programming which is the basis of CT"* ***Interview: 26.02.24***
> *R4: "ideal for programming / coding. This enhances CT as it is done easily on phone"* ***Interview: 26.02.24***

The open-ended interview findings also revealed that the integration of computational thinking in Magnetcode application can develop the understanding of the transducers and actuators for STEM projects. The participants agreed that Magnetcode features are relevant in pedagogical strategies for agricultural STEM-based projects and have an impact on their knowledge and skills in integrating computational thinking in teaching and learning. The findings illustrated the effectiveness of using the application in developing computational thinking, which is foundational for critical thinking and ease of programming on a smartphone.

Conclusion

Integrating computational thinking skills among STEM educators is vital in creating a new teaching strategy in STEM education. The application of Magnetcode as a computational thinking tool in STEM subject-based content such as science, agricultural science, engineering and mathematics, thereby broadening students' understanding and interest in STEM fields. Overall, the study highlights that by enhancing educators' CT skills through tools like Magnetcode, the quality of STEM education in Zambia can be significantly improved, preparing students for future innovations and problem-solving in the STEM landscape.

Official Conference Proceedings

Abstract
Health literacy refers to the ability to understand, evaluate, and apply health information. Individuals with higher health literacy are able to comprehend the content of health education materials. In contrast, those with lower health literacy may struggle to understand the information, potentially leading to worsening health conditions. As the global population aged 65 and above continues to grow rapidly and cognitive abilities decline, providing more readable texts can enhance reading comprehension. Thus, assessing the readability of health education texts has become an important research topic. To improve reading comprehension, different countries have established their readability guidelines. For example, the United States recommends texts suitable for a 5th to 6th-grade reading level. However, Taiwan currently lacks similar guidelines for health education texts. Given this research gap, the present study employs eye-tracking experiments to gather physiological data from the reader's perspective. This approach helps verify the reading process and comprehension performance, ensuring that the content is effectively understood. In the analysis, the eye-tracking data from 11 participants were used, focusing on five commonly studied eye-tracking indicators. The results showed that the regression in count for diabetes proper nouns reached a significant level. This study recommends that the difficulty of health education texts should not exceed a 6th-grade reading level.

1. Introduction

With the continuous advancement of medical technology, health literacy has increasingly become an important evaluation indicator. Health literacy refers to an individual's ability to understand, evaluate, and apply health information in daily life (Sørensen et al., 2012). Individuals with high health literacy can quickly comprehend health information, which helps to enhance their personal capabilities and eliminate doubts regarding health-related information (Kickbusch et al., 2013; Rudd, 2013). For example, during the COVID-19 pandemic, healthcare institutions commonly used online methods to disseminate information. However, the content presented in these texts was often too complex for the general public, leading to a lack of full comprehension and missed opportunities for self-protection (Szmuda et al., 2020). It can be concluded that providing easily understandable text content can effectively address these issues and help individuals find more suitable treatment options (Brown et al., 2004; Howell et al., 2017).

In fact, even without the pandemic, the readability of texts is crucial for older adults. With the growing proportion of the global population aged 65 and above, the demand for healthcare services has also increased (McNicoll, 2002). For example, there is greater emphasis on oral health care and hearing care (Lee et al., 2020; Wallhagen & Strawbridge, 2017). Providing written materials or pamphlets can assist older adults in recalling important information and allow them to learn at their own pace (Bernier, 1993). Goodman and Lambert (2023) and Pearman and Storandt (2005) further pointed out that the decline in cognitive function among older adults should be considered when assessing their ability to understand texts. Providing easily understandable medication information for older adults can help reduce side effects caused by improper medication use (Liu et al., 2014).

To provide suitable reading materials, the American Medical Association (AMA) and the U.S. Department of Health and Human Services (USDHHS) recommend that the difficulty of texts should be kept at the level of 5th to 6th grade (Kutner et al., 2006). In the UK, guidelines recommend that health education materials for older adults should not exceed a readability level of 12 (Petterson, 1994), corresponding to the 11th-grade level in the U.S. (Gunning, 1952). In Australia, the SA Health agency recommends that texts should be at an 8th-grade reading level to ensure comprehension (Cheng & Dunn, 2015).

In summary, Western countries have established guidelines for the grade level at which texts should be understandable. Whether on the website or on paper, there are standards that can be referenced. In contrast, there is relatively little research in Taiwan that explores the appropriate grade level for health education texts. Therefore, the purpose of this study is to explore the level of difficulty in health education texts that are most suitable for older adults to read. Eye-tracking experiments will be conducted from the readers' perspective to understand their reading process and reading comprehension levels.

2. Literature Review

Readability is the extent to which readers can understand the text (Dale & Chall, 1949; Klare, 1963, 2000; McLaughlin, 1969). Readable text allows readers to understand and absorb content more effectively (DuBay, 2007). For example, using easily understood vocabulary, simpler sentence structures, and appropriate article length can enhance readability (Klare, 2000; Van Den Broek & Kremer, 2000). Therefore, when evaluating the readability of a text, it is essential to consider the reader’s ability and strive to minimize cognitive load.

In previous research, readability assessments typically employed readability formulas. Especially in English-speaking countries, these formulas provide a standardized quantitative metric, allowing the difficulty of a text to be measured and evaluated directly (DuBay, 2007). Traditional readability formulas are primarily used to assess the complexity of sentence or word structures in a text (Pruthi et al., 2015). By calculating indicators such as word length, sentence length, and the proportion of difficult words, the readability grade level of the text can be determined. This value indicates the appropriate grade level for reading the text. Common readability formulas are shown in Table 1.

In addition to using readability formulas to assess text difficulty, some researchers have employed eye-tracking experiments to confirm participants' reading processes and reading comprehension strategies. During these experiments, eye-tracking data offer insights into what readers focus on, the order in which they read the text, and the time they spend on different sections (Holsanova et al., 2009). In addition, eye-tracking experiments can be used to identify individual differences between readers. For example, students with adequate prior knowledge tend to experience a lower cognitive load when learning specific domain content. Therefore, this results in better learning outcomes (Jarodzka et al., 2010). Thus, eye-tracking experiments can help us understand differences in text comprehension among readers with varying levels of reading ability.

To gain deeper insights into participants' comprehension patterns, eye-tracking indicators can be subjected to analysis. These indicators derived from different types of eye movements, include Total Fixation Duration (TFD), Total Fixation Count (TFC), Percentage of Fixation Duration, First Fixation Duration, Number of regressive saccades, and so forth. Common eye-tracking indicators are detailed in Table 2. By analyzing several common eye-tracking indicators, the aim is to understand the reading comprehension and reading performance of older adults and to provide them with appropriate texts to read.

Table 1: Common Readability Formulas and Indicators

Formula name	Calculation formula	Indicators
Flesch Reading Ease （Flesch, 1948; Flesch, 1979）	Reading Ease = 206.835 –（1.015 × ASL）–（84.6 × ASW）	Average Sentence Length、Average Number of Syllables per Word
Gunning FOG （Gunning, 1952）	Gunning Fog Index = （ASL + PHW）×0.4	Average Sentence Length、Percentage of Hard Words
SMOG （Mc Laughlin, 1969）	SMOG Grade = 1.0430 $\times\sqrt{\text{number of polysyllables} \times (\frac{30}{\text{number of sentences}})}$ + 3.1291	Number of polysyllables、Number of sentenced

Table 2: Common Eye-Tracking Indicators

Eye-tracking Indicators	Definition/Measurement	References
Total fixation duration	The total time spent on all fixation points, with longer durations indicates a greater cognitive processing load.	Hannus & Hyönä, (1999); Hegarty & Just, (1993)
Total fixation count / the number of fixations	The number of fixations within all AOI. Areas with more fixations require more time for cognitive processing.	Eitel, (2016); Schnotz & Wagner, (2018)
Percentage of fixation duration	The fixation duration within the AOI / the total fixation duration on the screen. It reflects the reader's attention allocation to each text segment.	Alemdag & Cagiltay, (2018)
First fixation duration	The duration of the reader's first fixation on a word reflects the degree of selective attention given to the word.	Alemdag & Cagiltay, (2018); Lai et al., (2013); Scheiter & Eitel, (2015)
Number of regressive saccades	It is the total number of times the eyeball jumps from the position of the rear text to the front, reflecting the reader's late processing of single words. When readers encounter words or sentences they don't understand, they will look back more often.	Jian et al., (2013); Mason et al., (2016)

3. Method

This study conducts eye-tracking experiments focused on older adults. The objective of this study is to examine how text difficulty influences the reading comprehension of older adults with varying reading abilities. Eye-tracking indicators can reflect readers' cognitive processing and learning performance of text. For example: dwell time, total fixation count, dwell time %, first fixation duration, and regression in count. In addition, by asking participants to complete the Diabetes Knowledge Questionnaire (DKQ), it can be further investigated whether eye movement performance is related to the knowledge background of the reader or is caused by differences in individual reading ability.

3.1 Participants

For this study, 15 participants aged 65 and older were recruited. They lived in Taipei City. All participants were native Chinese speakers, and it was confirmed that their vision was either normal or corrected to a level that would be considered normal. Four older adults were excluded from the study due to not meeting the age criteria or failing to record eye-tracking data. Ultimately, 11 participants were included in the analysis.

3.2 Apparatus

The experiment used the SR Research Eyelink 1000, which recorded eye movements at a sampling rate of 1000 Hz. A chin bar was used to stabilize the participants' heads. The reading text was presented on a 24-inch LCD monitor with a resolution of 1920 x 1200

pixels. The text size was set to 28, and the distance between the monitor and the participants was 65 cm.

3.3 Experimental Materials

This experiment focused on the topic of diabetes due to the continuous global increase in the number of diabetes patients, particularly among older adults. A review of the statistical data shows that the worldwide prevalence of diabetes is expected to rise to 642 million by 2040, with the largest increase projected among individuals aged 60 to 79 (Ogurtsova et al., 2017). In Taiwan, the incidence of diabetes and cancer is also on the rise. According to the 2023 statistical data from the Ministry of Health and Welfare on the ten leading causes of death, malignant neoplasms (cancer) ranked first, accounting for 25.8% of total deaths, while diabetes was ranked fifth. The primary causes of death among diabetes patients are closely related to malignant tumors, cardiovascular diseases, and other conditions. Notably, 87% of cancer-related deaths occur in individuals aged 55 and above. Providing health education texts that are suitable for reading can significantly reduce the cognitive load of the elderly, help them understand the disease more deeply, and take appropriate measures according to the symptoms and risks (Conner et al., 2019; Ebaid & Crewther, 2019). In light of this, the study selected diabetes as the theme and categorized the texts read by participants into three levels of difficulty: easy (6th grade), medium (9th grade), and Hard (12th grade). The texts were authored by six professional teachers, verified for readability, and reviewed by professional doctors to ensure content accuracy.

3.4 Reading Ability Test

Given the dearth of knowledge regarding the range of reading abilities among Taiwanese elders, this study employed the Diagnostic Assessment of Chinese Competence (DACC) to gain insight into the comprehension abilities of older adults across varying reading ability levels. Through computerized adaptive tests, participants' reading abilities are assessed in five aspects: word recognition, superficial meaning comprehension, textual meaning integration, inferential comprehension, and analysis and evaluation. The test results showed that the participants' reading abilities ranged from second to twelfth grade (Lee et al., 2021). Based on the DACC test results, this study categorized participants into two groups for further analysis: low reading comprehension (below 7th grade) and high reading comprehension (above 8th grade).

3.5 Diabetes Knowledge Questionnaire

To determine whether differences in participants' eye movement behaviors stem from their background knowledge of diabetes or their reading abilities, this study first had participants complete the Diabetes Knowledge Questionnaire (DKQ). This questionnaire assesses their understanding of diabetes knowledge and serves as a reference indicator during the reading experiments. The DKQ is a commonly used tool for measuring diabetes knowledge, with good internal consistency, indicated by a Cronbach's α coefficient of .78 (Garcia et al., 2001). A staff member with a bachelor's degree in English translated the DKQ, which was subsequently reviewed by two experts: a psychometrician and a physician certified in diabetes education. The translation process also referenced the simplified Chinese version developed by Hu and colleagues (2013), which reported a Cronbach's α coefficient of .89. The questionnaire consists of 24 brief statements, with each item offering three response

options: true, false, or unsure. The total score ranges from 0 to 24, with higher scores indicating a greater understanding of diabetes knowledge among the participants.

According to the results in Table 3, individuals with low reading comprehension abilities had an average score of 15.00 on the questionnaire, while those with high reading comprehension abilities had an average score of 16.67. Individuals with high reading comprehension abilities performed better than those with low reading comprehension abilities. Additionally, the standard deviation for high reading comprehension participants is 2.73, which is higher than the 2.00 for low reading comprehension participants. The *t*-value is -1.13, with a *p*-value of .29, indicating that the results are not statistically significant.

Reading comprehension is closely linked to vocabulary mastery and reading fluency (Ehri, 2014). Individuals with better reading comprehension are generally more skilled at understanding the vocabulary within the text, which helps them integrate and infer the content while adapting their reading strategies (Cain et al., 2004; Connor et al., 2015; Zargar et al., 2020). Moreover, readers with relevant background knowledge can better synthesize the meanings of sentences, thereby enhancing their reading comprehension skills (Mayer, 2005; Perfetti & Stafura, 2014; Schnotz & Bannert, 2003; Schnotz et al., 2014). Therefore, to investigate whether eye movement behavior is influenced by the reader's background knowledge, this study employs independent samples *t*-tests to examine the relationship between participants' performance on the knowledge questionnaire and their reading comprehension across different reading abilities. In statistics, independent samples *t*-tests are commonly used to explore differences between two distinct groups, such as comparing the performance of experts and novices in solving math problems (Chen & Wen, 2023). However, according to the results, both groups have a similar level of diabetes knowledge, which does not significantly affect their comprehension of diabetes-related texts.

Since the scores on the diabetes knowledge questionnaire did not show statistically significant differences, the subsequent eye-tracking analysis excluded the influence of diabetes background knowledge. This allows for an exploration of whether there are differences in eye movement comprehension performance among participants with varying reading abilities. The analysis uses eye-tracking indicators to examine the cognitive processes of participants with different reading abilities as they read texts of varying difficulty, thereby facilitating further inferences.

Table 3: *t*-Test Analysis of Correct Responses on the Questionnaire by Reading Ability

	n	*M*	*SD*	*t*
Low reading ability	5	15.00	2.00	
High reading ability	6	16.67	2.73	-1.13

*$p < .05$; **$p < .01$

3.6 Procedure

The experimental flow chart of this study is shown in Figure 1. Before the experiment officially begins, the contents of the informed consent form are first explained to the participants. After the participants understood the entire experimental process, they signed a consent form to express their agreement to participate in the experiment. Subsequently, they completed the DKQ to assess their prior knowledge of diabetes. Following this, the DACC was conducted to evaluate the participants' reading abilities. The duration of the testing phase

was approximately 40 minutes to 1.5 hours, after which participants were permitted a 10-minute break before commencing the eye-tracking experiment.

Before officially starting the eye-tracking experiment, each participant underwent a nine-point calibration and verification process to adjust the camera's position and focus, ensuring that their pupils were aligned with the central cross on the screen. The eye-tracking experiment was then initiated and divided into three stages. After reading each page of text, participants pressed the space bar to proceed to the next page. When the screen displays "Congratulations, you have completed this section", participants are asked to answer questions about the text's topic. After responding, participants were given a 5 to 10-minute break. The entire eye-tracking experiment lasted approximately 20 minutes.

For subsequent analyses, this study utilized heatmaps to evaluate participants' comprehension of the text and their reading behaviors. This involved calculating the fixation duration and frequency in areas related to diabetes proper nouns and non-diabetes proper nouns. The rationale for focusing on these two main categories is that vocabulary significantly impacts readers' understanding of the text. According to Chaffin et al. (2001), readers usually spend more time on cognitive processing when they encounter novel or unfamiliar words. Jian et al. (2013) also explored how readers understand academic vocabulary in physics, finding that readers can infer the meanings of these terms through contextual cues and other familiar vocabulary. Following this, a quantitative analysis of Area of Interest (AOI) was conducted to extract five common eye-tracking indicators, aiming to gain deeper insights into the participants' reading comprehension processes.

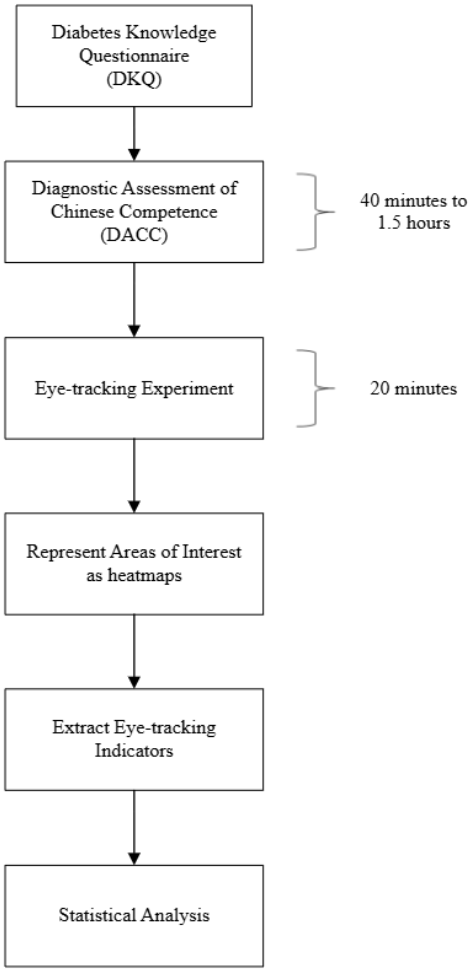

Figure 1: The Experimental Flow Chart

4. Results

This study used heatmaps to visually analyze eye-tracking data, giving an initial look at how participants with different reading skills performed when reading texts of different difficulty levels. Figures 2, 3, and 4 illustrate the findings. The heatmaps show text paragraphs marked with varying color intensities, with darker colors indicating longer reading times and more frequent fixations. Following this initial analysis, diabetes proper nouns and non-diabetes proper nouns were identified as Area of Interest (AOI). The diabetes proper nouns were selected based on definitions provided by the International Diabetes Federation (2024), the American Diabetes Association (2024), and SA Health (2022). Non-diabetes proper nouns were excluded from the specialized terms vocabulary. Subsequent eye-tracking analysis was then conducted on these AOI, as depicted in Figures 5 and 6.

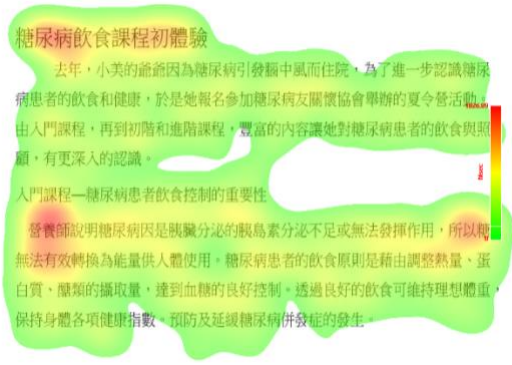

Figure 2: Heatmap of Low Reading Ability Participants Reading a Text of Easy Difficulty

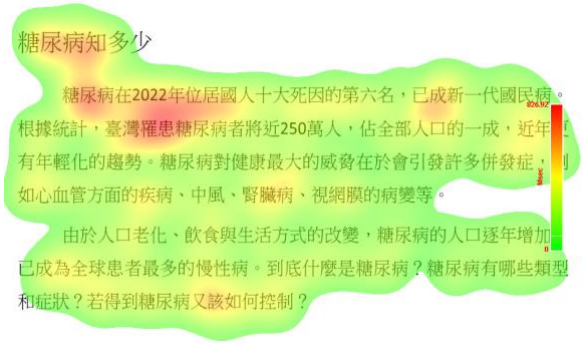

Figure 3: Heatmap of Low Reading Ability Participants Reading a Text of Medium Difficulty

Figure 4: Heatmap of Low Reading Ability Participants Reading a Text of Hard Difficulty

Figure 5: Heatmap With Diabetes Proper Nouns As AOI

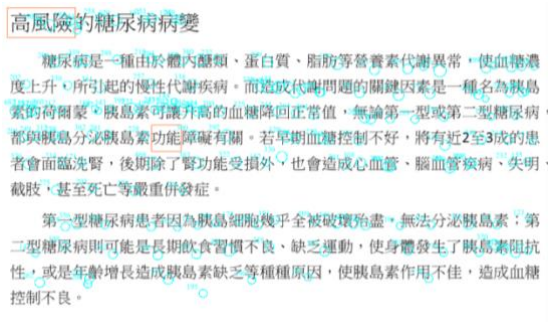

Figure 6: Heatmap With Non-diabetes Proper Nouns As AOI

4.1 Data Selection and Analysis

According to Rayner (2009), participants' gaze duration typically ranges between 100 and 500 milliseconds. If the gaze duration exceeds 1,000 milliseconds, it may be attributed to instrumental error. Therefore, during the eye-tracking data analysis, data with gaze durations shorter than 100 milliseconds or longer than 1,000 milliseconds were excluded (Morrison, 1984; Rayner & Pollatsek, 2016). Ultimately, data from 11 participants were collected, including 5 participants with low reading ability and 6 participants with high reading ability. For the data analysis, diabetes proper nouns and non-diabetes proper nouns were designated as AOI. The eye-tracking indicators employed were based on commonly used eye-tracking indicators from past studies (Jian & Ko, 2017; Jian et al., 2013; Rayner, 1998; Rayner et al., 2006; Schad et al., 2014), such as dwell time, total fixation count, dwell time %, first fixation duration and regression in count. Commonly used eye-tracking indicators are detailed in Table 4.

Table 4: Common Eye-Tracking Indicators

Eye-tracking Indicators	Definition/Measurement	References
Dwell time	The total time spent on all fixation points within the AOI is summed, with longer durations indicating a greater cognitive processing load.	Jian & Ko, (2017); Lai et al., (2013)
Fixation count	The total number of fixations across all AOIs is summed, with a higher number of fixations indicating a higher degree of cognitive processing or that the text information is more engaging.	Eitel, (2016); Schnotz & Wagner, (2018)
Dwell time %	The proportion of dwell time on the AOI relative to the total dwell time on the entire text reflects the reader's selective attention allocation or the time spent on processing the information within the AOI.	Alemdag & Cagiltay, (2018); Mason et al., (2013)
First fixation duration	The first fixation duration reflects the reader's initial semantic processing or the degree of selective attention given to a word; the more attractive or familiar the word is to the reader, the shorter the fixation duration will be.	Alemdag & Cagiltay, (2018); Jian et al., (2013); Scheiter & Eitel, (2015)

Regression in count	The total number of regressions, where the eyes jump backward to earlier positions in the text, reflects the reader's late-stage processing of words. When encountering unfamiliar words or sentences, the number of regressions increases.	Jian et al., (2013); Mason et al., (2016)

4.2 Statistical Analysis Methods

In the statistical analysis, this study followed the experimental design of Jian and Ko (2017), using reading ability (low and high) and text difficulty (medium and hard) as independent variables, with eye-tracking measures as the dependent variables. During the experiment, participants read two articles, and data analysis was based on eye-tracking indicators selected from the AOI. Additionally, following the study by Jou and Mariñas (2023), which assessed the reading behaviors of individuals with dyslexia, the independent variables were set as people without dyslexia and those with dyslexia, as well as three different text designs, with eye-tracking measures again as the dependent variables. Participants read three different text designs in sequence, and subsequent analysis and inference were conducted based on the eye-tracking indicators.

Upon reviewing the two studies mentioned above, a common approach can be observed: the use of a two-factor mixed design, where reading ability is treated as a between-subjects factor and text difficulty as a within-subjects factor, with various eye-tracking indicators as dependent variables. This aligns with the design approach of this study. Therefore, in this study, the independent variables were set as low reading ability (below 7th grade), high reading ability (above 8th grade), and text difficulty (6th, 9th, and 12th-grade levels). The dependent variables were five eye-tracking indicators, aiming to explore the performance differences of participants with different reading abilities when reading texts of varying difficulty, and to infer their eye-tracking behavior further.

4.2.1 Analysis Results Using Diabetes Proper Nouns and Non-diabetes Proper Nouns As Units

In selecting the AOI, the analysis primarily focused on diabetes proper nouns and non-diabetes proper nouns. The descriptive statistics summary is presented in Table 5, and the ANOVA summary table is shown in Table 6. Among the five eye-tracking indicators, only the regression in count for diabetes proper nouns reached significant interaction between reading ability and text difficulty, $F(2, 18) = 3.69$, $p < .05$, $\eta^2 = .29$. This eye-tracking indicator may reflect eye movement behavior when readers have difficulty understanding the text or vocabulary, leading them to integrate or clarify their perspective (Rayner et al., 2003). Additionally, text difficulty also exhibited a significant main effect, $F(2, 18) = 5.75$, $p < .05$, $\eta^2 = .39$.

From the results in Table 7, it can be seen that the simple main effect of reading ability significantly impacted regression in count for easy texts, $F(1, 27) = 5.09$, $p < .01$, $\eta^2 = .16$. Post-hoc comparisons indicated that participants with low reading comprehension ($M = 0.87$, $SD = 0.51$) exhibited significantly higher regression counts when reading easier texts than those with high reading comprehension ($M = 0.42$, $SD = 0.25$). Research suggests that participants with low reading comprehension tend to learn from simpler text and images primarily because easier texts are more comprehensible for them. Consequently, they

concentrate more attention on these simpler texts, leading to a significant increase in the number of fixations and total reading time.

The analysis of regression behaviors also indicated that participants with low reading comprehension had significantly more regressions in easier texts compared to more difficult ones. In other words, individuals with low reading comprehension tend to spend more time and focus on easily understandable texts, aiding their learning and information integration within these materials (Jian & Ko, 2017). However, this study categorized text difficulty into three levels (6th, 9th, and 12th grade) and classified participants' reading comprehension into low (below 7th grade) and high (above 8th grade). As the reading ability of the participants in this study ranged from 5th to 7th grade, providing 6th-grade level texts does not create a significant cognitive gap. In summary, the complexity of the health education texts should be kept at a level that is easily understandable for 6th graders.

On the other hand, the results in Table 7 indicate that the simple main effect of text difficulty significantly influenced participants with high reading comprehension, $F(2, 18) = 10.16$, $p < .01$, $\eta^2 = .06$. Post-hoc comparisons revealed that participants had higher regression in counts when reading texts of medium difficulty ($M = 1.25$, $SD = 0.29$) and high difficulty ($M = 1.14$, $SD = 0.34$) compared to easier texts ($M = 0.42$, $SD = 0.25$). This suggests that even readers with good comprehension skills may need to put in extra effort to understand content when reading texts that match their reading level.

This phenomenon is similar to what is seen in individuals with low reading comprehension, who often take more time to understand texts. As text difficulty increases, readers' fixation durations and regression counts also rise (Jacobson & Dodwell, 1979; Rayner et al., 1989; Rayner et al., 2006). An increase in fixation count reflects the reader's need for higher-level cognitive processing when comprehending the text (Eitel, 2016; Schnotz & Wagner, 2018). Therefore, participants with a high level of reading comprehension tend to have significantly more regressions when they read texts of medium to high difficulty than when they read texts of lower difficulty.

Table 5: Descriptive Statistics Summary of Regression in Count by Reading Ability and Text Difficulty (diabetes proper nouns)

Text Easy		Text Medium		Text Hard	
Low reading ability	High reading ability	Low reading ability	High reading ability	Low reading ability	High reading ability
5	6	5	6	5	6
0.87	0.42	1.00	1.25	0.89	1.14
0.51	0.25	0.30	0.29	0.30	0.34

5. Conclusion

Previous studies primarily focused on elementary and university students to provide appropriate reading materials for them. In contrast, this research focuses on older adults as the participants, whose cognitive comprehension differs from students. To understand the reading abilities of older adults and provide suitable health education texts, this study employed testing and eye movement experiments to observe the reading behaviors and performances of the participants.

In selecting the AOI, the analysis concentrated on diabetes proper nouns and non-diabetes proper nouns, utilizing five eye-tracking indicators. The results revealed a significant effect solely in the regression in count for diabetes proper nouns. Specifically, participants with low reading comprehension showed more regressions when reading simpler texts than those with high reading comprehension; this indicates that individuals with lower reading comprehension may be more willing to spend additional time understanding easier texts. Moreover, participants with high reading comprehension exhibited significantly higher regression in counts when reading medium and hard texts than when reading easy texts. This suggests that even highly proficient readers put in significant effort to understand texts that match their reading level, resulting in longer fixation durations and more regressions as the text difficulty increases. This shows that although cognitive decline does occur in older adults, the results are consistent with previous research and help to fill in the gap. In summary, the 11 participants in this study were from the Taipei metropolitan area. Five of them were identified as having low reading comprehension skills. This group included one fifth grader, one sixth grader, and three seventh graders. In theory, all of these participants have relatively good reading comprehension skills. However, in order to take into account the reading comprehension levels of older adults in non-metropolitan areas, we recommend that the level of difficulty of the text provided should be no higher than the sixth grade level.

6. Limitations of the Study

This study focused on five common eye-tracking indicators for analysis. However, the range of available eye-tracking indicators is extensive. Future research could consider incorporating additional indicators from different dimensions, such as average saccade length and fixation position as spatial metrics. This would provide a more comprehensive observation of participants' eye movement behaviors and enable deeper exploration. In addition, this study

had limitations related to sample size, which may affect the results of statistical analyses. To enhance the inferential strength of future research, it is advisable to increase the sample size and collect more data for a more thorough statistical evaluation.

7. Acknowledgments

This project was financially supported by the Empower Vocational Education Research Center of National Taiwan University of Science and Technology (NTUST) from the Featured Areas Research Center Program within the framework of the Higher Education Sprout Project by the Ministry of Education (MOE) in Taiwan. This project was also supported by funding from the National Science and Technology Council, Taiwan (111-2410-H-011 -039 -MY2).

Transforming Education: Using the Pedagogy, Spaces and Technology (oPSTi) Framework to Teach Project Based Learning Among Southeast Asia Educators

Sanura Jaya, SEAMEO RECSAM, Malaysia
Parvinder Singh Amar Singh, SEAMEO RECSAM, Malaysia
Azman Jusoh, SEAMEO RECSAM, Malaysia

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Digital citizenship encompasses interaction via the network, appropriate learning spaces and suitable technology tools in an emerging trend in STEM education. The digital literacies comprise the teaching and learning skills that enable technology to emerge in teaching and learning. This article examines the transformative impact of the Pedagogy, Spaces, and Technology (oPSTi) Framework on teaching and learning among educators in Southeast Asia. The study employed a case study research design using post-test questionnaire. Twenty-four educators from Southeast Asian were involved in the purposive sampling to identify the impact of the oPSTi framework in teaching and learning. The findings reveal a significant enhancement in teaching practices, experiences, and confidence among these educators following their engagement using the oPSTi Framework in the workshop. The findings indicated the key pedagogical strategies and innovative teaching activities, which were highly effective, with a mean value ranging from 4.41 to 4.68. The framework's emphasis on self-determined learning, adult learning principles, and project-based learning with the application of digital learning tools was pivotal in this enhancement. Notably, the use of technology tools, both hardware and software, enabled effective integration of coding and computational thinking skills using Magnetcode. The respondents reported increased motivation and a greater propensity to recommend the oPSTi Framework to their peers, highlighting its potential to drive substantial improvements in educational practices. The study underscores the oPSTi Framework's capacity to foster a dynamic and effective teaching environment, aligning with the current trends in digitalization of STEM education. This transformation is crucial for equipping educators with the skills and confidence needed to integrate coding and programming into their teaching practices, ultimately contributing to the broader advancement of STEM education in the region.

Keywords: oPSTi Framework, Magnetcode Application, Microcontroller, STEM Education, Southeast Asian Educators

Introduction

In the rapidly evolving educational landscape, digital citizenship and STEM (Science, Technology, Engineering, and Mathematics) education have become crucial components (Economic Planning Unit, 2021). Integrating technology into teaching not only enhances learning experiences but also prepares educators for a technologically advanced future (Qismullah & Yunisrina, 2018). The integration of digital culture in education is a cornerstone of teaching innovation, as highlighted by recent studies on digital education (Cerstin & Andreas, 2019). The pivotal role of digital technology in moving away from traditional models has been especially significant in remote learning environments, bringing attention to training spaces, digital skills, and learning methods(Mason & Rich, 2019; Mattila et al., 2022). This shift has reignited the potential of digital technology, as emphasized in recent STEM educational (Norhaqikah & Kamisah, 2017; Yean & Abdul Rahim, 2021). STEM education has many advantages as it is an innovative and attractive tool for teaching and learning (Suryani et al., 2024). It is an exciting field for children to satisfy their curiosity about the world (Hsieh et al., 2022).

STEM education in Southeast Asia faces several significant challenges in both teaching and learning (Faikhamta et al., 2020). One major issue is the outdated curriculum that many educational institutions still rely on, which fails to reflect the latest advancements in STEM fields (Stamatios et al., 2023). Additionally, the curriculum often lacks contextual relevance, making it difficult for teachers to connect with subject based contents(Blackley & Howell, 2019; García-Peñalvo, 2018). Pedagogically, the reliance on teacher-centered methods, such as lecture-based teaching, limits student engagement and critical thinking. Furthermore, there are limited opportunities for educators to participate in ongoing professional development to update their skills and knowledge in STEM education (Khairani, 2017). This professional stagnation contributes to a lack of student interest in STEM subjects, partly because they are perceived as difficult and uninteresting (Nik Hazimin & Hazrati, 2019).

The adoption of technology tools in STEM education presents its own set of challenges among Southeast Asian teachers (Susilo & Sudrajat, 2020). Teachers face challenge in integration of the learning space physically and virtually which is technological infrastructure, and inconsistent internet connectivity further hampers the effective use of online learning tools (Sastra et al., 2021). Teacher preparedness is another critical issue, as many educators are not adequately trained to integrate technology into their teaching practices effectively (Siti Noor Aneeis et al., 2022; Yeh & Tsai, 2022). This lack of technological literacy (Wu & Anderson, 2015), combined with resistance to change due to unfamiliarity with digital tools, further complicates the adoption process. Additionally, limited financial resources restrict the acquisition of up-to-date technology and software necessary for effective STEM education. The scarcity of high-quality, localized digital educational content and tools also hampers the ability to cater to the specific needs of Southeast Asian students (Daugherty Michael & Carter, 2019; Hidiroğlu & Karakaş, 2022; Lakshminarayanan & McBride, 2015).

Addressing these issues requires a comprehensive approach involving teaching and learning strategies in STEM education embedded with learning space and technology. The researcher aim to assess the impact of the oPSTi framework in term of pedagogy, learning space and technology to enhance the quality of STEM education and better prepare students for the demands of the modern workforce.

Research Objective

To assess the impact of the oPSTi Framework on teaching and learning among Southeast Asian educators.

Research Question

What is the impact of the oPSTi framework on teaching and learning among Southeast Asian educators?

Literature Review

The oPSTi framework is a conceptual map for planning or revising any teaching, learning or lesson. It can be easily adapted and mixed with the elements in the framework. The oPSTi framework was developed through the design and development research (DDR) using the experts consensus for the constructs and elements (Sanura et al., 2022). The Pedagogy-Space-Technology (PST) is the existing framework from Carrick Institute by Professor Radcliffe for the Next Generation Learning Spaces project at the University of Queensland (Radcliffe et al., 2008a, 2008b). The learning environment originated from three interdependent aspects: pedagogy, space and technology (Fisher, 2005; Oblinger, 2005). Earlier scholars, Wilson, Powell and Tibbetts (2008) implied "a nexus between pedagogy, the design of the learning spaces and technology and suggested the PST framework as guidelines in NGLS to enhance 21st-century skill in era 5.0. The transition from PST framework have been improved with development of the oPSTi framework with the strength in emergence the elements of pedagogy in innovative ways, application of the technology and suitable learning space by looking into the objective and implementation of the framework in teaching and learning (Sanura et al., 2022). Figure 1 illustrated the existing framework and oPSTi framework. The outdoor classroom environment and the utilization of space will influence the preferred teaching methods and technology for both teachers and students in next-generation education as illustrated in Figure 1.

(a) (b)

Figure 1: (a) The Transition From Existing Framework
(b) PST Framework to oPSTi Framework
Sources: (Radcliffe, 2008) and (Sanura, 2023)

Figure 1 illustrated the transition from the existing PST (Pedagogy, Space, Technology) (Radcliffe et al., 2008a) framework to the new oPSTi framework represents a significant evolution in educational methodology. While the existing PST framework focuses on integrating traditional teaching methods, learning environments, and basic technological tools, the oPSTi framework enhances these elements with a more dynamic and interactive approach (Sanura, 2023). It incorporates innovative pedagogies such as heutagogy and andragogy, which promote self-directed learning and critical thinking (Blaschake, 2021; Porman Lumban Goal, 2020). Additionally, it extends the concept of learning spaces from outdoor classroom environments to include specialized environments like Makerspaces, STEM Community Hubs, and Virtual Learning Environments, which are designed to foster collaboration and hands-on learning (Bruno Schardong et al., 2020; Hadad, 2020; L. Peterson & Scharber, 2018). The technological component is also significantly advanced, with the inclusion of collaborative technologies, advanced digital tools, and computational thinking, thereby creating a more engaging and interactive learning experience. Overall, the oPSTi framework integrates these enhanced elements to create a holistic, student-centered educational experience that is adaptive to the evolving demands for STEM education among Southeast Asian educators.

Project-Based Learning in STEM Education

The oPSTi framework can be effectively integrated with Project-Based Learning (PBL) to enhance the teaching and learning experience. According to Chistyakov et al (2023), pedagogical strategies through project based learning can influence on student learning, especially in science and STEM education. Project-based learning is a process-oriented learning approach (Mazlini Adnan et al., 2018)that requires flexible learning spaces which is the learning can be everywhere by used of technology tools (Sanura & Rozniza, 2022).

PBL inherently relies on innovative pedagogies (Imms & Kvan, 2021). Therefore, the oPSTi framework emphasizes activities and strategies such as heutagogy and andragogy, which are critical in PBL. According to Mahat and colleagues (2018) these approaches encourage students to take control of their learning process, fostering self-directed learning, which is a core principle of PBL. Project-based learning strategies can upgrade understudies' basic and imaginative reasoning abilities in science acquiring. According to Zulyusri and colleagues (2023), teachers can use the syntax of the project-based learning method to assist students in optimizing their creativity and critical mindsets. By project based learning, students starting learning with essential questions, working together to plan, developing project completion schedules, timelines, and deadlines (Zulyusri et al., 2023).

The framework includes various learning environments like Makerspaces, STEM Community Hubs, Virtual Learning Environments (VLEs), and Outdoor Learning Environments. PBL benefits from these diverse spaces as they provide flexible and dynamic environments where students can collaborate, experiment, and engage in hands-on activities crucial for project-based tasks (Barak, 2020; Nurul Natrah & Ahmad Shidki, 2020; Wang, 2023).

PBL requires the integration of collaborative technologies, digital learning tools, and computational thinking (Malik & Zhu, 2023). The oPSTi framework highlights the use of hardware and software tools, especially the Magnetcode application, screen casting, and other media technologies, which guide teachers to facilitate the implementation of PBL by enabling students to research, collaborate, and present their projects effectively (Khusna et al., 2022; Lin et al., 2021).

The effective implementation of PBL is supported by the oPSTi framework through the creation of conducive learning spaces and the selection of appropriate technological tools. By ensuring that the physical and virtual spaces are suitable for collaborative and interactive learning, the framework enhances the efficacy of PBL. Therefore, both the oPSTi framework and PBL focus on clear learning objectives. For instance, applying technical skills and engaging in collaborative projects help achieve specific learning outcomes. Teachers using the oPSTi framework are guided to set objectives that align with the goals of PBL, ensuring that students develop critical thinking, problem-solving, and teamwork skills.

Methodology

This study used a quantitative approach with a case study design. The researcher employed a one-group post-test design and to evaluate the effectiveness of the oPSTi framework in enhancing project-based learning among Southeast Asia country STEM secondary school educators. The researcher used purposive sampling to select 22 educators who teach STEM subjects, ensuring the participants are directly involved in the areas most likely to benefit from the integration of project based learning using Magnetcode application. The intervention consists of a workshop focused on the practical application of coding and programming through Magnetcode for STEM-based hands-on projects. To assess the impact of integration oPSTi framework using the Magnetcode application, the researcher measured the effectiveness of the oPSTi application among the educators before and after the workshop using standardized survey questions. Five-point Likert scale was used to gather the mean for the impact of the framework.

The oPSTi framework, as outlined by Sanura (2023), provides a structured approach for teachers to achieve their teaching and learning goals through the integration of various strategies and tools (Peterson et al., 2018). Teachers are encouraged to set clear objectives, such as the application of technical skills using diverse media (Lock et al., 2021). They should plan appropriate strategies within their learning environments, like active learning, which facilitates student engagement through discussion or interactive demonstrations. The creation and selection of effective activities, including online learning, is crucial, as is ensuring that the learning spaces, such as collaborative teaching areas, are suited to these activities (Bojer, 2019; Chiasson, 2022). The framework also emphasizes the importance of selecting appropriate technological tools such as smart phone (Schuck et al., 2017), laptop and screen casting for online tutorials, which allow students to engage and build on prior knowledge through peer discussions (Sage et al., 2020). Implementing the oPSTi framework boosts teachers' confidence in using technology, enabling them to evaluate learners with a scaffolding approach that prioritizes student learning and allows for flexible teaching sessions.

Findings and Discussion

This study investigates the impact of the oPSTi Framework on teaching and learning among Southeast Asia educators. Focusing on what is the impact of the oPSTi framework on teaching and learning, the findings ought to answer the research objective and research question in this study. Table 1.0 shows the quantitative findings from the case study design in implementation of the oPSTi framework. The findings reveal significant improvements in teaching practices, experiences, and confidence levels. The mean values for various aspects of the framework's implementation range from 4.41 to 4.68, indicating a high level of effectiveness and satisfaction among the participants as show in Table 1.

Table 1: The Impacts of the oPSTi Framework

No	Impacts of the oPSTi Framework	N	Mean	Standard Deviation
1	The teaching activities introduced in the workshop using oPSTi Framework enhanced my teaching	22	4.41	.503
2	The pedagogies strategies embedded in the oPSTi Framework enhanced my teaching	22	4.59	.503
3	The teaching activities introduced in the workshop using the oPSTi Framework enhanced my teaching experience.	22	4.59	.503
4	The pedagogies strategies embedded in the oPSTi Framework enhanced my teaching experience.	22	4.55	.510
5	The activities during the workshop using the oPSTi Framework provided effective methods for integrating self-determined learning into my teaching]	22	4.55	.510
6	Adult learning was visible during the activities conducted in the workshop using the oPSTi Framework	22	4.45	.596
7	Activities conducted in the makerspace during the workshop using the oPSTi Framework was beneficial for my understanding.	22	4.50	.598
8	The tools utilized in the Makerspace using the oPSTi Framework enhanced my teaching and learning.]	22	4.41	.503
9	The Virtual Learning Environment (VLE) simulation in the workshop using the oPSTi Framework was effective in demonstrating the integration of Magnetcode	22	4.68	.477
10	Project based learning applied in the workshop using the oPSTi Framework contributed to my understanding of integrating Magnetcode	22	4.68	.477
11	The technology tools (hardware) used in the workshop using the oPSTi Framework were effective for integrating Magnetcode in my teaching.	22	4.55	.510
12	The technology tools (software) introduced in the workshop using the oPSTi Framework were helpful in understanding the integration of Magnetcode in the project	22	4.68	.477
13	The digital learning tools used in the workshop using the oPSTi Framework will be beneficial for integrating Magnetcode in my teaching practices.]	22	4.50	.512
14	The workshop using the oPSTi Framework enhanced my skills in computational thinking and coding with Magnetcode	22	4.64	.492
15	I feel more confident to use the oPSTi Framework in my educational practices after attending the workshop.]	22	4.50	.673
16	I will recommend this workshop to other educators to integrate the oPSTi Framework elements into their teaching and learning practices.]	22	4.64	.492
17	The elements in the oPSTi Framework increase my motivation to teach.	22	4.55	.739
18	Overall, the workshop using the oPSTi Framework significantly encouraged me to transform my teaching strategies.	22	4.64	.492

Table 1 illustrated the integration of the oPSTi Framework in teaching activities resulted in enhanced teaching practices and experiences, with mean values of 4.41 and 4.59 respectively. Educators reported that the pedagogical strategies embedded in the framework were particularly effective, with a mean value of 4.55 for enhancing teaching experiences. This demonstrates that the framework successfully incorporates innovative teaching methods that resonate well with educators.

The study also found that the activities conducted during the workshop provided effective methods for integrating self-determined learning into teaching practices, with a mean value of 4.55. Additionally, the visibility of adult learning principles during these activities received a mean score of 4.45, indicating that the framework aligns well with adult learning theories, making it suitable for professional development. The use of the makerspace and technology tools such as Magnetcode application within the oPSTi Framework was highly beneficial.

Educators found the tools used in the makerspace (mean value 4.50) and the integration of Magnetcode in the Virtual Learning Environment (VLE) simulation (mean value 4.68) to be particularly effective. This highlights the importance of practical, hands-on learning environments and advanced technology tools in enhancing teaching practices.

Project-based learning, as applied in the workshop, contributed significantly to the understanding and integration of Magnetcode, with mean values of 4.68 for both software and hardware tools. The framework also enhanced educators' skills in computational thinking and coding, reflected in a mean value of 4.64. This underscores the framework's effectiveness in promoting critical STEM skills. The workshop using the oPSTi Framework significantly boosted educators' confidence in their teaching practices, with a mean value of 4.50, and increased their motivation to teach, with a mean value of 4.55. The willingness to recommend the workshop to peers (mean value 4.64) indicates a strong endorsement of the framework's benefits.

Conclusion

The study underscores the transformative impact of the oPSTi Framework on teaching and learning in Southeast Asia. The framework's emphasis on integrating pedagogy, learning spaces, and technology has proven to be highly effective in enhancing teaching practices, educator experiences, and confidence levels. The findings suggest that the oPSTi Framework's approach to self-determined learning, adult learning principles, and project-based learning is particularly beneficial in fostering a dynamic and effective teaching environment.

The Role Played by the Student-Centred Approach in the Acquisition and Development of 4Cs of 21st Century Skills Through a Project-Based STEM Curriculum

Vidujith Vithanage, Lincoln University College, Malaysia
Nicola Nakashima, St. George's Teacher Training Institute, Sri Lanka

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The study aims to investigate the role played by the student-centred approach to teaching and learning in the transfer and development of the 4Cs (creativity, critical thinking, collaboration and communication) of 21st-century skills via a project-based STEM curriculum. In a rapidly changing world with technological advancements, where most algorithmic functions are on the verge of automation, 4Cs have become pivotal for future career success. Thus, the schools, being institutions that prepare students for the future, should be able to equip them with the required skill set through the curriculum and instructional approaches used. Project-based learning and STEM learning are the two most popular strategies for cultivating 21st-century skills. There is substantial empirical evidence to support the positive impact project based STEM has on the 4Cs. It is equally important to understand the influence of the pedagogical approaches on the positive nurturing relationship between project-based STEM and the 4Cs of 21st century skills. The context for the current study is created at the middle school level in an international school in Colombo, Sri Lanka. The study used a mixed method research prerogative to explore the effects of the student-centred instructional approach on project-based STEM curriculum. The quantitative and qualitative data analysis converged on a student-centred instructional approach to significantly impact the acquisition and development of 4Cs through a project-based STEM curriculum, thus qualifying a student-centred pedagogical approach as a recommended instructional method for project-based STEM.

Introduction

STEM is a learning strategy that incorporates components of Science, Technology, Engineering, and Mathematics into the learning process. STEM education employs problem-solving-based learning by inadvertently including scientific study and the application of mathematics in the construction of technology as a problem-solving strategy (Johnson et al., 2016). Scientific inquiries are uncommon in technology education, while technological design is uncommon in scientific classes. However, in ordinary life, design and scientific research are frequently used in tandem as a technical solution to real-world challenges (Sanders, 2009). These aspects encompass the ability to inquire about scientific concepts and identify problems, devise and execute investigations, utilize mathematical skills, employ information and computer technology, apply computational thinking, and acquire, evaluate, and convey information (Afriana et al., 2016). Project- based learning is highly beneficial and provides strong support for students. One way to facilitate the implementation of habituation activities is by incorporating the STEM (Science, Technology, Engineering, and Mathematics) approach in the classroom. This involves assigning project tasks to learners, which can help them develop skills and knowledge in these areas (Anggraini & Huzaifah, 2017). The ability to think critically is essential for learners to effectively address the diverse challenges they encounter in today's world. By engaging in a systematic thinking process, individuals can develop the necessary skills to analyse and solve problems (Bhakti et al. 2018). Extensive research conducted comprehensively examined the impact of a student-centered learning method on the transfer of the 4Cs of 21st-century abilities (Critical Thinking, Communication, Collaboration, and Creativity) within a project-based STEM curriculum. The concept of student-centered learning places a strong emphasis on learner agency, which empowers students to actively participate in their educational experiences and assume responsibility for their own learning process.

4C’s and Student-Centred Learning

The implementation of a student-centered approach in education promotes the development of critical thinking skills through the encouragement of students to actively engage in questioning, analyzing information, and autonomously exploring potential solutions. The implementation of project-based STEM assignments requires students to engage in the critical evaluation of information sources and the use of analytical reasoning to address intricate challenges. This aligns with the cultivation of critical thinking abilities, as highlighted by Kwon and colleagues (2017). The implementation of student-centered learning methodologies facilitates the development of communication skills by means of interactive activities that necessitate students to express their thoughts, participate in peer dialogues, and provide presentations of their discoveries. In the context of project-based STEM education, it is imperative for students to engage in collaborative teamwork, which requires them to effectively communicate difficult technical concepts to their colleagues and stakeholders (Hmelo-Silver et al., 2007).

Collaboration serves as a fundamental principle in both student-centered learning and project-based STEM education. Collaborative tasks within project-based environments bear resemblance to real-world situations, as students engage in collective efforts to combine multiple viewpoints, navigate discrepancies, and jointly generate knowledge (Krajcik & Shin, 2008). Creativity is fostered within student- centered learning environments, as they provide opportunities for students to engage in critical thinking and explore novel methodologies. The integration of project-based STEM education enables students to develop innovative

solutions to real-world problems by granting them the independence to invent their own techniques while applying STEM principles (Häkkinen et al., 2017). Educators can enhance student engagement and facilitate deeper learning experiences by implementing a project-based STEM curriculum that prioritizes a student-centered approach. This method 34 capitalizes on students' innate motivation and interests, as highlighted by Prince and Felder (2006). This approach is in accordance with the 4Cs framework, since it promotes the development of critical thinking skills, effective communication abilities, meaningful collaboration, and the use of creative potential within a supportive and empowering educational setting.

There is evidence of a statistically significant beneficial relationship between the implementation of student-centered learning approaches and the enhancement of the 4Cs skills, namely Critical Thinking, Communication, Collaboration, and Creativity. Numerous studies have consistently shown that educational methodologies that prioritize student-centered learning, thereby granting learners agency and fostering active participation, are correlated with heightened critical thinking abilities (Prince & Felder, 2006), enhanced communication skills (Hmelo-Silver et al., 2007), more successful collaborative efforts (Johnson et al., 2016), and heightened levels of creativity (Häkkinen et al., 2017) among student populations. The aforementioned results collectively emphasize the beneficial impact of student-centered learning in promoting the development of the 4Cs skills, hence contributing to comprehensive and well-rounded educational achievements. The extant literature also provides evidence of a statistically significant association between student-centered learning and the acquisition of 4Cs skills (Critical Thinking, Communication, Collaboration, and Creativity) through the implementation of a project-based STEM curriculum. Research findings suggest that the implementation of student-centered methodologies in project-based STEM education facilitates the cultivation and utilization of the 4Cs skills, as supported by studies conducted by Hung and colleagues (2008) and Krajcik and Shin (2008). Learners actively participate in project-based activities where they work together to address authentic challenges, fostering the development of critical thinking, proficient communication, productive teamwork, and innovative problem-solving abilities (; (Bell, 2010; Shin & Kim, 2019). The incorporation of student-centered learning into the project-based framework fosters a mutually beneficial connection between both instructional methods, thereby augmenting the acquisition of 4Cs abilities and equipping students to tackle the problems of the 21st century.

Theoretical Framework

Integrating social constructivism, social cognitive theory, and digital connectivism provides a comprehensive theoretical foundation for investigating the role played by student-centred learning approaches in project-based STEM (Science, Technology, Engineering, and Mathematics) education. The theoretical framework of social constructivism, founded on the ideas of Vygotsky, emphasizes the importance of collaborative processes in building knowledge through interactions among peers and the development of common understanding. This perspective aligns well with the collaborative character of project-based STEM assignments and with the ideas such as agency and active engagement of students in the student-centred approaches. (Bell, 2010; Vygotsky, 1978). Bandura's social cognitive theory provides a valuable perspective that aligns with the aforementioned argument. It emphasizes the significance of learners' observation and imitation of their peers' activities within project-based STEM groups. This process enhances many cognitive abilities, including problem-solving, critical thinking, and communication skills (Bandura & Walters,

1963). Self-efficacy in Bandura's theory is closely linked with student-centred practices in learning. Digital connectivism is a concept that explores the influence of technology-mediated networks, with a particular focus on the significance of digital tools and online communities in project-based STEM learning. It highlights promoting cooperation and broadening access to various information sources (Siemens, 2004). In the digital space students get to exercise more autonomy and creates more opportunities for student agency. The synthesized framework presented in this study serves as a guiding framework for research in project-based STEM contexts. It emphasizes the importance of collaboration, observational learning, technological integration, and self-regulation in these contexts. By adopting a holistic perspective, this framework enables researchers to examine effective instructional strategies and outcomes comprehensively.

Present Study

Considering all the literature analyzed in the review above, it can be understood that room exists for a study to investigate the role played by student-centred learning approach in the acquisition and development of the 4Cs of 21st-century skills via a project-based STEM curriculum in the South Asian region at the middle secondary education level to establish statistical significance through the quantitative survey analysis and to further explore in depth any other interrelationships that exist through collection and analysis of qualitative data. Thus, the research gap can be identified as related to geography, which is the South Asian region (Sri Lanka), an academic level which is middle secondary school level (age 12 years to 14 years).

Method

The current study used a case study research model as it has only collected data from a single school in Sri Lanka and conducted a mixed methods study using a convergent parallel design. Researchers used both quantitative and qualitative measurements to analyse the degree and direction of influence student-centred learning has on project-based STEM. Statistical analyses, such as regression analysis, generated helpful information on the degree of link between variables (Hair Jr et al., 2019). Mixed methods allow the author to explore the research questions more comprehensively while drawing from the strengths of both quantitative and qualitative methods and also mitigating their weaknesses (Creswell & Plano, 2011).

When gathering quantitative data authors implemented the Morgan sample size calculator to calculate sample size from a population of 140 middle school students. The sampling strategy used for this study was stratified proportionate random sampling as the middle school student population at the international concerned has unequal gender distribution; thus, this sampling technique ensures that the random sample chosen is reflective of the real population. This method ensures that male and female students are fairly represented in the sample by segmenting the population into different strata based on gender (Fowler Jr., 2013). According to the Table 1, the study used a sample size of 103 students. Researchers can more accurately capture these variances using stratified proportionate random sampling, leading to a better understanding of the total student population (Creswell & Plano, 2012). As it prevents potential biases and guarantees that the research findings are fair and applicable to all gender groups, ensuring proportionate representation of genders in the sample is also crucial from an ethical standpoint (National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, 1979).

When selecting the sample for a focus group interviews, purposive sampling was thought to be the best strategy. With this approach, volunteers were specifically chosen based on traits, backgrounds, or areas of knowledge related to the study's subject. The depth and richness of the focus group talks were increased through purposeful sampling, providing deeper insights. Researchers can choose participants through purposive sampling if their characteristics closely match the goals and issues of the 72 study (Klassen et al., 2012). The focus group talks delivered focused and applicable insights by selecting participants with knowledge, experiences, or viewpoints that are relevant to the study. Focus group discussions aim to produce in-depth and complex insights (Patton, 2014). This strategy allowed diverse perspectives in the debate thus contribute to enhance the validity of the qualitative data (Onwuegbuzie & Leech, 2007). By streamlining the participant selection procedure, researchers collected data from resourceful participants who were knowledgeable about the subject matter. Selectively selecting participants who can offer distinctive insights that would not be easily obtained through other methods is made easier using purposive sampling (Dillman et al., 2014; Palinkas et al., 2015).

Survey questionnaire was developed using validated survey items from Project-based learning impact on 21st century skills survey by Hixson and colleagues (2012), items related to STEM learning from Engagement in Science Learning Activities version 3.2 by Masters (1982), and items feeding to 4Cs from 21st century skills survey developed by R. Kelley and colleagues (2019).

Procedure & Ethical Considerations

Participants were asked to complete the survey on paper; the survey consisted of 35 items on a 5-point Likert scale, where each participant was asked to select strongly agree, agree, undecide, disagree, and strongly disagree for each survey item presented. Cronbach's alpha for 4Cs overall was found to be 0.777, and for student-centred learning is 0.853 in the questionnaire, which is acceptable in terms of reliability. To abide by the ethical guidelines, written permission was obtained from the school authorities for data collection. Since participants were legally minors, consent was taken from their parents via a standard informed consent form, which aided in alleviating any concerns about deception or manipulation (Busher & James, 2012). Measures were taken to secure the anonymity and confidentiality of the participant data. Student identities were not collected, so researcher responses could not be linked to specific students (Lapan et al., 2012; Walker, 2017). A participant ID was generated using open-source software, enabling the author to remove the data gathered from a particular participant on request.

Credibility and Trustworthiness

To ensure the effectiveness and the high quality of the data gathered at focus group interviews the following measures were taken. The study objectives and the precise information sought through focus group interviews were explicitly outlined (Krueger & Casey, 2015). This helped to keep the talks focused and relevant. Participants with appropriate expertise or experience with the research issue were carefully chosen. This contributed to the variety and depth of the talks (Morgan, 2014). To successfully lead talks, promote participation, and manage group dynamics, skilled and experienced moderators were used (Barbour & Morgan, 2017). Prior to the session, participants were given detailed information regarding the focus group format and objectives helped to prepare the participants and contributed to a more informed discussion (Morgan, 2014). The focus group discussion was well structured to meet

the objectives, and the group size was at optimum 6 participants to allow more in-depth discussion (Morgan, 2014; Krueger & Casey, 2015).

Various procedures were employed to ensure the credibility and trustworthiness of qualitative data, specifically for data collected via focus group discussions (FGDs) utilizing purposive sampling. The utilization of multiple data sources and methodologies, as proposed by Denzin (1978), contributed to the credibility of the research. the practice of member checking, as advocated by Lincoln and Guba (1985), which entailed sharing research findings with participants to ensure the accuracy and validity of the results. The authors also engaged in reflexive journaling (Charmaz, 2006), which served to uphold transparency and allowed researchers to critically examine any biases. The adherence to qualitative research principles was observed through the establishment of consistency in data collecting (Gibbs, 2007), the incorporation of a theoretical framework to guide the research (Charmaz, 2006), and the deliberate selection of a diverse purposive sample. The implementation of these techniques together served to augment the credibility and reliability of qualitative findings.

The corresponding author was mindful of his background and experiences related to STEM curricula, activities, and views about student-centred learning may have introduced biases into the study. As a teacher by profession, the author strongly supported the idea of activity-based STEM learning to improve skills such as critical thinking, creativity, innovation, and teamwork, so there might been a larger room for subjectivity in collecting qualitative data as it is based on purposive sampling. To overcome, the authors incorporated reflexivity practices where a deliberate attempt was made to list out the authors' own views about the investigation and the variable in concern, then a careful thought process as to how those may have influenced the selection and interpretation of the qualitative data. Authors presented the findings to focus group participants following thematic analysis to verify whether the transcription of the analysis has omitted or distorted their ideas, over a genuine attempt to convey their original ideas. Since the study was a mixed method, the collection and integration of quantitative data aids in adding more objectivity and minimizing researcher bias. For this purpose, triangulation of quantitative and qualitative data was carried out.

Data Analysis

H_{01}	Student-centred learning practices have a significant positive impact on the development of the 4 Cs of 21st century skills in a learning context where project-based STEM activities are conducted

Data was subjected to a linear regression and correlational analysis to test the hypothesis. Regression analysis aided in quantifying the impact of STEM activities and controlling for confounding variables, offering predictive insights. Correlational analysis, on the other hand, explored the strength and direction of these relationships, providing initial insights and a simpler interpretation (Creswell et al., 2012). Together, these methods provide a robust approach to understanding the benefits of STEM activities on student development via the transfer of 4Cs of 21st century skills.

Following the coding and thematic analysis of focus group data, themes emerging from data was compared with survey items used for quantitative data collection, to identify the recurrence of themes, themes converging into variables measured, and points that stand apart (diverge), charts were used by the author to visualize these patterns. The author employed the themes derived from qualitative data to elucidate and provide context for the patterns noticed

in the quantitative results, thus yielding a more comprehensive and nuanced interpretation (Teddlie & Tashakkori, 2010). Furthermore, an additional approach was implemented in which a single dataset was utilized to corroborate or substantiate the conclusions drawn from the other dataset, hence augmenting the total credibility of the research (Creswell et al., 2012).

Findings

Regression Analysis

Table 1: Result of R Square Values

R	R Square	Adjusted R Square	Std. Error of the Estimate
.872[a]	.0.83	.870	9.479

Based on the R Square value of 0.83 is pivotal. It reveals that approximately 83% of the variance in 4C's skills can be explained by variations in student-centered learning activities. With a reasonable standard error estimated at 9.479, and an adjusted R square of 0.870 this analysis emphasizes the crucial role of student-centered learning activities in enhancing 4C's skills.

Table 2: Result of Regression Model

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	10975.83	1	10975.831	25.884	.000[b]
	Residual	41555.31	98	424.034		
	Total	52531.14	99			
a. Dependent Variable: skills (4C's)						
b. Predictors: (Constant), student-centered learning activities						

The ANOVA table clearly demonstrated the strong statistical significance of the regression model incorporating the predictor variable "student-centered learning activities" (F-statistic=25.884, $p<0.0005$). This indicated a substantial influence of "student-centered learning activities" on skills (4C's). The model accounted for a significant portion of the variability in skills (4C's), as indicated by the high R-squared value.

Table 3: Result of Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	68.838	5.667		12.147	.000
	Student-centered learning	.448	.088	.457	5.088	.000
a. Dependent Variable: 21st century skills (4C's)						

As per the results of table 3, the linear regression model assessed the relationship between student-centered learning and 21st Century skills (4C's) in a STEM and project-based learning environment. Results revealed a significant positive impact of student-centered learning on 21st Century skills. The constant (B=68.838) represents the expected 4C's score

when student-centered learning is zero. Student-centered learning (B=0.448) positively affected 4C's skills, with a standardized coefficient (Beta) of 0.457.

The t-statistic (5.088) was highly significant ($p<0.001$), confirming the substantial positive influence. This supports the objective that student-centered learning activities positively impact 21st Century skills in the specified learning environment.

Thematic Analysis

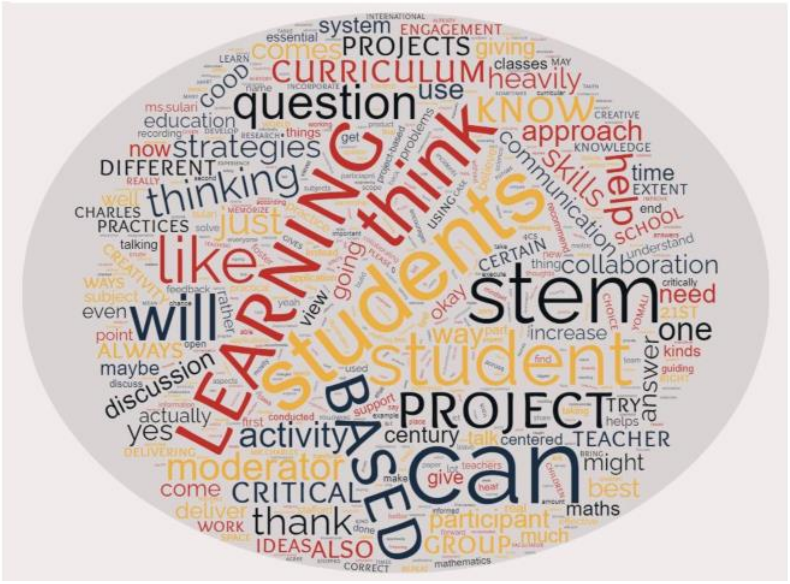

Figure 1: Word Frequency Chart from Teachers' Focus Group

The main themes emerged 4C's, project-based STEM learning and student-centred learning is in apparent agreement with the literature available. Among the sub themes catering to diverse learners relating to student-centred learning and purposeful learning process related to project-based STEM learning were noticeable. Figure 12 depicts the code references and Figure 13 illustrates the word frequencies of these results. Further, appendix 18 provides selected quotes for each theme identified.

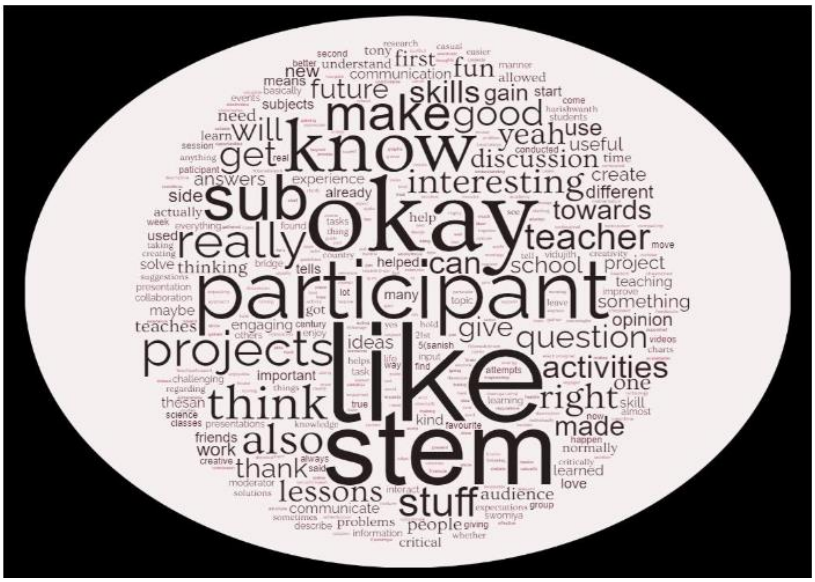

Figure 2: Word Frequency Chart from Students' Focus Group

The main themes emerged from students' focus group were 4C's, project-based STEM learning, and student-centred learning was in apparent agreement with the literature available. Among the sub themes learner satisfaction relating to student-centred learning and design and planning process related project-based STEM learning were noticeable. Figure 2 illustrates the word frequencies of these results.

4C's, project-based STEM learning and student-centred learning was found as sub themes in the survey questionnaire that was administered to gather quantitative data from the students. The word frequency chart is given in Figure 3.

Figure 3: Word Frequency Chart for the Survey Questionnaire

Qualitative findings could be further supported by the following extracts from the focus group interviews.

> Participant T2: "It encourages them to study the subject much more than when we compare it with a situation." "So, you apply those things where it is necessary, and it helps in, you know, Motivating the student and keeping."
>
> "So, we try as much as possible to bring the practical aspects of what we are learning into the subject. Uh, Maybe we can try to do it as a group activity."
>
> "We try to diversify a bit and try to implement different methods of approach to get the knowledge across."
>
> "It helps all kinds of students achieve their learning goals instead of just focusing on one type of student."
>
> Participant T2: "When it gives independent thinking skills for the students to stand on their ground, for their own opinion."
>
> Participant S6: "Come up with like problems and we'll have to, you know, think how to solve it. And sometimes we have events and stuff, which I think is really fun. And

also, I just think that A teaching is really good because it's like a more casual approach in my opinion."

Participant S4: "Give us examples of what we have to do. So he would show us, what he's expecting of us, and then he would point out what we can do to maybe improve and like go beyond his expectations and we would find it fun and we would normally meet his expectations."

Participant S1: "We are allowed to do anything. What we want or like related to STEM

Triangulation and Convergence

The qualitative findings of this study are in congruence with the existing body of research. As The findings propose integration of student-centered learning methodologies and project-based STEM education is mutually beneficial in fostering the development of the 4Cs, namely Critical Thinking, Creativity, Collaboration, and Communication. Student-centered learning, a pedagogical approach that prioritizes active participation, individualized exploration, and self-directed investigation (Means et al., 2014), aligns with project-based STEM education by positioning students as the focal point of their educational journey. The cultivation of autonomy in students fosters the development of critical thinking abilities, as they engage in the examination of problems, assess many potential solutions, and ultimately arrive at well-informed conclusions within the context of project-based learning (Partnership for 21st Century Skills, 2007). Moreover, the iterative and inquiry-based characteristics of student-centered learning are in perfect harmony with the problem-solving element of project-based STEM activities, creating a suitable atmosphere for the cultivation of innovative thinking and creativity.

project-based STEM education offers a tangible and contextualized platform for the utilization of information and skills obtained through student-centered learning. By engaging in practical assignments, students work together to address real-world STEM problems, so strengthening their abilities in collaboration and communication, as outlined by Bell (2010). The interaction between student-centered learning and project-based STEM approaches facilitates the acquisition of theoretical knowledge and its practical application through collaborative projects. This process enhances students' skills in effective communication and teamwork (Thomas, 2000). The integration of student-centered learning and project-based STEM education fosters a mutually beneficial learning environment that is congruent with the comprehensive development of the 4Cs, equipping students with the diverse set of skills necessary for achievement in the modern era.

Conclusion

A deeper exploration of the regression coefficients provides nuanced insights. The positive effect of student-centered learning on 4C's skills is quantified by a standardized coefficient (Beta) of 0.457, with the t-statistic's pronounced significance ($p < 0.001$) attesting to the substantive positive influence of these pedagogical approaches. These quantitative findings reinforce the assertion that student-centered learning activities are indispensable in positively shaping 21st Century skills within the designated project-based STEM learning environment. Qualitatively, participant testimonials further illuminate the positive impact of student-centered learning activities. Participants articulate how these pedagogical approaches foster

independent thinking, enhance motivation, sustain engagement, and facilitate the practical application of knowledge through collaborative group activities. The qualitative narratives resonate with the quantitative outcomes, spotlighting the multifaceted advantages of student-centered learning in championing a diverse array of skills. These findings advocate for a steadfast emphasis on student-centered pedagogies, urging educators to embrace and refine these practices as they constitute a linchpin for nurturing a versatile skill set essential for triumph in the ever-evolving landscape of STEM disciplines and beyond.

Avenues for Future Research

The implementation of longitudinal research would provide significant contributions in understanding the enduring effects of project-based STEM education and student-centered learning on the continuous enhancement of 21st Century skills. By conducting longitudinal studies on students, researchers would have the opportunity to study the progression of skill acquisition and retention over an extended period. This would contribute to a more comprehensive comprehension of the long-term impacts of different educational approaches. The examination of the impact of cultural and socioeconomic factors on the correlation between educational methods and the development of 21st Century abilities is a promising avenue for research. The examination of how various cultural contexts and socioeconomic backgrounds influence the ways in which students engage with project-based STEM activities and student-centered learning has the potential to enhance educational methods that are culturally sensitive and inclusive. Tailoring Instruction for Different Age Groups: Considering the observed disparities in age within the current study, it would be beneficial for future research to explore the customization of instructional methodologies to cater to distinct age groups. Examining the impact of students' developmental stages on their involvement in project-based STEM activities and student-centered learning would yield practical knowledge for educators to modify their methodologies to effectively cater to the varying requirements of students during different phases of adolescence.

Limitations of the Study

In collecting quantitative data, the research utilized a sample size of 104 individuals chosen by a random stratified proportionate sampling method. Even though this strategy improves representativeness, the sample size may still be insufficient to capture the variety of experiences that middle school students have had with project-based STEM learning. Because of this, it is possible that the findings cannot be properly generalized to a larger population of pupils. There is a concern regarding response bias in quantitative data, even though random stratified proportionate sampling was utilized. It is possible that participants will provide socially desirable responses, which will affect the correctness of the quantitative data. The environment of the study may have an effect on the degree to which the responses of the participants provide an accurate reflection of their experiences and attitudes.

When considering the qualitative data utilization of two focus groups, which were chosen through the process of purposive sampling, it might not completely encompass the many points of view that are present within the participant pool. There is a possibility that the qualitative findings will be impacted by the particular qualities of the individuals who participated in the focus group. This could potentially restrict the ability of qualitative insights to be transferred to a more general setting. Dynamics of Focus Groups Due to the nature of focus group talks, there is a possibility that social desirability bias or dominating voices within the group could be introduced, which could have an impact on the qualitative

data. The richness and authenticity of the qualitative findings may be impacted by the fact that some participants may be reluctant to share thoughts contrary to the group norms or may comply with the norms they perceive to be prevalent. The research was carried out in a particular middle school that is part of an international school in Sri Lanka because of the distinctive context of the school. It is possible that the findings cannot be generalized to other educational settings due to the specific characteristics of this particular school, which include its cultural and educational context. This is especially true for educational settings that have different curriculum frameworks or student demographics.

Acknowledgements

The authors wish to express their sincere gratitude to Mr. Simon Northcott for granting approval for data collection from students at his school. They also extend their appreciation to the parents for providing consent, to the participants for their active engagement, and to the moderators for conducting the focus group interviews in an effective and professional manner. This study did not receive any funding from the government, local educational authorities, or other organizations.

Envisioning Possible Post-PhD Careers Outside Academia: An Exploratory Study of Two Chinese Doctoral Graduates' Differentiated Experiences

Sangge Qi, University of Turku, Finland

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Amid heightened positional competition in the graduate labor market, doctoral graduates' progression into non-academic employment has become an emerging focus of concern. Drawing on the concept of possible selves, this exploratory study examines how doctoral graduates envisage and plan for their post-graduation careers outside academia in the context of China. The study presents the narratives of two PhD holders from the field of Social Sciences and graduated from universities of varying reputational statuses, both of whom had made the decision to enter non-academic employment during their doctoral journeys. The analysis demonstrates marked differences in the scope of graduates' envisioned future careers and their perceived abilities to realize them along the lines of privilege and disadvantage associated with institutional hierarchy, which in turn shaped their strategies of responding to the intensified job competition. In doing so, the paper sheds light on both the material and affective dimensions involved in graduates' construction and negotiation of envisioned future careers, and provide insights into how this is shaped by institutional hierarchy that enables or constrains the ways post-PhD career possibilities can be imagined. With that, this paper seeks to contribute to the broader discourse on doctoral employment and offers implications relating to post-PhD career planning.

Keywords: Doctoral Career, Non-academic Employment, Possible Selves, Institutional Reputation

Introduction

The increasing emphasis on the notion of knowledge-based economy in global policy discourses has led to a substantial rise in the number of PhDs awarded worldwide in recent decades (OECD, 2016). While the rates of doctoral expansion and labor market conditions vary across countries, in most national contexts, it is evident that a significant proportion of doctoral graduates are leaving academia to pursue non-academic careers upon completing their degrees. This shift aligns with political agenda that frames doctoral recipients as vital contributors to the knowledge economy, especially when employed outside academia. Within this vision, doctoral graduates are positioned as highly qualified human capital whose expertise facilitates knowledge transfer into further societal and economic development (Hancock, 2019).

The Chinese context shares this global outlook. Since the 1980s, the Chinese higher education (HE) system has expanded rapidly following a series of state-led initiatives, producing abundance of doctoral admission opportunities (Huang & Shen, 2019). In 2012, the number of Chinese doctoral graduates (i.e., 53,011) surpassed that of the United States (i.e., 50,977) for the first time, making China the world's largest PhD producer (Li, 2004). Thereafter, the Chinese doctoral population has continued to grow steadily. According to the latest national statistics, a total number of 87,126 doctorates graduated in 2023 from Chinese higher education institutions (HEIs), accounting for an approximate increase of 5.8% from the previous year (National Bureau of Statistics of China, 2024). In light of this doctoral expansion, the global phenomenon of doctoral graduates venturing into non-academic careers is also visible in China. While academia remains the preferred choice for many when first embarking on the doctoral journey, a gradual diversification in post-PhD career destinations has been noted. Increasingly, Chinese doctoral graduates are seeking employment in industry and business sectors, government agencies, and non-governmental organizations, etc. (Shen et al., 2018; Shen & Chen, 2018). As reported in the collective data published by a group of research-oriented Chinese universities, nearly 50% of their doctoral graduates are occupying non-research positions outside academia since 2018 (Chen, 2021).

However, crossing from the familiar academic environment to the dynamic non-academic settings is not always straightforward. Given the increasingly congested graduate job market which fails to keep pace with HE expansion and the excessive supply of highly skilled workers, doctoral graduates are likely to face an intensified job competition where they are placed within a hierarchy based on their relative desirability to employers (Brown et al., 2004). Despite it being a subject of growing relevance, research on doctoral graduates' experiences of navigating the complexities of the non-academic job market remains limited, including how these individuals envisage their possible careers and strategize for post-graduation job competition. Given China's rising prominence in the global doctoral education landscape, the Chinese experience is particularly salient that warrants a deeper exploration.

This paper intends to address the gap by presenting empirical findings derived from interviews with two female doctoral graduates from universities associated with differing reputational statuses in China. Using the concept of possible selves, the paper explores how these graduates envisaged and planned for their post-graduation careers, with a particular focus on examining the role of institutional reputation within this. The findings shed light on both the material and emotional dimensions involved in the construction and negotiation of

their envisioned career possibilities. In doing so, this paper provides insights into the interplay between institutional reputation and doctoral employment in the context of China.

Post-PhD Occupational Landscape Outside Academia

The progression from doctoral education into professional destinations takes place against the backdrop of an increasingly competitive labor market. While the empirical shift of doctoral graduates pursuing non-academic employment is widely recognized and highly encouraged, not all doctoral recipients are able to find opportunities that align with their career aspirations.

We were previously driven to believe that the value of academic credentials would continue to rise as the economy became more knowledge-intensive (Brown et al., 2011). Following this, doctoral graduates were assumed to be moved to the front of the labor market queue with an advantageous access to elite firms and more 'upper-hand' positions (i.e., professional and managerial roles) at the top of the occupational hierarchy. In reality, however, the global expansion of HE has led to more apparent credential inflation, meaning the value of academic credentials as a 'currency of opportunity' is declining (Brown & Souto-Otero, 2020). Similar to undergraduates and master's degree holders, doctoral graduates may also find themselves competing for limited high-status job opportunities that are now allocated based on how well they can demonstrate the exclusivity of their credentials and prove their relative worths.

In the meantime, the labor market competition is complicated by structural divisions, which further undermine the assumption that doctoral graduates are readily welcomed into non-academic sectors. It has been well established that rising participation in HE does not necessarily eliminate inequalities; rather, these disparities are reproduced in new forms (Marginson, 2016). In the Chinese context, the development of a high-participation HE system has been accompanied by an entrenched hierarchical structure that stratifies HEIs into different status groups with distinct reputational influences (Mok, 2016). This institutional hierarchy plays a significant role in differentiating graduate outcomes (e.g., Sheng, 2017).

Essentially, this suggests that doctoral graduates do not compete on a level playing field. The job market competition is therefore framed as a power struggle, where graduates are expected to leverage diverse resources – including their credentials granted by institutions of varying reputational statuses – to create a competitive edge over others. Within this competitive framework, some doctoral graduates may experience prolonged periods of searching and waiting than others (McAlpine & Amundsen, 2016). On top of that, they may also end up in positions offering considerably less than expected (Brown et al., 2004). These outcomes reflect more than just individual differences, but also structural conditions such as institutional hierarchy that perpetuates beyond HE settings to regulate recruitment preferences.

The Concept of Possible Selves

This paper adopts the concept of possible selves to examine how doctoral graduates envisage and plan for their post-graduation careers outside academia. While this concept is grounded in the broader framework of self-concept developed within the field of social psychology (Markus & Nurius, 1986), it has previously been applied in the context of HE to analyze how students' aspirations vary by class differences (e.g., Hardgrove et al., 2015; Harrison, 2018; Henderson et al., 2018; Jones et al., 2021). This thus makes it a useful lens for exploring how

doctoral graduates' perceptions of their possible careers varied along the lines of advantage and disadvantage created by the reputational status of their own universities, and how this shaped their strategies for post-graduation job competition.

According to Markus (1977, 1990), the self-concept is seen as a set of knowledge structures consisting of an individual's generalized assumptions and understanding about himself or herself. Possible selves represent the future form of one's self concept, capturing perceptions about a range of future-oriented visions of the self resulting from the construction of numerous imaginaries (Harrison, 2018; Henderson et al., 2018). As outlined by Markus and Nurius (1986, p. 954), "Possible selves are the ideal selves that we would very much like to become. They are also the selves we could become, and the selves we are afraid of becoming." This underlies the central notions of possible selves, that are, the ideal, probable, and feared selves. These notions define what individuals see as opportunities and constraints, and impact how they initiate and structure their actions to realize or avoid the future selves (Markus & Ruvolo, 1989). It is suggested that when possible selves are activated, it is accompanied by emotions tied to how individuals imagine themselves experiencing the future state (Markus & Nurius, 1986).

A key contribution of this concept lies in its exploration of the relationship between aspirations (or ideal self) and expectations (or probable self). These two dimensions are not necessarily the same, with expectations often tempering aspirations (Harrison & Waller, 2018). The role of elaboration is essential here, referring to how clearly individuals can articulate the imaginaries of their future selves and the steps they must take to realize them (Harrison & Waller, 2018; Jones et al., 2021). The fuller and more coherent these imaginaries are, the more they can be linked to specific strategies to achieve desired outcomes (Oyserman et al., 2002, 2006). The coherence points to the alignment of aspirations and expectations, or in other words, the ideal and probable selves. Such alignment is found to be particularly powerful in motivating individuals to connect present actions with future goals (Leondari, 2007).

Moreover, Markus and Nurius (1986, p. 954) have emphasized that the concept of possible selves also reflect the extent to which the self is socially determined or constrained. This suggests that structural contexts shape normative values and the resultant range of possible selves that can be envisioned. As such, the ability to construct a viable future trajectory is differentially distributed (Harrison, 2018; Papafilippou & Bathmaker, 2018).

Drawing on these insights, the main focus of this paper is to explore how institutional reputation enables or constrains the scope of doctoral graduates' envisioned possible post-graduation careers and the practices undertaken to facilitate the fulfillment of their imaginaries.

Method

The data presented in this paper are part of a larger research project investigating the early career trajectories of Chinese Social Science and Humanities (SSH) doctoral graduates beyond academia. The primary method of data collection involved semi-structured interviews conducted in Chinese Mandarin. The open-ended questions facilitated free-flowing discussions, allowing participants to share openly their experiences of and reflections on how they prepared for the process of seeking post-graduation employment. Questions followed a

pre-determined interview outline, focusing primarily on tracing participants' educational and professional trajectories.

The following section presents the narratives of two female SSH doctoral graduates. Their degree-granting universities are both located in Shanghai, but are associated with differing reputational statuses. The following table provides an overview of their backgrounds.

Table 1: Participant Profile

Pseudonym	Age	Institutional group	Field of study
Song	32	C9 League university	Gender Studies
Cai	31	Non-C9 League university	Cultural Studies

Song earned her doctoral degree from a university known as part of the C9 League in Chinese terms, which refers to an elite group of institutions with long-standing and nationwide reputations bolstered through supportive government policies and funding privileges. On the other hand, Cai graduated from a university outside of the C9 League, with a relatively limited scope of recognizability. Both graduates have made the decision to pursue non-academic careers during their doctoral studies. It is evident from their narratives that institutional reputation had played a significant role as they positioned themselves explicitly as advantaged or disadvantaged graduate job seekers attuned to the reputational status of their respective universities. This in turn influenced their perceptions of what was possible for them to be and achieve in the job market competition, and how to act upon those perceptions.

The use of data from only two interviews was intentionally designed, seeking to provide illustrative and in-depth cases that illuminate the interplay between institutional reputation, possible selves, and individual agency. This aligns with the objective of the paper, which is not to generalize findings, but to offer rich and contextualized insights into how doctoral graduates navigate the complexities of the post-graduation job competition.

Data analysis was guided by the concept of possible selves, focusing on identifying the two graduates' ideal, probable and feared selves. Upon close reading and re-reading of the interview transcripts, the analysis proceeded to uncover the influence of institutional reputation in shaping graduates' imaginaries of post-graduation careers. This involved examining how they revised, confirmed, and translated their envisaged selves into actionable strategies. In this paper, graduates' experiences are presented in reduced forms, accompanied by direct quotes.

Interview Findings

Song's Experience

Song graduated from a C9 League university in 2022, majoring in Gender Studies. She is now working in the area of corporate social responsibility at an IT firm based in Shanghai. She had initially planned to become a university lecturer, but later shifted to non-academic options because of her desire for higher earnings.

Despite her awareness of the supply-demand imbalance within the graduate job market, Song still sensed a wide range of employment opportunities available owing to her institutional affiliation. Coming from a well-regarded university, she believed that she enjoyed an advantageous basis in the job competition and greater chances of securing decent

employment upon graduation. This was articulated as a sense of confidence in the symbolic value of her credential, in which the ideal self was rooted:

> I had a strong faith in the value of my credential and thought it would differentiate me from others. It would help me find something, maybe not the top firms, but for sure it would lead me to a place that wouldn't be too bad.

Throughout her doctoral journey, Song focused wholeheartedly on academic duties and did not engage in additional CV-building activities. According to her, she sought to complete the doctoral degree on time without disruptions. With that, she has not considered alternative strategies for post-graduation job competition other than relying on the reputational value of her credential.

As she started sending out her CV for job applications in the final year of her doctoral studies, unanticipated outcomes were encountered, including constant rejections and unsatisfactory offers which were not aligned with her aspiration. A significant disconnect between what she aspired to achieve (i.e., the ideal self) and what the actual opportunities or realities were (i.e., the probable self) was realized. She reflected, "I thought this would be easy, but now I was told that I was falling short."

At that point, her feared self included more than just prolonged periods of searching and waiting, but also a potential risk of becoming unemployed. As a doctoral graduate from a highly prestigious university, she described this scenario as "getting a slap on the face". This thus reflected her fear of social stigma relating to perceived job market failure. This urged her to develop "some immediate measures in place, to get out of this situation and get back on track". In other words, the need for action emerged as a form of coping strategy to avoid the feared self.

Following the advice of her doctoral supervisors, Song participated in an internship at a start-up company. Although the status of the firm conflicted with her initial aspiration, she explained, "It wasn't the time to be picky … ultimately it was about gaining experience". She was assigned with heavy responsibilities that demanded full commitment and ability to work across several departments. Towards the end of the internship, Song gained clarity about what she could bring to the table and modified her job applications accordingly. In this way, the internship allowed her to recalibrate her aspiration into more attainable goals, aligning her ideal and probable selves to facilitate more targeted job applications.

Cai's Experience

Cai completed her doctoral degree in Cultural Studies earlier this year, and currently works as a social media and community specialist at a leading high-tech company in Shanghai. With the recommendation of her master's degree supervisor, she pursued her doctorate in the same university where she had completed her previous degrees. Although she insisted that her university is a "good one", she also acknowledged that "it's not as prestigious as those top institutions with nationwide reputations". It was explained as such that those outside of Shanghai might not be familiar with her university.

Despite her initial intention to stay within academia upon graduation, the prevailing emphasis on publishing across Chinese HEIs created uncertainty with respect to her academic career prospects. She shared, "the pressure to publish more papers made me anxious about my

future in academia, I wondered if these academic posts were actually stable." After careful consideration, Cai decided to explore the non-academic options.

She was aware that the regionally-confined reputational influence of her university might pose as a constraint in post-graduation job search, making her less competitive in comparison to other graduate job seekers from more prestigious universities:

> My university doesn't have the same nationwide reputation as those top universities, so employers might not see candidates like me as their first choice. I wasn't sure how my credential would be perceived, especially by those based outside of Shanghai. I was worried that it might be less valued, and I might have to focus on finding jobs within Shanghai.

The above comment revealed her feared self, characterized by a sense of insecurity regarding the potential devaluation of her credential when applied beyond the immediate regional boundary, and anxiety linked to perceivably limited chances of success in competing against peers from more prestigious universities. Her sense of what was possible to be and act upon appeared rather restricted, with the expected career options being concentrated within Shanghai where her institutional affiliation might be more appreciated:

> I definitely wanted to join those leading firms, but I must be realistic. I must bring something else to the table, something more than my credential in order to make this happen. Otherwise, I could only expect local employment opportunities because here, employers know my university.

Cai viewed internships as an effective means of acquiring additional forms of distinction. She completed two internships during her doctoral journey. As she was not committed to any specific industry and occupational role, these internships allowed her to develop a more focused career orientation by identifying the business sectors and the kind of roles that she was interested in. By the time she was involved in post-graduation job search, Cai was already able to envisage a more specific and viable career self. With the additional experiences, skills, and industry exposure gained from the internships, Cai felt more prepared to compete in the graduate job market.

Conclusion

This paper provided a preliminary exploration of how doctoral graduates from universities associated with differing reputational statuses envisaged their post-PhD careers and planned for their subsequent movements. Through the conceptual lens of possible selves, the findings reveal how the scope and nature of the two graduates' envisioned career possibilities were shaped by how they perceived and internalized the structural advantage or limitation imposed by the reputational status of their own universities. Song, graduated from a distinctively prestigious C9 League university, perceived the long-standing and nationwide reputation of her university as a significant advantage that created favorable chances of succeeding in the job competition. On the flip side, Cai viewed her affiliation with a non-C9 League institution as a constraint that exposed her to the potential risk of having to narrow down the scope of her job search within the regional confine. Essentially, the internalized hierarchical differences in institutional reputations produced a subjective sense of how they were positioned within the labor market queue and their relative desirability to potential employers. This subjective positioning shaped not only the ways in which their possible careers were

framed, but also informed the kind of practices to be adopted to prepare for post-graduation competition.

In this paper, the role of feared self stemmed as a key motivational force. For Song, the fear of social stigma concerning job market failure prompted her to adjust her aspirations and take pragmatic steps to develop more attainable goals. Similarly, Cai, driven by her fear of a limited range of employment opportunities, subscribed to internships to progressively build her profile and enhance her chances of achieving the pre-determined aspirations. Both cases resonate with Markus and Nurius' (1986) proposition that feared self can drive concrete and targeted strategies to bridge the gap between desired and real-world outcomes, thereby aligning the ideal and probable selves and at the same time avoiding the feared ones.

In fact, the two graduates' interpretations of their relative chances of success in the labor market competition appeared to be underpinned by distinct emotions. Song exhibited a sense of confidence in articulating her ideal self, reflecting the internalized advantage conferred by the distinctively prestigious status of her university. In contrast, Cai's narrative revealed her anxiety associated with her perceived disadvantage in competing against peers from more prestigious institutions. The emotional undertones noted here underscore Reay's (2005) notion of 'psychic landscape of class', wherein structural inequalities are not only lived but also deeply felt.

While this paper contributes to the broader discussion on doctoral employment outside academia, the findings presented here are drawn from a small sample that limits their applicability to the larger doctoral population. Future research can build upon this, incorporating larger and more diverse samples to explore patterns across different disciplines, geographical regions, and cultural contexts, etc. The use of longitudinal methods can also provide a more nuanced understanding of how doctoral graduates' perceptions and strategies evolve over time in response to shifting labor market conditions and policies. Furthermore, the emotional dimensions identified in this paper in shaping how doctoral graduates envision their future selves and possible careers present an important avenue for further exploration. Integrating psycho-social theories with structural analyses can offer a more comprehensive perspective on the interplay between individual agency and structural divisions in individual career trajectories.

Official Conference Proceedings

Abstract
This study examines how sustainability influences Generation Z's choices in study abroad programs, including Student Exchange, Work and Study, and Language Immersion Programs. Using Multi-Criteria Decision Analysis (MCDA) and the Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS), researchers evaluated factors like program duration, specialization, cost, financial aid, research opportunities, and quality. The Theory of Planned Behavior (TPB) was applied to understand how these sustainability factors affect decisions. Structural Equation Modeling (SEM) revealed relationships among ten variables, including Perceived Benefits (PB), Perceived Cost (PC), Perceived Risk (PR), Perceived Trust (PT), Attitude (A), Subjective Norms (SN), Perceived Behavioral Control (PBC), Awareness of Service (AOS), Intention (IN), and Behavior (B). An artificial neural network (ANN) enhanced the accuracy of identifying key sustainability factors. Data from 320 respondents via 60 surveys indicated that sustainability significantly influences study abroad decisions, with Perceived Behavioral Control (PBC) having the strongest impact, followed by intention and attitude. Perceived Benefits (PB), Perceived Risk (PR), Perceived Trust (PT), and Awareness of Service (AOS) were crucial in shaping intentions. Subjective Norms (SN) indirectly influenced decisions. Student Exchange Programs were the preferred choice due to perceived sustainability benefits. This study provides insights for educational institutions and policymakers better to align programs with Gen Z's sustainability goals.

www.iafor.org

Introduction

The international workforce demands globally proficient individuals (G20, 2011). Abroad programs are one of the various steps that aid students in developing their expertise in the global field (Pruitt, 2021). It has been shown that there has been a significant advancement in the number of students opting to study internationally over the past three decades (Granato et al., 2024). Relevant research has been focusing on elements that influence their decision-making process and shape their engagement in abroad programs to enhance experiences, thus improving the rate of students' participation (Cebolla-Boado et al., 2018). For instance, a study by Wang and Crawford (2020) that focuses on the decision-making process of Chinese students who study abroad illustrated that male students from a lower socioeconomic background were more interested in selecting their destination based on what benefits it would offer in terms of their socioeconomic status. In contrast, younger students rely more likely on subjective recommendations of their circle (Wang & Crawford, 2020). In other studies, factors that impact students' intention to study abroad are immigration opportunities (King & Sondhi, 2017) research opportunities (Delicado, 2010; Ahmad et al., 2010), and their overall experience abroad (Delicado, 2010). Furthermore, status and career upgrades also significantly affect their decisions in international studies (Ahmad et al., 2010). Previous studies, which were cited in a study by Li et al., illustrated that South Korean students opted for master's or doctoral degrees offered by American elite universities for them to have a global competitive edge and cultural capital, Hongkong students going abroad to study to enhance their advances in the labor market, and Chinese students find that gaining learning experience from international universities are perceived as a motivator towards their future careers' success (L. Li et al., 2021). Hence, several institutions have enhanced their program plans abroad and expanded their programs by offering scholarships, focusing on their marketing strategies to increase the higher education students' participation rate (Pruitt, 2021). However, as time evolves, the context of factors that shape their decisions may have significantly changed. This calls for ongoing research to adapt and provide relevant research, ensuring educational institutions and policymakers can accurately design and plan their academic programs (Cheng & Agyeiwaah, 2022).

The Filipino student market for international education is one of the largest and fastest growing in Southeast Asia, driven mainly by students seeking postgraduate degrees. With around 49,000 Filipino students currently studying abroad, this market is expected to grow by 13% annually over the next five years (Tolentino, 2023) China has emerged as a critical partner, actively fostering educational ties with the Philippines over the past two decades. China supports Filipino students to study in the country and facilitates their return to continue their education, reflecting a solid commitment to enhancing cooperation in the educational sector between the two nations. According to Jose Miguel Habana, country director of IDP Philippines, the number of Filipino students studying abroad is expected to grow by 8-10% annually in the coming years due to increasing interest in overseas learning and the perception that it provides opportunities to find work and potentially migrate to more developed countries after completing their education. Many Filipino students are also drawn by the higher quality of education in destination countries and the availability of specific courses that may not be offered in the Philippines (Delaney, 2019). This study aims to determine the factors influencing Filipino students' decisions to study abroad.

The study addresses gaps in the existing literature on Generation Z's decision-making regarding study abroad, specifically in choosing between private and public state universities and colleges (SUCs). While some studies have explored factors such as students' ability,

student development, academic engagement, community/civic engagement (Stebleton et al., 2013). political standpoint and worldview (Siddiqui, K., 2013), personal experiences, social experiences, and educational experiences (Pruitt, 2021). influencing study abroad decisions among a broader participant pool, the researchers recognized the limited focus on Gen Z students. This study thus narrows its scope to investigate the unique decision-making processes of Generation Z in international education. Incorporating the Theory of Planned Behavior (TPB) with additional variables such as perceived cost, perceived risk, perceived benefits, and perceived trust distinguishes this research from previous works. By utilizing multi-criteria decision analysis (MCDA), structural equation modeling (SEM), and artificial neural networks (ANN), the study aspires to provide a more comprehensive understanding of the intricate factors shaping the study abroad decisions of Generation Z students, shedding light on the distinctions between private and public SUCs in this decision-making process.

This study aims to underscore the factors shaping Generation Z's decision-making process in selecting abroad programs among students from private and public state universities and colleges (SUCs). Multi-criteria decision Analysis (MCDA) seeks to determine the criterion that affects the perceived overall quality of programs abroad: The Student Exchange Program, Work and Study Program, and Language Immersion Program. In addition, this study will also explore various variables to understand their role in shaping and influencing the behavior of Gen Z in international studies. Through SEM-ANN, this will shed light on the most critical factors that affect their decision to study. Thus, this study mainly intends to explore and develop insights into how private and public SUCs can entice and improve to make Gen Z students commit to a particular institution. In addition, this also aims to provide relevant research on the decision-making process of Generation Z students that will aid in the planning of abroad programs at various institutions.

The outcomes of this research not only enhance our comprehension of the preferences of Generation Z but also carry practical implications for educational institutions and policymakers. These findings can guide them in customizing study abroad programs to better align with the needs of this generation, fostering more enriching international learning experiences. Furthermore, the study provides a strategic approach for private and public state universities and colleges to boost their competitiveness and attract Generation Z students to participate in overseas education. By assisting educational institutions in refining their programs and services to align with the preferences of Generation Z students, this research aims to contribute valuable insights. The study offers practical recommendations to address the identified research gap and build upon related studies.

Methodology

Participants

Studies incorporating Structural Equation Modeling (SEM) with ten to fifteen variables require a population size of at least 200 (Siddiqui, 2013; Jou et. al. 2022). The 60-component questionnaires were sent to 320 participants from the Net Generation, or Gen Z, via an online platform and face-to-face survey. In addition, the current study applied stratified random sampling, where the researchers divided the sample size of students from public and private state universities and colleges residing in Occidental Mindoro.

Structural Equation Modeling

Structural Equation Modeling (SEM) is a method that uses statistics to analyze the correlation of several variables presented (Hair, 2010; Ouyang et al., 2018; Li et al., 2020; Ong et al., 2023). Thus, SEM is often preferred to implement because it can model observed and latent constructs in a single framework (Kline, 2015; Ang & Lau, 2024). SEM will analyze multiple variables, namely Perceived cost, Perceived risk, Attitude, Perceived benefits, Perceived behavioral control, Subjective norms, Intention, Awareness of service, Perceived trust, and Behavior. In this study, SEM tested ten latent variables, such as Perceived Benefits (PB), Perceived Cost (PC), Perceived Risk (PR), Perceived Trust (PT), Attitude (A), Subjective Norms (SN), Perceived Behavioral Control (PBC), Awareness of Service (AOS), Intention (IN), and Behavior (B). The IBM SPSS AMOS software version 26 was used to analyze the initial to final SEM model data. Moreover, the software was also used to see the model reliability through the Cronbach alpha, estimates, and the Goodness of Fit.

Artificial Neural Network

Artificial neural networks (ANNs) are adept at addressing complex, uncertain, nonlinear, multifaceted, and stochastic problems. The structure of an ANN, as described in the Principles of Artificial Neural Networks (3rd Edition), meticulously specifies the layers, activation functions, and neuron arrangements. Various studies, such as those conducted by (Saritaş & Yaşar, 2019) have explored using ANNs for understanding and predicting global human behavior. Assessing the performance of an ANN model requires a careful selection of evaluation metrics and validation techniques to comprehensively measure its efficacy. In the present study, recognizing the limitations of linear methods like Structural Equation Modeling (SEM), the researchers opted for ANNs implemented through SPSS (Fan et al., 2016). They initiated an optimization process to identify the optimal activation functions, node quantities, optimizer, and training/testing ratios, facilitating a detailed analysis that captures nonlinear relationships within the dataset.

Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS)

The Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) was introduced in the 1980s as one of the approaches that can be used as a multi-criteria decision analysis approach (Hwang & Yoon, 1981). TOPSIS can identify the most preferred alternative by a specific population based on the distances from given alternatives and the ideal solution (Madanchian & Taherdoost, 2023). In this study, several criteria are incorporated: program duration, specialization, perceived cost, financial support, research opportunities, and program quality. Programs such as the Student Exchange Program, Work and Study Program, and Language Immersion Program are the following alternatives integrated in this study, based on the Gen Z's from public and private SUCs.

Results and Discussion

SEM-ANN Results

Figure 1 presents the ANN model considered in this study. It shows that the variables are interconnected to each other, which is similar to the SEM results with a p-value of >0.05, which shows PC, PR, PT, PB, A, SN, PBC, AOS, and IN were considered the input nodes for the ANN which represents the correlation to behavior. The final result of the ANN model

shows that the most critical factor is PBC, followed by IU, A, SN, PT, PB, PR, AOS, and PC. However, despite yielding comparable outcomes, the study highlights the significant influence of the indirect effect of SEM on its results, underscoring its importance alongside ANN (Blunch, 2013; Onyelowe et al., 2023; Praveen et al., 2020). Hence, the importance of the independent variable is showcased in Figure 4 confirming the consistency of results between both models. This underscores the significance of the finding, as validated by the hybrid SEM-ANN approach.

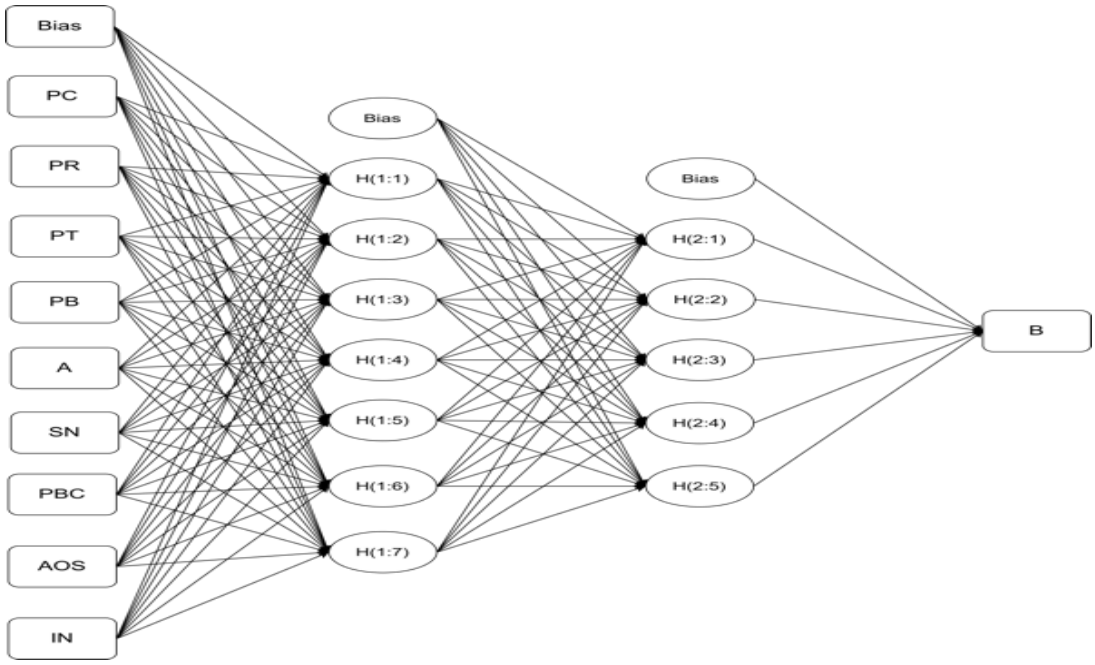

Figure 1: Artificial Neural Network Model

TOPSIS Result

The Technique for Order Preference by Similarity to an Ideal Solution (TOPSIS) is a well-known multiple criteria decision analysis method. Its function is to identify the best alternative that is nearest to the positive ideal solution and farthest from the negative ideal solution. TOPSIS is integrated to explore the generation's decision-making regarding studying abroad of the three educational program alternatives based on public and private school preferences. The three alternatives evaluated are the Student Exchange Program, the Work and Study Program, and the Language Immersion Program. Result shows that in Public and Private, the most preferred alternative is Student Exchange Program, while the least is Language Immersion Program.

Conclusion

This comprehensive study investigated the factors shaping Generation Z students' decision-making process regarding study abroad program selection at both private and public state universities and colleges (SUCs) in Occidental Mindoro. By integrating a multi-pronged approach encompassing Structural Equation Modeling (SEM), Artificial Neural Networks (ANN), and Technique for Order Preference by Similarity to Ideal Solution (TOPSIS), the research offers valuable insights into the unique priorities and decision-making patterns of this emerging student cohort.

This study revealed that perceived benefits significantly impact intention, followed by perceived risk, trust, and service awareness. Moreover, subjective norms don't significantly impact the intention, which contrasts with other literature studies. The ANN models further validated the SEM results, identifying perceived behavioral control as the most influential predictor, followed by intention to use, and attitude. The TOPSIS analysis provided a ranking of the three study abroad program alternatives - student exchange, work and study, and language immersion - based on factors such as program duration, specialization, perceived cost, financial support, research opportunities, and program quality. The study abroad program's ranking shows that the language immersion pro-gram has the lowest ranking, and the student exchange program is the highest. This holistic assessment offers valuable insights for educational institutions to optimize their international education portfolios.

These multifaceted findings carry significant practical implications. By under-standing the nuanced priorities and decision drivers of Generation Z, universities can tailor their study abroad programs to better align with the needs and expectations of this critical student segment. This, in turn, can help boost participation rates in international education and foster more enriching global learning experiences. Moreover, the strategic framework developed in this research provides a roadmap for both private and public SUCs to enhance their competitiveness in attracting Generation Z students to engage in overseas studies.

Overall, this study contributes to the evolving literature on study abroad decision-making, offering a comprehensive perspective on the factors shaping the international education choices of the next generation of students. The integration of SEM, ANN, and TOPSIS techniques provides a robust and holistic analytical approach that can be replicated in future research to yield valuable insights for educational institutions and policymakers alike.

Research on the Key Success Factors of Literacy-Oriented Courses Using DANP Method

Chia Wei Wang, National Taiwan Normal University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
To align with international trends emphasizing Literacy-Oriented teaching, Taiwan's educational authorities officially implemented a new curriculum in 2019. These guidelines are based on the core principles of "autonomy," "interaction," and "common good." They emphasize three dimensions: "autonomous action," "interactive communication," and "social participation," along with nine specific core competencies that integrate knowledge, skills, and attitudes in learning. To examine the difficulties and challenges schools have encountered in implementing Literacy-Oriented instruction since the new curriculum was introduced over four years ago, this study focuses on seed teachers in the national professional communities of technical high school educators. By reviewing literature, we developed a prototype framework of key success factors. After refining this framework using the Delphi method, eight experts were invited to evaluate the influence weights of different factors. We combined the Decision-Making Trial and Evaluation Laboratory (DEMATEL) method with the Analytic Network Process (ANP) to explore the key success dimensions and criteria for Literacy-Oriented teaching. The study identified four major dimensions: "philosophical alignment," "teacher empowerment," "administrative support," and "evaluation and feedback." According to the DEMATEL causal diagram and ANP network, the "philosophical alignment" dimension is central and has a direct impact on other dimensions. The second most influential dimension, "teacher empowerment," also affects "administrative support." Moreover, the elements within the "philosophical alignment" and "teacher empowerment" dimensions exhibit internal influences. The findings of this study can serve as a reference and provide suggestions for future interdisciplinary curriculum development in Literacy-Oriented education in technical high schools.

Introduction

To align with international trends emphasizing Literacy-Oriented teaching, Taiwan's educational authorities officially implemented a new curriculum in 2019. High schools have since faced significant curriculum reforms, including offering diverse elective courses and flexible learning time to provide students with opportunities for varied and adaptive exploration.

However, the practice of Literacy-Oriented teaching poses significant challenges for most teachers in the field. More than four years since the new curriculum's introduction, the implementation of Literacy-Oriented teaching remains far from meeting policy expectations. Schools face numerous difficulties, particularly technical high schools, which tend to adhere to a skill-based approach. Many vocational subject teachers exhibit resistance to competency-based teaching, often characterized by reluctance to understand or adapt their teaching methods, resulting in limited implementation effectiveness.

Promoting Literacy-Oriented teaching requires the establishment of interdisciplinary teacher communities and the infusion of various resources. These include teachers' in-depth understanding of Literacy-Oriented instruction, curriculum leadership from principals and academic directors, and administrative support and resources. For technical high schools, it is essential to break the barriers of subject-specific skill-based teaching to advance interdisciplinary Literacy-Oriented curricula. Additionally, the distinct groups within technical high schools bring unique cultures and challenges.

To realize the concept of Literacy-Oriented teaching, this study employs multi-criteria decision-making analysis—specifically the Decision-Making Trial and Evaluation Laboratory (DEMATEL) method to identify interdependencies among key success dimensions and the Analytic Network Process (ANP) to determine the weights of evaluation criteria. These serve as considerations for advancing Literacy-Oriented teaching initiatives.

Literacy-Oriented Teaching

The primary research on the development of core literacies by international organizations focuses on the "United Nations Educational, Scientific and Cultural Organization" (UNESCO, 2003), which identified five dimensions and twenty-one specific elements of core literacies; the "Organization for Economic Cooperation and Development" (OECD, 2005) with its DeSeCo framework comprising three dimensions and nine specific elements; and the "European Union" (EC, 2005), which outlined eight dimensions and seven specific elements of core literacies.

The Ministry of Education in Taiwan adopts an integrative perspective from the EU and OECD, defining "literacy" as the indispensable knowledge, skills, and attitudes required by individuals for sound development and to meet the needs of various life contexts (Tsai & Chen, 2013). The concept of core literacies has increasingly gained the attention of scholars, many of whom emphasize the necessity of designing curriculum based on core literacies to address the challenges of an ever-changing social environment.

Literacy-oriented curriculum design and the transformation principles of teaching materials stress the importance of holistic learning, avoiding an exclusive focus on knowledge. It emphasizes a balanced integration of knowledge, skills, and attitudes, fostering meaningful

learning through contextual and situational approaches. Lin Yong-Feng (2017) highlights the need to combine learning content with inquiry processes through curriculum planning and instructional design, enabling students to develop self-directed learning skills. Greater student participation and proactive learning contribute to the cultivation of more effective cognitive and affective dimensions of literacies. Through hands-on learning and reflective practices in real-life contexts, students achieve skill transfer, comprehensive expression, and continuous improvement (Lin, 2017).

Therefore, the implementation of curriculum concepts should not merely stop at policy announcements or the publication of curriculum guidelines. The key lies in how these ideas are practically applied in teaching environments (Lin, 2021).

Decision-Making Trial and Evaluation Laboratory-Based Analytic Network Process (DANP)

DANP combines the DEMATEL (Decision-Making Trial and Evaluation Laboratory) and ANP (Analytic Network Process) methods. It is commonly used to address interdependencies and feedback issues in multi-criteria decision-making by analyzing the mutual influences among dimensions and criteria, ultimately deriving weights and priorities.

DEMATEL (Decision-Making Trial and Evaluation Laboratory)

The Decision Making and Trial Evaluation Laboratory (DEMATEL) is a method developed by the Battelle Memorial Institute of Geneva between 1972 and 1976 as part of the Science and Human Affairs Program. This method is designed to solve complex and intertwined problems. DEMATEL enhances understanding of specific issues, organizes interrelated problems into groups, and provides a hierarchical structure to identify feasible solutions (Tzeng et al., 2007). The key feature of DEMATEL lies in its ability to illustrate the interrelationships among dimensions or clusters and to identify the core criteria that represent these dimensions or elements effectively. (Hori & Shimizu, 1999; Chiu et al., 2006; Liou et al., 2007; Wu & Lee, 2007; Wu et al., 2009).

ANP (Analytic Network Process)

The Analytic Network Process (ANP) theory and application were proposed by Saaty (1996) as an extension of the Analytic Hierarchy Process (AHP). ANP is designed to address decision-making problems where elements exhibit dependence and feedback. Thus, the ANP can be described as a mathematical theory capable of systematically handling problems involving interdependence and feedback. In addition, the hierarchical structure of AHP is linear, whereas ANP adopts a non-linear network structure (Deng, 2005). The ANP analysis method incorporates interdependence and feedback, using a supermatrix to calculate weights. While the AHP framework represents problems with unidirectional hierarchical relationships, ANP allows for more complex interrelationships within and between levels or elements.

Research Framework

This study is based on the research framework proposed by various scholars on the key factors of competency-based teachers, synthesizing literature. A group of eight teachers from national technical high schools, all of whom are current or former first-level administrative leaders and have participated as guiding teachers in competency-based teaching professional

communities, was selected as the expert panel. The study integrates key factors identified by scholars for promoting competency-based teaching in schools. A first-round Delphi expert questionnaire was conducted, and the framework was adjusted based on expert opinions. The following month, a second round of expert interviews was held to further refine the framework. This was done to understand the difficulties and challenges faced by schools in implementing competency-based teaching, while also gathering further insights from experts. After two rounds of expert interviews and revisions, a final research framework was established, which includes four dimensions and twelve criteria. The formal evaluation levels and definitions were then compiled.

DEMATEL Result Analysis

This study evaluates the interrelationships between the four dimensions of competency-based teaching success factors: Conceptual Alignment, Teacher Empowerment, Administrative Support, and Assessment and Feedback. The aim is to establish an ANP evaluation framework. Therefore, the DEMATEL method was used to clarify the causal relationships between these dimensions and measure the degree of influence of each criterion. The results are analyzed as follows:

Establishing the Direct Relationship Matrix

In this study, the geometric mean of the responses from 8 expert questionnaires was calculated to derive the direct relationship geometric mean matrix A (as shown in Table 11). From the direct relationship matrix, it can be seen that the degree of influence between the Conceptual Alignment dimension and the Teacher Empowerment dimension is extremely high (above 4). The degree of influence between the Administrative Support dimension and the Assessment and Feedback dimension is high (above 3.5).

Table 1: Direct Relationship Matrix

	Philosophical	Administrative	Teacher Professional	Assessment
Philosophical	5	4.63	4.13	3.75
Administrative	4	5	3.75	3.75
Teacher Professional	3.63	3.63	5	3.5
Assessment	3.5	3.5	3.75	5

Standardized Direct Relationship Matrix

By calculating the sum of the values in each row and each column of the matrix, we can determine the total sum for each row and column. The maximum total sum is 17.5. By dividing the values in the matrix by the maximum total sum of 17.5, we can obtain the normalized D matrix.

Table 2: Standardized Direct Relationship Matrix

	Philosophical	Administrative	Teacher Professional	Assessment
Philosophical	0.29	0.26	0.24	0.21
Administrative	0.23	0.29	0.21	0.21
Teacher Professional	0.21	0.21	0.29	0.2
Assessment	0.2	0.2	0.21	0.29

Establish the Total Relationship Matrix

To establish the Total Relationship Matrix (T), we use the following formula:

$$T = \frac{D}{I - D}$$

Next, based on the values of the Total Relationship Matrix (T), calculate the sum of each row and column to obtain the row sum (R) and column sum (C). Then, using the row sum (R) and column sum (C), calculate the sum (R + C) and the difference (R - C) for each row and column, as shown in Table 3.

Table 3: The Total Relationship Matrix

	Philosophical	Administrative	Teacher Professional	Assessment	R	C	(R+C)	(R-C)
Philosophical	4.0377	4.1347	4.0671	3.8586	16.09	14.90	31.00	1.19
Administrative	3.7399	3.9231	3.7943	3.6311	15.08	15.41	30.50	-0.32
Teacher Professional	3.5920	3.7066	3.7535	3.4977	14.54	15.23	29.78	-0.68
Assessment	3.5350	3.6478	3.6205	3.5528	14.35	14.54	28.89	-0.18

Set Threshold Values and Draw Causal Diagram

In order to identify the significant influence relationships among the clustered dimensions, the geometric mean calculated was 3.755. Based on Table 14 and expert decision results, the threshold value \(\alpha=3.75 \) was set for the Total Relationship Matrix (T). If the values in matrix T exceed \(\alpha \), it indicates a stronger mutual influence and are retained. If the values are below \(\alpha \), indicating weaker relationships, they are removed and set to 0. Therefore, the Total Relationship Matrix T remains unchanged. Using the (R+C) values and (R-C) values from Table 14, with (R+C) as the X-axis and (R-C) as the Y-axis, a causal relationship diagram of the main dimensions and subdimensions is then drawn (as shown in Figure 1).

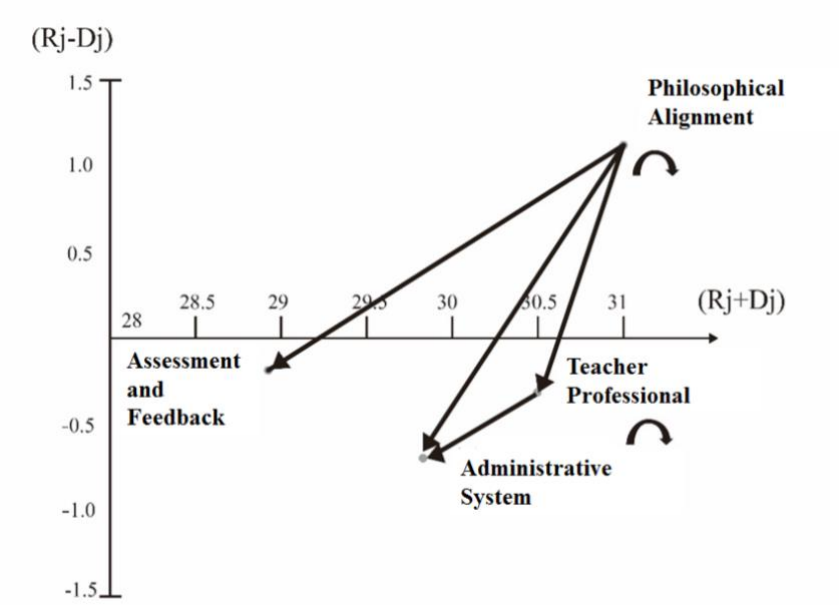

Figure 1: Causal Relationship Diagram (Threshold value α=3.75)

Establishing the ANP Evaluation Framework

The results shown in Table 4 indicate that the ”Conceptual Alignment” dimension is the central influencing factor. At the same time, the “Conceptual Alignment” dimension and the “Teacher Empowerment” dimension are significant driving factors, while the “Administrative Support” and “Assessment and Feedback” dimensions are outcome factors. Based on these relationships, a dynamic causal influence network diagram, required for the ANP method, can be established (as shown in Figure 2).

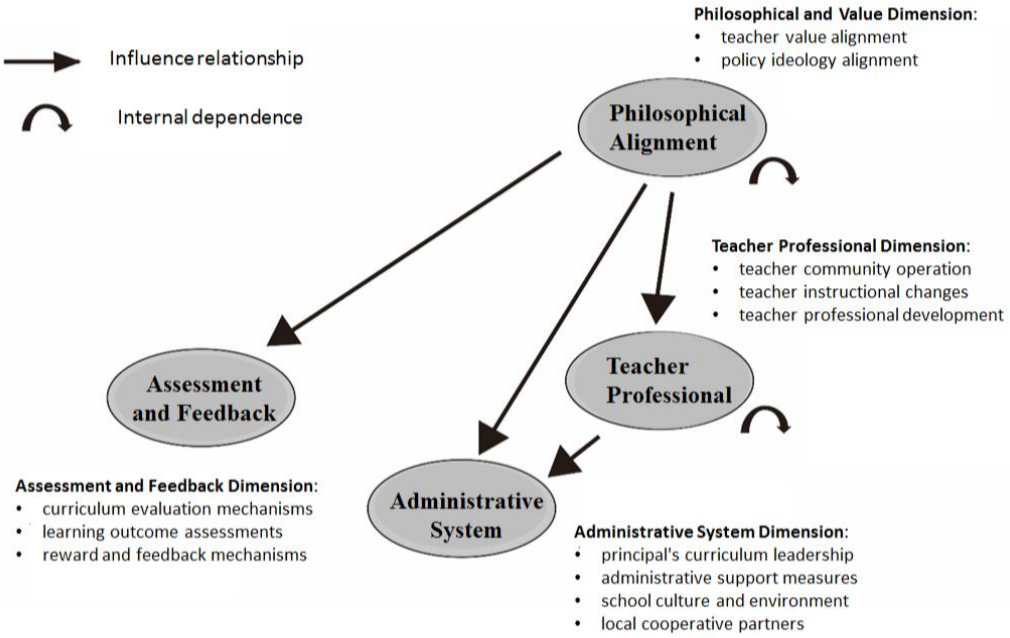

Figure 2: Dynamic Causal Relationship Network Diagram Using the ANP Method

Conclusion

This study synthesizes key success dimensions and elements from relevant literature on competency-based teaching. Based on the opinions of 8 expert scholars, the dimensions identified include "Conceptual Alignment," "Teacher Empowerment," "Administrative Support," and "Assessment and Feedback." Using the DEMATEL questionnaire's pairwise comparison matrix, a total impact relationship matrix was formed. In the causal relationship diagram, the "Conceptual Alignment" dimension directly impacts the "Teacher Empowerment," "Administrative Support," and "Assessment and Feedback" dimensions. The "Teacher Empowerment" dimension also affects the "Administrative Support" dimension, while both "Administrative Support" and "Assessment and Feedback" are influenced, without causing an impact on other dimensions. Additionally, in terms of internal dependencies, both the "Conceptual Alignment" and "Teacher Empowerment" dimensions have internal influences.

Through the ANP method, a dynamic causal relationship network diagram clearly presents that when promoting competency-based teaching policies, the alignment of teachers with the policy's conceptual framework is crucial. This includes whether teachers recognize the value of their roles in education. Secondly, the implementation of teacher empowerment depends on the operation of teacher communities and the enhancement of teachers' expertise, forming a learning organization within the school that promotes teacher growth and willingness to change teaching practices. Teacher empowerment not only relies on conceptual alignment but also influences school administrative support. When teacher motivation is high, curriculum leadership and administrative support are more willing to offer greater assistance, forming a robust support system for teacher empowerment. Furthermore, although "Assessment and Feedback" does not directly impact other dimensions, its internal mechanisms—curriculum assessments, learning outcome evaluations, and reward feedback systems—reflect whether the competency-based teaching philosophy is being implemented and how to adjust the promotion methods and outcomes.

This study finds that when schools promote competency-based teaching, the most important factor is the alignment of teachers with the policy's conceptual framework. Only with conceptual alignment will teachers be motivated to engage in teaching changes. Next, for competency-based teaching to be effectively implemented, teachers play the most critical role. Schools should focus on how to encourage teachers to participate in communities, continuously engage in professional empowerment, and implement teaching changes in the classroom. The school administration can offer reward mechanisms, results presentations, and exchanges to foster mutual growth in teaching between teachers and students, creating a positive school culture.

This study surveyed experts from technical high schools or vocational backgrounds. The findings may differ from those in general high schools or other educational stages, so future research could focus on comparing different educational systems. Secondly, due to the large number of pairwise comparison items and the complexity of the supermatrix in the ANP network analysis method, it is recommended that future studies further investigate to obtain more detailed weight rankings.

The Efficacy of Pre-editing as a Means of Improving NMT Output

Kayo Tsuji, Osaka Metropolitan University, Japan
Benjamin Neil Smith, Kwansei Gakuin University, Japan
Kiyo Okamoto, Osaka Metropolitan University, Japan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Neural machine translation (NMT/MT) replicates human brain networks and is often considered a "black box" due to its unexplained structure and function. To use NMT effectively, target-language (TL) learners should pre-edit source-language (SL) documents, similar to how humans paraphrase first-language (L1) texts before translating to their second language (L2) (Tsuji, 2024). Previous studies have shown that pre-editing SL texts improves the quality of MT output. However, the specific differences between NMT output with and without editing have been explored less. This study aims to compare NMT translations with and without pre-editing and examine the impact of pre-editing on the quality of TL texts. The study involved 54 Japanese university students with intermediate English proficiency, each composing a Japanese text which was translated into English using NMT. Three language researchers analysed issues in the unedited NMT output, and systematically categorised them into lexical, grammatical, semantic and formatting errors. Comparing the results with those of Tsuji (2024), exploring issues in pre-edited NMT outputs, showed that NMT output *without* pre-editing displayed more frequent errors than NMT output *with* pre-editing. In particular, the semantic issues in unedited NMT output significantly limited readability. On the contrary, the pre-edited NMT translations described in Tsuji (2024) were generally comprehensible and contained minor errors that did not significantly affect comprehensibility. This study indicates that pre-editing SL texts is essential for improving the quality of NMT translations. The errors illustrated in this study could potentially be used to assist students learning L1 paraphrasing skills required for the human L2 translation process.

Keywords: Pre-editing, Neural Machine Translation, NMT Errors, Japanese-English Translation

iafor

Introduction

Neural machine translation (NMT) has significantly advanced in recent years, achieving higher accuracy compared to statistical machine translation (SMT) (Bahdanau et al., 2015; Sutskever et al., 2014). Designed to mimic human neural networks, NMT continues to evolve, enhancing its capabilities (Ninomiya et al., 2021). Despite its progress, the internal workings of NMT systems remain largely opaque, often referred to as a "black box." Nonetheless, translations produced by modern NMTs are widely perceived to approximate human translation quality.

To further enhance NMT quality, human intervention in the form of pre-editing (modifying the source text) and post-editing (refining the output text) is often required. With the focus of this study being pre-editing, this paper begins with an exploration of four studies that highlight its effectiveness (Farhana et al., 2023; Feifei et al., 2022; Kokanova et al., 2022; Liang & Han, 2022). Following this is an examination of two studies reporting some of its potential limitations (Marzouk & Hansen-Schirra, 2019; Rantan, 2024) with a final discussion of research addressing practical considerations for pre-editing. While prior studies offer mixed insights into the efficacy of pre-editing in improving MT quality, the continuous evolution of NMT raises the question of whether pre-editing will remain necessary as the technology advances.

Previous Studies

Value of Pre-editing

Several studies have demonstrated the advantages of pre-editing for enhancing NMT output. For example, Farhana et al. (2023) investigated English translations of Indonesian texts, focusing on students in translation and interpreting courses as participants. Their findings revealed that over 90% of the pre-edited NMT output was error-free, producing clear and comprehensible English translations. Key pre-editing strategies included reordering sentence elements, refining vocabulary, and eliminating superfluous phrases, leading to improved accuracy and efficiency. The authors emphasized the importance of pre-editing training to maximize its benefits.

Similarly, Liang and Han (2022) compared the different benefits of pre-editing and post-editing when translating academic and medical texts between English and Chinese. They found pre-editing to be essential for enhancing semantic accuracy, while post-editing helped to refine linguistic and cultural aspects of the output text that MT lacks awareness of. These findings underscore the complementary roles of pre- and post-editing in producing high-quality translations.

Feifei et al. (2022) examined the impact of pre-editing on translating an English academic book into Chinese. Their study revealed significant improvements in BLEU scores due to precise adjustments such as adding, omitting, or replacing words and ensuring technical terms were accurately rendered, resulting in contextually appropriate translations.

In another study, Kokanova et al. (2022) evaluated the translation of English news articles from *bbc.com* into Russian. They observed that pre-editing reduced lexical inaccuracies, particularly in handling polysemous words, which were often mistranslated without pre-

editing. This intervention enhanced both clarity and precision, highlighting the value of pre-editing in mitigating common translation errors.

Collectively, these studies demonstrate the substantial role of pre-editing in improving MT quality, particularly in addressing lexical challenges and refining text clarity across various genres.

The Potential Limitations of Pre-editing

That being said, not all research supports the efficacy of pre-editing. Rantan (2024) analysed English-to-Finnish translations, specifically focusing on the challenges posed by Finnish prepositions. The findings indicated that pre-editing strategies were insufficient to fully address errors associated with complex sentence structures and, consequently, the study suggested that post-editing might be more effective for such cases.

Marzouk and Hansen-Schirra (2019) evaluated the application of controlled language (CL) rules in German-to-English translations of technical manuals. Their results showed minimal differences in error rates before and after applying CL rules, suggesting that modern NMT systems can often produce accurate texts without extensive pre-editing. They concluded that the relevance of pre-editing might diminish as NMT technology advances, and this would likewise diminish the need to investigate and implement effective strategies thereof.

Despite the benefits of pre-editing, these studies raise questions about its necessity in an era of increasingly sophisticated NMT systems.

Purpose of the Study

This study aims to identify differences in translation quality between pre-edited and unedited source texts (STs), focusing on Japanese-to-English translations of academic reports written by Japanese learners of English. Specifically, it seeks to verify the efficacy of pre-editing as a means to improve NMT output. The central research question is: What are the specific differences between NMT output produced with and without pre-editing? By addressing this question, the study could illuminate the areas where pre-editing enhances translation accuracy and readability in this context, as well as its potential limitations.

Methodology

This study compares the NMT output without pre-editing to the output with pre-editing. To achieve this, data from Tsuji (2024) was used as pre-edited NMT output. In said study, 73 students with intermediate English proficiency wrote reports in Japanese during the spring semester of 2022. The participants input their texts without pre-editing into a NMT system to generate NMT output. They then compared the resulting target-language texts (TTs) to the source-language texts (STs), identifying parts of the translations that did not accurately reflect the ST. The problematic parts in STs were subsequently rewritten (pre-edited), and then re-entered into NMT. The students repeated this until they were satisfied that the ST meaning was accurately reflected in their TTs. The final TTs, consisting of about 15-20 sentences, and the revised STs were collected as raw data. Each student selected several TSs that they were unable to verify the accuracy of, making for a total of 183 TL sentences.

Reflecting the above, the current study involved 54 students who wrote academic reports in Japanese during the spring semester of 2023. They followed the same procedure and identified parts of the translations that did not accurately reflect the STs. However, this set did not pre-edit their sentences and submitted them as is. Each TT consisted of approximately 400 words, organized into 15-20 sentences, with 144 TL sentences being submitted for analysis in total. In identifying the common errors that students couldn't self-diagnose, typical MT errors present in students' writing can be illustrated. In both cases, the STs and TTs were collected as raw data.

Participants were all students enrolled in English courses taught by the researchers, and provided consent for their writing to be used for research purposes. The participants were deemed appropriate as they had an intermediate level of English proficiency, representative of a typical university student in Japan. As in Tsuji (2024), the 54 participants were instructed to create their academic texts on their own specialised subject under the condition that their degree of familiarity with the topic should be relatively high.

Three language researchers, comprising one native English speaker and two native Japanese speakers, analysed both sets of the data. The analysis was conducted manually by the analysts initially working independently and later collaborating to compile and classify results based on mutual agreement. The analysts identified syntactic and semantic errors, as well as mistranslations, in the unedited MT output, and categorized these problematic elements accordingly.

Among the freely available online NMT tools, this study focused on DeepL, which has demonstrated strong performance based on BLEU (Bilingual Evaluation Understudy) scores, a widely recognized metric for assessing MT quality (Fujii et al., 2021). Higher BLEU scores indicate translations that are closer in quality to human-generated translations.

Results

As in Tsuji (2024), three language researchers systematically categorised errors in unedited NMT output into *Lexical, Grammatical, Semantic* and *Formatting Issues*. *Lexical Issues* included inappropriate use of TL vocabulary and redundant or repeated TL expressions, while the *Grammatical Issues* discovered were mainly those such as misuse or lack of determiners, misuse or lack of prepositions, and inappropriate singular and plural forms. *Semantic Issues* related to incomprehensible sentences and missing information. Finally, *Formatting Issues* indicated misuse of punctuation, misuse of upper- and lower-case characters, and missing quotation marks.

The findings of this investigation reveal that many errors were present in the unedited translations, while pre-edited NMT translations displayed fewer and relatively minor errors, shown in Tsuji (2024).

Two prominent error categories, in particular, relating to *Lexical* and *Semantic Issues*, showed significant difference between the NMT output with and without pre-editing.

With regard to *Lexical Issues*, there was little difference between the pre-edited and unedited NMT output. Moreover, these errors largely did not impede the comprehensibility of the sentences in both the NMT output with and without pre-editing. This issue may therefore

require greater TL (English) knowledge to repair, as pre-editing had little effect on its occurrence.

Regarding *Semantic Issues*, without pre-editing, errors emerged more frequently, negatively impacting the accuracy and readability of the translations. In contrast, pre-editing let authors simplify sentence structures, thereby reducing semantic ambiguities.

The errors in the unedited NMT output were frequently linked to long or overly complex SL sentences. TL sentences observed in the unedited output mixed multiple pieces of information in a single sentence, and the subject and predicate did not always align, making it difficult to understand the relationship between each piece of information or what was and was not a necessary sentence element. Further analysis highlighted the nature of these semantic issues, which were especially prevalent in the unedited NMT translations.

The results emphasize the critical role of pre-editing in enhancing the clarity and precision of NMT output.

Examples of Lexical Issues

Detailed examples of *Lexical Issues* are discussed in this section.

NMT Output Without Pre-editing

Example 1
MT output[1]: There is a problem that children with *disabilities float* in class due to their *disability* characteristics.

The word “float” does not make sense in this context, wherein the author meant that children with disabilities may be left behind or ignored in the class. Moreover, “disability” is incorrectly used as an adjective, where the correct phrasing ought to be “disability’s characteristics” or, potentially, “disabled characteristics”. Since “disabilities” is mentioned earlier in the sentence, the word could also be deleted and the sentence would make more sense. That said, despite these problems the overall meaning of the sentence comes through in the NMT output.

Example 2
MT output[2]: Although I was still not very good at *making* hairpins and smashes, when I was able to actually *make* them in the matches, I *could feel* the results of my technical practice, and I *felt* a sense of accomplishment.

Although there is nothing mistaken in this sentence, it displays repetition of the verbs “make” and “feel” in different forms and its length makes its meaning somewhat difficult to parse. By using synonyms or equivalent phrases or by separating the ideas into different sentences, its readability would be improved.

[1] The SL equivalent of the MT output is as follows: 障害特性により、障害を持った子供たちがクラスで浮いてしまうという問題がある。
[2] ヘアピンやスマッシュの精度はまだまだでしたが、実際に試合で決めることができたときは、技術練習の成果を感じることができ、達成感を感じました。

NMT Output With Pre-editing

Example 3
MT output[3]: A semiconductor made from a single crystal with no impurities is called a *true* semiconductor, in which the outermost electrons of the atoms that make up the semiconductor, *such as silicon,* are used for covalent bonding without excess or deficiency.

Here, the term "true semiconductor" is incorrectly used in place of the term "intrinsic semiconductor", and the placement of the example "such as silicon" would work better following the initial term it is an example of. Despite this, the overall meaning does come through, albeit somewhat awkwardly.

Example 4
MT output[4]: In addition, companies are set up to conduct development *locally*. However, their arrangement for R&D activities is still less than that of companies that do manufacturing *locally* or sales *locally*.

These sentences use the word "locally" repetitively and although the meaning is clear its readability would be improved by either cutting one instance of the word (for example, "manufacturing or sales locally") or using a synonym in its place.

From these examples, it can be seen that both the NMT output with and without pre-editing exhibited lexical issues, but this did not tend to affect their comprehensibility in both cases. Within this data, this type of issue can be edited during the phase of post-editing, but given its minor nature it is less of a priority for NMT users to focus on.

Examples of Semantic Issues

Detailed examples of *Semantic Issues* are discussed in this section.

NMT Output Without Pre-editing

Example 5
MT output[5]: It can be inferred that the element sought in American *anime* is the ability to *experience* through images what one cannot *experience* oneself by looking down from a third person's point of view, to feel *a sense of* elation and to *experience a sense of* the extraordinary.

The organization of the text in a relatively long sentence make the author's meaning unclear, as it is difficult to understand exactly how one point connects to another. Moreover, repetitive phrasing ("experience", "a sense of") and the wrong term make it more unintelligible. The use of "anime" is incorrect in this context, as this term is used mainly for animations made in

[3] 不純物を持たない単結晶で作られた半導体を真性半導体といい、シリコンなどの半導体を構成する原子の最外殻電子が過不足なく共有結合に使用された状態である。
[4] また、開発を現地で行う会社が設置される。しかし、研究開発活動を行うためのそれらの配置は、製造を現地でする会社や販売を現地でする会社に比べるとまだ少ない。
[5] 第三者の視点から俯瞰して見ることで、自分では体験できないことを、映像を通して体験することで高揚感を抱いたり、非日常感を味わったりすることができるのがアメリカのアニメに求められる要素なのではないかと推測できる。

Japan with a particular and iconic style. A more appropriate term would be “animations” or “cartoons”.

Example 6
MT output[6]: I believe that *women, among all the stressful household chores*, lack understanding and appreciation from those around them.

This example illustrates incorrect word order and semantic ambiguity. The phrase “women, among all the stressful household chores” suggests that women are somehow included as a household chore, which is nonsensical. This error stems from ambiguity in the ST, which could have been resolved by reconstructing the sentence during the pre-editing phase.

NMT Output With Pre-editing

Example 7
MT output[7]: The background of the incident may be that people in a socially distressed position, of low status and low income, were not in a situation where they could fully use their *reason* due to the hardships of life and dissatisfaction with the *disparity*.

In this sentence, there is missing information, since the form of “disparity” is unmentioned (for example, it may refer to “wealth disparity”). Moreover, the NMT has incorrectly used the word “reason” rather than “reasoning”. However, given the proximity of “reason” to “reasoning” and the context within the sentence, the true meaning can be easily gleaned without much effort from the reader.

Example 8
MT output[8]: Bischofia javanica is a popular guide item *as a “bleeding tree”*; when the bark is injured, red sap flows from the wound.

This sentence is also missing information, as the subject is “known as a bleeding tree” (rather than literally being a “bleeding tree”) due to its characteristics. As with example 7, however, this too, can be understood by the reader due to the context provided in the sentence.

From these examples, it is clear that pre-editing can help reduce the impact of semantic problems and improve the overall comprehensibility of sentences. The output of unedited STs was often long with ideas mixed together in ways that made the overall meaning difficult to parse, whilst the output from pre-edited STs – although still displaying errors – could be understood without difficulty.

Examples of Other Frequent Errors in Unedited NMT Output

Here are sample sentences of frequent errors: inappropriate use of subjects, inappropriate use of conjunctions, and illogical causal relationships.

[6] 私は女性が、家事をストレスに感じる中でも特に周りからの理解や感謝が足りないのではないかと思う。
[7] 事件の背景にあるのは、社会的に苦しい立場にいる、低い地位、低収入の人々が、生活苦や格差に対する不満などで、理性を十分に働かせるような状況になかったということでないかと思われる。
[8] アカギとは「血を流す木」として人気のあるガイド項目で、樹皮を傷つけると傷口から赤い樹液が流れる。

Inappropriate Use of Subjects

Other frequently observed errors fell under the category of inappropriate use of subjects. Japanese learners of English often omit the subject in their writing, as it is typically implied in Japanese and contextually understood (Tsuji, 2024). This characteristic led to frequent subject-related errors.

Example 9
MT output[9]: Therefore, *we* decided to prevent influenza infection by increasing the rate of hand disinfection using bottles of disinfectant ethanol, which *we* are tempted to push.

In this example, the double use of "we" is inappropriate as it creates ambiguity – either the people who decided to use disinfectant ethanol are the same as those who are tempted to use it, or these are two distinctly defined groups of people. Given the context of preventing the spread of infection, it is likely that the second "we" is referring to a larger group (which may or may not include those of the former "we"). Therefore, substituting this for a generic term such as "people" would improve intelligibility and make it clear that the latter "we" is separate and greater, and that the former "we" were making a decision for the benefit of a larger group. This more closely aligns it with the ST.

Based on the findings of Tsuji (2024), pre-editing had a significant effect on this kind of issue. As mentioned, Japanese is a language that often omits explicit subjects in favor of implied ones, which can lead to ambiguous or inappropriate translations when entered into NMT systems. Pre-editing addressed this by allowing the author to explicitly supplement implied subjects, improving clarity and syntactic correctness.

Inappropriate Use of Conjunctions

Other frequent errors, pertaining to inappropriate use of conjunctions, were also prominent, as illustrated by the following sentence.

Example 10
MT output[10]: I have not had much opportunity to work with people who lack self-care at this point, *and* I do not think I have been able to develop such skills.

Although grammatically and structurally correct, the conjunction "and" does not effectively convey the causal relationship implied in this sentence. Replacing it with "so" would better reflect the intended connection between the two statements. Notably, the ST itself lacked punctuation, which may have contributed to the suboptimal translation. This could easily be remedied through pre-editing, giving the author an opportunity to add the necessary punctuation to help clarify meaning.

Illogical Causal Relationships

Another notable issue was illogical causal relationships.

[9] そこで、つい押したくなる消毒用エタノールのボトルを使用し、手指消毒の実施率をあげることでインフルエンザ感染を予防することとした。
[10] 私自身もあまり現時点でセルフケアが欠如している人と関わる機会がなくそういった力をつけることができていないと思うので。

Example 11
MT output[11]: This has increased the income of farmers, and the population has also risen due to the *increase in society*.

This output demonstrates a logical inconsistency. The statement “the population has also risen due to the increase in society” is vague and illogical, as the rising population would likely cause societal changes rather than result from them. While the translation is grammatically accurate, the logical disconnect likely originates from the ST. Such issues must be addressed during pre-editing to ensure coherent causal relationships in the NMT output.

Conclusion

This study sought to identify specific differences in NMT output with and without pre-editing. Analysis revealed that errors relating to lexical and semantic problems were particularly prevalent in translations without pre-editing. Semantic errors, such as incomprehensible sentences and missing information, were observed frequently and had significant implications for the comprehensibility of a sentence. NMT output without pre-editing often exhibited poorly expressed sentence elements, illogical idea connections, and subject inference errors, resulting in unintelligible texts. However, the degree and frequency of these errors in pre-edited NMT outputs are reduced to the point that they did not significantly hamper readability, demonstrating its effectiveness in enhancing clarity and accuracy of NMT output. Whatever developments improve NMT capabilities, the results suggest that, at present, pre-editing remains essential to improve the quality of NMT output.

Limitations

Despite its valuable insights, the study had several limitations. The sample consisted of a limited number of students with intermediate TL proficiency. This was due to the small-scale of the study, as the participants were all students enrolled in English courses taught by the researchers. Moreover, the pre-edited NMT output data was not collected since the time allocated to complete the task was limited by the curriculum prescribed by the university administration. Furthermore, the study focused exclusively on the NMT output of academic reports translated from Japanese as a source language to English as a target language. These limitations mean that the findings may not generalize to other language pairs, genres of writing, different levels of TL proficiency in the authors, or alternative contexts. Future research should involve larger participant groups, adopt a longitudinal design, and include multiple genres to provide more comprehensive insights.

[11] それにより農家の収入も上がり、社会増加による人口の上昇も実現した。

Chanin Tungpantong, King Mongkut's University of Technology Thonburi, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study investigates the factors influencing Thai high school students' university selection decisions and their perceptions of future educational trends. A survey was conducted among 139 applicants of KMUTT to technology-related programs in the 2023 academic year. The main respondents were female students (57%) recent high school graduates (around 18 years old) from public schools (86%) from all over Thailand. Regarding academic background, 45.32% graduated from the Science-Math stream, followed by Arts-Mathematics (25.18%) and Language Arts (14.39%). The dominant student interest resided in science and technology fields integrated with art and design (43.17%). A significant portion (33.09%) expressed interest in Education or Industrial Education, Engineering (9.35%) and Business Management (5.04%). Architecture, Fine Arts, Communication Arts, Mass Communication, and Law drew interest from a smaller percentage of students. Perceptions of future educational trends were largely consistent. Most students anticipated a shift towards blended learning, a focus on analytical thinking skills, and the integration of AI and robotics in teaching. University selection factors were evaluated using a 5-point scale. "Better career opportunities" received the highest score (mean=4.61), followed by "support from family" (mean=4.56) and "meeting personal needs" (mean=4.42). Issues that still need to be addressed include providing sufficient information for University program admission and promoting student preparation for further study. This survey provided valuable insights for universities to design learning programs that cater to current high school students' evolving needs and aspirations. Additionally, analyzing applicants' information could help schools enhance their guidance for students.

Introduction

Choosing a university for higher education is currently a major decision for high school students, as it affects their educational path and future job market opportunities. Therefore, studying the factors that influence the decision to choose a university, as well as important trends that may affect the future education of high school students, is something that colleges recognize as important. The university will analyze the importance of the decision and understand the factors that affect the decision-making process, as well as predict trends that play an important role in educational development. We will conduct an analysis of the important factors influencing students' university selection. Studying these important factors is important for universities that want to select students with diverse abilities that meet university needs, as well as respond to policies that are being changed in education in line with future labor market needs.

In addition to analyzing the factors that influence university selection, this research also explores important trends for future education, such as the importance of digital learning, interdisciplinary education, and more skill-based learning. In analyzing such educational trends, it is possible to know about the changing trends of universities in the future to adapt to the changing world. This research aims to study the decision-making process of current students and strategic planning for educational institutions to enhance their competitiveness in the future job market.

This research will comprehensively analyze both the factors affecting university selection and the future educational trends of students. This study presents an overview of the impacts of changes in higher education. This research aims to study the factors affecting university selection and the perspectives of future educational trends among high school students, focusing on those who applied to study in related technology fields in the Faculty of Industrial Education and Technology at King Mongkut's University of Technology Thonburi (KMUTT). The results of this study will serve as guidelines for improving and developing the curriculum to be in line with the needs and expectations of future students.

Methodology

This research utilized a survey method through questionnaires to collect data from high school students applying to the Faculty of Industrial Education and Technology at King Mongkut's University of Technology Thonburi. The questionnaire consisted of questions regarding factors influencing university selection and future educational trends. The sample group included 240 high school students who applied for the 2024 academic year to study in the fields of Printing and Packaging Technology, Educational and Communication Technology, and Applied Computer-Multimedia.

Data was collected using an online questionnaire via Google Forms, which included both closed-ended and open-ended questions. The survey employed a 5-point Likert scale for opinion assessment, ranging from 1 (least) to 5 (most) for collected data analysis, as shown in Table 1. The collected data was then analyzed using descriptive and inferential statistical methods. The questions in questionnaire included of 3 sections:

- Section 1: General Information of Respondents.
- Section 2: Questionnaire on Higher Education Preferences, Interests, and Educational Goals, 6 questions with multiple choice for selection and 1 open-ended questions.

- Section 3: Questionnaire for Opinions, consisting of 5 closed-ended questions with a 5-level rating scale and 2 open-ended questions.

The topics of multiple choice for selection in Section 2 included of 7 questions:

1) Academic program studying in high school
2) Subjects interested during studying in high school
3) Interest of fields in higher education
4) Reasons for interested fields
5) Factors influence decision for higher education
6) Change in the future of educational trends
7) Important role in the future of interested fields (open-ended question)

The topics of questions in Section 3 included of 5 questions for rating:

1) Higher education at university gives better career opportunities.
2) Preparation of students for university application.
3) Support from family for university study.
4) Sufficient information about the field of study in university.
5) Higher education meets your personal needs.

There are 2 additional open-ended questions: 1) plans or goals for study in university and 2) additional opinion on future education.

Table 1: The Descriptive and Inferential Statistical Methods With 5-point Likert Scale

Scale	Scale Interval	Opinion for Quality
5	4.50-5.00	Most
4	3.50-4.49	High
3	2.50-3.49	Moderate
2	1.50-2.49	Low
1	1.00-1.49	Least

Results and Discussion

General Information of Respondents

From a total of 240 participants, it was found that 139 students responded to the questionnaire. The main students were female, totaling 80 students (58%), followed by males 59 students (42%), and 1 student did not specify their gender. The respondents were aged around 18, accounting for 109 students (78%) and aged around 19, accounting for 18 students (13%). Most of the students came from public schools (government-run schools) across the country, totaling 116 students (83%), while 23 students (17%) were from private schools, as shown om Figure 1.

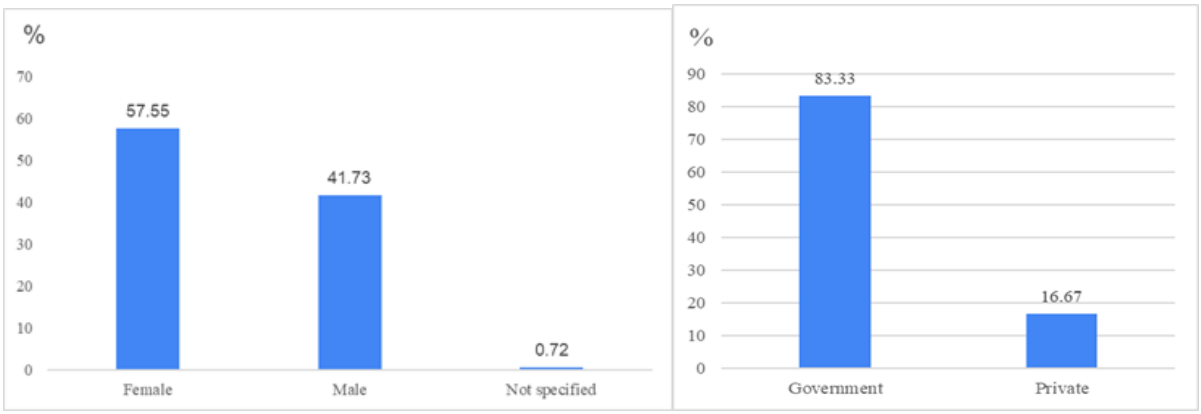

Figure 1: The General Information of the High School Students as Respondents

Questionnaire on Higher Education Preferences, Interests, and Educational

The survey showed that among the high school students as the respondents, most of them (63 students) graduated from the Science-Mathematics field, accounting for 45.32%. The second largest group with 35 students graduated from the Arts-Calculations field at around 25.18%. The third group with 20 students graduated from the Arts-Languages field or 14.39%. The remaining students graduated from other fields with smaller numbers, as shown in Figure 2. For studying the higher education level at KMUTT, there are many programs relating to Sciences, Engineering, and Technology accepting the applicants graduated the school from the field of Science-Mathematics.

The information showed that most students who applied to study at the university were interested in studying Education, with 82 students, making up 58.99%. This was followed by Science and Technology with 62 students, or 44.60%, and Business Administration with 52 students, or 37.41%, respectively, as shown in Figure 3.

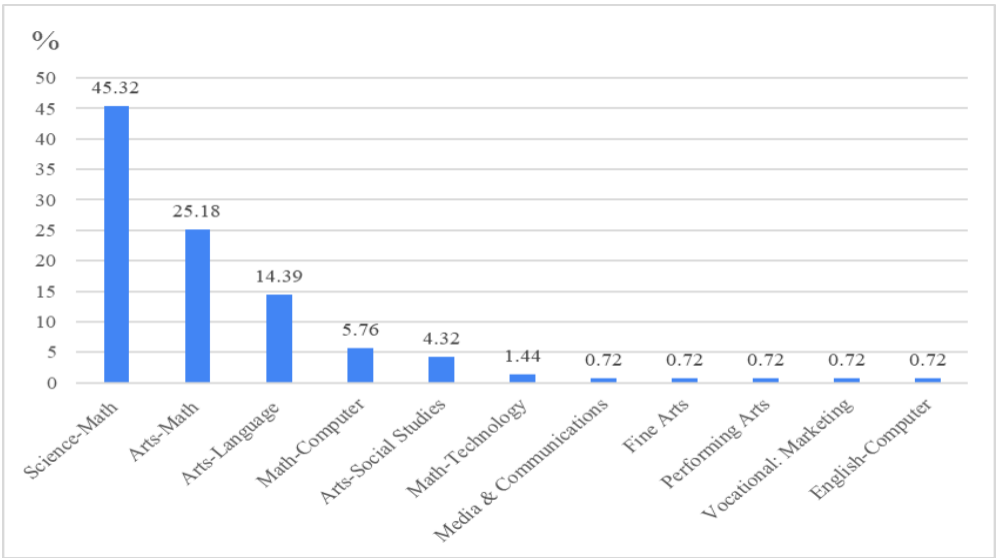

Figure 2: The Graduated Field of High School Students

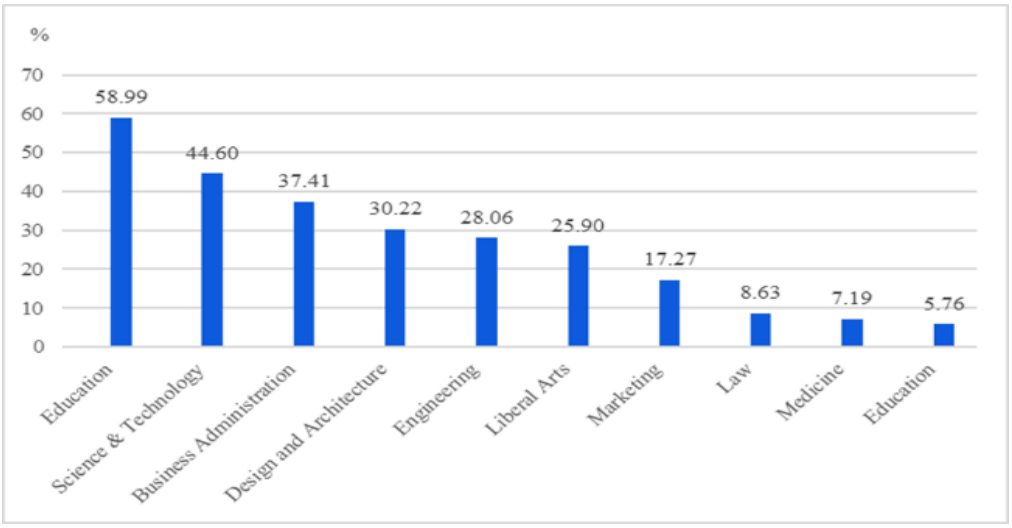

Figure 3: The Interesting Program of High School Students for Study at the University

The respondents also gave the reasons for interested fields, as shown in Figure 4. The results showed that 62.59% of the respondents were concerned about the high opportunity to work. The second reason was the good income at 50%. The last reason was desire to help society at 15.11%.

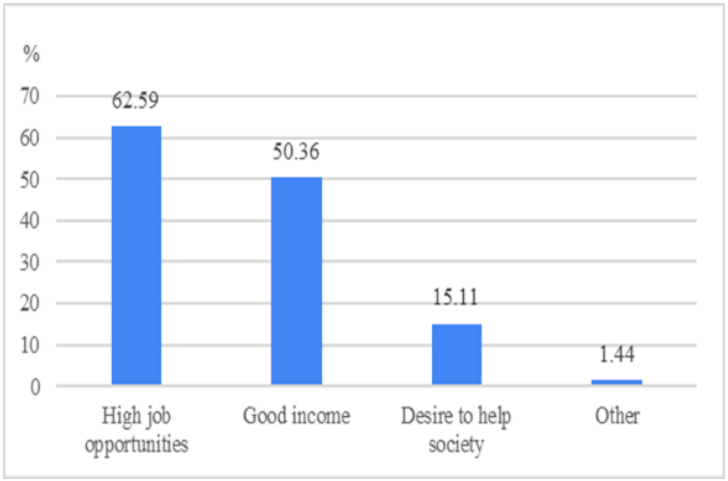

Figure 4: The Reasons for Interested Fields

From the survey responses of 139 participants, the factor that most influenced their decision in program selection for study at higher education was personal interest responded by 126 students, 90.65%. The next factors were labor market trends and economic conditions, responded by 50 students, 35.97%, and family advice, responded by 47 students, 33.81%, respectively, as shown in Figure 5.

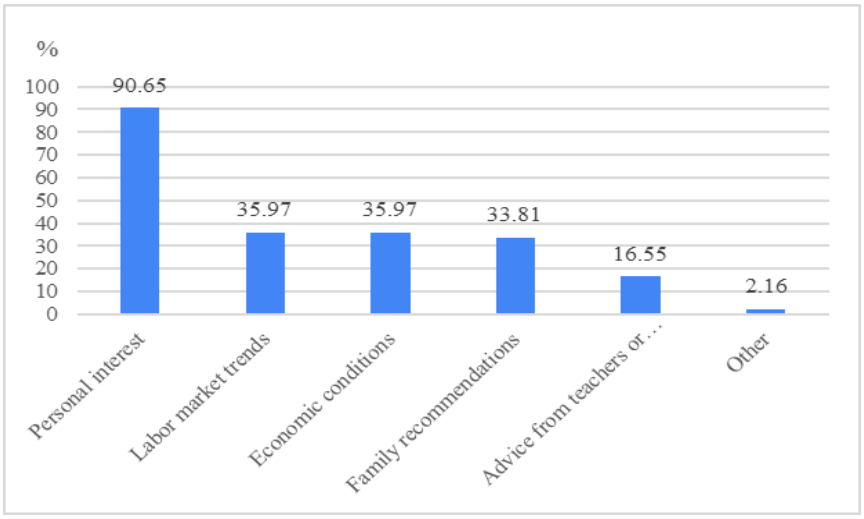

Figure 5: The Factor Influences the High School Students' Decision in Program Selection for Higher Education

Additionally, the researcher inquired about how future education trends might be changed. According to the responses from 139 respondents as in Figure 6, the following opinions were expressed regarding future education trends: Blended Learning was the most popular, agreed with 53 students, 38.13%. With 40 students, or 28.78% of respondents agreed with the use of AI and robotics in teaching and learning. The next trends emphasis on critical thinking skills and artificial intelligence skills, agreed with 33 students, or 23.74%. The least popular trend was online learning and teaching, responded by 12 students, or 8.63%.

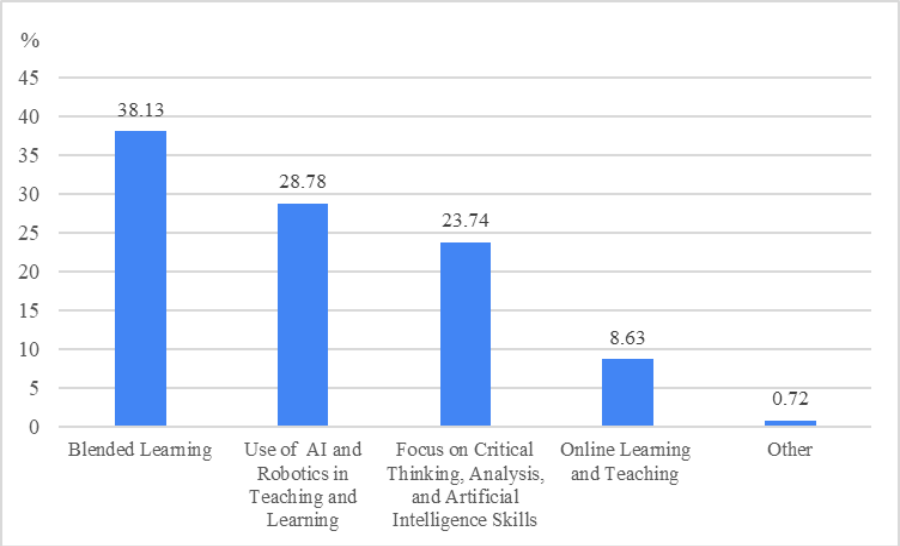

Figure 6: The High School Students' Opinion About the Future Education Trends

The Closed-Ended Questions With a 5-Level Rating Scale

The high school students who applied to study at KMUTT responded to the questionnaire in the Google Form. They expressed their opinion on the study in higher education level with a 5-level rating scale in the closed-ended questions, as shown in Table 2**.**

Table 2: The Students' Opinion on Higher Education

Item	Evaluation Topic	Mean	S.D.	Definition
1	Higher education at university gives better career opportunities.	4.61	0.56	Most
2	Preparation of students for university application.	4.16	0.76	High
3	Support from family for university study.	4.56	0.77	Most
4	Sufficient information about the field of study in university.	4.12	0.75	High
5	Higher education meets your personal needs.	4.42	0.71	High
	Total mean score	4.37	0.71	High

Among the 139 respondents, the topic "Pursuing higher education will provide better career opportunities" had the highest mean score ($\bar{X}$=4.61 and S.D.=0.56). The second topic was "Receiving support from family to pursue higher education" ($\bar{X}$=4.56 and S.D.=0.77). The third topic was "Feeling that higher education will meet personal needs" with $\bar{X}$=4.42 and S.D.=0.71.

For additional open-ended questions, they responded about plans or goals for study in university as follows:

Academic and Career Goals

- Intend to pursue a master's degree to expand knowledge and career opportunities in the future.
- Focus on learning fully in every subject to apply the knowledge in developing a stable and efficient career.
- Aim to explore myself through learning in various fields to find my strengths and interests in a suitable career.
- If possible, I want to secure a scholarship to study abroad, especially in Austria, as a long-term goal.

Self-Development

- Plan to use every opportunity to improve myself through society, studies, and activities to prepare for real-world work.
- Commit to learning and gaining experience through both education and participation in university activities.
- Plan to study foreign languages and seek opportunities to participate in exchange programs to enhance international experience.

Contribution and Knowledge Sharing

- If they gain useful knowledge, they would like to share it and use it to help others.

Overall Perspective on Education

- They want to apply the knowledge and experience gained to fulfill my dream career and create a stable income in the future.

- Overall, university education is a significant opportunity for me to develop myself, preparing for a stable career and life, both in terms of knowledge, skills, and experience.

They responded about the additional opinion on future education as follows:

- Education should be developed into a more systematic approach to ensure that all children have equal access to learning opportunities. It should emphasize a blend of theoretical knowledge and practical application.
- Learning methods should be diverse, with activities that encourage knowledge and idea exchange, aligned with labor market demands, and prepared for international standards.
- Classroom hours should be reduced, allowing more time for activities that build skills and experiences, while technology should be integrated into the learning process.
- Education must adapt to global changes, promoting learning that focuses on critical thinking, problem-solving, and resilience in overcoming unexpected challenges.
- The use of electronic devices for learning should be encouraged, alongside opportunities for hands-on practice in real-world scenarios.

Conclusion

Most of the survey respondents were female, aged 18, and primarily studying in government educational institutions. Most of the participants had a background in science-mathematics, followed by arts-mathematics and arts-language fields. Most respondents expressed interest in pursuing higher education in fields related to science and technology, followed by education/teaching. The primary reasons for choosing their fields of interest were personal preference and high employment opportunities. Regarding future education trends, most respondents believed that learning would shift towards a blended learning model, emphasizing critical thinking skills and incorporating AI and robotics in teaching. The respondents overwhelmingly agreed that pursuing higher education would provide better career opportunities, followed by strong family support for continuing their studies. In conclusion, most students aspire to pursue university education, preferring a blended learning approach that leverages AI technology to enhance learning experiences.

Suggestions

Based on the findings of this research, the following suggestions are proposed:

1. Universities should enhance the quality of academic programs to meet higher standards and address labor market demands.
2. Efforts should be made to promote the university's reputation through public relations and collaborations with other institutions.
3. Foster a learning environment that supports the development of students' skills and abilities.
4. Increase opportunities for internships and job placements to better prepare students for entering the workforce.

Acknowledgements

The authors would like to express their deepest gratitude to King Mongkut’s University of Technology Thonburi (KMUTT), Bangkok, Thailand, for providing the necessary support

and resources to make this study successful. We would also like to acknowledge the cooperation and assistance of the sample group, printing and packaging technology, educational and communication technology and applied computer-multimedia, which were crucial to the study. Their support greatly improved the quality and scope of this study.

Examining Vocational Education in Indo-Pacific Countries and Implications for Taiwan's Vocational Education

Jen-Chia Chang, National Taipei University of Technology, Taiwan
Po-Ching Lu, National Taipei University of Technology, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Vocational education is pivotal in shaping a country's workforce by providing essential skills and training to meet modern economic demands. However, Taiwan's current vocational education system faces multiple challenges, including insufficient government support for vocational training needs, inadequate industry collaboration, and a lack of innovation. These issues need to be addressed to enhance Taiwan's vocational education level and prepare its workforce for future economic challenges. Countries in the Indo-Pacific region, such as Japan, India, Australia, and the United States, have developed robust vocational education systems that have substantially contributed to their economic achievements. This comparative study analyzes the vocational education frameworks of these countries, offering insights for improving Taiwan's vocational education system. By employing a comparative analysis methodology, this study systematically evaluates the vocational education systems of these nations alongside Taiwan's. Historical and policy analyses further assess the development and effectiveness of these systems. Key findings indicate that successful vocational education systems rely on strong government support, effective industry collaboration, continuous innovation, and rigorous quality assurance. Implementing these strategies in Taiwan could significantly improve its vocational education framework, better preparing its workforce for future economic challenges. The study emphasizes the importance of comprehensive legislation, fostering industry partnerships, integrating digital skills, and establishing quality assurance mechanisms. By adopting these measures, Taiwan can enhance its vocational education system to better meet the evolving demands of the global economy and maintain its competitive edge.

Keywords: Vocational Education, Government Support, Industry Collaboration, Innovation, Quality Assurance

iafor
The International Academic Forum
www.iafor.org

Introduction

Vocational education is a crucial factor in developing a nation's workforce by providing practical skills and specialized training to meet the demands of modern economies. Particularly in rapidly industrializing regions, vocational education plays a vital role in helping the workforce adapt to the evolving needs of industries. For Taiwan, whose economy heavily relies on technology and innovation, vocational education holds significant potential to drive long-term economic success and sustainable development. However, Taiwan faces challenges in promoting vocational education, fostering industry-academia collaboration, and adopting innovative practices, which hinder its ability to fully realize its potential and respond effectively to the rapidly changing global economy.

The aim of this study is to identify best practices from the vocational education systems of Japan, India, Australia, and the United States that can be applied to Taiwan's vocational education framework. By analyzing the successful strategies of these countries and the shortcomings of Taiwan's current approach, this study provides specific policy recommendations to enhance government support, foster effective industry collaboration, and promote continuous innovation. Ultimately, the goal is to better prepare Taiwan's workforce to meet future economic challenges and maintain competitiveness in the global market.

This study examines key countries in the Indo-Pacific region, including Japan, India, Australia, and the United States, which have successfully leveraged vocational education to cultivate a highly skilled workforce, contributing significantly to their economic growth and global competitiveness. Through comparative analysis, this research explores the policies, historical developments, and innovations within these countries' vocational education systems, extracting key insights and best practices that Taiwan can adopt to overcome its challenges and improve its vocational education framework to better respond to the rapidly changing global economy.

The analysis focuses on three critical areas: government promotion, industry-academia collaboration, and continuous innovation. These elements have been proven effective in other countries and can serve as a blueprint for vocational education reform in Taiwan. By advancing legislative reforms, fostering industry partnerships, integrating digital skills training, and establishing quality standards, Taiwan can strengthen its vocational education system and enhance its competitiveness.

The findings of this study have significant implications for Taiwan's vocational education sector. These strategies can help Taiwan better address future economic challenges while creating more career development opportunities and economic prosperity for its citizens. By adopting the best practices of regional leaders, Taiwan can build a stronger competitive edge in the global economy and ensure sustainable development.

Literature Review

Vocational Education and Economic Growth

Vocational education plays a pivotal role in economic development by equipping individuals with the technical skills required by industries. Numerous studies emphasize how well-established vocational education systems contribute to enhanced workforce productivity and economic resilience (Hanushek et al., 2017). In countries like Japan and Germany, strong

vocational systems are credited with maintaining competitive advantages in the global market. According to Oketch (2007), vocational education bridges the gap between education and employment, directly impacting economic growth by reducing youth unemployment rates and fostering economic inclusivity.

Government Support in Vocational Education

Government support is critical in ensuring that vocational education systems are well-structured and adequately funded. According to Raffe (2011), government investment in vocational education can drive both innovation and inclusion by creating policies that promote access and industry alignment. In Japan, the government has been instrumental in aligning vocational education policies with national development strategies, ensuring that skills development matches labor market needs (Hori, 2018). In Taiwan, research suggests that challenges in promoting vocational education and fragmented policies have hindered the growth of its vocational education system (Cheng, 2020). Strengthening government involvement in Taiwan could significantly elevate the quality and relevance of vocational training programs.

Industry Collaboration and Its Impact

Collaboration between industries and vocational education institutions is fundamental to ensuring that the skills taught in schools are relevant to market needs. Many countries have adopted the dual training model, which integrates classroom learning with practical on-the-job training. Countries like Germany and Australia excel in this area, where partnerships between industries and educational institutions ensure that students gain hands-on experience (Busemeyer & Trampusch, 2012). Taiwan's vocational education system, however, faces challenges in this regard. Studies indicate that the lack of close industry collaboration leads to a mismatch between skills learned in vocational schools and those required in the labor market (Wang, 2019). Greater involvement from industry in curriculum development and practical training could address this gap.

Innovation in Vocational Education

The integration of digital skills and new technologies into vocational education is crucial in today's knowledge-based economy. According to OECD (2020), countries that embed digital literacy into vocational training programs produce graduates who are better equipped to work in emerging industries such as IT, renewable energy, and artificial intelligence. Australia's focus on integrating technology into vocational programs has enabled it to produce a workforce capable of competing in the global digital economy (Knight, 2021). In Taiwan, while traditional industries like manufacturing are well-supported through vocational training, the system has been slow to incorporate digital skills into its curriculum. Studies recommend that Taiwan prioritize digital innovation to remain competitive in the rapidly changing global economy (Lin & Chen, 2021).

Quality Assurance in Vocational Education

Quality assurance mechanisms are essential for ensuring the effectiveness and relevance of vocational education programs. According to UNESCO (2016), effective quality assurance involves the establishment of national qualification frameworks, accreditation systems, and regular program evaluations. These mechanisms help maintain consistent educational

standards and ensure that vocational training aligns with the needs of the labor market. For example, Australia's quality assurance framework, managed by the Australian Skills Quality Authority (ASQA), has been instrumental in maintaining high standards in vocational education and training (ASQA, 2020). Similarly, Germany's dual vocational training system relies heavily on quality assurance measures to align educational outcomes with industry requirements (Busemeyer, 2015). Taiwan currently lacks a comprehensive quality assurance system for vocational education, which undermines the consistency and effectiveness of its training programs. Implementing a robust quality assurance framework could help Taiwan improve the quality and credibility of its vocational education, ultimately making it more attractive to both students and employers.

Lifelong Learning and Vocational Education

Lifelong learning is increasingly recognized as a critical component of vocational education, particularly as industries undergo rapid technological changes. According to Aspin and Chapman (2007), lifelong learning ensures that workers can continually update their skills to remain relevant in an evolving job market. Finland, for instance, has successfully integrated lifelong learning into its vocational education system, offering adults multiple opportunities to reskill or upskill in response to changes in the labor market (Stenström & Virolainen, 2014). Taiwan's vocational education system has yet to fully embrace lifelong learning as a central tenet, which limits opportunities for adult learners to participate in vocational training. Promoting lifelong learning through vocational education programs could enhance workforce adaptability and resilience, enabling Taiwan to maintain its competitive edge in a rapidly changing global economy.

Methodology

Research Design

This study adopts a comparative analysis approach by examining the vocational education frameworks of Japan, India, Australia, and the United States, to identify best practices that can be applied to enhance Taiwan's vocational education system. The research combines historical analysis and policy analysis, systematically evaluating these countries' vocational education systems in comparison with Taiwan.

Data Collection

Data sources include:

- Government Reports and Public Data: Policy documents and annual reports from relevant government bodies, such as Japan's Ministry of Education, India's Ministry of Skill Development and Entrepreneurship, Australia's Department of Employment and Skills, and the United States Department of Labor.
- International Organization Reports: Reports from organizations like the Organization for Economic Cooperation and Development (OECD), World Bank, and Asian Development Bank (ADB) that provide assessments of vocational education systems.
- Academic Journals and Papers: Analysis of studies on the impact of vocational education on economic growth and specific strategies used in each country. Key journals include the Journal of Vocational Education and Training.
- Official Educational Statistics: Statistical data from official websites of Taiwan's Ministry of Education and Australia's National Skills Commission.

These data sources provide in-depth insights into the vocational education systems of these countries, including policy background, government investment, industry collaboration, and innovation integration.

Comparative Framework

To conduct effective comparisons, this study developed three core areas of analysis: government promotion, industry collaboration, and continuous innovation. These elements have proven to be essential in successful vocational education systems elsewhere and can serve as a blueprint for vocational education reform in Taiwan.

Table 1: Comparative Framework

Country	Government Promotion	Industry Collaboration	Innovation Integration
Japan	Strong government support aligned with industry needs	Strong emphasis on industry-academia collaboration	Integration of digital skills in curricula
India	National skill policies to expand vocational education	Key role of private companies in vocational training	Introduction of innovative learning technologies
Australia	Government incentives and support policies	Deep industry collaboration with dual training implementation	Digitalization and technology-driven curriculum
United States	Vocational policies aligned with economic needs	Local industry participation in curriculum and training	High digital integration and future skills emphasis
Taiwan	Insufficient support and fragmented policies	Lack of close collaboration with industries	Slow adoption of digital skills and innovation

The comparative framework helps in analyzing Taiwan's gaps in government support, industry collaboration, and innovation integration, providing directions for reforms.

Data Analysis

The primary analyses used in this study are descriptive statistics and comparative analysis. Descriptive statistics are used to present the baseline situation of key variables in the vocational education systems of different countries, such as government investment in vocational education, levels of industry collaboration, and the extent of innovation integration. Comparative analysis was used to assess the differences between these variables and to derive implications for Taiwan.

Key Variables

Government Promotion: Policies and investments made by governments in vocational education. Industry Collaboration: The cooperation model between vocational schools and industries, including internships and curriculum development. Innovation Integration: The extent of technological innovations in vocational curricula. The analysis results reveal that Taiwan falls short in all three areas, highlighting the need for further policy intervention.

Additional Information on Regulations

Table 2: Information on Regulations

Indicator	Japan	India	Australia	United States	Taiwan
Regulation Name	Vocational Training Law	National Skill Development Law	Vocational Education and Training Law	Carl D. Perkins Vocational and Technical Education Act	Technical and Vocational Education Act
Regulation Years	1958 - 2021	2009 - 2020	1992 - 2020	1984 - 2018	1995 - 2022
Key Content and Features	Government support for training, industry collaboration, skill certification	Skill development agency, public-private cooperation	National quality assurance framework, industry participation	Federal funding, curriculum innovation	Diversification, alignment with industry needs
Historical Context	Introduced skill certification in 1980s, emphasized digital skills in 2021	Reinforced under "Skill India" in 2015, introduced digital training in 2020	Strengthened digital skills in 2020	Introduced accountability mechanisms in 1998, emphasized digital skills in 2018	Promoted lifelong learning in 2000s, introduced digital skills in 2015
Challenges Faced	Aging society, lack of youth interest	Workforce lacking training, resource inequality	Status disparity with higher education	Insufficient funding, low recognition	Lack of attractiveness, policy discontinuity
Implications for Taiwan	Enhance attractiveness, strategies for different age groups	Comprehensive skill system, equitable resources	Elevate status, flexible responses	Increase funding, social recognition	Increase industry participation, strengthen continuity

Data Sources Summary

This study uses data from various countries to analyze vocational education systems, including government reports from Japan, India, Australia, and the U.S., as well as international sources like the OECD and World Bank. It also references the Journal of Vocational Education and Training and official statistics from Taiwan and Australia to provide recommendations for improving Taiwan's vocational education.

Results and Discussion

Results

The results of this comparative study indicate that Taiwan's vocational education system lags behind those of Japan, India, Australia, and the United States in several key areas: government support, industry collaboration, and innovation integration. The descriptive statistics highlight Taiwan's shortcomings in government investment, industry collaboration participation, and innovation integration. Specifically, Taiwan's government investment in vocational education is significantly lower compared to other countries, limiting its capacity to expand and innovate vocational training programs.

The results also show that Taiwan's industry collaboration rate is suboptimal, which hinders the effective alignment of vocational education with industry needs. This lack of collaboration leads to a skills mismatch, where graduates of vocational education programs may not possess the competencies needed by employers. Moreover, the innovation integration level in Taiwan remains low, indicating that digital and emerging technologies are not sufficiently incorporated into vocational curricula, which reduces the competitiveness of graduates in the modern workforce.

Discussion

The findings underscore the importance of comprehensive government support, effective industry collaboration, and continuous innovation as essential components of a successful vocational education system. Countries like Japan and Australia have demonstrated the positive impact of strong government policies that align vocational training with industry needs, highlighting the need for Taiwan to develop similar frameworks.

Government Support: Strong government involvement, as seen in Japan and Australia, ensures that vocational education is well-funded and aligned with national economic needs. According to research by Smith and Brown (2020), government policies that align funding with economic needs have been instrumental in improving vocational training outcomes in these countries. Taiwan needs to increase its financial commitment to vocational education and develop cohesive policies to overcome fragmented support. This increased investment would facilitate the development of specialized training programs tailored to evolving industry needs.

Industry Collaboration: The successful models of industry collaboration in Australia and Germany emphasize the importance of creating partnerships between vocational institutions and industries. According to Johnson (2019), industry partnerships in Germany have significantly reduced the skills mismatch and improved graduate employability. Taiwan should establish stronger incentives for industries to participate in curriculum development and offer on-the-job training opportunities. These partnerships are crucial for closing the skills gap and ensuring that vocational education meets labor market demands.

Innovation Integration: Innovation, particularly in the form of digital skills integration, is critical for modern vocational education. Australia's focus on integrating technology into vocational curricula has enabled the development of a highly competitive workforce (Davis, 2021). Taiwan must prioritize digital literacy and integrate emerging technologies into

vocational training to prepare students for the rapidly evolving job market. This includes incorporating courses on artificial intelligence, renewable energy, and other growth sectors.

The analysis also points out the need to address the challenges Taiwan faces, such as policy discontinuity and the lack of attractiveness of vocational education. Research by Lee (2022) suggests that continuous policy frameworks are essential for maintaining stable support for vocational education. By establishing continuous policy frameworks, Taiwan can ensure sustained support for vocational education and increase its appeal to prospective students. Additionally, the need to elevate the social status of vocational education in Taiwan is evident, as this would help improve enrollment and enhance the overall quality of vocational training.

Conclusion and Policy Recommendations

Taiwan's vocational education system requires substantial reforms to enhance its effectiveness and align with international best practices. To achieve this, the government should increase investment in vocational education, strengthen partnerships with industries, and integrate digital skills into the curriculum. Specific recommendations are as follows:

Firstly, the government should significantly increase funding for vocational education to ensure that schools and training institutions have sufficient resources to improve teaching facilities, acquire advanced equipment, and hire instructors with practical experience. At the same time, the government should provide incentives to attract more outstanding teachers to the vocational education field, thereby improving the quality of instruction.

Secondly, a closer collaboration mechanism between academia and industry should be established to strengthen the connection between schools and industries. Specifically, the government can encourage companies to jointly design curricula with schools and provide internship opportunities to ensure that students gain real work experience during their studies. Companies should also participate in teaching evaluations to ensure that the curriculum content aligns with market needs, thereby enhancing students' employability.

In addition, the government should promote the comprehensive integration of digital skills, enabling students to acquire the abilities needed to adapt to the future digital economy. This includes adding programming, data analysis, and artificial intelligence to the curriculum and providing relevant teacher training to ensure that educators can effectively teach these skills. The government should also collaborate with technology companies to offer students opportunities to access the latest technologies, bridging the gap between learning and practical application.

Finally, Taiwan can learn from the successful experiences of countries such as Japan, India, Australia, and the United States to formulate policies that meet local needs. For example, Taiwan could introduce Australia's vocational qualification framework to provide students with diverse learning and certification pathways, allowing them to flexibly choose suitable learning directions at different stages. Through these measures, Taiwan can establish a more resilient vocational education system that meets market demands, improves satisfaction for both students and employers, and ultimately drives sustainable economic development.

Professional Identity Development of Multi-role Teachers in Technical High Schools

Chia-Hao Liu, National Taipei University of Technology, Taiwan
Hsiao-Fen Liu, National Taipei University of Technology, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The professional identity is the core of professional practice, and the formation, maintenance and change of professional identity are a lifelong learning process. For teachers with multiple identities in a technical high school, the construction of professional identity in multiple roles is an important issue that needs to be clarified in the professional development selection process, whether it is to prioritize the general teaching role, optimize administrative capabilities, or develop coaching skills. This article finds that for teachers with multiple mixed roles, the concept of professional identity is sometimes vague and overlapped. Based on phenomenology, this article uses the body as a research tool to clarify the perception of professional identity in seven perceptual propositions under the state of vagueness and adjustment of professional identity. After repeated reviews of texts, self-extraction and reflection, this article preliminarily classifies the concept of professional identity and development for teachers with multiple identities in four dimensions: 1. Professional identity should start from within, 2. The lack of identity makes it difficult for teachers to develop professionally, 3. Teachers with multiple professions need guidance in the process of identity recognition, and 4. Emphasizing the career development and professional growth of teachers with multiple role identities. Through the clarification of these four dimensions, this article provides a reference for teachers with multiple identities to adapt and adjust themselves internally and externally in the process of changes and entanglements.

Keywords: Professional Identity, Social Identity, Phenomenology

www.iafor.org

Introduction

The new era and modern educational landscape have given rise to a new ecology of educational personnel. In alignment with the context of social changes and career expectations of education professionals, teachers' professional identity has evolved under new policies promoting interdisciplinary competency development.

In technical high schools, there are two primary sources of professional teachers. The first comprises those who obtain qualified teacher certificates through national examinations and are subsequently selected through teacher recruitment processes to serve as formal teachers. The second consists of teachers who receive national-level professional skill certifications through national skill assessments (or competitions). Objectively, the latter group serves both as teachers and professional technicians, creating a subjective identity formation where professional technical personnel engage in student guidance and classroom management within schools. While this may not necessarily lead to conflicts in duty execution, teachers with dual professional backgrounds may develop "multiple" (or hybrid) complex identities. For teachers with such dual professional backgrounds, the process of developing and exploring self-identity and professional identity, without adequate guidance or equivalent understanding, often results in contradictory and ambiguous feelings toward their professional or technical professional identity. When a teacher's professional identity exists in such an ambiguous state, struggling to confirm their sense of identity, it inevitably affects their attitude and willingness toward professional advancement and development in their teaching career.

Furthermore, many professional subject teachers must not only fulfill their duty of transmitting professional knowledge but also implement student guidance and classroom management as educational work, while engaging in school administrative affairs. Additionally, due to their professional technical certification and background, they often bear the mission of coaching students for relevant competitions according to the school's development blueprint, thereby assuming another role with a professional image.

Under such multi-tasking conditions, for teachers in technical high schools, determining their professional development path—whether to prioritize general teaching identity, optimize administrative capabilities, or develop as a professional technical "coach"—becomes a significant issue in constructing professional identity amid multiple roles. However, as teachers committed to lifelong learning, their professional identity development process must face the dynamics and entanglements within external social identity structures while simultaneously enduring the impact, conflicts, and adaptation processes from internal professional recognition. Therefore, how teachers find their professional identity amid multiple overlapping roles remains a topic worthy of investigation.

Literature Review

The implications of teacher professionalism have been explored for years in both regulatory and academic research domains. The topic of teacher professional identity has also been extensively studied. In Wei, Song, and Zhang’s (2013) research, they posit that the subject of "teacher occupational identity" is the individual teacher, while the objects of "teacher occupational identity" include both the "teaching profession" and the "professional role" internalized by individual teachers. They identify four dimensions of teacher professional identity: occupational values, role values, occupational belonging, and occupational behavior.

Their research indicates that both the individual teacher's understanding of their role's meaning and their personal awareness of the collective consciousness of the teaching profession as external constraints of occupational responsibility demonstrate that teacher professional identity encompasses not only teachers' self-identity consciousness of their occupation but also the scope of professional identity as constrained, defined, and regulated by external factors.

Xing and colleagues (2019) studied teacher professional identity through multiple perspectives, including professional identity stage theory, external expectation factors, and internal expectation factors. Their research suggests that teacher professional identity involves complex interactions between many internal and external factors and is a dynamic process that changes over time.

1. External Professional Identity of Teachers

Wang Yuwen (2017) points out that postmodern teacher professional identity involves creating a personal style, where teachers must be sensitive to external self-regulatory discourse while seeking their self-defined professional teacher image. This indicates that teachers' professional identity forms through continuous interaction, negotiation, and communication with external social contexts, pursuing and shaping a self-identified professional pattern. Xing Zhibin and colleagues (2021), in their study of guidance teachers with professional psychological counseling certificates, found that school guidance teachers receive more workplace recognition than counseling psychologists primarily due to practical factors, including salary structure, working conditions, and social evaluation. This context influences dual-professional individuals' choice of school guidance teaching as a career. Yan Guoliang (2003) suggests that teacher professionalism in school duties is recognized through completing action research, teaching portfolios, self-compiled materials, certification workshops, IT integration in teaching, teaching demonstrations, and professional development evaluations set by educational administrative agencies. In summary, during teacher professional identity formation, many key factors affecting teachers' professional self-identity come from external social expectations, views, norms, and evaluations.

2. Teachers' Self Professional Identity

Teachers' professional self-identity closely connects with their personal perceptions and expressions. According to B. Bernstein, teacher professional identity reflects external circumstances (translated by Wang Ruixian, 2005), maintaining this identity shows the function of externally-driven projective discursive organization/practice, meaning professional identity links teachers' feelings with the external environment, expressed through discourse. Guo Yingjie (2008), studying junior high school guidance teachers' professional role identity, found their challenges mainly stem from struggles between "self-awareness" and "others' expectations," doubts about "professional definition," and tension between "ideals" and "performance." Thus, teachers' internal and external adjustments or compromises during professional development are necessary perceptual integration processes in self-identity stages.

Past emphasis on teacher professional description and normative meaning has shifted to professional self-identity in teachers' professional life development. Teachers are no longer viewed as a collective but as unique individuals with life experiences, educational concepts, and value systems. Scholars now emphasize teachers' "voices" and lives, highlighting how

personal values, life experiences, and knowledge systems influence both the journey toward professional identity and its continuous shaping. Teachers' varying educational backgrounds and personal experiences lead to different levels of professional identity awareness in their teaching careers (Zhou, 2004).

Identity is a transformation process. When teachers consider their identity, self-awareness of experiences, occupation, and life values influences their perspectives, strategies, and actions. Teachers' self-identity forms the basis for giving meaning and making decisions in their profession (Korthagen, 2001). Teachers must identify with themselves to move toward professionalism, and identifying with their profession enables opportunities for deep cultivation and development.

3. Professional Identity in Multiple Roles

Teachers' mission includes teaching their subject, transmitting knowledge, and guiding students. Recent educational policy changes have increased the number of teachers with dual or multiple professional identities. For dual-professional teachers, single-profession teaching regulations can create identity conflicts and impacts. External factors further influence teachers' professional identity choices, conflicts, adjustments, or avoidance issues, emerging during professional development promotion.

Domestic research on multiple professional identities in schools is limited. Only Guo Yingjie's (2008) study on "Junior High School Guidance Teachers' Professional Role Identity Challenges and Responses" and Zheng Chunqi's (2016) research on "Professional Identity Experiences of High School Guidance Teachers with Counseling Psychologist Certificates" address professional identity states and challenges for guidance teachers with professional psychological counseling qualifications at different school levels. The researcher believes different school types and professional work experiences create different perceptions through personal experiences and social expectations. When teachers possess multiple professional identities in educational settings, their professional identity impacts become more complex.

Teachers with multiple identities in educational settings live in external and internal conflicting circumstances as cross-domain hybrid roles. While appearing simply as school teachers, they carry multiple identity backgrounds, constantly choosing, struggling, and compromising in daily work life. In pursuing teacher professional identity, their persistent perceptions and insights merit further exploration.

Research Methods

This research topic emerged from the researcher's personal experiences of confusion, challenges, and insights regarding professional identity. According to Zhou Shuqing's (2003) research, the shaping of teacher professional identity can be facilitated through narrative processes, helping individuals understand the relationship between self and society, providing a means for critical reflection and reconstruction. Phenomenologist Husserl believed that intentional activities have a constitutive effect on objects, as objects do not exist independently but are constructed through self-consciousness via intentional activities. Therefore, the existence of objects is intentionality itself, representing the conscious relationship between subject and object (Li, 2007).

Consequently, this study will utilize the researcher's perceptual narrative process within a phenomenological framework to examine the bodily perceptual intentions of teacher professional identity amid multiple roles. It will explore the state, needs, and challenges of professional identity for teachers with multiple roles. Additionally, two technical high school teachers who also possess professional skills and administrative duties (detailed information about the researcher and interviewees is presented in Table 1) were invited to participate. Semi-structured interviews were conducted to collect textual data and perform perceptual comparisons. This approach aims to clarify the author's intersecting and mixed consciousness states under multiple identities, as well as the internal professional identity recognition, external development challenges, contexts, and opportunities faced by teachers with multiple roles.

Table 1: Basic Information of Research Participants

CATEGORY	RESEARCHER	INTERVIEWEE 1	INTERVIEWEE 2
CURRENT POSITION	Taipei Municipal Public Technical High School	Taipei Municipal Public Technical High School	Taipei Municipal Public Technical High School

Research Findings and Discussion

Teaching is a profession characterized by close human connections. A teacher's professional identity state continuously manifests dynamically—whether positively, neutrally, or negatively—through the interweaving of external factors and personal experiences. This internal-external adjustment process progresses from external to internal and back to external, encompassing cognition, behavior, and expression.

Based on the researcher's awareness of professional identity ambiguity, which emerges from the conscious relationship between self and situation, this consciousness is not simply caused by a sense of self-loss or unclear professional identity perception. Therefore, through reflection, detachment, and textual review, using a phenomenological perspective on the essence of ambiguous identity brought by multiple roles, the researcher proposes seven perceptual propositions to clarify the perceptual consciousness under ambiguous and adjustment states.

1. Sense of Life

Life occurs only once, with no chance for repetition. While we are powerless against time's passage and cannot change the present in our teaching career, we can anticipate the professional future. Sometimes, knowing too much about the future isn't beneficial, as the waiting mindset can consume one's passion for present matters.

> Compared to the enjoyment of practical courses, the repetitive teaching mode of theoretical courses can feel monotonous. Such formalized life creates a sense of emptiness, while relatively challenging administrative roles provide a feeling of fulfillment and growth. (Interviewee 1)

In a limited lifetime, regular teachers performing the same tasks for 30 years, without competition or self-growth, might be interpreted as specialized dedication. However, this unchanging pattern creates dissatisfaction with life, feeling that limited youth will be consumed in "waiting" like a candle in the wind.

2. Physical Sense

A healthy body is essential for a good life, particularly for professional teachers who lead by example. Previous professional technical work modes made acute bodily awareness a natural ability, considering many subtle physical perceptions as "natural." In the workplace, appropriate environmental transitions sometimes provide distance, allowing space to perceive our primary professional state. However, unexpectedly, prolonged separation can gradually diminish the body's original energy and superior functions.

> As a professional technician, prolonged equipment contact and practical operation led to more acute physical responses. As a general teacher in school, while professional technical judgment skills may gradually decline over time, teaching experience increases and can become living teaching material, showing students that skills require practice for improvement. Though not meeting industry professional standards might slightly shake professional identity, basic teaching doesn't affect teaching confidence. (Interviewee 2)

3. Sense of Space

Pressure fosters growth and propels forward movement. While excessive pressure requires release to find personal living space, insufficient pressure makes personal space feel too empty and life hollow, lacking the driving force for professional development.

> Despite facing multifaceted pressure and challenges in multiple roles, this state, though stressful with stronger life tension, can stimulate more motivation under pressure. Compared to regular teachers' more uniform lifestyle, multiple roles enable more personal growth. (Interviewee 1)

4. Sense of Existence

Teaching's vocation is to achieve success for every student. Regardless of how illustrious one's pre-teaching experiences were, with the role transition, the feeling of being noticed and expected gradually diminishes. When external applause disappears and self-achievement becomes insufficient to support self-identity, one begins to question their existential purpose.

> The source of personal existence stems from whether one's confidence in professional abilities is sufficient. The stronger my professional capabilities, the more I'll be needed by students or the school, and the stronger my sense of existence becomes. Having dual professional identities as both technician and teacher enables me to excel in both theoretical and practical courses, making me less replaceable and more distinctly present. (Interviewee 2)

5. Sense of Time

Time in the objective material environment is measured by clocks, seconds, and physical changes. However, when time exists within subjective consciousness, it becomes emotion, awareness, perception—a sum of multiple sensations. During the busy state of multiple roles, a day's objective time isn't merely displayed in numbers, but in the accumulation of various tasks and events. Teachers exist in a blurred temporal experience, while full-time teachers' lives, with fewer uncertain administrative duties, have clear time markers and planning for each class. Time passes gradually between classes, increasing the sense of subjective time passing, yet leaving little trace in life. Time's passage isn't frightening; what's frightening is losing oneself in passing time.

6. Sense of Interaction

> Administrative work involves frequent but superficial interactions with stronger defensive mechanisms. As a training teacher or full-time teacher, being the core duty of teaching, interactions with students and parents are closer. Through these interactions, one can better understand students' backgrounds and conditions, becoming more helpful in guiding and assisting students. However, interactions among colleagues lack external environmental factors to promote closer relationships. (Interviewee 2)

7. Sense of Center

Single-role teaching duties are clear with simple responsibilities, making it easy to distribute work and life focus. However, under intersecting multiple roles, more detailed planning is needed for time management, task prioritization, and energy investment control. Overly complex duties create an "heavy" sense of life center, while simple duties of full-time teachers may create a "weightless" feeling of having no burdens. Finding balance between "light" and "heavy" in life's center becomes crucial for healthy and passionate professional development.

Regarding these seven propositions of professional identity's ambiguous perception, through detachment from events themselves and external perspective examination, reflection, self-detachment, and interviewee text comparison confirm that the sense of professional identity ambiguity indeed influences multiple-role teachers' professional identity state through these seven propositions' different aspects within external environmental frameworks and internal self-perception intersections. These seven propositions interact without absolute or single directionality (such as center sense affecting existence sense, or time sense affecting space sense), but rather interconnect and influence each other reciprocally. For instance, sense of center links with sense of existence, which in turn intersects with sense of center, thus creating the researcher's initial perception of ambiguous, confused, and disordered professional identity.

Conclusion

After self-detachment, reflection, and review of interviewees' texts, this research preliminarily categorizes the concepts of professional identity and development for teachers with multiple roles as follows:

1. **Professional Identity Should Develop From Inside Out**
   Throughout the process of identity formation, teachers continuously respond to a single question through countless events in their teaching life: "Am I a professional teacher?" While self-questioning, one's consciousness becomes involved in pursuing the teacher identity. For teachers with dual roles as both teacher and coach, besides asking "Am I a professional teacher?", they must also ask "Am I a professional coach?" Through this self-seeking process of constant stimulation and tension, they gradually clarify that while having a single identity (teacher), they possess dual professional characteristics (teaching/training). Through pursuing professional self-identity, they realize that professional development must first involve continuous introspection, analyzing role tasks, understanding self-capabilities, and familiarizing with environmental expectations to identify with their profession. Only then can their perceived sense of life, physical sense, and sense of space have clearer directionality.
2. **Professional Development is Difficult Without Identity Recognition**
   Li Xinrong (2022) believes that teacher identity formation should enable self-agency and aim for self-realization, though the implementation process isn't always smoothly progressive. Based on both interviewees' experiences, the inadequate development of professional skills in their early career affected their self-realization process, creating ambiguity in professional identity. This hindered development in both general teaching and athlete training capabilities, demonstrating that professional development is unlikely without sufficient self-professional identity. In such ambiguous states, external support through policies or peer support might have helped

clarify confused perceptions of existence, time, and center through interaction and exchange.

3. **Teachers With Dual Professions Need Guidance in Identity Formation Process**
   Teacher professional identity is a dynamic, continuous reflective process. In teachers' career cycles, their development level results from the combined effects of personal characteristics, school environment, support systems, and solid training processes (Steffy, 2001). Therefore, for teachers with technician (coach) and teacher dual professional identities, like our interviewees, besides clarifying professional identity through reflection, school development, peer support, external professional training, or guidance from experienced individuals can serve as lifelines for teachers caught in professional identity ambiguity, reducing perceptual emptiness and uncertainty from lack of interaction, helping them find their uniqueness and subsequently develop deep roots.
4. **Emphasizing Career Development and Professional Growth for Teachers With Multiple Roles**
   Single-identity teacher roles experience perceptual voids and imbalances in life sense, time sense, and center sense, leading to ambiguous and disordered professional identity states. However, teachers with multiple role careers can develop broader and more diverse thinking dimensions in understanding educational professionalism, professional skill inheritance mission, and policy implementation. This enriches their growth energy in life sense, center sense, or existence sense along professional development paths. From a school management perspective, considering teachers' perceptions of time and space in experiencing professional identity, when planning and arranging duties, maintaining balance in teachers' "multiple roles" clarifies satisfaction with different role self-identities and achieves teachers' agency in developing multiple roles. This creates opportunities for teachers to experience diverse roles, contributing to the deepening and development of their professional careers.

Exploring the Effects of Gender, Technology, and Economic Status Towards Indonesian Students' Science Performance in PISA 2022

Wawan Kurniawan, The University of Adelaide, Australia

The Asian Conference on Education 2024
Official Conference Proceeding

Abstract
Science is one of the vital subjects that assists students to develop their high order thinking skills. Correlatively, Programme for International Student Assessment (PISA) is one of impactful international studies that is also assess and evaluate students' science performance through tests and surveys that may affect their performance in science. However, studies that explore how gender, technology, and economic status is rarely found in Indonesian and global contexts. Therefore, this study aims to examine the effects of gender, information and communication technologies (ICT) resources, and index of economic, social and cultural status (ESCS) towards Indonesian students' science performance based on PISA 2022 data. This quantitative study used the whole sample (N=13,439) of 15-year-old Indonesian students who participated in the tests and surveys. Through the conduction of structural equation modelling (SEM) using AMOS software 29 version, this study found that student gender insignificantly influences science performance (β=-0.05) and also has minor correlation towards ICT resources and ESCS (β=0.02). Meanwhile, ICT resources had direct moderate effect (β=0.29) on science performance which is supported by ESCS as it is highly correlated to the availability of ICT resources (β=0.99). Although this research provides a substantial impact on the body literatures, this research is limited only based on PISA data which there could be other relationships among variables included in the study. Further investigation is recommended to include other variables to clarify whether there are different effects on science performance, particularly with diverse background of students in Indonesia.

Keywords: Science, Gender, ICT, ESCS, Indonesia, PISA

Introduction

The international standard of quality education can be measured from many aspects, and one of the largest programs named Programme for International Student Assessment (PISA) test, which is held by Organization for Economic Co-operation and Development (OECD) has measured education quality in many countries in the last two decades. The PISA test measured three main subjects, namely science, mathematics, and reading performance. In this case, science achievement becomes one of the intriguing topics among academic researchers, and there are many factors that can be examined. According to PISA 2018 results (OECD, 2019), Indonesian students' performance in science in 2018 were at low level. After pandemic corona virus disease (COVID-19) occurred, Indonesian students' science performance in PISA 2022 is lower compared to previous test in 2018 (OECD, 2023b). The situation that happened in 2020 to 2022 changed the way in which schools were conducted lesson from face-to-face to online. This situation forced students to use digital devices, such as computer, laptop, and smartphone during learning processes which can be considered as Information and Communication Technologies (ICT). The availability of ICT resources enables students to access learning material without depending on school activities, allowing them to enhance their knowledge independently.

Numerous studies have been conducted that examine factors influencing science achievement such as teaching approaches, learning media, and socioeconomic status. For example, a study by Gómez and Suárez (2020) mentioned that socioeconomic is one of the strong predictors that influence science achievement in PISA 2015. There are many potential factors that may influence student's science performance in Indonesia based on PISA 2022. In this case, it is possible that ICT resources, students' gender, and socioeconomic status are associated to one another and might become the significant factors among other variables that collected in PISA test. Besides, remote learning or online learning that conducted during the pandemic might also influence on PISA test 2022. Therefore, this study aims to explore the influence of student gender, the availability of ICT resources, and economic status regarding science performance based on PISA 2022 dataset in Indonesia. This report will contribute to the literature as the evidence from Indonesia to support the development of knowledge as there are only few studies that examine factors influence science performance in Indonesia. The findings may also contribute to the development of quality education in Indonesia and other developing countires regarding the implementation of technology in learning activities. Moreover, this report may also influence other educational researchers to explore further that related to science.

Research Question

The grand question of this study is "How is the influence of gender, ICT resources, and Index of economic, social, and cultural status towards Indonesian students' science performance in PISA 2022?"

Review of Related Literatures

There is literature that related to the scope of this study which is limited to gender, ICT, and economic status towards science performance. However, there are limited literature that focuses on Indonesia based on reputable resources. Therefore, the supporting evidence in this study is combined from various countries. Student gender can sometimes become the factor that differentiate students' academic performance at school. A study by Reilly and colleagues

(2019) which compared academic performance in science based on Trends in Mathematics and Science Study (TIMSS) found that female students achieved better than male in mathematics and science. Also, a study by Stoet and Geary (2018) on science literacy which is based on PISA data 2015 found that female students achieve higher score than male students. The previous studies are contrast with study by Jia and colleagues (2020) in China found that although female students have more interest in science, male students somehow achieve better in some section such as multiple-choice section. Likewise, Smith and colleagues (2014) claimed that male students have more confidence in science than female, meaning that male students may have more interest in science which leads to better performance. From the literature found, student gender is not always influence academic performance in science because both male and female have equal opportunity in learning.

Moving to ICT resources, this factor has massive effect in our daily activities as well as for education purposes (Al-Rahmi et al., 2020). Both female and male students may have different interest in the use of technology in their learning processes. An investigation by Dúo-Terrón and colleagues (2022) in Spain, which involved primary school students reported that male students presented higher score in using ICT than girls. It is also happened in Bangladesh, as Rashid (2016) found that female has more hurdles to use ICT although compared to male students. The use of ICT in learning may directly affect students' academic performance in various subjects. For instance, a research by Bai and colleagues (2021) revealed that ICT improves English performance which is align with Rohatgi and colleagues (2016) who claimed that ICT positively correlated to computer science performance. Similarly, some studies by Xiao and Sun (2022), and Palomares-Ruiz and colleagues (2020) also found that ICT resources are positively affects students' academic performance, meaning that the availability of ICT at school and home assists students to obtain better visualization on science resources and supports their interactive learning activities. In detail, Palomares-Ruiz and colleagues (2020) claimed that the implementation of ICT in science class increases student's motivation to learn science, and they mentioned that female student scored higher that male students. Ultimately, it is true that ICT supports students to achieve better in their academic environment and both male and female students have the equal opportunities to enhance their knowledge through ICT. Besides, there are various ICT resources either hardware or software that can be used by teachers and students in teaching and learning activities. For example, study by Zainuddin (2018) in Indonesia reported that online interactive quiz increase students' motivation in learning. However, the literature found are mostly from other countries as there is limited resources from Indonesia. Besides, pandemic that happened across the world in the last few years indirectly forced students to have ICT resources to support their learning and they were required to be able to learn independently.

OECD also has categorized the ICT resources items that are commonly used by school communities for their learning activities both at school and home. Those devices include portable computers such as notebook and laptop, tablets, smartphones with all operating system, e-book readers. In addition, supporting facilities also required to accommodate ICT resources such as a room of your own, internet access, and television (OECD, 2023c). In this case, decent ICT resources at home is provided by their parents. Moreover, there must be integration among devices in order to work properly. For example, integrated computer consists computer, software, and internet connection in order to be used by students. The availability of ICT resources is highly correlated to family support. In this context, PISA also measured index of economic, social, and cultural status (ESCS) which is the combination of parents' occupation, parents' education, and home possession.

According to PISA 2022 dataset, there is no data of parents' professions. In this case, parents' educational background and home possession can be the indicator of financial support for students which is associated to ICT resources support at home and students' academic performance. A study by Roksa and Kinsley (2019) stated that financial support from students' family has indirect impacts on their academic attainment, which is supported by Claro and colleagues (2015) based on Chile PISA dataset, who claimed that parents' education is highly correlated to better academic performance. It is because socioeconomic status may support students with electronic devices and digital skills, allowing students to explore more information related to school activities independently. Likewise, a study conducted by Lagravinese and colleagues (2020) that explored data in PISA 2009 and 2012, also mentioned that socioeconomic is correlated to students' academic performance. Similarly, Gómez and Suárez (2020) who explored factors influence science achievement in PISA 2015, claimed that socioeconomic characteristic is strong factor that affect science performance. In addition, socioeconomic may also correlated to ICT resources at home as parents should provide budget to have technology devices at home. Hence, the different of socioeconomic status may lead to different results in science performance.

Based on the studies that found related to gender, ICT resources, and ESCS towards science performance, hypothesized path model has been formulated which is shown in Figure 1 below.

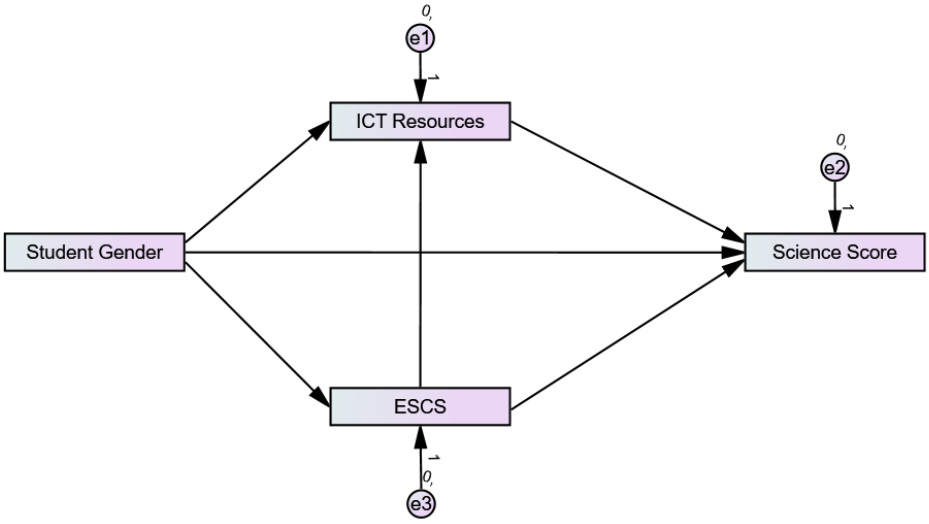

Figure 1: Hypothesized Path Model

Methodology

This quantitative research report is based on Program for International Student Assessment (PISA) data reported in 2022 which was held by OECD. Therefore, the selected data of ICT questionnaires in PISA data 2022 is based on OECD framework (OECD, 2023a). According to OECD, surveys and tests were conducted by employing questionnaires and using two methods namely paper-based and computer-based (OECD, 2023c). There are many developing countries that participated in the study and Indonesia data were chosen in this study. Indonesia participated in PISA test 2022 which 13,439 students from 410 schools were completed the test and surveys. The number of participants in this period is higher compared to PISA 2018 which is at 12,098.

Data for this report focuses on student gender, ICT resources, index of economic, social, and cultural status (ESCS) or Economic Status and science score in Indonesia PISA 2022 dataset. According to OECD (2024), there are some changes in the survey. ICT resources in 2018 has 21 items while in PISA 2022 only 12 items. Therefore, ICT resources items were trimmed from 12 items to nine items because only nine items that similar to previous period in 2018. Besides, data for ICT resources in Indonesia were focused on the availability at home which can be seen from the survey. Moreover, items from ICT resources that are not included were moved to ESCS items because the items of ICT resources also from ESCS in PISA survey. It can be seen from PISA technical report where ESCS consist of three main components namely parent profession, parent education, and home possession. In this case, ICT resources items were included in home possession. Furthermore, ESCS component only include parent education and home possession because parent profession items were not found in the Indonesia PISA 2022 dataset. In addition, value for each item have been checked and there are some items that its value required to be recoded. For instance, the value for ICT resources in ST250Q01JA has value number 1= Yes and 2= No, which recoded to 1=1 and 2=0 so that all factor loadings that generated by the software will become positive, in other words, all items will have the same direction of scale. Detail for the variables name, code, and recoded values that used in this report can be seen in Appendix A.

Data from PISA 2022 were analyzed by using SPSS (Statistical Package for the Social Sciences) version 29 to describe the data and explore the component of questionnaire. Moreover, AMOS (Analysis of Moment Structure) software version 29 was employed to conduct confirmatory factor analysis (CFA) which aims to assess the validity and reliability of questionnaire items in four alternative models. CFA allows researchers to identify factors, variance, and correlation between latent constructs (Hill & Hughes, 2007) cited in Yosita Ratri (2023). In addition, it is important to look at the factor loadings produced by CFA analysis before creating structural equation modelling (SEM) model. According to Hair and colleagues (2021), data analysis through SEM methods allows researchers to examine multivariate analysis where there are complex associations among various dependent and independent variables.

Results

The objective of this study is to scrutinize and estimate the influence of gender, ICT resources, and index of economic, social, and cultural status towards science performance in Indonesia. Initially, confirmatory factor analysis (CFA) on ICT resources and ESCS items reveals the best model for SEM analysis. All models and summary of goodness fit model indices is shown in Appendix B. From all models, hierarchical model is decided to be the best model of ICT resources and ESCS. Therefore, the model for SEM combines both hierarchical models. The SEM model in this study is depicted in Figure 2 below.

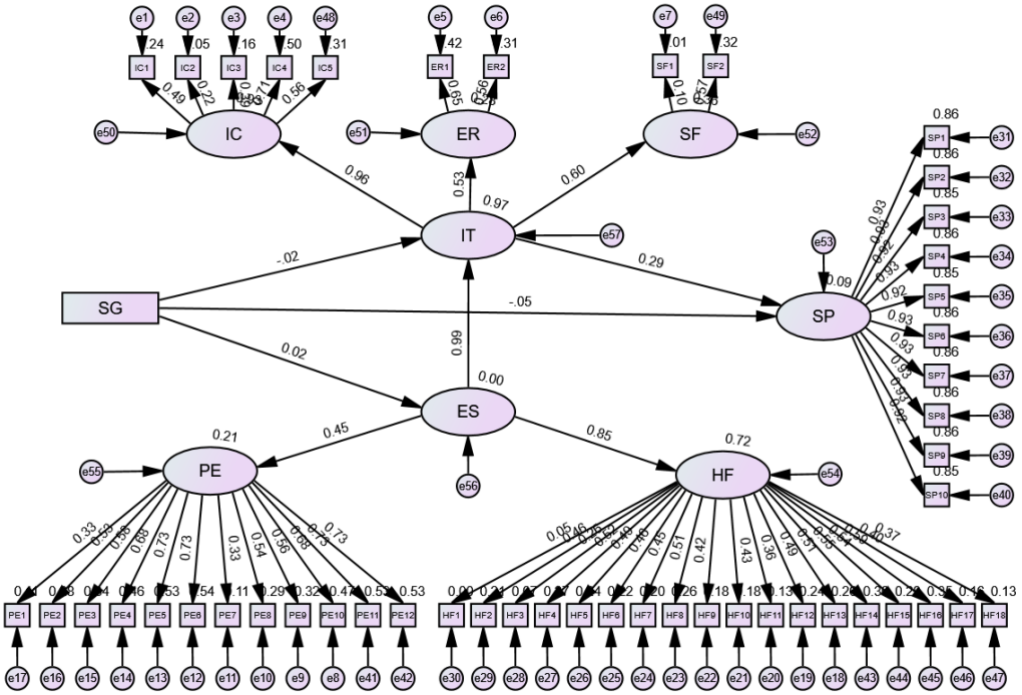

Figure 2: Final Model of SEM

Lists of abbreviation in the model:

SG= Student Gender
IT = Information Technology (ICT Resources)
ES= Economic Status (ESCS)
SP= Science Performance
IC= Integated Computer
ER= Electronic Reader
SF= Supporting Facilities
PE= Parent Education
HF= Home Facilities (Home Ownership)

The final model of SEM includes all items for each variable in order to maintain the model. It is because there is different value of RMSEA when some items that have factor loadings less than 0.30 were trimmed. When some insignificant items not included, the value of RMSEA is increasing from 0.064 to 0.068. Moreover, the path from ESCS to science performance was removed because it leads to negative value of ICT recources to science performance. The value of TLI and CFI are 0.801 and 0.818 respectively, meaning that the values still below standard level of good model fit. Detail of regression weights and significant levels is depicted in Table 1.

Table 1: Standardized Significant Levels and Regression Weights of the Final Model

	Standardized Regression Weights	S.E	P level
SG -> ES	0.016 (0.02)	0.002	0.144
SG -> IT	-0.023 (-0.02)	0.004	0.014
ES -> IT	0.986 (0.99)	0.069	***
SG -> SP	-0.045 (-0.05)	1.104	***
IT -> SP	0.291 (0.29)	3.068	***

Based on the table above, it can be seen that science performance in Indonesia PISA 2022 dataset can be influenced by gender, ICT resources, and ESCS. Student gender in PISA 2022 seems has insignificant impact on science performance as the effects value is very small which indicate that male perform better than female students. Compared to gender, ICT resources directly affect students' performance (β=0.29) and ESCS directly affect ICT resources with path loading extremely high at β= 0.99. Furthermore, ESCS has positive affects towards ICT resources, meaning that a high-income family will be able to provide more ICT resources for learning. On the other hand, low income family will provide limited resources for the students.

Looking more details, each item has different value on how it influences students' performance in science. For example, in ICT resources, the availability of laptop computer and notebooks becomes the most influence among other items while private room becomes the less influential aspects with factor loadings at 0.71 and 0.10, respectively. Moreover, parents educational background has the biggest influence in index of economic, social, and cultural status with factor loadings at 0.73. However, it seems that most parents in Indonesia has low educational level because the International Standard Classification of Education (ISCED) indicate that they are at level 4 and 5. Also, those levels have highest factor loading for both mother and father education. Detail factor loadings for each item is shown in Appendix C.

Discussion

The results of this study indicate that Indonesian students' academic performance in science can be influenced by gender, ICT resources and economic status. However, student gender has poor impact science performance in PISA 2022 which is align with the literature found where both female and male students have equal opportunity in their learning activities which are indicated by their academic performance. Besides, the correlation between student gender and science performance in this study is not is not significant which can be seen from the value less than 0.30.

In terms of ICT resources, the result of analysis is positively aligned with the literature found where it supports learning activities, in this case, science subject (β= 0.29). In detail, electronic device that popular among Indonesian students is laptop computer or notebooks which has significant factor loadings at 0.71. On the other hand, it seems that most students in Indonesia has no private study room in their house as the factor loadings is extremely small at 0.10 and they also do not depend on educational software to support their study because the factor loadings only 0.22. The results are positively correlated with the situation at school where computer or laptop is the most reliable device that can be used in learning activities. For example, working on assignments and quiz, online group meeting, and access online material from the teachers. In addition, Indonesia is a developing country where many students are from low-income family, meaning that their family may have limited budget to provide ICT resources facilities. Furthermore, learning activities in Indonesia may not depend on educational software as the learning management system (LMS) such as Canvas (Mpungose & Khoza, 2022), as teachers may use software that both students and teachers are already familiar with. For instance, they can use free platform such as Google classroom or social media such as WhatsApp to manage classroom activities. Hence, ICT resources is directly influence Indonesian students' performance in science based on PISA 2022 dataset.

Probing further, the results of this study indicate that economic status (ESCS) results is not aligned with the hypothesized as ESCS has indirect impact on students' science performance in Indonesia through ICT resources (β= 0.99). In detail, the data from Indonesia PISA 2022 depicts that not all parents have higher degree education (ISCED level 7-8) which can be seen from the factor loadings that lower compared to education level 4-6. In this case, low performance in science may because of lack of parent educational level. Parent educational level is important especially when pandemic COVID-19 occurred, and students were studying with their family at home. Parent education background enables students to received support when they face difficulties in learning. Moreover, socioeconomic status also consists of home possession or facilities that students can be used to study. The result shows that books play an important role to support academic achievement, either physical book or electronic book which can be accessed through computer, tablet, and e-book readers. The factor loadings for the availability of technical book and science book are higher at 0.59 and 0.55 respectively compared to other items on home facilities. However, other aspects also important and correlated each other. Ultimately, parents with higher education level may have higher income, meaning that they will be able to provides all facilities at home, including ICT resources to be used by students. In other words, the higher ESCS level may lead to better academic outcome, particularly in science score. The results of this study are aligned with previous investigation such as the report from Lagravinese and colleagues (2020).

Conclusion

To sum up, the present study aims to explore the impact of gender, ICT resources, and index of economic, social, and cultural status towards students' science performance in Indonesia based on PISA 2022 dataset. The study employed CFA and followed by multivariate analysis through SEM in AMOS software. The results indicate that student gender almost has no influence towards science performance, while ICT resources directly affect science performance in PISA 2022, which is highly supported by socioeconomic status. The availability of computer laptop becomes the most significant items that influence of students' performance in science which is supported by parents' educational background and home facilities such as science books. The findings may contribute to educational policies, particularly on how government assists school activities by providing decent educational resources in ICT devices for students. In addition, Lagravinese and colleagues (2020) mentioned that there should be public policies in education sector that are able to reduce inequalities among students that are from various socioeconomic level. For example, provide activities to improve students' literacy skills which also supported with adequate facilities such as books and free access learning materials to students. However, this study is based on Indonesia PISA 2022 dataset, which is limited to quantitative data by OECD surveys. According to OECD, test and surveys in PISA 2022 were collected through surveys which is only using quantitative approaches (OECD, 2023c). Further investigation is required, particularly with factors that are related to science performance such as science enjoyment and support from family for students' learning activities. Also, employing qualitative approach will allow to obtain more details factors that affect Indonesian students' performance in science.

Cultural Affective Factors and Group Dynamics in COIL Projects: How Much Autonomy Is Too Much Autonomy?

Brian Bachman, Kyoto University of Foreign Studies, Japan
Michael David Barr, Kyoto University of Foreign Studies, Japan
Yi-hung Cathy Liao, National Pingtung University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study examined the collaboration and group dynamics within international cohorts researching the United Nations' Sustainable Development Goals in a COIL (collaborative online international learning) environment. It culminated in a final recorded video project in the format of a multi-participant screencast-style presentation. Cultural concepts of politeness, leadership, turn-taking, and perceived notions of correct behavior naturally affect interactions in group communicative situations. This study aimed to develop a greater understanding of the interplay between stereotypically shy Japanese behavior and traditionally assertive Taiwanese communicative norms. What can we do as language educators to promote effective group work and intercultural communication, and what is the best balance between scaffolded content and student-centered autonomy? This project was the fifth iteration of an ongoing COIL project between Taiwan and Japan. Building on past successes, shared materials on the Google platform were used as an effective method of working between international groups in asynchronous interactions. Additionally, participants used LINE OpenChat groups for direct communication, allowing for a safe and moderated space which maximized privacy and transparency. Students utilized their choice of online platforms for live meetings, giving each cohort autonomy within their learning environment. Our methodology for evaluating the efficacy of group interactions used student surveys and the analysis of recordings and transcripts of group meetings. Consent and anonymization of data protected student privacy and confidentiality. This study should be of interest to educators undertaking COIL projects and/or enabling their students to improve communication skills in international contexts.

Keywords: COIL, Cross-Cultural Communication, Group Dynamics, International Collaboration

Introduction

Collaborative Online International Learning (COIL) has become a trendy and crucial approach in bridging cultural divides and fostering global citizenship. By integrating academic tasks with intercultural collaboration, COIL projects offer students opportunities to engage in meaningful interactions while addressing global issues, such as the United Nations Sustainable Development Goals (SDGs). However, the success of such initiatives hinges on navigating the complexities of intercultural communication and group dynamics.

This study focuses on the fourth iteration of a COIL project between Kyoto University of Foreign Studies (KUFS) in Japan and National Pingtung University (NPTU) in Taiwan. Over a four-week period, students worked in 20 international groups to research and present on SDG-related topics through collaborative video projects. These interactions revealed key challenges, including differing cultural norms in leadership, turn-taking, and communicative politeness. Groups involved in the project examined the SDGs within the context of both synchronous and asynchronous virtual interaction. The project's structure, culminating in a multi-participant, screencast-style video presentation, presented unique challenges and learning opportunities, particularly as participants navigated diverse cultural communicative norms. In group settings, cultural concepts of politeness, leadership, turn-taking, and behavioral norms were hypothesized to influence the ways in which students would interpret and respond to each other.

Our research seeks to address two critical questions:

1. How do cultural affective factors, such as politeness, leadership, and turn-taking, influence group dynamics in COIL projects?
2. How can educators balance scaffolded guidance with student autonomy to optimize intercultural collaboration and communication?

By examining these questions, we aim to provide actionable insights for educators and policymakers seeking to enhance the effectiveness of COIL projects and equip students with essential skills for global engagement.

Literature Review

Intercultural collaboration in educational settings, especially within COIL projects, has garnered significant attention due to its ability to bridge cultural divides and develop students' global awareness. This section explores key themes in existing literature related to cross-cultural communication styles, leadership dynamics in international collaboration, high-context versus low-context communication, and the pedagogical balance between scaffolding and autonomy.

High-Context vs. Low-Context Communication Styles

One of the foundational frameworks for understanding intercultural communication is the distinction between high-context and low-context communication, as introduced by Edward Hall (1976). High-context cultures, such as Japan, rely heavily on implicit communication, shared cultural knowledge, and non-verbal cues. Silence and subtlety are essential in maintaining group harmony, as direct disagreement is often avoided (Gudykunst & Ting-Toomey, 1988). In group settings, this can lead to misinterpretations by individuals from low-context cultures, who may perceive silence as disengagement rather than respect. For

instance, Japanese students may avoid direct disagreement by softening their language or relying on pauses, which can be interpreted as a sign of thoughtfulness or respect.

In contrast, Taiwanese communication, while historically influenced by high-context norms, incorporates notable elements of low-context communication, particularly among younger generations. Taiwanese students are often more direct in expressing opinions or offering feedback, especially in academic or professional contexts influenced by Western norms and educational style (Curtis & Sussex, 2018; Wu & Kawamura, 2011). This dual influence creates a unique blend of communicative influences whereby Taiwanese students balance politeness and assertiveness depending on the context or task.

Taiwanese communicators are often more direct and willing to express dissent than their Japanese counterparts, particularly in academic or professional contexts. Ting-Toomey and Chung's (2005) intercultural communication competence framework underscores the need for individuals in multicultural settings to recognize and adapt to these differing styles to minimize conflict and enhance collaboration.

These distinctions are particularly relevant in COIL projects, where implicit assumptions about communication can affect group dynamics, lead to misunderstandings, or create friction. Educators must equip students with the tools to interpret and respond to both verbal and non-verbal cues effectively. Understanding and adapting to these communication styles is critical for fostering effective collaboration in both academic and professional settings.

Intercultural Leadership Dynamics

Leadership in intercultural contexts involves navigating differing cultural expectations regarding authority, collaboration, and decision-making. According to Hofstede's (1980) cultural dimensions theory, hierarchical or power-distance orientations influence how leadership roles are assumed and perceived. In high-power-distance cultures, leadership is often authoritative and positional, while low-power-distance cultures favor egalitarian and rotational leadership styles.

In East Asia, collectivism adds another dimension to leadership practices. Japanese group dynamics often emphasize shared decision-making and role rotation, aligning with Hofstede's concept of high collectivism. Leadership is viewed as a collaborative responsibility rather than an individual role (Matsumoto, 1994). Taiwanese leadership, while also collectivist, tends to integrate assertiveness and proactive task delegation, reflective of lower power-distance influences in younger generations (Wu & Kawamura, 2011).

Studies on intercultural leadership suggest that misaligned expectations can hinder group cohesion and productivity. Thomas and Peterson (2015) emphasize the need for cultural intelligence (CQ) in navigating such differences, recommending structured interventions like role definitions and reflective discussions to harmonize team dynamics. In COIL settings, fostering intercultural leadership can cultivate essential global competencies among students, such as adaptability and empathy.

Pedagogical Balance: Scaffolding vs. Autonomy

The interplay between teacher-led scaffolding and student autonomy has been widely studied in collaborative learning contexts. Vygotsky's (1978) concept of the Zone of Proximal

Development (ZPD) highlights the importance of guided support to help learners achieve tasks beyond their independent capabilities. In intercultural settings, scaffolding provides students with structured strategies for communication, such as frameworks for active listening, turn-taking, and conflict resolution (Chen & Starosta, 1997).

However, excessive scaffolding can inhibit the development of autonomy, which is critical for fostering adaptability and confidence in global contexts. Deci and Ryan's (1985) Self-Determination Theory emphasizes the importance of autonomy in motivating learners to engage deeply and take ownership of their learning. In COIL projects, this balance is particularly crucial as students navigate linguistic and cultural barriers.

Wu and Kawamura (2011) suggest a phased approach, where initial scaffolding transitions to greater autonomy as students gain confidence and competence. This allows students to internalize structured skills while developing the independence needed for authentic intercultural collaboration.

Cultural Stereotypes and Their Impact

Cultural stereotypes, though often reductive, play a significant role in shaping perceptions and behaviors in intercultural settings. Stereotypes of Japanese communication frequently highlight indirectness, formality, and a preference for silence, whereas Taiwanese communication is characterized by warmth, expressiveness, and a willingness to engage in open dialogue.

Gao and Ting-Toomey (1998) note that affective factors like politeness, turn-taking, and emotional expressiveness significantly impact group dynamics. For example, silence may signify respect in Japanese culture but could be misinterpreted as disengagement by participants from low-context cultures. Similarly, the use of humor or emotional expressiveness in Taiwanese communication may be perceived as inappropriate or unprofessional by more reserved cultures (Matsumoto, 1994).

While these stereotypes provide a starting point for understanding cultural differences (see table below), their application in real-world settings can lead to oversimplifications. For instance, younger generations in both Japan and Taiwan are increasingly influenced by global norms, resulting in communication styles that blend traditional and modern elements. Educators must approach these stereotypes with caution, emphasizing flexibility and individual variation over rigid assumptions. Familiarity and awareness with cultural stereotypes is a valuable tool for the educator, however it must also be emphasized that communicative stereotypes are obviously not true in all circumstances for all students. This is particularly true in the context of higher education, with students having varying degrees of multicultural or international experience.

The impact of stereotypes was observed in the KUFS-NPTU project, where initial interactions often reflected preconceived notions of politeness and assertiveness. Specific examples will be discussed later in the findings section. By fostering open discussions about cultural norms and encouraging reflective practices, the project helped students move beyond stereotypes, cultivating a deeper understanding of each other's perspectives.

Key Cultural Communication Traits of Japanese and Taiwanese Students: A Collaborative Foundation for COIL Project

To provide a strong foundation for the COIL project, this table—developed collaboratively by the three instructors and authors—summarizes key differences in Japanese and Taiwanese communication styles. Japanese communication is characterized by indirectness, reserved emotional expressiveness, and the strategic use of silence to foster harmony. These traits often prioritize group consensus over individual expression, promoting cohesion but occasionally creating misunderstandings with participants from low-context cultures.

Table 1: Stereotypical Cultural Communicative Factors in Group Dynamics

Aspect	Japanese (JP)	Taiwanese (TW)
Directness	Indirect, often avoids saying "no" directly to prevent offending, using hints or softened refusals.	More direct, may openly express disagreement while maintaining respect, especially in group settings.
Expressiveness	More reserved in physical expression, with a focus on subtle gestures and limited overt emotion.	Tends to be expressive, using body language and tone to convey emotions.
Use of Silence	Silence is meaningful, used to convey thoughtfulness or respect, and is an integral part of dialogue.	Less reliance on silence; pauses are generally brief or conversational.
Harmony and Conflict	Prioritizes group harmony (Wa), often suppressing personal opinions to align with group consensus.	Open to expressing individual views in group contexts.

Taiwanese students, influenced by a blend of traditional and Western educational norms, are more direct and expressive. They openly share opinions while maintaining respect, using tone and body language to enhance clarity in discussions. Pauses in Taiwanese communication are typically brief and conversational, encouraging an inclusive and active exchange of ideas. This openness fosters dynamic group interactions, balancing personal viewpoints with collective goals.

By integrating these insights into project design, COIL instructors ensured participants were equipped to navigate cultural differences effectively. Understanding these distinctions empowers students to embrace diverse perspectives, mitigate potential misunderstandings, and leverage the strengths of both cultural approaches for meaningful collaboration.

Methodology

This study explores the intercultural communication and group dynamics of a Collaborative Online International Learning (COIL) project between students from Kyoto University of Foreign Studies (KUFS) in Japan and National Pingtung University (NPTU) in Taiwan. Conducted over a four-week period, the project aimed to foster linguistic proficiency, leadership development, and cross-cultural understanding through research and presentations on topics related to the United Nations Sustainable Development Goals (SDGs).

Project Design and Timeline

The COIL project followed a structured, phased timeline to guide student collaboration and learning:

Table 2: KUFS-NPTU COIL Project Design & Timeline

Phase	Tasks	Activities	Objectives
1	Contact & Connect	- Use LINE OpenChat for introductions and team building. - Orientation on communicative appropriateness (e.g., politeness, turn-taking).	- Establish rapport in a low-pressure environment. - Foster initial team cohesion and comfort with communication tools.
2	Communicate & Compare	- Engage in discussions to identify SDG-related issues. - Reflect on global and local challenges using descriptive writing exercises (5W1H framework)	- Develop understanding of global and local perspectives. - Enhance descriptive writing and analytical discussion skills.
3	Correlate & Collaborate	- Synthesize data gathered from prior discussions. - Conduct brainstorming sessions on shared challenges & opportunities. - Analyze regional dynamics collaboratively.	- Foster solution-oriented thinking. - Promote dynamic group discussions and mutual learning.
4	Construct & Change	- Produce a final multimedia video presentation. - Combine persuasive speaking, collaborative design, and advocacy.	- Clarify issues and propose actionable solutions. - Encourage advocacy and engagement through creative multimedia outputs.

These phases provided a balance between guided activities and opportunities for independent decision-making, allowing students to develop linguistic, critical thinking, and intercultural competencies.

Tools and Platforms

Two primary tools were used to facilitate the COIL project: LINE OpenChat and Google Workspace.

LINE OpenChat.

LINE was chosen for its familiarity and ease of use among students, providing a moderated and invite-only platform to ensure privacy and transparency. It allowed students to communicate asynchronously, fostering friendly, informal exchanges before transitioning to more formal tasks.

A clear rationale for starting with an SNS (social networking) platform is that an international project which could seem daunting to university students, started with the method of informal, concise, and immediate communication that students already use regularly.

The LINE application, widely used by Asian students, was chosen specifically for several reasons. First, it's a platform that most students are comfortable with. Secondly, it ensures privacy. Invite-only, moderated LINE groups are protected and moderated by the professors, which largely eliminates issues like cyberbullying or discomfort with students sharing personal information. Finally, the use of such an SNS platform lends itself to specific instruction, scaffolding, and orientation regarding appropriate communication manners. Students are then more effectively prepared to engage in collaborative research on global or local issues. Because students have an innate curiosity about their international peers' community, living situations, and academic environment, our goal as educators should be to nurture that curiosity. A foundation of informal, friendly, 'chat-based' communication results in participants who are more invested and motivated in the COIL project.

Workshops, practice sessions, and in-class instruction proved to be an effective tool for Japanese participants, allowing them to bridge the gap between a traditionally reserved or indirect communicative style, and the more assertive and direct approach of their Taiwanese counterparts. These workshops covered techniques for effective greetings, offering choices, asking questions, encouraging others, turn-taking, and promoting group sharing. Practicing these skills in a controlled environment before team meetings helped immensely.

Google Workplace (Google Sheet, Google Slides, Google Docs).

Google Sheets, Slides and Docs served as the main platform for collaborative work, enabling students to co-create presentations. Its features, such as color-coded sections and integrated links, ensured accessibility, flexibility, and clarity. Students used this suite of tools to organize their ideas, share resources, and prepare their final video projects. For students with a limited experience using the Google Suite of applications for education, familiarity and practice with these ubiquitous platforms in an international shared context yielded a tremendous collateral benefit for students, many of whom will have opportunities to work collaboratively in their future careers.

Additionally, the combination of these platforms facilitated synchronous and asynchronous interactions, ensuring that all participants could engage effectively despite differing schedules and technological proficiencies. The reality of COIL projects is that a great deal of logistical negotiations become necessary when a group of participants attempt to align schedules and project-based activity.

Data Collection and Ethical Considerations

Data were collected from multiple sources to analyze group dynamics and communication strategies, including:

- Transcripts of group discussions and meeting recordings.
- Reflective surveys documenting students' perceptions of leadership, communication styles, and collaborative experiences.
- Observational notes on participation and interaction patterns during workshops.

All participants provided informed consent, and data were anonymized to protect privacy and confidentiality. These ethical protocols ensured that the study adhered to international research standards, maintaining the integrity of the research process.

Integrating ChatGPT for Communication Data Analysis

To analyze the communication data from the COIL project, ChatGPT was leveraged as a scalable AI tool to process and interpret the extensive chat logs generated by participants. ChatGPT enabled for the systematic analysis of key communication patterns, including leadership traits, participant engagement, and group dynamics, across groups A to T. Prompts were designed to identify leadership roles, quantify message contributions, and highlight collaborative behaviors such as turn-taking and problem-solving. This AI-driven analysis provided nuanced insights, such as identifying students who demonstrated strong leadership through initiative, task management, and organizational skills. Additionally, ChatGPT helped uncover patterns in group interactions, revealing how cultural communication styles influenced collaboration and adaptability. The integration of AI not only streamlined the data analysis process but also allowed for real-time exploration of group dynamics, supporting the study's aim to better understand intercultural collaboration. This approach demonstrates the potential of AI tools in educational research for efficiently extracting meaningful trends from large datasets.

Communication data analysis using ChatGPT included:

- **Analyze Group A to T Chat Logs:**
  Summarize notable leadership traits exhibited by students in Groups A to T.
- **Quantify Data:**
  Determine participant count, roles, number of messages, and word count for each participant in each file.
- **Provide Overall Leadership Analysis:**
  Summarize observations on students who exhibited leadership qualities within their groups.
- **Identify Strong Leaders:**
  Specify which students demonstrated good leadership skills based on engagement, initiative, and organizational skills.
- **Determine Patterns in Group Dynamics:**
  Explain observed patterns in group dynamics across all groups, including leadership, collaboration, and adaptability.

Figure 1: Data Analysis Findings Using ChatGPT

Conclusion

The integration of structured phases, user-friendly tools, and a well-grounded pedagogical framework provided students with a supportive yet challenging environment to develop intercultural communication skills. This methodology enabled researchers to observe the interplay between cultural norms, leadership dynamics, and the balance of scaffolding and autonomy, offering valuable insights for future COIL projects.

Results & Discussion

Quantitative Results and Analysis

The quantitative analysis of group dynamics and leadership roles was conducted using AI tools such as ChatGPT to process communication data from LINE OpenChat logs. The results provided insights into participant engagement, leadership distribution, and messaging trends across 20 COIL groups.

Leadership dynamics in Multicultural Teams

This table provides an overview of the leadership roles and contributions observed across the 20 COIL project groups. The data highlights how leadership was distributed, with a majority of leaders being Taiwanese participants who demonstrated strong organizational and task-oriented behaviors, such as setting meeting agendas, coordinating schedules, and guiding group discussions. Notably, Japanese leaders, though fewer in number, contributed significantly by fostering inclusivity and maintaining group harmony. For instance, in Group F, leadership responsibilities were shared between Casper (TW) and Kurumi (JP), illustrating a collaborative approach that bridged cultural communication styles. This data underscores the interplay of proactive task management and collaborative harmony, emphasizing the complementary strengths that diverse cultural approaches bring to group dynamics.

Leadership Distribution

The analysis revealed that 85% (17 out of 20) of group leaders in the dataset were Taiwanese participants, while only 15% (3 out of 20) were Japanese students. This indicates a significant disparity in leadership roles, with Taiwanese participants frequently assuming proactive leadership positions.

Leadership Contributions

Key leadership activities included, organizing meetings and managing schedules, assigning roles and maintaining focus on group objectives, and facilitating topic discussions and ensuring progress on SDG-related tasks. For instance, in Group A, the Taiwanese leader was responsible for setting the SDG focus and coordinating meeting agendas, while the Japanese leader in Group F supported the group by scheduling meetings and assisting with coordination.

Patterns in Communication and Engagement

The analysis also quantified engagement by examining the frequency of messages and the distribution of responsibilities. Taiwanese participants, on average, sent more directive and action-oriented messages, while Japanese participants contributed by providing reflective inputs and ensuring inclusivity. The data confirmed that these complementary styles fostered group cohesion and productivity.

Table 3: Leadership Roles and Contributions in COIL Project Groups

Group	Leader(s)	Leadership Contributions
A	WeiZi (TW) Sammy Tu (TW)	Organized meetings, set SDG focus
B	Tiffany (TW)	Set group norms, coordinated tasks
C	Rita (TW)	Managed meeting schedules, inclusive approach
D	Jessie (TW) Agnes (TW)	Organized schedules, led topic focus on SDGs
E	Amanda (TW)	Guided meetings, maintained group focus
F	Casper (TW), Kurumi (JP)	Scheduled meetings, helped with coordination
G	Yuki (JP)	Facilitated introductions, kept the group on task
H	Sun (TW)	Coordinated meetings, managed scheduling
I	Sheren (TW)	Organized topic voting, clear communication
J	Jin Ni (TW)	Set group structure, coordinated tasks
K	Adam (TW)	Setup chat, guided discussions
L	Daisy (TW)	Led group introductions, managed schedules
M	Grace (TW)	Organized meetings, maintained focus
N	Cindy Wu (TW)	Facilitated topic discussions, organized meetings
O	Wendy (TW)	Setup chat, encouraged participation
P	Hana (JP)	Coordinated schedules, guided SDG topic focus
Q	N/A	No data available
R	Abner (TW)	Set meetings, facilitated collaboration
S	Shi Yiyi (TW)	Led setup and maintained group cohesion
T	Sherry (TW)	Established group structure, supported collaboration

Qualitative Results and Analysis

Students demonstrated critical thinking skills such as (1) leadership, (2) negotiation, and (3) problem-solving, which are crucial for managing group dynamics and ensuring productive outcomes. In addition, participants had to (4) balance scaffolded and autonomous interactions. By leveraging LINE OpenChat as the preferred communication platform, students could coordinate their efforts seamlessly, share ideas in real-time, and maintain a record of their progress. ChatGPT allowed for the rapid data analysis of text exchanges to identify real-time text exchanges for examples of these key skills. Insights are supported by chat transcript excerpts and data visualization from ChatGPT analysis.

Leadership Skills

Students exhibited leadership within their groups by using communication in LINE OpenChat. On Wednesday, May 8, 2024 at 12:19 PM, the Japanese student (Kana) from Group L texted her group. Her text message was as follows:

> "What our group will do first:
> 1. Decide on one SDG as a group.
> 2. Discuss solutions.
> 3. Divide roles for the presentation (examples: introduction, SDG explanation, solutions, examples, and closing).
> 4. Determine roles for video submission (e.g., video editing, PowerPoint slides, YouTube upload).
>
> The video is due June 9. Let's give it our best!"

This detailed message highlights Kana's clear organization and encouragement of group participation. It also exhibits her ability to maintain focus on deadlines and tasks. Furthermore, it shows initiative because her action was from self-motivation to benefit the group.

Negotiation Skills

An additional exchange using LINE OpenChat showed a clear example of negotiation. On Tuesday, May 14, 2024 starting at 7 PM, Group R discussed the following:

> Abner: "I'm free on weekends."
> Haruto: "Yes."
> Abner: "Which SDGs are you interested in?"
> Haruto: "SDG 2 is interesting."
> Yuri: "I'm also interested in SDG 13. What about everyone else?"
> Yuri: "We have to decide one SDG as a group?"
> Haruto: "I can accept SDG 2."
> Abner: "I am interested in both SDG 2 and SDG 4."
> Yuri: "So will our group choose SDG 2?"
> Abner: "Yes."

This exchange from Group R demonstrates negotiation as students collaboratively discussed their preferences for SDG topics. Members openly shared their interests, considered alternative suggestions, and worked toward a consensus by agreeing on their selection. The dialogue reflects respectful communication and a willingness to accommodate differing opinions to reach a group decision effectively. As a result, the team was able to successfully compromise on SDG 2.

Problem-Solving Skills

Students communicated in Line OpenChat to problem-solve specific issues in their groups. On Tuesday, May 11, 2024, beginning at 9:45 AM, Group F exchanged the following messages:

> Kurumi: "Can anyone create a Google Meet room and record it?"

Casper: "I can create the room, but I don't have storage space on my phone to record."
Hana: "Thank you, Casper! I'll use the screen recording function on my phone to record it."

Group F's problem-solving exchange demonstrates effective teamwork and resourcefulness. Kurumi identified the need for both a meeting platform and a recording solution, initiating the problem-solving process. Casper contributed by creating the Google Meet room but acknowledged a limitation in recording capabilities. Hana offered a practical solution by using her phone's screen recording feature. This demonstrated adaptability and willingness to take responsibility. This exchange highlights how open communication and shared efforts can resolve logistical challenges efficiently within a group.

The Balance Between Scaffolding and Autonomous Activities

Achieving an optimal balance between scaffolding and autonomy requires ongoing assessment and flexibility from educators. As the dynamics of roles within cohorts coalesced, structured support was gradually reduced, and instructors transitioned from explicit guidance to a more observational role, with feedback offered only when necessary. Such an approach respected the individual learning trajectories of students, allowing them to develop confidence in both controlled and autonomous group interactions. By fostering both structured skill-building and opportunities for independent application, a nurturing learning environment encouraged not only linguistic proficiency but also essential skills for global citizenship.

Furthermore, student-centered autonomy is important in cultivating authentic group dynamics. Giving students control over group tasks, such as choosing topics, assigning roles, or deciding on the methods they will use to accomplish goals, encourages ownership of their learning and fosters a sense of accountability. When students are encouraged to negotiate roles and contribute their unique perspectives, they not only learn language skills but also develop the ability to navigate and appreciate diverse viewpoints. This aspect of autonomy can deepen intercultural competence by promoting an open-minded attitude and adaptability in group settings.

Discussion

The study's findings provide a nuanced understanding of how cultural communication styles influence group dynamics in COIL projects, addressing both research questions effectively. Leadership, negotiation, and problem-solving emerged as essential skills, with Taiwanese and Japanese students contributing distinct strengths that balanced directness and harmony. These insights demonstrate the potential of diverse cultural approaches to enhance group collaboration and innovation.

The phased structure of the project, combining scaffolding with autonomous activities, enabled students to navigate intercultural challenges while developing confidence and competence. By gradually transitioning to autonomy, students were able to take ownership of their tasks and decisions, fostering critical thinking and intercultural adaptability. These practices also deepened students' appreciation for diverse perspectives and communication styles.

Qualitative analysis revealed meaningful patterns in leadership and collaboration, with students successfully negotiating tasks, resolving logistical challenges, and building inclusive group dynamics. The integration of AI tools like ChatGPT to analyze the communication data from LINE OpenChat logs facilitated a detailed examination of these interactions, offering valuable recommendations for refining future educational strategies. In sum, this study highlights the transformative potential of COIL projects in preparing students for meaningful engagement in a multicultural and interconnected world.

Conclusion

This study provides valuable insights into how COIL projects can bridge cultural divides and prepare students for the demands of global citizenship. By examining leadership, negotiation, and problem-solving within the context of intercultural collaboration, the research questions were addressed with a focus on cultural communication norms and the pedagogical balance of scaffolding and autonomy.

The findings reveal the complementary strengths of Taiwanese and Japanese students in managing group dynamics, with the former often taking proactive leadership roles and the latter ensuring inclusivity and harmony. These dynamics illustrate the potential for diverse cultural approaches to enrich collaboration and foster mutual understanding. The project also highlighted how carefully calibrated scaffolding transitions to autonomy can empower students to take ownership of their learning, fostering critical skills and confidence.

The integration of AI tools like ChatGPT for analyzing communication provided actionable insights into group interactions, enhancing the ability of educators to tailor support to students' needs. This approach offers a scalable and innovative model for improving the effectiveness of COIL projects.

Looking ahead, future COIL initiatives should explore larger and more diverse participant groups, incorporate longer-term collaborations, and examine the role of emerging technologies in supporting intercultural learning. By continuing to innovate and refine these practices, COIL projects can play a vital role in equipping students with the skills and perspectives needed to thrive in an interconnected, multicultural world.

Abstract
Project-based learning (PBL) is a pedagogy that is widely adopted for its authentic, complex and collaborative learning experience. Many studies have shown that team effectiveness (TE) plays a pivotal role in determining the success of project outcomes. Effective teams are generally characterised by shared goals, clear communication, mutual respect and a commitment to collective success. This paper aims to study the specific mechanisms and conditions that optimally enhance team performance in PBL. It highlights the importance of effective team processes and team dynamics, including appropriate deployment of decision-making and conflict resolution strategies, task assignments, team feedback and reflections, in conjunction with the cohesive integration of each member's contribution with a growth mindset towards the development and evaluation of team competencies. Furthermore, it also explores the role of project supervisors in fostering team effectiveness through providing structured guidance, constructive feedback and appropriate resources to students. The framework of fostering a positive team culture is evaluated by four dimensions, namely Team Motivation (TM), Team Structure (TS), Team Dynamics (TD) and Team Excellence (TE). Empirical evidence inferred from their strong positive Spearman correlation ($\rho > 0.82$) confirm the proposition that team characteristics are interrelated and mutually reinforcing for the facilitation of successful PBL learning outcomes.

Keywords: Project-Based Learning, Team Effectiveness, Team Motivation, Team Structure, Team Dynamics and Team Excellence

Introduction

Teamwork is the catalyst for success in project-based learning (PBL). By leveraging diverse perspectives and skills, teams can tackle complex challenges, foster innovation, and achieve exceptional outcomes. Effective collaboration is crucial for optimising learning and project quality. Given the significant impact of team effectiveness on student learning and performance, there is imperative to explore the key components of effective teams and identify strategies to cultivate positive team dynamics within the PBL framework. This research aims to answer the following questions:

1. What are the core characteristics of a high-performing team in a PBL context?
2. Which strategies can educators implement to foster a positive and collaborative team environment within PBL projects?

To fully understand and enhance team effectiveness in PBL setting, this study will adopt a multidimensional framework comprising Team Motivation (TM), Team Structure (TS), Team Dynamics (TD) and Team Excellence (TE).

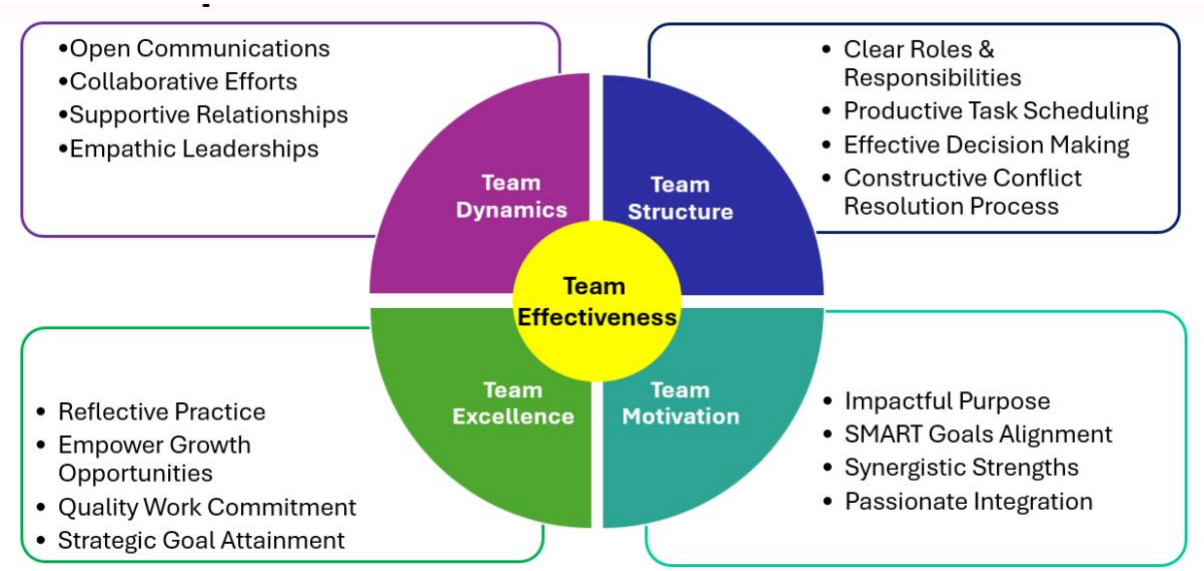

Figure 1: The Conceptual Framework of an Effective Team in PBL Settings

Figure 1 illustrates these dimensions and their subcomponents. The first dimension, TD, delves into the interpersonal interactions and relationships within the group that foster a positive and collaborative team culture. Effective collaboration depends on open communication and mutual support among team members. Team members who can share relevant information, expressing their opinions and feelings, offering active listening and constructive feedback would also respect and appreciate each other's diverse perspectives, needs, and emotions to create a supportive and trusting environment. The second dimension, TS, explores the organisational aspects of the team that facilitate optimal performance. These aspects involve defining clear roles and responsibilities, facilitating productive task scheduling, establishing effective communication channels, making decisions, and resolving conflicts constructively. A well-structured team assigns tasks based on members' strengths and preferences, coordinates efficiently to meet deadlines, makes decisions that reflect the team's consensus and goal directives, and manages disagreements and conflicts in a respectful and positive way, focusing on issues rather than personality differences and seeking win-win solutions. It conveniently leverages on e-platforms (e.g. WhatsApp, Telegram, and Google Doc) and regular meetings for facilitating group discussions. The third dimension, TM,

examines the factors that would inspire team members to engage in the project. These factors include having a clear and meaningful purpose that aligns with the team's values and interests, identifying and synergise the diverse strengths and skills of the team members in the facilitation of shared SMART (Specific, Measurable, Achievable, Relevant, Time-bound) goals. The passionate integration of the team members is manifested in their enthusiasm, passion, and dedication for the project. The final dimension, TE, is envisioned to be adopting a growth mindset that leads to high-quality innovation and improved student learning outcomes through reflective practice, opportunities for growth and commitment to quality work. While achieving the strategic goals, teams are capable of self-monitoring, recognising strengths and weaknesses and using feedback or mistakes as learning opportunities. Teams are also dedicated to continually improving their skills and producing high work standards.

Literature Research

PBL is a pedagogical approach that engages students in active and collaborative inquiry to solve authentic problems and acquire domain knowledge and transferable skills (Guo et al., 2020; Helle et al., 2006; Marinho et al., 2022; Sadji et al., 2023; Žerovnik et al., 2021). PBL aims to develop the 21st century competencies in students with emphasis on problem-solving, critical thinking, teamwork and communication (Billah et al., 2019; Martínez, 2022; Yong & Saad, 2023). By working in small groups, students can tackle real-world issues that are relevant and meaningful to them and their communities. Several studies have shown the positive effects of PBL on student learning outcomes, motivation, and teamwork and collaboration (Andriyani & Anam, 2022; Hasan et al, 2023; Hussein, 2021; Johnsen et al., 2024; Le, 2018; Lee et al, 2015; Lou et al, 2004; Papanikolaou & Boubouka, 2010). Qualitative and quantitative research methods have been used to explore the effects and outcomes of collaborative learning in PBL settings. Qualitative studies have revealed how PBL fosters an inclusive and equitable culture that leverage on the diverse backgrounds of the group members to enhance their social and academic skills. In particularly, deep conceptual understanding and knowledge retention are important for Science and Technology education (Alharbi et al., 2018; Almulla et al., 2020; Dogara et al., 2020; Kim & Iwuchukwu, 2022; Konrad et al., 2021; Ma, 2022; Setyowidodo et al., 2020; Zhang et al., 2023). In contrast, quantitative studies complement the investigations by providing empirical evidence on the positive impact of PBL on student outcomes. Various measurement instruments of questionnaires, peer assessments, interviews, observations and self-reflection journals have been used to assess quality of the teamwork, efficacy and motivation in students (Andriyani & Anam, 2022; Guo et al., 2020; Zhang & Hwang, 2022). For instance, Andriyani and Anam (2022) showed that PBL can improve collaborative skills among Indonesian university students. Similarly, Guo and colleagues (2020) emphasised the importance of using multiple measurement methods to elicit students' experiences and perceptions. Moreover, Zhang and Hwang (2022) examined how peer assessment and problem-solving tendencies interacted to affect students' learning achievements and collaboration in a technology-enhanced PBL environment. However, challenges and barriers had been identified to hinder effective collaboration. Conflicts often emerge in teams due to poor communication, unfair task allocation, clashing values, lack of responsibility and communication skills among team members which can jeopardise the group’s synergy. Other barriers may include the uncertainty about the project scope, process, and outcomes as well as inadequate competency or skills needed for the project. These challenges prompt the need for careful instructional design and intervention strategies to facilitate and sustain successful collaboration in PBL (Alharbi et al., 2018; Berta et al., 2020; Dogara et al., 2020; Hussein, 2021; Marinho et al., 2022).

Methodology

Forty-five year two DPCS students (n=45) had been recruited for this study. They were divided into thirteen project teams, with six groups consisting of four students and seven groups consisting of three students. Each group was assigned a real-world project, sponsored by industry partners who provided the general project direction and requirements. The cohort was divided into six groups of four and seven groups of three. Each team with composition of diverse skills, interests, personalities and working styles, was responsible for working out the specifics and managing project to achieve innovative solutions using PBL. This approach encourages collaboration and helps students develop transferable skills of problem-solving, decision making and investigative abilities, in addition to acquiring relevant technical knowledge and skills.

Figure 2 illustrates the five stages of PBL. They involve planning, organisation and monitoring, forming the key aspects in developing communication and collaborative teamwork skills. During the initial stage of ‘Questioning’, teams employed an inquiry-based approach to ignite curiosity and generate innovative ideas for their projects. By conducting SWOT analyses, teams leveraged on their strengths and opportunities while mitigating weaknesses and threats. Simultaneously, team members brainstormed and developed interview questions to gather consumer insights. These insights guided the team's strategic ideation process, leading to the 'Define' stage, where the team established the project's persona, needs statement, scope, roles and responsibilities designation and SMART goal setting. Establishing shared goals and ground rules within a team not only increased accountability and clarified expectations for each member, but also enabled the team to effectively plan and track project milestones with the use of Gantt charts. Prior to beginning experimentation, the 'Research' stage allows teams to gather relevant information from reliable sources, including books, journals, lecture notes, articles, and online materials. The teams then organised, analysed, synthesised, and made sense of the information to answer the driving questions. This led to knowledge sharing, collaborative learning, and peer feedback. During the 'Create and Improve' stage, teams engaged in prototyping activities such as setting interim goals, experimenting with formulations, testing, data collection, and other laboratory work whereby collaboration and communication skills are emphasised. Teams were given the autonomy to collectively manage resources as well as recommend improvements and solving problem-solving methods. Additional support from their project supervisors and industry partners were also rendered. A robust monitoring and feedback system is essential to track each member’s progress, ensure resource availability, evaluate findings and facilitate efficient and effective decision-making. In the final ‘Present and Evaluate’ stage, team collaborated to achieve their goals, reflect on their findings and present their recommendations to an audience of lecturers, industry partners and professionals.

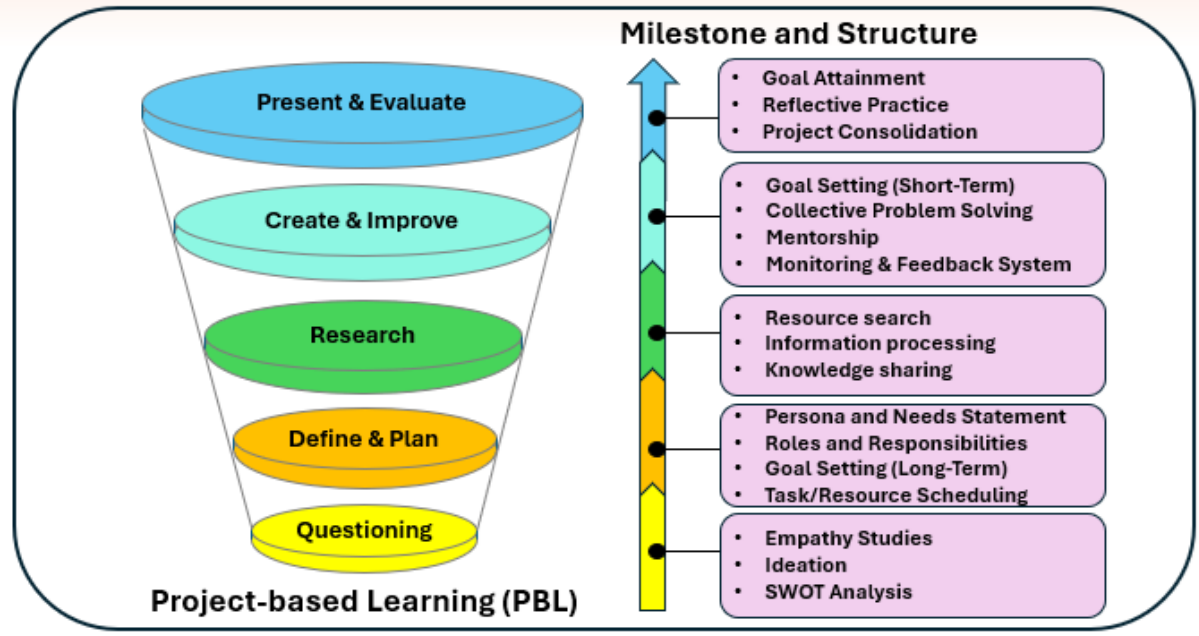

Figure 2: The Facilitation of Effective Teamwork in PBL Settings

To monitor the team effectiveness throughout the project, dialogue sessions were conducted in the first and third quarter of the semester. These sessions aimed to help the students reflect on their collaboration and communication skills beyond the project tangible outcomes. As a final evaluation, a questionnaire adapted from the Team Effectiveness Diagnostic by London Leadership Academy, National Health Service, was administered. The assessment tool used a five-point Likert scale - (1-Strongly Disagree; 2-Disagree; 3-Neutral; 4-Agree; 5-Strongly Agree) - to measure the students' perception of their team effectiveness based on four dimensions: TM, TS, TD and TE respectively. These dimensions capture the key aspects of team functioning that are considered crucial for successful PBL.

Results and Discussions

The reliability of the questionnaire was first assessed by calculating the Cronbach alpha (α) for each dimension of team effectiveness. This parameter is a measure of internal consistency that indicates how well the questionnaire items in a scale are related to each other. With reference to Table 1, the data reflected that all the dimensions had high reliability, with α values ranging from 0.972 to 0.980. This indicates that the questionnaire items were consistent and coherent in measuring the different aspects of team effectiveness in PBL. A Spearman correlation analysis was subsequently conducted to examine the relationships between the four dimensions of team effectiveness in PBL settings. The results in Table 1 showed that all the dimensions were positively and significantly correlated at 95% confidence level, signifying that they were mutually reinforcing and collectively contribute to the overall team performance. A matrix plot was used to graphically represent the data in Figure 3. The upward trends observed in all the plots validate the analysis with strong correlations with ρ values of 0.934, 0.922, and 0.909 between TS and TD, TS and TM, and TD and TM respectively. These findings suggest that the quality of team interactions and relationships has a direct impact on the formation of team structure and motivation. A well-defined team structure emerges from effective communication, trust, and collaboration among team members, who can clarify their roles and responsibilities, allocate tasks, and make decisions efficiently. Similarly, team motivation is enhanced by clear team goals that minimise

ambiguity and uncertainty, which are potential sources of stress and demotivation. When team members have a shared understanding of what is expected from them and how their individual contributions align with the team's outcomes, they are more likely to perform their tasks competently with a sense of accomplishment. This positive feedback loop is strengthened by fostering a culture of sharing and learning among team members, which further improves the quality of interactions and facilitates the development of a structure that supports coordinated, communicative, and collaborative work. The learning environment becomes a motivating one where team members feel respected, challenged, confident in their ability to contribute and excel, leading to enhanced performance and ultimate team success.

Table 1: Spearman's Coefficients (ρ) and Cronbach's Alpha (α) Values.

Spearman Coefficient (ρ)	Team Motivation	Team Structure	Team Dynamics	Cronbach's Alpha (α)
Team Motivation				0.9799
Team Structure	0.922			0.9724
Team Dynamics	0.909	0.934		0.9776
Team Excellence	0.839	0.884	0.832	0.9794
			Overall	0.9829

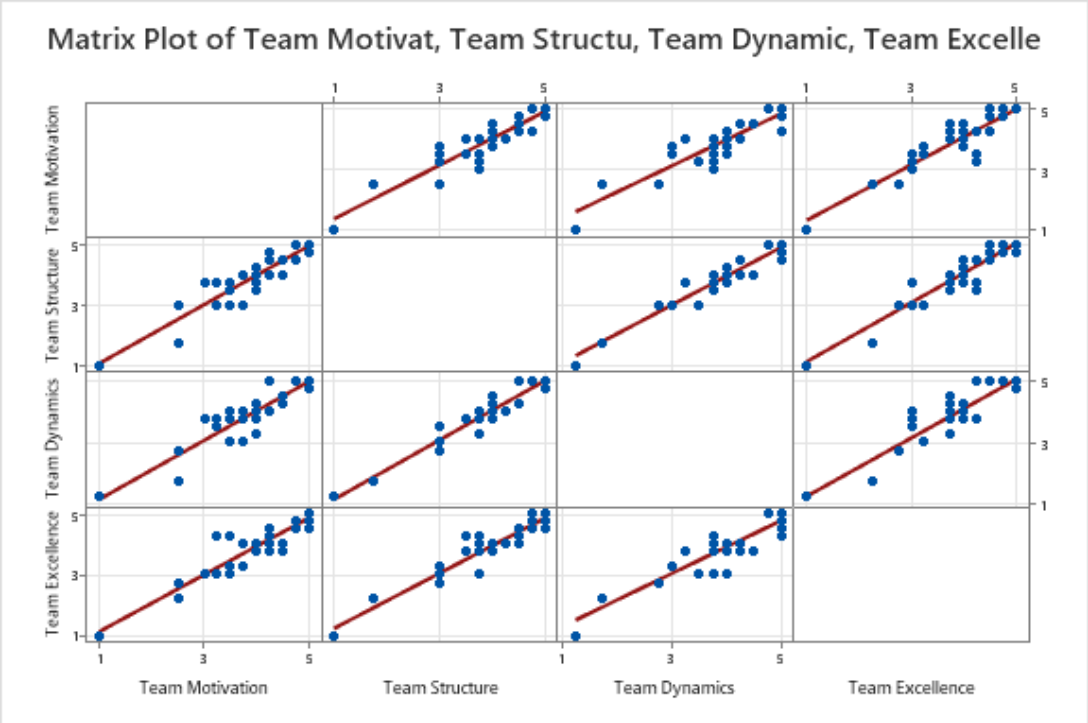

Figure 3: The Matrix Plot Comparison of the Measured Variables

In this section, we posit a team effectiveness model in PBL settings that integrates the four dimensions. The proposed model, depicted in Figure 4, represents the sequential relationship between these four factors that influence and support one another. The innermost layer (TD) is the foundational condition that affects the quality of team interactions and sets the stage for team activities in relation to group dynamics. It involves the development of positive interpersonal relationships, trust, cohesion, communication and conflict resolution among team members. The second layer (TS) is the mechanism that guides and regulates team interactions towards productive outcomes. It involves the implementation of a structural system that the team establishes and adapts to changing conditions and encompasses the

process of defining and assigning roles, responsibilities, tasks, setting milestones, monitoring progress and performance, and providing feedback and support. The third layer (TM) is the driving force that energises and directs team interactions towards shared goals. It involves the alignment of team vision, values and purpose as well as encompasses the intrinsic and extrinsic factors that motivate team members to participate, contribute and collaborate in the team. The outermost layer of the model (TE) is the mindset that shapes the team's attitude and approach in addition to a collective belief in the team's capabilities and potentials. It involves fostering a culture of growth, improvement and resilience in the pursuit of excellence. For example, positive team dynamics can facilitate the adoption of an effective team structure, which in turn can enhance team motivation and team excellence. Conversely, negative TD can hinder the establishment of a clear TS, which in turn can affect TM and TE subsequently.

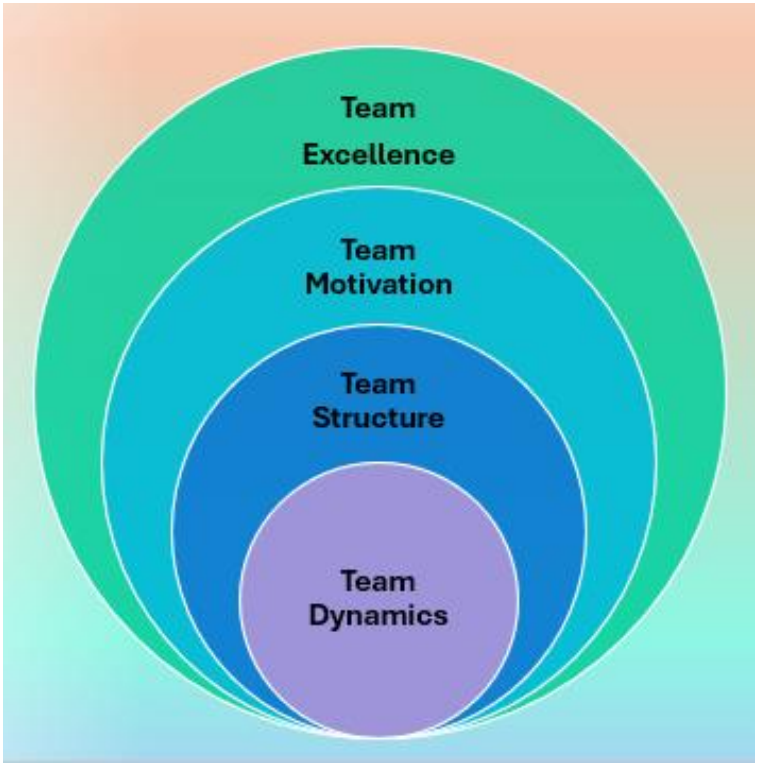

Figure 4: The Conditions and Mechanisms That Optimally Enhance Team Effectiveness in PBL Settings

On the other hand, the model should also consider the diversity and complexity of PBL settings and allows for flexibility and adaptability in its application. Therefore, it does not prescribe a fixed or universal set of conditions and mechanisms for optimal team performance but rather provides a flexible and adaptable framework that can be applied and adjusted according to different situations and needs. Consequentially, the team performance model is not a static outcome but a dynamic process that evolves over time and responds to multiple contextual factors such as the nature of the problem, the characteristics of the learners, the role of the facilitator, and the institutional environment.

In PBL settings, one of the key factors is the role of the project supervisors from academia and professional. They are instrumental (Alharbi et.al., 2018; Kokotsaki et.al., 2016) in enhancing the team's performance, learning and satisfaction by facilitating teams to establish and maintain a clear and coherent team structure that is consistent with the team objectives

and project demands. They also monitor and evaluate team's progress and performance, steer teams towards the desired direction, provide constructive feedback and timely support to address challenging issues such as constructive feedback and support to address challenging issues that exceed students' control, such as technical difficulties, ethical dilemmas or interpersonal conflicts. Furthermore, project supervisors can alleviate students' anxiety by ensuring that the team has adequate and reliable resources, such as information, tools, materials and facilities, that enable them to accomplish the project successfully. While they can stimulate team members to reflect on their learning processes and outcomes periodically, they can also promote team motivation by recognising their accomplishments and progress.

Table 2 summarises the qualitative data collected from self and peer reflections on teamwork performance. The qualitative data revealed the team dynamics in terms of communication, collaboration, coordination and conflict resolution skills that affected the team outputs' quality, efficiency, and creativity, as well as the team members' satisfaction and motivation. The analysis identified various factors that influenced the level of team effectiveness, which are categorised into three levels of high, moderate, and low efficacy. The teams with high efficacy established a positive and supportive team culture that fostered mutual trust, respect and morale. Each member communicated clearly and consistently to ensure alignment with their team goals. The members showed high levels of motivation and accountability to provide constructive feedback and innovative solutions. The teams with moderate efficacy displayed some strengths and weaknesses in different aspects of team effectiveness, but they could improve by addressing their gaps and challenges. On the opposite end of the spectrum, the teams with low efficacy encountered significant difficulties in their fundamental issues such as ineffective leadership, personality clashes and lack of trust that hindered the teams to have clarity about their team goals and roles and responsibilities, leading to the escalation of internal conflicts. Due to an absence of a proper execution of the team mechanism, the ‘free riders’ persisted to lack initiative. The unequal work distribution and contributions from the team members resulted in low team morale and manifested in their poor feedback and creativity skills.

Table 2: The Qualitative Evidence of the Key Team Characteristics Associated to Various Level of Team Effectiveness.

Level of Team Effectiveness	**Team Assessments**
High	- Contribute proactively and significantly to goal attainment by conducting extensive research, sharing of knowledge, seeking feedback regularly and striving for continuous improvement - Exhibit strong role/goal alignment, set detailed plans and follow timelines - Actively engage in problem-solving and provide valuable recommendations and constructive ideas - Develop comprehensive action plans and apply effective strategies collaboratively - Demonstrate high cooperation and strong mutual support in a blame-free environment by actively, acknowledge feelings, maintain optimism and spread positivity, show appreciation, and maintain mutual respect that foster high team morale - Demonstrate effective communication and leadership qualities - Demonstrate strong responsibility. remarkable dedication and adaptability

Moderate	- Inconsistent leadership style and role alignment - Occasional lapses in shared goal setting (prioritise personal goal), task delegation. communication, commitment and contributions, resulting in struggles to meet some of the deadlines - Selective listening and acceptance of criticisms - Moderate efforts in providing innovative ideas
Low	- Ineffective leadership style and role alignment - Inability to overcome personality differences that hinders team dynamics - Failure to understand team goals - Lack of initiative/proactiveness/urgency and commitment, requiring for close supervision - Unequal/minimal contributions - Low team morale resulted from inconsistent support and communication issues

Limitations and Recommendations

There are several limitations in this preliminary study that suggest possibilities for future research. One of them was the short span of a 15-week semester, which might not capture the full development and outcomes. A longitudinal design will offer a more holistic and dynamic evaluation of the team characteristics and their impact on the PBL process. Another limitation lies in the customisation of the intervention strategies that can address the specific needs and challenges of each team, rather than applying a uniform strategy. Extensive studies on various factors such as team leadership, conflict management, and peer evaluation, as well as faculty support in terms of coaching, mentoring, or scaffolding techniques, can reveal how they affect team performance and satisfaction in relation to different levels of team efficacy. They can also help to tackle fundamental issues such as social loafing and blocking in self-selected teams and enhance the team characteristics such as goal clarity, feedback mechanisms, interpersonal relationships, trust, commitment, communication, and respect etc. Furthermore, regular reflections by the team members will lead to more realistic assessment of the strengths and weaknesses of their team composition, process, dynamics and behaviours, and how they influence their overall performance and satisfaction with the projects. This would enable teams to make the necessary adjustments along the way and guide the design, implementation and recommendations of future PBL activities for improving team skills and competencies among students. A third limitation was the focus on one course and subject area, which might limit the relevance and generalisability of the findings to other courses and subject areas. A comparative study of different courses and subject areas, as well as different modes of delivery, such as online or blended learning, could examine the similarities and differences of the team characteristics and outcomes across different contexts and settings.

Conclusion

This study proposes a model of team characteristics that can optimise the benefits of PBL through effective teamwork. PBL is a pedagogical approach that engages the DPCS students in authentic and meaningful projects that require collaboration, communication, creativity, and critical thinking skills. It can effectively enhance the students' learning outcomes and experiences, especially when the team characteristics are well-developed and aligned. The empirical findings indicate that the four dimensions of team effectiveness (TD, TS, TM and

TE) are strongly correlated and mutually reinforcing (ρ>0.82), creating a trajectory of positive PBL experiences. The team characteristics serve as indicators to evaluate team performance. The key to a highly effective team is a cohesive TD that lays the foundational condition for an effective implementation of TS to meet the project requirements and expectations. A clear and strategic structure should guide students' actions and facilitate their project coordination. This clarity of the mechanism drives TM. The high level of enthusiasm and commitment in teams leads to TE, which involves the development of a growth mindset of continuous improvement on the learnings and challenges encountered throughout the PBL process. The strive for excellence continues to promote a collaborative team culture, strengthen team structure, and boost motivation. This cycle of reinforcement is further supported by project supervisors who play a vital role of a facilitator in creating a positive and productive learning environment and providing timely guidance and support in the development of students' technical and soft skills. They also offered opportunities for reflective practice so that teams could evaluate their progress and performance at strategic intervals. In conclusion, this study provides an alternative perspective on how to optimise the benefits of PBL through effective teamwork.

Acknowledgement

The authors would like to express their gratitude to Singapore Polytechnic for its invaluable support in this research.

Declaration of Generative AI and AI-Assisted Technologies in the Writing Process

During the preparation of this work the author(s) used ChatGPT, Gemini, Copilot and Perplexity AIs for drafting, language polishing, and content enhancement. Official Conference Proceedings

Abstract
The emergence of artificial intelligence (AI), particularly ChatGPT, has become widely used to aid students in educational tasks. This study investigated students' usage and perceptions of ChatGPT in academic work engagement using a revised Technology Acceptance Model (TAM) and Theory of Planned Behavior (TPB). An online questionnaire with 55 items was distributed, collecting 315 responses. Eleven latent variables were examined: technology readiness, user engagement, perceived ease of use, perceived usefulness, social influence, academic work engagement, attitude towards using ChatGPT, self-efficacy, response quality, intention to use, and actual use of ChatGPT. Structural Equation Modeling (SEM) revealed that technology readiness positively correlated with user engagement. User engagement significantly influenced social influence, affecting academic work engagement. Intention to use was significantly influenced by attitude towards using, response quality, and was related to the actual use of ChatGPT. Integrating Artificial Neural Networks (ANN) indicated the intention to use it as the most influential factor. The findings provide insights into the factors influencing ChatGPT adoption in academic environments and enhance the platform's performance.

Keywords: ChatGPT, SEM, ANN, Academic Work Engagement

Introduction

ChatGPT is an artificial intelligence-based chatbot developed by OpenAI that uses natural language processing (NLP) to generate human-like responses to text-based inputs. Its emergence became a topic of interest, especially in the academic field, emphasizing its benefits and challenges. It has gained 100 million monthly active users in the two months since its release, marking it the fastest-growing consumer application in history (Dempere et al., 2023). Previous studies highlight the diverse benefits of ChatGPT in education, including research support and automated grading; however, issues such as online testing security, plagiarism, and broader societal and economic impact also arise (Robledo et al., 2023).

In the Philippines, ChatGPT has shown transformative effects on the education system. It became a tool that helps educators create educational content, as it offers suggestions and aids them in answering learners' questions, promoting collaborative work (Malik, 2024). Students in the Philippines utilize ChatGPT to generate and explore new concepts and ideas for their academic work (Antivola, 2023).

However, there are issues regarding its usage, such as the possibility of providing wrong and misleading information and plagiarism (Yu, 2024). However, despite these issues, integrating ChatGPT in academic environments positively impacts teaching-learning (Abderahman, 2024). Integrating ChatGPT in education has advantages and disadvantages; thus, educating teachers and students about its capabilities and restrictions is crucial (Agariadne, 2024).

An artificial neural network (ANN) is a computational model based on the structure and functions of biologically derived neural networks like humans' brains. It comprises interconnected nodes or neurons divided into layers: input, hidden, and output. Each neuron processes input data using weights, biases, and activation functions, allowing the network to learn from complex, non-linear relationships in the data through training. In SEM, indicator variables can be integrated with indirectly visible indicators (Shaghayegh, 2023). A new generation that merges SEM with artificial neural networks (ANNs) has emerged and aims to address the issues that cannot be solved solely by SEM analysis.

Contrary to SEM, an ANN is not suitable for hypothesis testing, but further to linear relationships can also deal with non-linear relationships. In addition, the ANN is capable of assessing the non-compensatory procedures. Moreover, the ANN is more reliable and can provide more accurate predictions than linear models (Sol & Baras, 2022). Furthermore, the integration of the SEM and ANNs allows for further validation of the findings of the SEM and the capture of the non-linear interactions between the antecedents and the outcome variables (Ghavifekr & Rosdy, 2015).

The research examines how college students utilize ChatGPT for their academic studies, aiming to fill a significant gap in the existing literature on this subject. The research examines how college students utilize ChatGPT for their academic studies, aiming to fill a substantial gap in the existing literature on this subject. These findings have implications for educators and students and provide valuable insights into teaching methods and strategies that promote deeper learning and responsible technology used in the classroom. By understanding how students engage with ChatGPT, educators can adapt their instructional approaches to integrate better AI-powered tools into the learning environment, ultimately enhancing the overall educational experience for students (Khan & Siddiqui, 2023). By understanding how students engage with ChatGPT, educators can adapt their instructional approaches to

integrate AI-powered tools into the learning environment better, ultimately enhancing the overall educational experience for students.

The study offers insights into the potential challenges and opportunities associated with AI-powered writing assistants, particularly in developing regions such as the Philippines. By shedding light on adopting the technology acceptance model (TAM) at the academic level, this research contributes to an expanding body of knowledge on the utilization of AI tools in educational settings (Kamalov et al., 2023). Understanding the unique challenges and opportunities presented by AI-powered writing assistants in developing regions can inform the development of tailored strategies to maximize their benefits and address potential barriers to adoption, thereby contributing to advancing educational practices and technologies in these contexts.

The research aims to comprehensively investigate the factors consistently motivating college students to utilize ChatGPT within educational settings. By exploring elements such as perceived usefulness in academic tasks, convenience in accessing information, efficacy in resolving queries, and broader impacts on academic advancement, the study seeks to uncover the fundamental motivations underlying students' recurrent engagement with the platform. Through this thorough examination, the research endeavors to attain a holistic understanding of what encourages students to persistently employ ChatGPT as a valuable resource in their educational pursuits.

The research investigates accessibility and ongoing user engagement, particularly among college students, to facilitate effective utilization of AI tools for deeper learning and responsible technology use. This endeavor highlights the importance of adopting a holistic strategy, including implementing innovative pedagogical practices integrating AI tools into educational approaches. By offering dynamic learning experiences tailored to diverse learning styles, educators can address potential disinterest or boredom that may lead to persistent usage of AI tools (Nguyen, 2023).

Moreover, ethical considerations are pivotal, necessitating open discussions on responsible technology use to empower students to make informed decisions and navigate ethical dilemmas associated with AI tools. Adopting student-centered approaches allows educators to understand better and address motivations driving persistent usage, fostering a sense of ownership and accountability among students (Iversen et al., 2015). Additionally, promoting critical thinking skills through activities that stimulate analysis, evaluation, and synthesis of information enables students to approach AI tools thoughtfully, minimizing the potential for over- dependence. Maintaining a balance between technology use and traditional pedagogical approaches ensures a comprehensive education encompassing varied learning experiences, diminishing the risk of excessive reliance on AI tools (Yu, 2024).

Methodology

Participants

The researchers implemented a hybrid methodology for disseminating survey questionnaires, integrating digital and conventional approaches. Google Forms served as the principal platform for distributing survey inquiries across diverse social media channels, complemented by face-to- face surveys wherein participants were provided with physical copies of the questionnaires. Before participation, each respondent provided informed

consent. The study was conducted at Occidental Mindoro State College (OMSC), encompassing eight distinct college departments with a population exceeding 5,000 individuals as of 2024. A simple random sampling technique was employed, and a sample size of 315 respondents was determined, exceeding the typical requirement of 200 respondents, especially in studies involving Structural Equation Modeling (SEM) (Khan & Siddiqui, 2023). These selected participants actively engaged in online and physical surveys, responding to a comprehensive questionnaire comprising 55 items.

The data gathered indicates that among the 315 participants surveyed, 54.3% identified as female, while 45.7% identified as male. Most respondents fell within the age range of 20-22 years (44.1%). Additionally, 33.7% were between 18-20 years old, 16.2% were aged 22-25, and only 6.0% were 25 years old and above. Regarding academic affiliation, the College of Business and Administration accounted for the most significant proportion of respondents, comprising 23.8% of the total. The School of Architecture had the lowest representation at 5.1%. Regarding educational attainment, 52.4% of respondents held a bachelor's degree, 34.9% had not completed high school, 8.3% had undergone college or vocational training, and 4.4% held a master's or doctorate. When examining monthly income, most respondents reported earning less than Php 10,000, constituting 60.6% of the sample. Additionally, 22.5% earned Php 20,000 or more monthly, 10.5% earned between Php 15,000 and Php 20,000, and only 6.3% earned between Php 10,000 and Php 15,000 monthly.

Structural Equation Modeling

The variables were drawn from a variety of research sources in literature. Observable factors were assessed using a Likert scale ranging from 1 to 5, where 1 signified "strongly disagree" and 5 signified "strongly agree", as shown in Figure 2. Data analysis was performed using AMOS software. The theoretical model data were confirmed through Structural Equation Modeling (SEM). SEM is especially effective for constructing a theoretical causal model that includes anticipated covariances among variables (Cruz-Cárdenas et al., 2021). This facilitates the exploration of covariances and provides valuable insights.

Results and Discussion

Results

This study investigates underlying factors influencing students' behavior and attitude in utilizing ChatGPT in their academic work. Eleven latent variables were examined using the structural equation model (SEM) to assess the relationship between technology readiness (TR), user engagement (US), perceived ease of use (PEU), perceived usefulness (PU), social influence (SI), academic work engagement (AWE), attitude towards using ChatGPT (ATU), self-efficacy (S), response quality (RQ), intention to use (IU), and actual use of ChatGPT (AUC). The SEM results show that out of 14 hypotheses, three were found to be insignificant, namely technology readiness towards perceived ease of use, academic work engagement towards perceived usefulness, and perceived ease of use towards attitude towards using ChatGPT having the p-value above 0.05, which does not meet criteria of the SEM standards on cut off procedures. Thus, a revised SEM was obtained by removing these hypotheses following the previous studies (Khoza et al., 2024).

Significant relationships, evidenced by p-values below 0.05, exist between technology readiness and user engagement (H1), user engagement and social influence (H3), user

engagement and perceived ease of use (H4), social influence and academic work engagement (H5), perceived usefulness and social influence (H6), perceived usefulness and perceived ease of use (H8), perceived usefulness and attitude towards using ChatGPT (H9), self-efficacy and attitude towards using (H11), attitude towards using and intention to use (H12), response quality and intention to use (H13), and intention to use and actual ChatGPT use (H14). Conversely, non-significant relationships, with p-values of 0.05 or higher, were found between technology readiness and perceived ease of use (H2), academic work engagement and perceived usefulness (H7), and perceived ease of use and attitude towards using ChatGPT (H10).

A detailed examination of literature-derived guidelines concerning students' engagement with ChatGPT alongside a compilation of standard model fit statistics obtained from a structural equation model. A thorough evaluation of these model fit indices is essential to ascertain how the proposed model accurately reproduces the observed co-variance matrix among all indicators. The Chi-Square (CMIN) statistic, when normalized by the degree of freedom (DF), yields an estimate of 2.196, indicative of an excellent fit. Moreover, the Comparative Fit Index (CFI), Incremental Fit Index (IFI), and Tucker Lewis Index (TLI) surpass the minimal values recommended for satisfactory fit, boasting respective values of 0.803, 0.805, and 0.792. Researchers have diligently addressed all modification indices within the same variable to enhance model fit, implying room for further refinement. Finally, the Root Mean Square Error of Approximation (RMSEA) meets the established criteria at 0.062, with lower values denoting superior fit (Ekşioğlu & Ural, 2022). The evaluation shows that a well-fitted model, based on positive values for all the fit indices, indicates potential improvements by addressing these modification indices within individual variables.

Artificial Neural Network

An Artificial Neural Network (ANN) operates similarly to the brain's neural structure, processing data through interconnected nodes to recognize patterns and make predictions (Raj, 2023). Similarly, Structural Equation Modeling (SEM) analyzes relationships between variables, making it an applicable tool for assessing how ANNs learn and predict outcomes. The SEM findings indicate that all latent variables positively correlate with each connection, as indicated by p-values > 0.05. In the context of ANN, input nodes such as RT, US, PEU, PU, SI, AWE, ATU, S, RQ, and IU demonstrate a significant correlation with the dependent variable, representing the actual use and the study's endpoint. The findings from the ANN revealed that the variable Intention to Use (IU) emerged as the most influential factor, followed by the respective parameters as outlined. The consistent findings observed in both SEM and ANN are crucial to consider the indirect effect of SEM, emphasizing its substantial impact on the reported outcomes. This underscores the discovery's significance, validated through the hybrid SEM-ANN methodology (Figure 1).

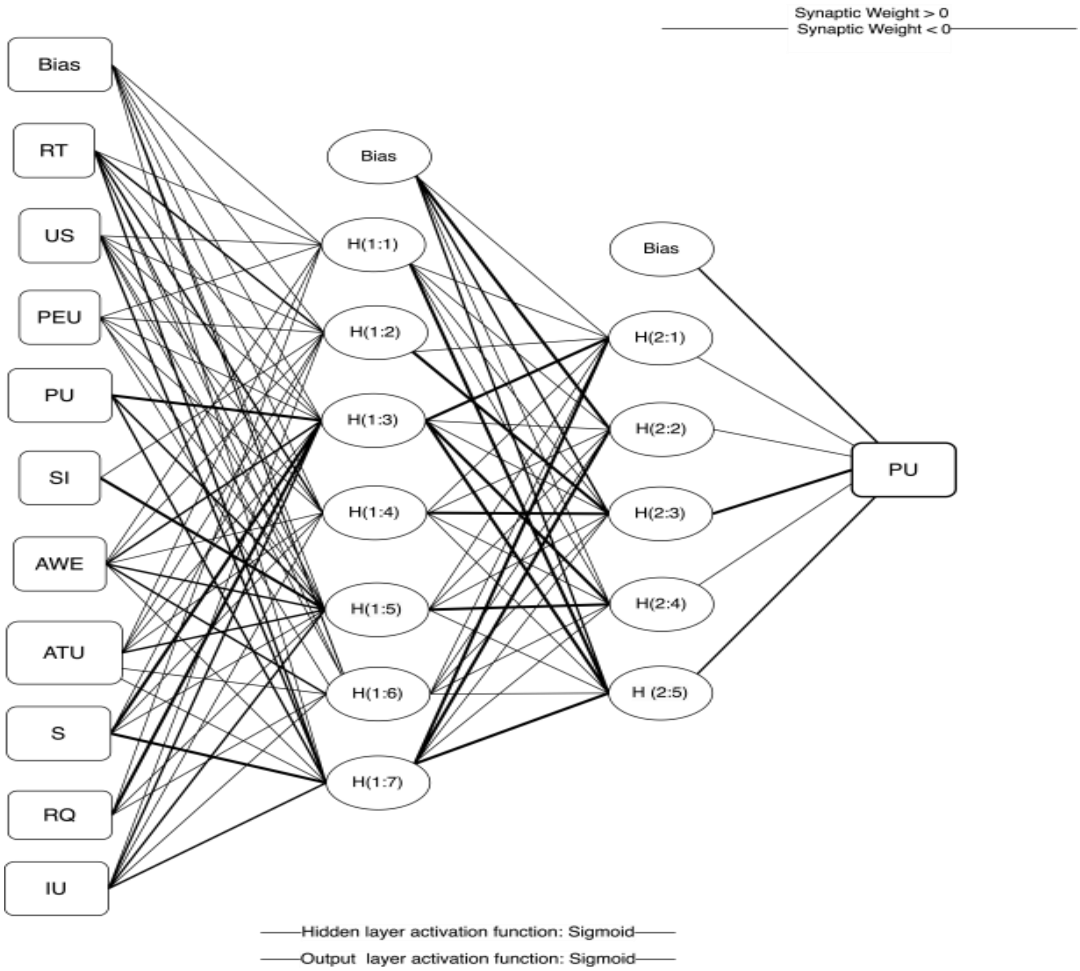

Figure 1: Artificial Neural Network Model

Conclusion

Flash Chat GPT is an artificial intelligence-based chatbot developed by OpenAI that uses natural language processing (NLP) to generate human-like responses to text-based in-puts. Its emergence has become a topic of interest, especially in the academic community, emphasizing its advantages and challenges. Hence, the study delved into the intricate relationships among various factors influencing college students' engagement with ChatGPT, including technology readiness, user engagement, perceived ease of use, perceived usefulness, social influence, academic work engagement, attitude towards using ChatGPT, self-efficacy, response quality, intention to use, and actual use of the platform. Utilizing Structural Equation Modeling (SEM), the analysis unveiled significant positive correlations, most notably between technology readiness and user engagement. This finding implies that students with a better grasp of effectively utilizing ChatGPT tend to participate more actively on the platform.

The researchers used digital and traditional methods in distributing survey questionnaires to 300 participants to understand students' attitudes, identify key engagement factors, and evaluate ChatGPT's impact on academic outcomes. The questionnaire, created by the researchers, was divided into 14 sections and covered 11 factors, with 55 questions. They used AMOS software to analyze the data and confirmed their theoretical model with SEM.

To further explore and validate these relationships, an Artificial Neural Network (ANN) model was employed to analyze training and testing datasets related to students' perceptions and usage of ChatGPT. The ANN model, trained on a 70% data sample and tested on a 30% data sample, provided performance metrics such as the Sum of Squared Errors (SSE) and Root Mean Square Error (RMSE), which indicated the accuracy and predictive capability of the models in assessing students' engagement with ChatGPT. Recognizing the limitations of SEM in capturing nonlinear relationships and non- compensatory procedures, the study integrated SEM with ANN. This hybrid approach allowed for a more comprehensive validation of SEM findings and enabled the capture of nonlinear interactions between the antecedent and outcome variables. The combined insights from SEM and ANN offer valuable implications for educators and students, informing the development of tailored strategies to promote deeper learning and responsible technology use in higher education settings.

In conclusion, the study provides researchers, teachers, and educational technology developers with a deeper understanding of factors that affect students' involvement in using AIWriters Writing Assistants, which offers valuable insight on developing effective teaching practices, as well as information on designing and implementing artificial intelligence tools in education settings.

The Impact of Skill Test on Technical High Schools in Taiwan

Jen-Chia Chang, National Taipei University of Technology, Taiwan
Shao-Chen Chou, National Taipei University of Technology, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This study primarily investigated the impact of skill test on vocational education in Taiwan. The skill test certificate, issued by the government, assessed the proficiency of technical skills, providing vocational school students with a clear understanding of their learning outcomes. Through a questionnaire survey, this research gathered insights from vocational school principals regarding the use of the skill test as a measure of student skill acquisition and its appropriateness within the educational context. A survey was conducted using a combination of open-ended and closed-ended questions as research instruments. The survey targeted principals of technical high schools and a total of 60 questionnaires were collected. The results indicated that the primary benefits of implementing a skill test were the improvement of the students' technical proficiency (98.3%) and the enhancement of the teachers' professional instructional skills (71.7%). The primary issues requiring improvement were the impact of skill test on traditional school instruction (45%) and the obsolete nature of examination questions (33.3%). The policy recommendations included: 1. increasing industry participation and assigning private organizations to manage relevant skill test certificates under the Workforce Development Agency, MOL. supervision; 2. reviewing and updating skill test to improve their content; and 3. urging the Ministry of Education to align the curriculum with skill test requirements. In conclusion, optimizing the content and processes of skill test, promoting Occupational Competency Standard and enhancing the social image of vocational education could effectively change societal perceptions of skills and improve the overall quality of vocational education.

Keywords: Skill Test, Skill Test Certificate, Vocational Education, Technical High Schools, Talent Cultivation, Special Achievement and Screening-Based Admission, Ability Identification

Introduction

The skill test as an evaluative tool for assessing technical proficiency has had a significant impact on the development of vocational education in Taiwan. Vocational education aims to equip students with specialized skills in specific fields to meet the rapidly changing demands of industries. The skill test system plays a critical role in this process, not only by providing students with a standard to self-assess their learning outcomes but also in helping institutions set educational goals and directions.

Research by Hsi-Shan Lai (2020) highlights a positive relationship between awareness of the skill test, learning effectiveness, and employment awareness. Furthermore, learning effectiveness positively influences employment awareness. In relation to skill test-related topics, experts and scholars in Taiwan have conducted extensive research on areas such as the appropriateness of question bank design, the impact on teaching, learning motivation, attitudes and learning effectiveness. These studies, primarily focused on students and teachers, include works by Wei-Ming Hsieh (2016), Ching-Chin Su (2019), Hsi-Shan Lai (2020), Tsu-Ming Yeh, Fan-Yun Pai, Yi-Long Shu (2020), and Chia-Yu Wang and Chung-Yung Tu (2021). These studies provide valuable insights for improving the content of the skill test and fostering student skill development, while also laying the groundwork for better alignment between vocational education and industry needs.

Although many scholars have offered valuable suggestions regarding the skill test and student skill development, there remains a lack of empirical research on the role and influence of vocational school principals in this area. As key leaders of vocational schools, the principals' perspectives are crucial to understanding the role of the skill test in vocational education. Therefore, this study aims to explore the views of technical high school principals on the use of the skill test to measure the students' skill acquisition and its appropriateness within the educational context. The main research objectives are as follows:

1. Understand the application of the skill test in vocational education.
2. Investigate the impact of implementing skill tests for full-time students in technical high schools on teaching.
3. Analyze technical high school principals' perspectives on the skill test system.
4. Provide suggestions for the application of the skill test system in Taiwan’s technical high schools.

Literature Review

Current Status of the Skill Test

The skill test is a system designed to assess the professional skills of technicians, with certificates awarded to those who meet the required standards. The primary objective of the skill test is to enhance labor skills and support social and economic development. The exam consists of both a written and a practical test, and individuals who pass are designated as "technicians," receiving a skill test certificate issued by the central competent authority. Since its inception in 1963, more than 9.7 million certificates have been issued.

Of the 139 available occupational categories, 82 carry legal significance, including fields such as crane operations, childcare, Chinese cuisine, occupational safety and health management and employment services. The skill test categories are divided into three levels:

Level A, B and C. If a category is not suited for this tiered classification, it is assigned a single level.

Application of the Skill Test in Vocational Education

The relationship between the skill test, talent cultivation and industry demand is dynamic and interdependent. The skill test not only boosts corporate productivity but also has a significant impact on vocational education. As industries rapidly evolve, educational institutions have increasingly integrated skill development into their curricula to ensure that students acquire the practical skills demanded by the marketplace. The Ministry of Education has adjusted educational policies accordingly, aiming to better align the skill test with formal education.

Special Achievement and Screening-Based Admission Policy.

To improve admissions pathways, the Ministry of Education introduced the "Special Achievement and Screening-Based Admission" policy in 2001 (Ministry of Education, 2001). This policy encourages vocational students to engage in skill learning by offering extra points on entrance exams for those holding relevant skill test certificates. However, some students began acquiring certificates unrelated to their field of study solely to gain bonus points, straying from the policy's original intent of promoting professional skill development.

As a response, the Ministry revised the qualifications for this program. Bonus points are now awarded to students who win prizes in international or national skill competitions. For students holding Level B or higher skill test certificates, bonus points for admission to 2-year and 4-year technological colleges are tiered based on the certificate's relevance to the student's field of study, with 15%, 8% and 4% bonuses for high, medium and low relevance, respectively.

Licensing in Vocational Education Policy.

To enhance the employability of vocational graduates, the Ministry of Education introduced the "Licensing in Vocational Education" policy in the 2009 academic year. This policy emphasizes aligning teaching content with employment demands, making Level B and C skill tests a graduation requirement to ensure that students are job-ready. This initiative has significantly boosted the competitiveness of vocational graduates in the job market (Meng et al., 2010). Institutions such as the Taipei University of Marine Technology and National Chin-Yi University of Technology have already incorporated certification as a graduation criterion. Additionally, the Ministry of Labor offers three certification channels: the national technician skill test, full-time student testing programs and instant testing, immediate evaluation and certification programs, encouraging students to obtain multiple skill test certificates.

Pilot Program for Encouraging Youth to Obtain Skill Test Certificates in Key Industries and Achieve Stable Employment.

To encourage the youth aged 15 to 29 to acquire professional skills and obtain skill test certificates, the Workforce Development Agency, MOL launched the "Pilot Program for Encouraging Youth to Obtain Skill Test Certificates in Key Industries and Achieve Stable Employment" on July 1, 2023 (Workforce Development Agency, MOL, 2024). Key industries include semiconductors, communications and smart machinery. The program

offers two tiers of incentives: first, a "Certificate Incentive Bonus" for youth obtaining skill test certificates in 22 key industries, with rewards based on the certificate level: NTD20,000 for Level A, NTD10,000 for Level B and NTD5,000 for Level C. Additionally, those who secure a certificate and work in a corresponding key industry for at least 90 days will receive an "Employment Incentive Bonus."

Impact of Full-Time Student Skill Testing on Teaching in Technical High Schools

The skill test assesses workplace-specific skills in-depth. While it helps students master individual skills, the preparation often involves repetitive practice, limiting the teaching of broader competencies (Fang, 2021). Huang-Chia Huang (2002) noted that skill testing significantly influences internship teaching in vocational high school electrical engineering departments, especially in private institutions. Many teachers believe regular classroom instruction is insufficient to prepare students for the skill test, necessitating additional practice outside of class.

I-Hsuan Chiang (2012) highlighted several challenges faced by vocational high schools' special education sections in preparing students for the Level C skill test, including limited practice time, high exam difficulty, a lack of administrative resources and insufficient specialized equipment. Despite these challenges, teachers still viewed the use of skill testing as an effective student development tool. Hui-Chun Chuang (2007) found that practical instructions based on skill test questions significantly improved the students' cognitive and technical performance. Tzu-Ming Yeh and colleagues (2020) showed that students' learning behavior, teaching methods and the learning environment significantly affect the outcomes of the skill test, demonstrating that vocational education certification aligns education with industry needs, enhancing student competitiveness and creating a win-win-win scenario.

Methodology

Participants and Procedure

A total of 141 questionnaires were distributed to principals of technical high schools, with 60 valid responses collected, yielding a response rate of 42.55%. The survey employed purposive sampling and was conducted via an online questionnaire from December 12 to December 15, 2023.

Measurement

The research tool used in this study was a questionnaire titled "Principals' Survey on Skill Tests for Full-Time Technical High School Students." It included sections on school attributes and location, featuring both multiple-choice and open-ended questions.

Results and Discussion

The SPSS statistical software was used to analyze data from the 60 valid questionnaires. The research findings are as follows:

Basic Data Analysis

The analysis focused on school attributes and whether or not the school was located in one of the six major municipalities. Among the respondents, 85% of schools were public, while 15% were private. In terms of location, 48.33% of schools were in the six major municipalities and 51.67% were not. The distribution of schools by both attribute and location is as follows: 35% were public schools in the six major municipalities, 13.33% were private schools in the six major municipalities, 50% were public schools outside the six major municipalities and 1.67% were private schools outside the six major municipalities, as shown in Table 1.

Table 1: Basic Data of Principals' Schools

(N=60)

Attribute	Category	Quantity	Percentage (%)
Public or Private	Public	51	85.00
	Private	9	15.00
School Location	Six Major Municipalities	29	48.33
	Not in the Six Major Municipalities	31	51.67
In the Six Major Municipalities	Public	21	35.00
	Private	8	13.33
Outside the Six Major Municipalities	Public	30	50.00
	Private	1	1.67

Data Analysis

Advantages of Conducting Skill Tests.

The principals were asked to select the advantages of skill tests. The top three were: "Enhancing students' technical abilities" (27.83%), "Improving teachers' professional abilities" (20.28%), and "Increasing graduates' employment rate" (14.15%). These results suggest that skill tests not only directly improve students' technical abilities but also enhance teachers' professionalism, ultimately increasing the graduates' competitiveness in the job market. The results are shown in Table 2.

Table 2: Advantages of Conducting Skill Tests (Multiple Selections)

Attribute (Advantages)	Frequency	Percentage (%)
Enhancing students' technical abilities	59	27.83
Improving teachers' professional abilities	43	20.28
Increasing graduates' employment rate	30	14.15
Improving school equipment	25	11.79
Increasing the graduates' further education rate	22	10.38
Enhancing the school's reputation	15	7.08
Increasing the chances of obtaining government funding	13	6.13
Expanding the students' international outlook	5	2.36

Disadvantages of Conducting Skill Tests.

The principals were also asked to identify the disadvantages of skill tests. The top three were: "Disrupting regular teaching" (22.88%), "Inappropriate exam content" (16.95%), and "Low student participation" (16.10%). This indicates that while skill tests have advantages in enhancing technical skills, they may also disrupt regular teaching and suffer from issues such as outdated exam content and low student participation. The results are shown in Table 3.

Table 3: Disadvantages of Conducting Skill Tests (Multiple Selections)

Attribute (Disadvantages)	Frequency	Percentage (%)
Disrupting regular teaching	27	22.88
Inappropriate exam content	20	16.95
Low student participation	19	16.10
Complex regulations for the test	17	14.41
Complicated administrative procedures	12	10.17
Low pass rate of the test	6	5.08
Exam content too simple	5	4.24
Poor communication between schools	5	4.24
Exam content too difficult	3	2.54
High difficulty in executing the test content	2	1.69
Low cooperation from host schools	2	1.69
Inefficient execution by host schools	0	0.00
Unclear test regulations	0	0.00

Impact of School Attributes and Location on the Advantages and Disadvantages of Conducting Skill Tests.

Chi-square tests were conducted to analyze the impact of school location and attributes on the advantages and disadvantages of skill tests. For advantages, several items showed significant effects:

1. School location and improvement of school equipment: Schools located in the six major municipalities were more likely to believe that conducting skill tests could enhance the improvement of school equipment compared to private schools.
2. School location and increased chances of obtaining government funding: Schools in the six major municipalities were more likely to believe that conducting skill tests could increase their chances of obtaining government funding compared to private schools.
3. School attributes and improvement of school equipment: Private schools were more likely than public schools to believe that conducting skill tests could enhance the improvement of school equipment.

However, in terms of disadvantages, neither "school location in the six major municipalities" nor "school attributes" showed any significant relationship with any of the disadvantage items. This indicates that while there are significant differences in the evaluation of the advantages of skill tests based on school location and attributes, their influence on the disadvantages is not significant.

Table 4: Chi-Square Test of School Location

Statistics	Is your school located in one of the six major municipalities?		χ^2
	Yes	No	
Improvement of school equipment			9.613*
Yes	18 (62.07%)	7 (22.58%)	
No	11 (37.93%)	24 (77.42%)	
Increased chances of obtaining government funding			5.432*
Yes	10 (34.48%)	3 (9.68%)	
No	19 (65.52%)	28 (90.32%)	

*p<.05

Table 5: Chi-Square Test of School Attributes

Statistics	School attributes		χ^2
	Public	Private	
Improving school equipment			9.714*
Yes	17 (33.33%)	8 (88.89%)	
No	34 (66.67%)	1 (11.11%)	

*p<.05

Conclusion and Recommendations

Conclusion

The results of the chi-square tests in this study indicate that most advantages and disadvantages are not significantly correlated with a school's geographical location or type, but they are significantly related to equipment updates and government funding. The study found that schools in the six major municipalities generally believe that holding skill tests helps increase the rate of equipment updates and makes it easier to receive government funding. In comparison, the private schools demonstrated a significantly higher recognition of the benefits of skill tests in promoting equipment updates than the public schools.

The differences between schools in the six major municipalities and those outside may stem from multiple factors. First, the economic development of the six municipalities is relatively stronger and resources are more abundant, enabling schools to more effectively promote skill tests and equipment updates. Additionally, schools in these municipalities are geographically closer to government agencies, making it easier to receive policy support and funding. Furthermore, the diverse vocational demands in these municipalities encourage schools to actively update their facilities to meet market needs.

Private schools, due to intense competition, prioritize equipment updates to attract students and enhance their image. Although public schools receive relatively more government subsidies, their use of resources is more constrained, which may lead to insufficient awareness or demand for equipment updates. These factors collectively influence how schools view skill tests and their implementation, which in turn affects the overall quality of vocational education and the development of students' skills.

In open-ended responses from principals, many pointed out that skill tests are often treated as the primary focus of vocational education, which may narrow its original goals. According to the 2018 examination regulations, industry experts make up only 39.2% of the exam

committee, while academic experts account for 42.8%. Despite efforts by the Ministry of Labor (MOL) to promote greater participation by industry experts, this proportion still needs improvement. Additionally, of the 138 skill test certificates issued by the MOL, only 82 have legal utility, with most concentrated in industrial categories. This suggests that over 40% of the certificates offer limited practical assistance to job seekers, thereby limiting the real value of vocational education to some extent.

Recommendations

Based on the survey results, it is evident that schools' views on skill tests vary according to geographical location, school type and access to resources. These differences influence the promotion of equipment updates and government funding support. To further improve the overall quality of vocational education and ensure that the certification system effectively fosters students' skill development, this study offers the following recommendations:

1. Enhance resource investment in equipment updates: To reduce the resource gap between schools in the six municipalities and those outside, it is recommended to provide more financial support to schools outside the six municipalities to minimize urban-rural disparities. Additionally, establishing an equipment-sharing platform between schools in and outside the six municipalities can reduce update costs, promote resource sharing and ensure that schools in all regions can effectively enhance the quality of vocational education.
2. Strengthen alignment between skill tests and industry needs: Increase the proportion of industry experts involved and delegate skill tests that lack legal utility to be managed by private organizations, with the MOL overseeing management. Industry stakeholders should be required to formulate certification standards and sign confidentiality agreements.
3. Support equipment updates in private schools: The government should provide targeted subsidies and financing support (such as loans) to private schools, allowing them to maintain teaching quality amid intense market competition. Furthermore, cooperation between public and private schools should be strengthened, encouraging both sides to form partnerships, share successful experiences in resource updates and promote cross-school collaboration.
4. Reduce over-reliance on skill tests: Vocational education should rebalance the relationship between teaching and certification, focusing on cultivating students' practical and innovative abilities rather than solely treating skill tests as the primary teaching objective. Therefore, it is recommended that the Ministry of Education strengthen guidance on school teaching policies, ensuring that the skills taught align with the content of skill tests and improve students' overall vocational competencies. A comprehensive assessment mechanism should also be established to provide students with diverse learning evaluations and promote holistic development.
5. Promote policy and industry dialogue: Regular industry-academia collaboration meetings are recommended to establish a long-term dialogue mechanism between the government, schools, and industries. This will facilitate ongoing assessment of the need for skill tests and equipment updates, ensuring that vocational education keeps pace with market changes and technological innovations.

Acknowledgments

I would like to express my sincere gratitude to Ms. Liu Huanyu for her assistance in organizing the data for this study. Her support was invaluable in the completion of this research. This study was partially funded by the National Science and Technology Council (NSTC) in Taiwan, with grant number NSTC 112-2410-H-027-021.

Yao-Ting Sung, National Taiwan Normal University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
Lifelong learning emphasizes continuous learning throughout one's life, with reading enriching elders' lives and aiding their adaptation to aging. However, aging is often associated with a decline in cognitive functions and an increased risk of impairment, making providing appropriate reading materials for elders a crucial matter. Scholars have explored the correlation between eye movement indicators and text difficulty. However, previous research has rarely explicitly linked eye movement indicators to linguistic features, which may limit authors' ability to comprehensively assess their texts' readability. Therefore, this study utilizes an eye tracker to observe elders' reading behavior when engaging with texts of varying difficulties, extracts eye movement indicators to examine challenges faced by elders with different reading abilities, and employs CRIE (Chinese Readability Index Explorer) to analyze the computational linguistic features. The aim is to understand why certain linguistic features pose reading challenges for elders. The findings revealed that when elders read difficult texts, their dwell time and regression count increased, particularly with longer sentences and unfamiliar vocabulary. Linguistic indicators exhibited moderate correlations with several eye movement indicators, suggesting that language structure significantly influences reading behavior. This study, beginning with the reader's reading process, identifies specific correlations between eye movement indicators and text difficulty, offering a novel perspective for research in eye movement and computational linguistics. Furthermore, it has implications for the cognitive health management of elders in medical and psychological fields, ultimately enhancing their quality of life and promoting lifelong learning.

1. Introduction

Since Taiwan entered an aging society in 1993, the proportion of people over 65 years old has been increasing year by year. According to statistics from the Ministry of Interior (2024), the population over 65 years old in Taiwan has reached 4.158 million, accounting for 17.8% of the total population. Given this data, aging has gradually become an important issue in Taiwan. For example, lifelong learning has been the focus of aging in recent years. In contemporary education and psychological research, lifelong learning is widely considered to profoundly impact individual cognitive, psychological, and social well-being. For the elderly, reading is not only a means of acquiring knowledge, but also a key activity for maintaining cognitive functions, promoting mental health, and social cipation (Rigg & Kazemek, 1983; Zhang et al., 2022). In light of the growing elderly population, it is imperative to provide materials that are appropriate for the reading abilities of elders.

Reading is a cognitively demanding activity that requires the coordination of both linguistic and non-linguistic cognitive functions, such as attention, abstract reasoning, working memory, long-term memory, and lexical and conceptual retrieval (Kweldju, 2015; Afifah et al., 2008). As people age, there are natural declines in memory, language, and other cognitive functions, which is a normal aspect of the aging process. Aging leads to cognitive decline and memory deterioration, among other cognitive impairments (Pearman & Storandt, 2005). Therefore, reading materials for elders should consider cognitive load to ensure that they can engage with reading while also receiving an appropriate cognitive challenge.

Many studies have started to focus on text difficulty, with research commonly falling into two categories. First, some studies use multiple-choice questions and cloze tests to assess text difficulty. For example, Bormuth (1969) utilized readers' performance on cloze tests as an objective measure of text readability. Fanguy and colleagues (2004) used cloze tests to determine whether readers understood a company's privacy policy. Similarly, the McCall-Crabbs Standard Test Lessons in Reading designed multiple-choice questions based on the writing and content of the texts, requiring readers to read the passages and respond to questions (McCall & Crabbs, 1961). Second, traditional readability models assess difficulty based on vocabulary quantity and complexity. For instance, Lively and Pressley (1923) argued that textbooks filled with technical terminology made it difficult for students to learn, while the Flesch Reading Ease formula measures readability by considering the average number of syllables per word and sentence length (Flesch, 1948). Although research on text difficulty is abundant, these readability assessment standards often predict readability using surface-level linguistic features, which fail to reflect the deeper cognitive mechanisms involved in reading (Benjamin, 2012; Bormuth, 1966; Davison & Kantor, 1982).

In comparison to the limitations of the traditional readability models previously discussed, eye-tracking technology provides a relatively objective method for investigating how readers engage with texts (Rayner, 1998). Eye movements are frequent and highly variable (Shan & Zhou, 2020), making eye-tracking an effective tool for providing real-time information about a user's psychological state (Djamasbi et al., 2010) and reflecting cognitive processing through eye-tracking indicators (Just & Carpenter, 1976; Martin et al., 2011). This method has been widely used to explore topics related to reading processes, such as eye movement characteristics, perceptual span, and information integration. Furthermore, eye-tracking data is frequently utilized to investigate cognitive processes across diverse cognitive tasks (Rayner, 1998), and eye-tracking devices provide sufficient indicators to capture real-time cognitive processing during reading (Jian, 2022). As this technology has matured, it has continued to be

applied in various fields of learning research, particularly in process-oriented studies. For instance, Wang and Jian (2022) reviewed nearly 30 years (1990-2020) of research on the reading processes of scientific text and images, revealing that research in this field has primarily focused on university students, with a few studies involving elementary school students (Guo & Jian, 2022). However, there is a notable lack of studies examining the cognitive processes of elders. Therefore, this study utilizes eye-tracking to observe the eye movement indicators of elders as they read texts of varying difficulty, aiming to explore the relationship between these eye movement indicators and text difficulty. The results can be applied to cognitive health management for elders, contributing to improving their quality of life and promoting lifelong learning.

2. Literature Review

Many studies have explored the relationship between eye-tracking indicators and text difficulty, although the methods used by each researcher vary. For example, Ko and colleagues (2005) examined the effects of term frequency and word class on eye movement patterns during the Chinese reading processes of university students. The research found that when analyzing words with available word frequency data, higher-frequency words tended to have shorter fixation times in both the first fixation duration and rereading gaze metrics when reading expository texts. This indicates that word frequency significantly influences word recognition during reading (Ko et al., 2005; Carpenter & Just, 1983; Rayner & Duffy, 1986). Ko and colleagues (2005) also examined the relationship between word class and fixation time, discovering that postpositions, a type of function word (e.g., "after" or "between"), had the highest fixation rates and the longest first fixation duration. They suggested that this could be related to temporal and referential coherence in narratives, which are crucial indicators of whether readers can understand the story content. This phenomenon also appears in English. Graesser and colleagues (1994) and Zwaan and colleagues (1995) found that postpositions in English bear a significant cognitive load for conceptual understanding. Liu and Zhou (2019) explored translation difficulty using fixation and saccade durations. Just and Carpenter (1993) investigated sentence comprehension among university students by examining pupil dilation, finding that more complex sentences required longer processing times and resulted in more significant pupil dilation.

In studies using eye-tracking to assess reading task difficulty, the results show that readers tend to have longer fixation times when processing the following types of words: long words (Just & Carpenter, 1980; Rayner et al., 1996), low-frequency words (Just & Carpenter, 1980; Inhoff, 1984; Rayner & Fischer, 1996; Rayner & Raney, 1996), novel or unfamiliar words (Chaffin et al., 2001; Williams & Morris, 2004), ambiguous words (Rayner & Duffy, 1986; Sereno et al., 2006), and words that are contextually unrestricted or difficult to predict based on the surrounding context (Ehrlich & Rayner, 1981; Zola, 1984; Rayner & Well, 1996; Ashby et al., 2005). Table 1 summarizes the above-mentioned studies, showing that scholars have explored text difficulty through eye-tracking indicators, but most of the participants in these studies were university students. In addition, researchers also conducted statistical analyses on the range of values for eye movement indicators. For example, Rayner (1998) reviewed 20 years of eye-tracking research (1978-1998) on reading and other information processing tasks and found that fixation duration typically ranges from 100ms to 500ms, and saccadic latency falls between 150ms and 250ms. Bentivoglio and colleagues (1997) observed that adults blink at a frequency of 10-20 times per minute. In summary, the variables considered in these studies were relatively limited, primarily focusing on basic linguistic features such as word frequency and word class. Important factors such as syntactic

complexity, contextual relevance, and the reader's prior knowledge were not fully addressed, limiting the studies' ability to accurately reflect the true difficulty of the texts (Collins, 2014).

Table 1: Research on Text Difficulty Using Eye-Tracking Indicators

Eye tracking indicators	Linguistic features	Text difficulty	Participants	References
Fixation Duration Saccade		Word Translation Difficulty	College Students	Liu & Zhou, (2019)
Fixation Duration Character per minutes		Classical Chinese Difficulty	College Students High School Students	Chen (2014)
First Fixation Duration Rereading Gaze	Word frequency Word class		College Students	Ko et al. (2005)
Fixation Duration	Word class		College Students	Ko et al., (2005)
Pupil Dilation		Sentence Complexity	College Students	Just & Carpenter, (1993)

The analysis of eye-tracking indicators is highly complex. Researchers not only examine eye-tracking data from a macro perspective but also conduct detailed analyses of Areas of Interest (AOIs), which may include individual words, sentences, or broader regions (Wang & Chien, 2022). This study references and integrates the eye-tracking indicators used in previous literature (Wang & Chien, 2022; Chen et al., 2010; Chien & Wu, 2012; Alemdag & Cagiltay, 2018; Hyönä et al., 2003; Mason et al., 2018). Although there is a wide variety of eye-tracking indicators, due to space limitations, Table 2 lists only five commonly used indicators. These indicators help us more precisely observe participants' reading behavior and identify their cognitive characteristics and challenges when processing texts.

Table 2: Common Eye-Tracking Indicators

Eye tracking indicators	Definition/Meaning	References
Total fixation count, TFC	The total number of fixation points within the AOI. Generally, a higher fixation count indicates a higher level of cognitive processing and is highly correlated with total fixation duration.	Eitel (2016); Schnotz & Wagner (2018)
First-pass fixation duration	The total duration of all fixations from the first entry into an AOI until leaving it, typically reflecting initial processing, such as semantic processing after word recognition.	Hyönä et al. (2003); Mason et al. (2013)
Regression count	The total number of times a fixation leaves an AOI and then re-enters it, typically reflecting late-stage processing, particularly when the reader encounters content they do not understand.	Chen et al. (2010); Mason et al. (2016); Schüler (2017)

Percentage of fixation duration	Other fixation duration metrics (e.g., total fixation duration on an AOI, first fixation duration, or re-fixation duration) divided by the total fixation duration during the learning period, usually reflect the reader's selective attention allocation.	Jian & Wu, (2012); Alemdag & Cagiltay, (2018); Mason et al., (2013)
Total fixation duration	The total duration of fixations within the AOI generally reflects the level of cognitive processing during reading. Longer fixation durations indicate that the reader needs to expend more cognitive resources to process the information in that area.	Chen et al., (2010); Jian & Wu, (2012)

Since different eye-tracking indicators capture various layers of cognitive activity during the reading process, this study aims to explore how elders with different reading abilities perform when reading texts of varying difficulty. To achieve this goal, this study utilizes the Diagnostic Assessment of Chinese Competence (DACC) developed by Li and colleagues (2021) to evaluate the reading ability of participants. Eye-tracking technology is used to record participants' eye movements, and eye-tracking indicators are extracted to analyze the corresponding sentences or words. Additionally, the CRIE (Chinese Readability Index Explorer) system (Sung et al., 2016) is employed to analyze the computational linguistic indicators of text. This study aims to explore the relationship between eye-tracking indicators and computational linguistic indicators. This study not only establishes a concrete connection between eye-tracking indicators and text difficulty in the fields of linguistics and eye-tracking but also provides new perspectives and methodological support for future eye-tracking research. In the fields of medicine and psychology, it can be applied to cognitive health management for elders, contributing to improving their quality of life and promoting lifelong learning.

3. Methodology

This study observes the reading behavior of elders using an eye tracker while they read texts of varying difficulty. Eye-tracking indicators are extracted to examine the challenges faced by elders with different reading abilities during the reading process. Furthermore, computational linguistic features of non-proper nouns, proper nouns, sentences, and passages are analyzed to explore how these features impact reading challenges for elders. The proper nouns are diabetes-related terms defined by the International Diabetes Federation (2024), the American Diabetes Association (2024), and SA Health (2024), while non-proper nouns are words excluding these diabetes-related terms. This study conducts eye-tracking experiments from the reader's perspective, using heat maps for visual analysis and defining Areas of Interest (AOI) based on non-proper nouns, proper nouns, and sentences. Various eye-tracking indicators are captured and analyzed, and the extracted words and sentences are input into the Chinese Readability Index Explorer (CRIE) (Sung et al., 2016) to observe the relationship between computational linguistic indicators and eye-tracking indicators. By aligning these two types of indicators, the study aims to achieve its research objectives.

3.1 *Participants*

The participants in this study were 15 elders aged 65 and above from the "Dinning Together for the Elderly" program in Taipei City. All participants were native Chinese speakers with

normal or corrected-to-normal vision. One participant did not meet the age requirement, two participants had partial data loss due to failure in eye-tracking during the experiment, and one participant skipped pages while reading. Therefore, a total of 4 datasets were excluded, leaving 11 usable datasets.

3.2 *Apparatus*

This study used the SR EyeLink 1000 eye-tracking system, with a sampling rate of 1000 Hz (i.e., 1,000 samples per second). The reading texts were displayed on a 24-inch LCD monitor with a resolution of 1920 x 1200, and the text size was set to 28. The distance between the participants and the monitor was 65 cm.

3.3 *The Experimental Text*

According to the report《Taiwan Diabetes Report 2000-2045》by the International Diabetes Federation (IDF) Diabetes Atlas, Taiwan has the highest prevalence of diabetes in Asia, with more than one in ten people potentially facing diabetes-related issues. Therefore, this study selected diabetes as the topic for the experimental texts. The texts provided to the participants were divided into three difficulty levels: easy (6th grade), medium (9th grade), and difficult (12th grade). The diabetes-related content was written by six professional reading teachers. The readability of the texts was confirmed using the CRIE (Chinese Readability Index Explorer) readability model (Sung et al., 2016), and the final difficulty levels were approved by the six reading experts. The accuracy of the medical content was also reviewed and verified by professional doctors.

3.4 *Diabetes Knowledge Questionnaire*

Before conducting the eye-tracking experiment, participants in this study were asked to complete the Diabetes Knowledge Questionnaire (DKQ) (Gracia et al., 2001) to assess their prior knowledge of diabetes. This step aimed to determine whether the participants' eye-tracking performance was driven by their reading ability or influenced by their familiarity with diabetes-related background knowledge. By administering this questionnaire, the study sought to investigate whether participants' eye-tracking data during the diabetes-related texts were associated with their prior knowledge, thereby further examining how differences in prior knowledge might impact reading behavior.

The Diabetes Knowledge Questionnaire (DKQ) is a standardized tool used to assess participants' understanding of diabetes knowledge and has demonstrated good internal consistency, with a Cronbach α coefficient of 0.78. The Traditional Chinese version of the questionnaire was translated by a native Mandarin speaker with a Bachelor's degree in English and back-translated by a Taiwanese professional translator with a Master's degree in English. The translation process was reviewed by two experts: a psychometrician and a doctor certified in diabetes education. The Simplified Chinese version of the DKQ, developed by Hu and colleagues (2013), was also referenced to ensure linguistic accuracy and cultural appropriateness. Through this questionnaire, the study can compare whether there are differences in prior diabetes knowledge among the participants.

3.5 *Diagnostic Assessment of Chinese Competence (DACC)*

During the experiment, participants will complete the Diagnostic Assessment of Chinese Competence (DACC) (Lee et al., 2021) to evaluate their reading abilities. This assessment is conducted in the form of a computer-adaptive test that comprehensively evaluates participants' reading proficiency. The DACC system assesses reading comprehension skills, including understanding (e.g., vocabulary, literal and inferential comprehension), contextual integration, analysis, and evaluation. The assessment is designed for students from second to twelfth grade. The DACC test items were drafted by school teachers, PhD students in psychology, and professionals in Chinese language research. All drafters must undergo and pass training before they are allowed to contribute test items to the DACC system. The DACC consists of multiple-choice questions, with each question corresponding to one of five dimensions: vocabulary, literal understanding, contextual integration, inferential comprehension, analysis, and evaluation. This design allows for a comprehensive measurement of student performance across these dimensions, providing an in-depth analysis of their reading ability upon completion of the DACC.

3.6 *Procedure*

The experimental procedure of this study is illustrated in Figure 1. Before the eye-tracking experiment begins, participants are first asked to sign an informed consent form, indicating that they understand the study details and agree to participate. After completing the informed consent form, participants are given the Diabetes Knowledge Questionnaire (DKQ) to assess their prior knowledge of diabetes. Next, participants take the Diagnostic Assessment of Chinese Competence (DACC) to evaluate their reading ability. After completing this assessment, participants are given a 10-minute rest before proceeding to the eye-tracking experiment. Before the formal experiment, the researcher asked participants to position themselves comfortably on the eye-tracker mount and adjusted their positions accordingly. Calibration and validation tests, necessary for data collection using the eye-tracker, were then conducted. The researcher used a nine-point calibration procedure, during which participants were instructed to steadily gaze at each calibration point until all nine were completed. If the calibration results showed no significant errors, the eye-tracker computed the correspondence function between the screen and eye movements, converting eye movement distances directly into screen coordinate displacements. The text was divided into three levels of difficulty—easy, medium, and hard. After reading each section, participants answered simple questions to ensure comprehension. To reduce cognitive load and eye fatigue, participants rested for five minutes after completing each section before proceeding to the next.

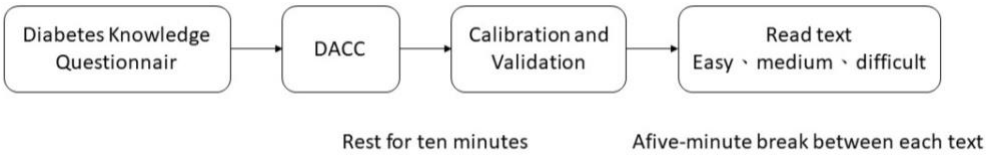

Figure 1: Experimental Procedure

4. Results

4.1 *Analysis Based on Areas of Interest: A Comparison of Sentences, Non-proper Nouns, and Proper Nouns*

4.1.1 *Diabetes Prior Knowledge Assessment*

In this study, participants were divided into two groups based on their reading ability: the low reading ability group (below 7th grade) and the high reading ability group (8th grade and above). The Diabetes Knowledge Scale (DKS) was used to assess participants' prior knowledge of diabetes. The average number of correct answers on the scale for the low reading ability group was 15.00, while the average for the high reading ability group was also 15.00. The results showed no significant difference between the two groups in their diabetes-related background knowledge, indicating that both groups had a similar level of understanding of the subject. Therefore, if significant differences are observed in eye-tracking indicators in subsequent analyses, these differences are likely attributable to variations in reading ability rather than differences in background knowledge about diabetes.

4.1.2 *Choose AOI*

In this study, participants were first divided into two groups based on their reading ability: low (below 7th grade) and high (8th grade and above). Heat maps for participants with different reading abilities were generated (as shown in Figures 2-4). Based on the heat maps of these two reading ability groups, non-proper nouns, proper nouns, and sentences that showed differences between the groups were selected as Areas of Interest (AOI). This selection aimed to identify which text components were processed differently by participants with varying reading abilities.

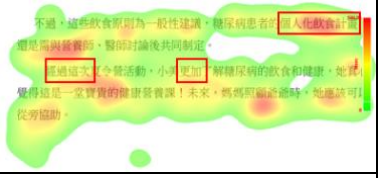

Figure 2: Heat Map for Low Reading Ability With Low Text Difficulty

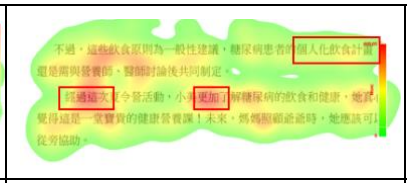

Figure 3: Heat Map for Medium Reading Ability With Low Text Difficulty

Figure 4: Heat Map for High Reading Ability With Low Text Difficulty

4.1.3 *Data Analyze*

Previous reading studies have often focused on analyzing individual word-level features (such as word frequency and word length) or used sentences as the sole unit of analysis. While this approach has provided valuable insights, it has not fully explored how readers simultaneously process both lexical and sentence-level information during reading, particularly the differences between proper nouns and non-proper nouns, which have been less examined in past research. To address this gap, this study divides the Areas of Interest (AOI) into three categories for data analysis: "non-proper nouns," "proper nouns," and "sentences."

This study consists of three parts, each focusing on a different unit of analysis: non-proper nouns, proper nouns, and sentences. After the experiment is completed, the collected eye-

tracking data and assessment results from each participant will be analyzed. The data analysis includes:

- Summarizing the reading results of the participants.
- Converting each participant's eye-tracking data while reading the three texts of varying difficulty into mp4 or avi files for post-experiment review.
- Using the Data Viewer software to define AOI regions and extract the AI report data for further analysis.

In eye-tracking studies focused on reading plain text, AOI (Areas of Interest) can be analyzed at the word, sentence, or paragraph level. The eye-tracking indicators selected for this study include Dwell Time, Fixation Count, Dwell Time Percentage (Dwell Time%), First Fixation Duration, and Regression Count, as detailed in Table 2, which provides a comprehensive explanation of each indicator's meaning.

4.1.4 *Analysis Results Based on Non-proper Nouns*

Following the experimental design of Jian and Ko (2017), this study employed a two-way mixed design ANOVA to examine the effect of vocabulary across different text difficulty levels and its interaction with reading ability on eye-tracking indicators. The results, as shown in Table 3, revealed that text difficulty had a significant main effect on total fixation count, $F(2, 9) = 4.26$, $p < .05$, $\eta^2 = .32$, indicating that text difficulty significantly influenced the total number of fixations. Post-hoc comparisons revealed that participants had significantly more fixations when reading simple texts compared to medium-difficulty texts. Although the interaction between reading ability and text difficulty did not reach statistical significance, an interesting pattern emerged from the raw data: in the low reading ability group, two participants had a higher fixation count for simple texts than for medium-difficulty texts. Similarly, three participants in the high reading ability group exhibited the same pattern. Even though the simple texts appear to be easier on the surface, participants may have needed more time to verify and comprehend the content, leading to a higher number of fixations. This outcome suggests that participants, when faced with simpler texts, might spend more time confirming information.

Table 3: Post-hoc Comparison Table of Fixation Count for Non-proper Nouns Across Different Text Difficulties

SV	*SS*	*df*	*MS*	*F*	η^2	Post-hoc Comparison
Reading Ability	0.01	1	0.01	0.01	0.00	
Error	9.99	9	1.11			
Text Difficulty	2.62	2	1.31	4.26*	0.32	Easy > Medium
Text Difficulty * Reading Ability	0.33	2	0.17	0.54	0.06	
Error	5.53	18	0.31			

*p<.05

4.1.5 *Analysis Results Based on Proper Nouns*

This study examined the effects of proper nouns on eye-tracking indicators about different text difficulty levels and their interaction with reading ability. The results, as shown in Table 4, revealed that text difficulty had a significant main effect on total dwell time, $F(2, 18) = 5.12$, $p < .05$, $\eta^2 = .36$, indicating that text difficulty significantly influenced total dwell time.

Post-hoc comparisons showed a significant difference between difficult and easy texts, with participants spending significantly more time on higher-difficulty texts. This finding aligns with Rayner and colleagues (2006), who suggested that processing time increases with text difficulty. The results indicate that when participants faced more challenging texts, they needed more time to comprehend the content, resulting in extended total dwell time. This outcome further supports the view that increased cognitive load during complex text processing significantly affects reading behavior.

Table 4: Post-hoc Comparison Table of Dwell Time for Proper Nouns Across Different Text Difficulties

SV	*SS*	*df*	*MS*	*F*	η^2	Post-hoc Comparison
Reading Ability	85509.63	1	85509.63	0.20	0.02	
Error	3845811.66	9	427312.41			
Text Difficulty	983292.20	2	491646.10	5.12*	0.36	Hard > Easy
Text Difficulty * Reading Ability	145779.50	2	72889.75	.76	0.08	
Error	1728420.79	18	96023.38			

*p<.05

As shown in Table 5, the results for first fixation duration indicate that text difficulty had a significant main effect, $F(2, 18) = 5.52$, $p = .01$, $\eta^2 = .38$, demonstrating that text difficulty significantly influenced the first fixation duration. Post-hoc comparisons revealed a significant difference between high and low-difficulty texts, indicating that participants spent significantly longer on their first fixation when reading high-difficulty texts compared to low-difficulty texts. First fixation duration reflects the initial understanding and response to words, and reading more difficult vocabulary tends to take longer, as participants require more time for initial cognitive processing (Jian et al., 2013). In this study, proper nouns are considered low-frequency words, which aligns with the "word frequency effect" in computational linguistics. The word frequency effect suggests that readers process high-frequency words more quickly, while low-frequency words demand more processing time (Inhoff & Rayner, 1986). Consequently, when encountering low-frequency words, participants showed significantly increased total fixation time and first fixation duration, reflecting the increased difficulty of processing these words (Inhoff & Rayner, 1986).

Table 5: Post-hoc Comparison Table of First Fixation Count for Proper Nouns Across Different Text Difficulties

SV	*SS*	*df*	*MS*	*F*	η^2	Post-hoc Comparison
Reading Ability	769.30	1	769.30	0.98	0.10	
Error	7101.06	9	789.01			
Text Difficulty	8776.67	2	4388.34	5.52*	0.38	Hard > Easy
Text Difficulty * Reading Ability	537.491	2	268.75	0.34	0.04	
Error	14298.40	18	794.36			

*p<.05

Previous studies have mostly focused on the reading behavior of children or university students and have consistently observed a common phenomenon: when confronted with high-difficulty texts or low-frequency vocabulary, both total fixation time and fixation count increase. However, this study, which focuses on elders, found a similar pattern—elders also

exhibited increased total fixation time and fixation count when reading high-difficulty texts. This result suggests that text difficulty significantly impacts readers across different age groups, especially when processing low-frequency proper nouns. This finding extends the current understanding of reading behavior in elders, showing that despite cognitive changes associated with aging, elders still exhibit reading patterns similar to those of younger participants. It highlights that text complexity, particularly the challenge posed by low-frequency vocabulary, affects readers regardless of age, indicating a universal aspect of cognitive processing during reading.

4.1.6 *Analysis Results Based on Sentences*

This study examined the effects of sentence-level text difficulty and its interaction with reading ability on eye-tracking indicators. The results showed that for regression count, first fixation duration, dwell time percentage, total dwell time, and total fixation count, neither reading ability, text difficulty, nor their interaction reached statistical significance. This suggests that in the current sample, these variables may have a weaker impact on eye-tracking behavior, or the sample size may have been insufficient to detect significant differences. Although some indicators approached significance, the overall results did not achieve statistical significance, particularly about text difficulty. Therefore, future research should consider increasing the sample size to further examine whether these variables significantly affect eye-tracking behavior. This would also allow for a more accurate assessment of the potential impact of text difficulty on reading behavior.

4.2 *Analysis Based on Passages*

At the vocabulary and sentence levels, AOI are primarily analyzed using heat maps, which provide localized insights from a micro-level perspective, allowing for a detailed examination of specific regions. In contrast, passages are analyzed from a macro-level perspective, helping researchers gain a comprehensive understanding of how readers process and comprehend the overall structure of the text. This broader approach allows for a more holistic exploration of readers' understanding of the entire language structure and their cognitive processing throughout the reading experience.

To correlate eye-tracking indicators with linguistic features, this study follows the approach of Ozeri-Rotstain and colleagues (2020) by utilizing Pearson correlation analysis. Based on Cohen's (1988) guidelines, the Pearson correlation coefficient r is used to measure the strength of the relationship between two variables. Specifically, an r-value of 0.1 indicates a small correlation, suggesting a weak relationship; an r-value of 0.3 represents a medium correlation, indicating a moderate relationship; and an r-value of 0.5 reflects a large correlation, suggesting a strong relationship with significant practical implications. This approach enables a clear interpretation of how linguistic complexity and cognitive load interact during reading, providing deeper insights into the connections between language features and eye-tracking data.

The passage analysis inputs the text into CRIE to analyze the computational linguistic indicators and extract the participants' eye-tracking metrics for Pearson correlation analysis, to examine the relationship between the computational linguistic indicators and the eye-tracking metrics. According to the statistical analysis results, there is a significant correlation between eye-tracking indicators and linguistic features. Table 6 defines these moderately correlated linguistic features. In terms of negative correlations, the log-transformed average

word frequency of the corpus showed significant negative correlations with total fixation time, total fixation count, and total saccade count ($r = -.30$, $r = -.33$, $r = -.33$, respectively). The ratio of noun phrase modifiers also showed a significant negative correlation with total fixation time ($r = -.31$), while the average number of prepositional phrases was negatively correlated with total fixation time, total fixation count, and total saccade count ($r = -.30$, $r = -.32$, $r = -.32$, respectively). On the positive correlation side, the number of intentional words had significant positive correlations with total fixation time, total fixation count, and total saccade count ($r = .31$, $r = .33$, $r = .33$). Additionally, the number of causal conjunctions was positively correlated with total fixation count and total saccade count ($r = .32$, $r = .32$), and the ratio of conjunctions in complex sentences also showed positive correlations with total fixation count and total saccade count ($r = .33$, $r = .33$). These results suggest that there are moderate positive and negative correlations between linguistic features and eye-tracking behavior, reflecting the potential influence of linguistic structure on reading behavior (Ozeri-Rotstain et al., 2020).

Table 6: Correlation Values Between Linguistic Features and Eye-Tracking Indicators

Linguistic Features	Definition/Meaning	Corresponding Eye-Tracking Indicators	Correlation Value
SD of average of word freq. in logcorresponding to external database	The average word frequency in the Academia Sinica Balanced Corpus is calculated logarithmically for all the words in the text, to align with the cognitive processes of word recognition	Dwell Time	-.30
		Fixation Count	-.33
		Saccade Count	-.33
Modifiers per NP	The average occurrence of modifiers in noun phrases. Studies indicate that the longer the modifiers, the more likely they are to cause comprehension difficulties	Dwell Time	-.31
		Fixation Count	-.33
		Saccade Count	-.33
Average propositional phrase	The average number of prepositional phrases per sentence in the entire text.	Fixation Count	-.32
		Saccade Count	-.32
Intentional words	The number of words in the text with an 'intent' meaning, such as 'attempt' or 'force'.	Dwell Time	.31
		Fixation Count	.33
		Saccade Count	.33
Causal conjunctions	The total number of causal conjunctions in the text used to indicate a causal relationship between two sentences, such as 'because,' 'therefore,' and 'so that'.	Fixation Count	.32
		Saccade Count	.32
Conjunction ratio in complex sentences	The proportion of compound sentences in the text that contain conjunctions.	Dwell Time	.31
		Fixation Count	.33
		Saccade Count	.33

This study explores the relationship between linguistic features and reading difficulty by analyzing readers' actual eye-tracking data. By examining the correlation between eye movement patterns and specific linguistic features, such as sentence structure or vocabulary, writers can more accurately assess the difficulty level of their text. These data can help authors gain clearer insights into which linguistic features significantly affect readers' perception of text difficulty, enabling them to make appropriate adjustments to improve the overall readability and comprehension of their articles.

5. Conclusions

The results of the study show that text difficulty has a significant impact on the processing of both non-proper nouns and proper nouns during reading. Specifically, while simple texts are easier to comprehend, participants exhibited a significantly higher number of fixations on these texts compared to medium-difficulty texts. This may be because elders are more willing to carefully scan and verify information when dealing with simpler content. In contrast, for difficult texts, participants spent more total fixation time processing proper nouns, which aligns with the "word frequency effect," indicating that low-frequency vocabulary requires more cognitive resources for processing.

This study also explored the correlation between eye-tracking indicators and linguistic features, particularly the relationship between different linguistic characteristics (such as word frequency and grammatical structure) and reading behavior. The results indicate that the linguistic features listed in Table 6 significantly influence readers' eye movement patterns, suggesting a strong connection between language structure and cognitive processing during reading.

The results indicate of log-transformed frequency of corresponding parent words, noun phrase modifier ratio, and average number of prepositional phrases are negatively correlated with total fixation duration and saccade count. This suggests that higher values for these linguistic indicators are associated with shorter fixation durations and fewer saccades, implying that these linguistic structures may reduce cognitive load. The indicators of intentional vocabulary count, causal connective count, and compound sentence connective ratio are positively correlated with eye-tracking metrics. This indicates that readers allocate more cognitive resources to process these complex grammatical structures and logical connections, resulting in increased fixation and saccade counts. These findings underscore the significant impact of syntactic structures on reading behavior, particularly as cognitive load markedly increases when readers engage with more complex linguistic units.

Overall, these results underscore the profound impact of linguistic features on reading behavior. Simpler language units, such as high-frequency vocabulary and more straightforward grammatical structures, reduce cognitive load for readers, while more complex language units increase processing difficulty. These findings not only support previous research but also provide valuable empirical evidence for future studies on language processing and eye-tracking behavior.

Future research could extend these findings to readers from different age groups or language backgrounds to validate the results of this study. Additionally, further analysis of the impact of passage-level linguistic structures on overall eye movement patterns could provide a more comprehensive understanding of the cognitive processes involved when readers engage with various types of discourse. This has particular significance for the field of education, as it can

inform the design of reading materials tailored to the needs of different readers, ultimately enhancing learning outcomes.

6. Limitations

This study provides initial insights into the relationship between eye-tracking indicators and linguistic features, but several limitations should be noted. First, the small sample size, which included only a limited group of elders, may reduce the representativeness of the statistical analysis and impact the reliability and generalizability of the results. This is particularly relevant when considering differences across various age groups, cognitive abilities, educational backgrounds, and reading habits within the elderly population. The small sample size may not fully capture these variations. Therefore, future studies should increase the sample size to enhance the external validity of the findings, ensuring that the observed relationships between eye-tracking indicators and linguistic features are more broadly applicable.

Acknowledgments

This project was financially supported by the “Empower Vocational Education Research Center” of National Taiwan University of Science and Technology (NTUST) from the Featured Areas Research Center Program within the framework of the Higher Education Sprout Project by the Ministry of Education (MOE) in Taiwan. This project was also be supported by funding from the National Science and Technology Council, Taiwan (111-2410-H-011 -039 -MY2).

"Students Have Been Cheating With or Without AI!": Doing What Matters Most – Designing Authentic, Critical and Meaningful Learning With AIEd

HG Retno Harsanti, National Taiwan Normal University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
A global survey conducted by UNESCO in 2023 across 450 schools and universities worldwide has disclosed a notable increase in the adoption of AI across various nations, yet only 10% among them have established regulatory frameworks governing its implementation. Concerns have been raised about the potential negative consequences of AI in education (AIEd), including fears that it may trigger unethical behavior in academics, blunt critical and creative thinking processes, lead to human loss in decision-making, and promote laziness. Through a systematic literature review of the Scopus database spanning 2018-2020 and 2022-2024, this study juxtaposes empirical instances of breaches in academic integrity by students. These insights serve as the foundation for advocating the development of a learning design tailored for K-12 educational settings in the AIEd era. This design involves (1) authentic learning through real-world problems and data-driven learning, (2) critical learning through open-ended critical questions, reasoning, and metacognitive processes, and (3) meaningful assessment such as performance-based, output-based, and action-driven assessment. The implementation integrates technology, including AIEd, and employs collaborative and communicative approaches. By adhering to this design, educators aim to enhance student engagement, mitigate academic misconduct, and maximize the benefits of AIEd in enriching the learning experience.

Keywords: AIEd, Authentic, Cheating, Critical, Meaningful, Learning

iafor
The International Academic Forum
www.iafor.org

Introduction

The rapid development of technology has encouraged high discussions about the impact of technology utilization in various fields, including education. Artificial intelligence (AI) is one of the topics that is very intensely discussed, especially related to concerns about educational output and outcomes. UNESCO (2023) reported the results of a global survey of 450 schools and universities regarding the use of AI, where the results of the survey indicated that the use of AI is increasing in various countries, yet only 10% of countries have regulations related to AI utilization. This condition encourages UNESCO to encourage countries to develop policies and regulations regarding the utilization of AI in education (O'Hagan, 2023).

Discussions related to the utilization of AI in the field of Education have sparked many debates around ethical issues (Akgun & Greenhow, 2022; Foltynek et al., 2023; Karan & Angadi, 2023). Debates have arisen regarding the dynamics of benefits obtained through Aid as discussed by some scholars argue with the belief that AIEd brings benefits such as enhancing personalized learning, improving student-teacher interaction in online learning (Seo et al., 2021), supporting students with special needs (Vincent-Lancrin & Vlies, 2020) nd reducing teachers' administrative workload (Grassini, 2023). On the other hand, some scholars have raised concerns about the decline in students' thinking abilities that can be caused by the use of AIEd in the learning process, such as blunting critical and creative thinking processes, impacting to human loss in decision-making and laziness (Ahmad et al., 2023). In addition, other concerns about the increasing unethical behavior in academics were also raised by Kamalov et al. (2023).

Based on the importance of the ongoing scientific discussions regarding the impact of AIEd utilization, the author proposes that both the pros and cons presented by scholars hold merit. While AI has benefits that can be leveraged in learning, it also has the potential to compromise academic integrity and stifle students' thinking processes if not managed properly. Notably, the issue of academic integrity and blunting of thought processes is not a new phenomenon, as students have been cheating all the time, with or without AI. Therefore, as educators, our primary concern should be designing authentic, critical, and meaningful learning experiences with the help of AI.

Systematic Review on Empirical Research on Academic Integrity of *AIEd*

The widespread use of AIEd has raised significant concerns regarding academic integrity, including in the research field. A systematic literature review was conducted in the Scopus database, focusing on the topic of academic integrity and AIEd, categorized by social sciences field categories, and including articles published between 2021 and 2025. The search query consisted of the following keywords: student AND cheating AND ai OR gpt AND PUBYEAR > 2021 AND PUBYEAR < 2025 AND (LIMIT-TO (SUBJAREA , "SOCI")) AND (LIMIT-TO (DOCTYPE , "ar")) AND (LIMIT-TO (EXACTKEYWORD , "Academic Integrity")) AND (LIMIT-TO (LANGUAGE , "English")). The search results yielded 64 articles relevant to the tertiary level. After screening using exclusion criteria, including non-English articles, non-relevant articles to academic integrity, and non-empirical research in the abstract section, 15 articles remained. To further refine the search, we added a focus on: high AND school AND K-12. The search results yielded 76 articles but only 3 are relevant to this paper. Therefore, in total there are 18 articles used in this paper.

The results of the literature review analysis conducted found that empirical studies related to academic integrity, triggered by AIEd, have been widely discussed in the academic community. Specifically, the results of the literature review found that in the realm of academic writing, there are complexities and challenges caused by the use of AI-generated content (Mah et al., 2024). In addition, there are different views between teachers and students regarding the use of technology, one of which is AI-generated content in completing learning assignments. For students, AI-generated content is seen as a tool that can help in exploring ideas and improving the quality of language in completing assignments. On the other hand, teachers view the use of AI-generated content as a shortcut that undermines the learning process. This tension increasingly shows the importance and need for regulations that regulate the Limits of AIEd use that can be understood by both students and teachers to provide clear guidelines and policies on ethical use.

The next emergence theme that was intensively discussed in the literature analysis was related to the impact of AI-generated content on academic integrity. Concern related to the importance of teaching ethics in academic writing related to the importance of the value of original work and the consequences of academic dishonesty, is considered very important for the purpose of plagiarism prevention (Premat, 2023). This objective can be achieved by teaching students how to present source criticism, and acknowledge the work of others through citation, doing appropriate paraphrasing and writing appropriate references. This theme is considered important because the discussion of plagiarism cases in writing assignments was found to be massive. The literature review also found that there is an emerging need for educators to be more aware and critical in assessing students' written work in order to be able to distinguish from human-written work as it becomes more challenging.

The next theme that is also an important discussion in the literature is the need for integration of higher order thinking in the preparation of student learning assessments. The massive AI-generated content that provides opportunities for students to get answers needs to be addressed by implementing the complexity of giving assignments to encourage students to think critically and creatively (Kirwan, 2023). In addition, AI is also seen as being able to help facilitate grading efficiently and objectively, although with the following weaknesses where it may not be able to capture the complexity of human thought that may be needed in assessing student learning performance (Kumar, 2023). This integration is important to consider considering that education does not only focus on results, but also on the process. Overall, the literature highlights the importance of striking a balance between embracing the benefits of AI-generated content and maintaining the integrity of education.

Students Have Been Cheating All the Time, With or Without AI

The systematic literature review in this article is continued in the second stage. It is essential to acknowledge that academic cheating is not a novel phenomenon and is not solely attributable to the presence of AI. According to a systematic literature review conducted using search keywords: student AND cheating AND academic AND integrity AND PUBYEAR > 2017 AND PUBYEAR < 2021 AND (LIMIT-TO (SUBJAREA ,“SOCI”)) AND (LIMIT-TO (DOCTYPE , “ar”)) AND (LIMIT-TO (LANGUAGE , “English”)) AND (LIMIT-TO (EXACTKEYWORD , “Academic Integrity”)). The results of the search yielded 94 documents, which were subsequently filtered to exclude non-relevant items, resulting in a final selection of 18 articles.

The findings of the systematic literature review revealed several significant themes. Firstly, the problem of academic integrity is a pervasive issue that affects students and institutions globally, with contract cheating being a particularly notable manifestation of this problem. The literature found that many students have a subjective threshold for outsourcing their academic work, and once they reach a certain level of energy expenditure, they are willing to engage in cheating. This can include paying someone else to do their work, which is a common practice known as contract cheating. One of the study found that 8% of respondents admitted to engaging in contract cheating, and that certain groups of students, such as those with a language background, are more likely to engage in this behavior (Foltynek et al., 2023). The student are willing to pay some money around US$33.32 per 1,000 works to get the work done (Amigud, 2020). Another study also found that essay mills, which provide custom-made essays, are readily available to students at a low cost, and that revenue calculations indicate a price point of US$31.73 per 1,000 words (Lancaster, 2019).

Secondly, the perceived reasons for indulging in plagiarism include busy schedule, easy accessibility of electronic resources, unawareness of plagiarism instructions, poor knowledge of research writing, and lack of penalty (Kampa et al., 2020). The literature also found that staff estimated high costs for assignments from online essay mills, believed that low numbers of students are using these services, and reported that outcomes were lenient. However, the literature identified three significant variables associated with contract cheating, including dissatisfaction with the teaching and learning environment, perceptions of cheating opportunities, and language background (Awdry & Newton, 2019; Bretag et al., 2019).

A systematic literature review reveals that academic integrity violations can occur independently of AI, in various forms. Notably, the presence or absence of AI does not guarantee the absence of cheating. Moreover, research conducted by Stanford University in 2023 found that the popularity of AIEd tools, including ChatGPT, did not significantly increase the prevalence of cheating among high school students, as 60-70% of respondents reported having engaged in cheating prior to the introduction of AI (Singer, 2023). A separate survey of 1,200 undergraduate students conducted by UCAS in the UK found that 53% of respondents used ChatGPT to assist with assignment preparation, while 36% employed AI as a private tutor to aid in concept explanation, and only 5% used AI-generated text in assessments without editing and violating institutional rules (Freeman, 2024). These findings suggest that academic dishonesty can occur with or without AI, but this does not preclude its prevention. As educators, it is essential for us to address this issue seriously and effectively to maximize the benefits of AI while preserving the core principles of education.

Doing What Matter Most: Designing Authentic, Critical and Meaningful Learning With AI

A critical examination of studies on academic challenges underscores the crucial role of educators in designing learning experiences that successfully achieve learning objectives. The increasing ubiquity of digital devices in educational institutions is undeniable, with 9 out of 10 students in OECD countries having access to computers within school infrastructure (OECD, 2024). However, despite this widespread adoption, digital efficacy remains a concern in various countries, including Jordan, the Philippines, Palestine, Morocco, and Thailand, where the digital divide persists. In these countries, only half or fewer students report feeling confident or very confident in using video-based communication programs (OECD, 2023a).

Furthermore, the time spent by students on digital devices at school is also increasing. According to the PISA 2022 database report, students in OECD countries spend a substantial amount of their daily time using digital devices for learning purposes (OECD, 2023c). On average, students allocate around 2 hours per day to digital learning activities, which is a significant proportion of their overall time. Moreover, students also spend a notable amount of time on digital devices for leisure activities at school, with an average of 1.1 hours daily. Notwithstanding the benefits of digital devices, concerns have been raised about their impact on student learning. Referring to OECD (2023b) data, it was found that students who studied with the help of digital devices for up to 1 hour per day had 14 points higher math scores than those who did not use digital devices. However, the use of digital devices also has negative impacts, where 65% of students report being distracted by digital devices in math classes, including decreased life satisfaction and emotional resilience caused by anxiety about being far away and not having access to using digital devices (OECD, 2024). Overall, the relationship between digital devices and student learning is complex, and it's important to strike a balance that maximizes the benefits while minimizing the drawbacks.

Proposed Learning Design

Based on the literature review and understanding of the psychological conditions of students in the current era, it is important to understand that technology provides benefits and also challenges in the teaching and learning process. In addition, technology cannot be avoided, but it needs to be managed carefully and appropriately so that it is useful and not disruptive. Therefore, a supportive learning design is imperative. Given the ubiquity of digital devices in learning, teachers must design learning experiences that enable students to utilize digital devices for learning purposes. However, teachers need to design engaging learning, so that even though there are digital devices, students fully use them for learning purposes, and avoid unnecessary distractions. Teachers play a pivotal role as facilitators, creating a conducive learning environment that encourages self-directed learning, fosters healthy communication and collaboration, provides guidance and support, offers feedback, models skills and behaviors, builds relationships, and provides choices and autonomy. Learning schemes that allow the use of media require a construct of trust between teachers and students, as well as the habituation of awareness of independent and responsible learning responsibilities.

To achieve a learning scheme that answers the challenges of the AIEd era, three essential elements must be considered when designing learning experiences: presenting authentic, critical, and meaningful learning. Authentic learning is facilitated by providing relevant real-world problems accompanied by the utilization of real data whenever possible. "Relevance" is the paramount keyword in presenting authentic learning. Relevant learning can be achieved by providing real-world problems to students, ensuring that the topics are contextual to their environment, so that they can be comprehended and engaging. The utilization of real data is also beneficial for students, particularly at the high school level, as it enables them to understand that the learning material is truly real and important to learn. This data can be used to design assignments that promote critical thinking and problem-solving skills. Teachers also do not have to be data providers all the time, on the contrary, teachers need to encourage students to search for and obtain data independently so that they can use the digital devices they have to explore data and additional information.

The second element of the learning design scheme is critical learning, where teachers must design critical questions that provoke critical thinking and curiosity. Following the provision

of real-world problems and supporting data, teachers must ask open-ended questions that are personal, and encourage exploration of open answers. Teachers need to be able to present critical questions that challenge students' reasoning abilities. This critical learning scheme will be more authentic if it is carried out dialogically than written assessment, although it does not rule out the possibility of being carried out in writing. However, dialogical discussions can present broader critical interactions between teachers and students more broadly. The teacher can pose questions such as, "What do you think about...?" "Why do you think that...?" "How do you feel about...?" "Why do you feel that way?" "What are you going to do about...?" "How will your plan work to solve the problem?" "how will you get the resources to do such a plan?" "What do you think about your friend's plans or arguments?"

In the discussion process, teachers play an important role in leading the discussion and being a moderator. In this framework, there are no right or wrong answers, as the priority is on developing students' thinking and argumentation skills. Teachers can also use a mix model scheme, where learning begins with giving authentic real-world problems and encouraging students to work on certain learning tasks, which are then presented and discussed in class. In this learning process, students are allowed to utilize digital devices to explore and obtain information. In some cases, students may be able to answer questions by asking AI, but it is essential to encourage students to be honest in presenting their thoughts and explain the sources they use to obtain information.

The third element of the learning design scheme is meaningful learning, where teachers must design high-quality assessments. Meaningful learning aims to encourage students to contribute to producing valuable or beneficial outputs or outcomes, so that students understand that their thinking and learning efforts have meaning and value. There are three assessment models that can be used to achieve meaningful learning. First, performance-based assessments where students are presented with a scenario, task, or problem that requires them to apply their knowledge and skills to solve a real-world problem or complete a task. The assessment is designed to mimic real-world situations, allowing students to demonstrate their ability to apply what they have learned in a practical and meaningful way. This assessment can take the form of project-based learning, case study, portfolio-based assessment, or simulation-based assessment.

Second, output-based assessments, where students are encouraged to develop tangible products or results of a learning process. This assessment model can be a continuation of the performance base, where after carrying out the thinking-based assignment model and worksheets, students can continue with the creation of performance output. This output can take the form of artwork, programs, designs, etc.

Finally, action-driven assessments can also be given to students. This assessment encourages students to take real action related to the real-world problems being studied. Actions that can be taken include creating a digital campaign, creating a letter of concern and sending it to relevant parties, holding hearings with relevant parties. This entire assessment process does not stop at the level of knowledge in the classroom but encourages students to produce something, whether it is an outcome, output, or action. In the process of carrying out assessments, students can also conduct various explorations using technology. Teachers must encourage students to be honest and give credit to the sources of ideas they use to carry out their assessments.

The Learning Support System

In implementing the design planning scheme, which incorporates the three key elements previously discussed, several support components are necessary to ensure effective implementation. First, schools must have adequate digital infrastructure in place to facilitate students' independent construction of knowledge using digital devices. This infrastructure includes reliable internet connections, learning management systems, IT support departments, and digital resources that are easily accessible to students, typically managed by the library. IT support can generate learning analytics reports, particularly from the Learning Management System (LMS) used by schools on a regular basis, such as mid-semester. Although teachers can access and analyze learning analytics data independently, reports from the IT department provide a broader and more comprehensive picture, enabling both teachers and administrators to inform their decisions regarding learning implementation.

The second support component is related to ICT literacy, digital competence, and citizenship, both for teachers and students. For teachers, training and workshops are necessary to equip them with the knowledge and skills to effectively manage learning with digital integration. Concurrently, students require ICT subjects (or equivalent) that provide an understanding of how to access and utilize technology and various digital learning resources independently and responsibly. In particular, with regards to the development of AIEd, teachers and students need to be equipped with engineering prompts and coding skills to maximize the use of AI. Enrichment programs can be one effective way to achieve this goal. The learning design scheme is presented in Figure 1.

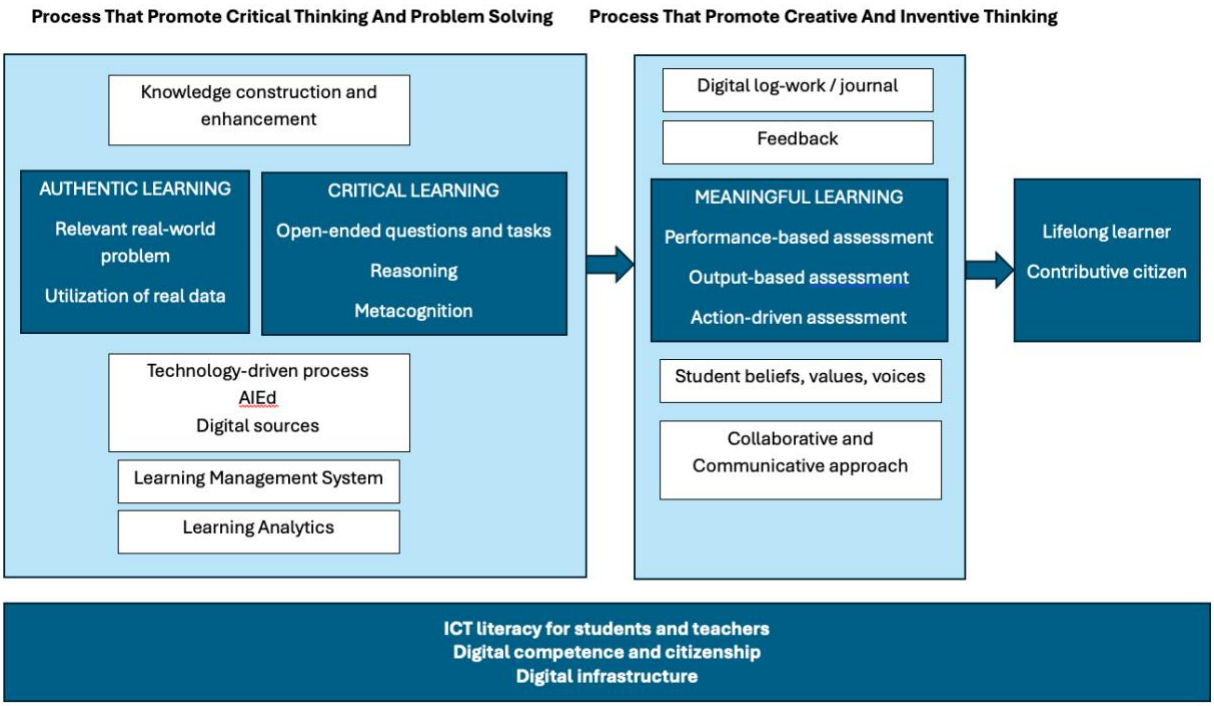

Figure 1: Learning Design Mapping (Source: Author)

Conclusion

The literature suggests that students have consistently committed academic integrity violations over a long period of time. Consequently, the concern that the emergence of AI will encourage students to commit academic violations can be understood but is not entirely legit. As technology continues to evolve and develop, educational institutions must foster adaptability among both teachers and students. Moreover, technology that is unavoidable in the classroom must be utilized lawfully to maximize the learning process.

To achieve authentic, critical, and meaningful learning, education should focus on engaging students with real-world problems, encouraging them to critique these issues, and producing a meaningful learning process. To accomplish this, substantial support is required, including: digital infrastructure that ensures seamless access to digital resources, enrichment programs on ICT literacy, digital competence, and citizenship to equip students with the necessary skills for responsible technology use, IT support/departments that are prepared to provide assistance to teachers and students throughout the teaching and learning process. By providing these support components, educational institutions can effectively leverage technology to promote meaningful learning outcomes.

Learning to Labor? Reconsider Schooling and Capitalism in the 21st Century From a Post-marxist Perspective

Autthapon Prapasanobol, National Taiwan Normal University, Taiwan

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
This article develops a theoretical framework to understand the relationship between schooling and capitalism in the present from a Post-Marxist perspective, critically reconsidering how students engage with schooling and labor in the context of 21st-century capitalism. Drawing on Paul Willis's classical Marxist ethnographic study, Learning to Labor: *How Working Class Kids Get Working Class Jobs*, this article uses key theoretical elements proposed by Willis as a foundation for debate and further development from a Post-Marxist perspective. Willis's work demonstrates how working-class students ultimately reconcile their roles as workers, despite initial resistance to schooling and awareness of capitalist ideology. His study highlights students' experiences as active subjects engaged in cultural processes that shape their relationship with education and labor. However, changes in the contemporary capitalist landscape require fresh analysis. In response, this article integrates key concepts from the theories of Hardt, Negri, and Žižek to extend Willis's ideas. The first section proposes new ways to understand how schooling functions within emerging modes of production and temporal structures, drawing on the concept of the "social factory." This is followed by a discussion of penetration, half-rejection, and counter-school culture. Using the notion of "fantasies," the article rethinks these concepts to explore the relationship between subjects and consciousness.

Keywords: Learning to Labor, Schooling, Capitalism

Learning to Labor in 1970s

During this period, the influential wave of liberalism dominated educational narratives, promoting the idea that every child could achieve upward mobility through education. Education was portrayed as a golden ticket to fulfilling dreams and attaining a better life. This perspective aligned with functionalist theories, which viewed education as a mechanism for allocating individuals to roles suitable for society. Those deemed proficient and fitting were positioned for higher societal roles. However, reality diverged from these promises. Leftist scholars argued that schools perpetuate and reinforce class structures within capitalism. Bowles and Gintis (1976) asserted that schools operate as microcosms of the broader societal structure, training students to become compliant and obedient workers. Consequently, school curricula and pedagogies were seen as tools for transmitting ideologies aligned with capitalism.

Yet, the leftist critique often reduces person as subject, particularly students, to passive objects shaped entirely by the system, portraying schools as being wholly dominated by capitalist ideologies. This perspective overlooks the creativity and agency of a person in their daily lives, ignoring how they construct meaning and make choices. Paul Willis's Learning to Labor addresses this gap, raising critical questions about the cultural processes occurring in everyday interactions between individuals and structures. How do these interactions unfold in daily life, and what do they reveal about the relationship between human agency and systemic forces?

In his study, Willis sought to understand why and how working-class students often end up in working-class jobs. Conducted in 1970s, his ethnographic fieldwork focused on 12 working-class boys, or “lads,” in a secondary school located in an industrial district in England. Over six months, Willis employed interviews, informal diaries, and observations to uncover the cultural forms and resistance strategies of these students. He identified a “counter-school culture” among the lads, characterized by opposition to school authority and the formal educational system. This culture manifested in behaviors such as mocking conformist students, neglecting schoolwork, playing cards during class, and openly drinking in public. Such actions defied the structured and regulated environment of the school, which the lads viewed as a restrictive and oppressive space. Willis observed parallels between this resistance and the “shop-floor culture” of working-class workers responding to exploitative capitalist conditions. Importantly, the lads were aware of the limits of social mobility through individual qualifications, recognizing its unattainability within their social reality. In response, they rejected the meritocratic promises of the education system and sought alternative paths. This demonstrated their ability to penetrate the illusions of their social position within capitalism, analyzing risks and opportunities within their constrained circumstances.

However, counter-school cultures are transient and rarely develop into broader collective movements. Willis argued that their understanding was only partial, preventing them from articulating a comprehensive critique of the system. Moreover, these cultural interactions often reinforced gendered and racialized divisions rooted in dominant forms of masculinity, leading the lads to perceive themselves as superior to other groups. This phenomenon exemplifies what Willis termed “half-rejection”.

From *Learning to Labor* to *Learning to Self-Entrepreneur*

While Willis's seminal work elucidates the cultural processes shaping students' transitions into the workforce under Fordist systems—characterized by regimented production lines and fixed schedules—it is vital to address the transformation of production methods in the post-Fordist era. Contemporary capitalism has fundamentally altered the dynamics of work, introducing flexible schedules, decentralized production, and new modes of labor control. This shift prompts a crucial question: how can *Learning to Labor* be reimagined within the context of 21st-century capitalism?

At the core of Willis's analytical framework lies a traditional Marxist perspective, which examines the modes of production, exchange, and exploitation inherent to capitalist systems. Central to this framework is the concept of capital accumulation, achieved by extracting *surplus value* from the labor power of workers during production. Marxist theory argues a foundational exchange relationship between capital and labor: while the capitalist class controls the means of production, the working class is compelled to sell its labor power in a supposedly free market. While the labor force inherently possesses the potential for unbounded creativity and agency, the capitalist system imposes structures to quantify and regulate labor. This commodification aims to maximize profit by controlling labor and extracting surplus value. Within this framework, the value of a commodity is not merely the sum of its costs and profits; it also embodies the surplus value created by labor. A portion of this value is retained by the capitalist class as capital, while wages represent the fraction returned to the laboring class. The utilization of wages, therefore, become mechanisms through which societal relationships are defined. These wages shape individuals' roles and positions within the broader capitalist structure, perpetuating the hierarchies and inequalities central to the system.

Wages serve as an innovation in transforming labor power as abstract value into concrete value, quantified by the time spent working each day. Willis explicates this transformation through the concepts of "abstract labor" and "concrete labor," illustrating how the capitalist system endeavors to convert labor from an abstract form into concrete labor—standardized and nominally represented. In this process, the "standard minute" emerges as a pivotal tool for measuring labor value, operationalized through timetables and segmented work schedules.

In this notion, factory workers' lives are regimented by a "rhythm" established through rigid work schedules. Such time patterns, however, are not exclusive to factories; they are mirrored in schools. Children are embedded within timetables that structure learning into blocks, with teachers acting as quasi-factory supervisors mediating the exchange relationship between students and knowledge. Willis characterizes counter-school culture as a form of resistance, challenging the fairness of these relationships and rejecting the mechanisms of standardization and control that limit alternative expressions of labor power.

Willis further delineates the capitalist system's constructed divisions between "mental work" and "manual work." These distinctions, far from natural, are ideologically shaped to perpetuate capitalist hegemony by determining who is deemed deserving of rewards or compensation, ostensibly based on merit. Mental work is positioned as superior to manual work, legitimizing claims to higher wages and status. This process, shrouded in the guise of meritocracy, is normalized as the natural order of reality. Working-class boys, as Willis observes, possess an acute awareness of these relationships. They recognize that while their jobs may involve manual labor, they derive satisfaction from earning higher wages than

women and marginalized racial groups, interpreting this as a symbol of male superiority. Wages thus become more than economic compensation; they serve as markers of hierarchical positioning within class structures.

In summation, *Learning to Labor* involves pedagogy to exist within the exchange relationships of a market under the paradigm of "standard minute", which dictates the conditions of the value of production. Labor is controlled and its value transformed based on measurable work hours. This learning extends to vertical relationships within society through "wages" and "job characteristics," indicating class symbols in the social hierarchy. It constructs an understanding of societal positions, revealing who occupies which class. Despite the possibility of resistance or rejection in the learning process, it is not inherently dangerous or alarming within the capitalist system. It ultimately culminates in the option of "half-rejection".

Willis's analytical perspective looks at the learning experiences of children both during and after their school years in same page with the industrial factory production, where the relationships are tied to standardized time, wage, and job characteristics. As evident, the school schedule is sometimes resisted by working-class children as it does not lead to meaningful returns for them. Additionally, recognizing themselves as different from the general student in terms of engaging in manual labor helps them perceive the reward as satisfactory and gratifying. Children's lives are shaped by the conditions and contexts associated with the three elements that guide their actions and decisions as students. However, in contemporary production, time is no longer strictly defined within an 8-hour standard schedule. Work hours have become more flexible and less rigid, while wage or reward and job characteristics have also undergone changes. In this context, what then is Learning to Labor?

Post-Marxist scholars have turned their attention to understanding production within the contemporary capitalist system. In their 2001 book *Empire*, Michael Hardt and Antonio Negri propose a new understanding of this changing landscape, particularly the concept of the *deterritorialization of production* (p. 296). This refers to the shift away from traditional factory settings, where labor is no longer confined to specific workplaces but has permeated every aspect of our daily life and relationships. The boundaries between work and life have become increasingly blurred, as evidenced by the rise of freelancing and various online social platforms.

This is what Hardt and Negri describe as the "social factory," where labor, production, and consumption continuously occur in everyday life. In this paradigm, labor is no longer confined to a workplace or factory; it can take place anywhere. Hardt and Negri introduce the concept of "biopolitical production" to explain these transformations in the capitalist system during the post-industrial era. A clear example of this new mode of production can be found in online food delivery platforms, where delivery riders are turning the "streets" into a "factory". In an interview from Tularak and Bunyasiriyanon's research on platform-delivery workers in Thailand, published in Prachatai News in 2022, one rider, a university student, described the flexibility of the work system. He had to plan his schedule independently to maximize earnings, often choosing to deliver long distances (sometimes up to 50 kilometers). He spent over 10 hours on the road during weekends and an additional 4-5 hours after classes, all while managing the risks of accidents on his own. Another rider, "Note," explained that working for over 10 hours a day left little time for rest, as breaks depended on where he happened to be along his route.

This example highlights a shift in the nature of labor: workers are no longer tied to standard schedules or factory machinery. Instead, they can set their own work hours within the framework of a flexible, often precarious system. This new model of production is characteristic of the post-Fordist era, which emphasizes temporary employment, flexible hiring practices, and increasingly unstable contracts. Alongside these structural shifts, a new consciousness has emerged—the "entrepreneurial self." In this context, individuals are encouraged to see themselves as the masters of their own labor. The ownership of production means has shifted from traditional capitalists to individuals who must create and control their own productive factors. However, this shift also means that individuals now bear the risks and costs of their work. Meanwhile, capitalists are no longer responsible for directly managing production but instead facilitate flexible work arrangements and determine the value of labor based on factors such as distance and number of deliveries. This new framework characterizes contemporary capitalism, where flexibility, uncertainty, temporariness, and self-regulation are paramount. Workers, now more than ever, must navigate a system that values flexibility and autonomy but places the responsibility for managing risk and maintaining productivity squarely on their own shoulders.

Although traditional factory production still exists, the transformation of the capitalist system has given rise to the concept of "social factories," blurring the boundary between work and life. Even in conventional jobs with clear schedules, individuals are increasingly connected as both producers and consumers of labor, extending beyond formal working hours. Willis's perspective suggests that the temporal structure of schooling plays a critical role in shaping students' perception. However, in today's capitalist landscape, schools may no longer hold the central place they once did. During the school day, students can escape the rigidity of formal time and evade classes, particularly through online spaces, as long as they are not under strict surveillance. In this context, the distinction between standardized time and flexible time becomes increasingly blurred. Students can learn to navigate between these time structures, gaining autonomy and agency over their decisions and actions. They become "active users" in digital spaces while also remaining "passive learners" within traditional educational systems. But does this represent a form of counter-school culture, or is it simply a response to the capitalist system that seeks to limit or control labor power, as Willis suggests?

In this sense, this behavior may not necessarily challenge the capitalist system directly. Instead, it reflects a response to traditional work structures where individuals have little control over their own labor power. The movement between standardized and virtual time is, in fact, a learning process that aligns with the development of flexible labor. In traditional Marxism, media and entertainment industries were seen as platforms where audiences passively consumed content. Today, however, individuals are active participants in the production of their own identity, becoming commodities in the broader market. Through posting, sharing, and uploading, people cultivate a sense of self-ownership, crafting and projecting their identities. This shift is emblematic of cognitive capitalism, where we are continually engaged in the production and exchange of symbols and meanings. In this new economy, students, like workers, learn to manage their labor power flexibly, blending emotional self-management with entrepreneurial practices.

The flexibility of time in this new era has led to the emergence of continuous and ubiquitous production. During study sessions, time after work, and other intervals are now opportunities for biopolitical production—an ongoing process of labor and value creation that spans all aspects of life. This transformation also signifies the dissolution of traditional metrics of value, no longer bound by standard time. From Willis's perspective, work and wages are

symbols that define our place within the capitalist hierarchy. The rigid distinction between "manual work" and "mental work" is increasingly irrelevant in this context. Instead, the primary divide may be between the "entrepreneur" and the "laborer." This divide represents the degree of autonomy one has in their work, which correlates with greater life independence. Social class today seems to be measured by the extent to which individuals can exercise this independence. The contemporary capitalist system seeks to erase overt class consciousness, instead fostering the illusion that everyone has the potential to be an entrepreneur.

Penetration and Entrepreneur's Fantasies

Willis's analysis offers an explanation for why working-class children often end up in working-class jobs, despite their resistance to the school system. Willis argues that these students do not merely resist; they learn to understand the system and recognize its illusions. For example, they come to see that the meritocratic ideal promoted in schools—where anyone can rise to the top of society—is a false narrative. They realize that school attendance does not translate into real-world rewards for them. As a result, they often view any job as an opportunity to earn money and achieve tangible results. This paradox reveals that, despite their resistance to school as a symbol of the capitalist system, they eventually accept and enter the labor market.

"Penetration" becomes thus a main concept that Willis uses to explain the phenomenon. For this concept, it is the ability of a person to understand their "positions" and "patterns of relationships" with others in society. It is what they learn to penetrate and articulate, infiltrating the fog of the capitalist system and understanding how it operates in their positioning with others.

This is what Willis is conveying, that while the capitalist system is at work, persons are also learning how the system operates in relation to themselves. They are not passive objective within the capitalist system. The ability of human to make sense of the world they inhabit through penetration is not accidental; it is because humans have the creativity to generate and produce culture based on their positions, with culture serving as a guiding principle.

However, the problem is that person cannot fully understand the system they are in. The existence of limitations serves as an obstacle and diverts learning from reaching its full potential. This results in our inability to achieve "political articulation by deep" (Willis,1981, p. 145). One example is the distinction between "mental work" and "manual work," where even though working-class students may penetrate the school's illusion of providing opportunities, the prevailing male-dominated culture imposes limitations on working-class children. They are unable to see the division; instead, they perceive themselves as superior to women and other ethnicities. Therefore, Willis refers to this situation as "half-rejection," meaning that, ultimately, even though they may break through, they still cannot fully comprehend the entire system. This ultimately results in temporary resistance, concluding with acceptance of the existing relationship. In this sense, the survival of the capitalist system is also because we are all "social agents are not passive" (Willis, 1981, p. 175).

Penetration and the development of consciousness in understanding the capitalist system present challenges for people. Willis argues that the capitalist system intentionally creates limitations, making it difficult for people to fully comprehend its structures and dynamics. These limitations are not just external, but also internalized by subjects themselves. This

aligns with traditional Marxist theory, which distinguishes between “consciousness” and “unconsciousness”. According to this view, workers are initially unaware of their exploitation, but once they gain a full understanding, they are positioned for liberation.

However, through the lens of Žižek (Myers, 2003; Žižek, 2009; Jayanama, 2022), we might argue that the notion of self-entrepreneurship has emerged as a crucial fantasy that conceals the Real—the actual social conditions that lie beneath the surface. Unlike Willis's view, which suggests that capitalism attempts to hide its flaws, Žižek posits that capitalism does not hide its contradictions or ideological failures. Instead, it openly exposes these flaws but presents them as an inherent part of reality. In this sense, self-entrepreneurship functions as a compelling fantasy, convincing individuals that success is possible within the capitalist system, provided they exert enough effort. This illusion sustains their desire and encourages them to accept their current circumstances, ultimately transforming them into active participants in the capitalist ideology.

Capitalism, then, does not operate by concealing its truths. On the contrary, it allows people to see the system in all its rawness. People are aware of how the system functions and its inherent flaws, but even so, they accept it as the way things are. As Fisher (2009) observes, “they know things are bad, but more than that, they know they can’t do anything about it” (p. 21). This recognition of the system’s failings, paired with a sense of powerlessness, exemplifies how the ideological structure of capitalism operates not by hiding the truth, but by making it appear unavoidable and inescapable.

When people can see the capitalist system clearly, there must still be an enjoyment element that encourages them to remain engaged. This enjoyment stems from fantasies, which shape desires and tell us who we are and what others expect from us. These fantasies construct desires that make us believe we must want certain things, even though these desires are not truly our own. They lead us to believe we are heading toward achievable goals, with success framed as a matter of self-discipline and personal choice. The ideology suggests that with proper planning and efficient work, success is attainable. For example, in an interview from the research project mentioned earlier, delivery riders expressed the belief that they had the freedom to work on their own schedules. Their ultimate goal was to earn more money. When asked for feedback on the platform company they worked for, one rider, after mentioning an accident, replied, “Nothing, they are already good,” before adding, “Increasing the pay a bit would be nice.” This response exemplifies how fantasies embedded in capitalist ideology allow us to find enjoyment, even when the system’s flaws are evident.

Fantasies also allow people to chase the reward of success or fulfillment. A poignant example of this is found in the documentary *School Town King*, which follows two boys, “Nont” and “Book”, from a slum in Thailand who dream of becoming rappers. Both clearly see that the education system under capitalism fails to meet their needs and attempts to mold individuals into uniform products, much like in a factory. The boys resist this by spending their after-school hours rehearsing songs instead of doing homework or attending additional tutoring, as many of their peers do. However, their paths diverge. “Nont” eventually decides to return to his studies, reflecting that “Dreams can be pursued anytime, but education must come first.” Meanwhile, “Book” drops out of school despite opposition from both his teachers and family, determined to carve out his own path as an entrepreneur. He believes that with hard work, success will eventually come. This belief is grounded in a fantasy that, despite the harsh realities they both understand, paints a picture of success within their reach. Unfortunately, Book’s fantasy is eventually shattered. He realizes that without engaging in political struggle,

his dream of a better life is unattainable. In 2021, Book joined the youth-led protests demanding democracy and a future free from the military regime (see The Standard, 2021, October 6, *Din Daeng protest: Why does it have to be violent? | UNCOVER #1*). Despite being labeled a violent troublemaker by some, his actions were a direct response to an oppressive system. After the protests lost momentum, Book was arrested and imprisoned in 2023. His story illustrates how the fantasy of self-entrepreneurship and individual success can only sustain individuals for so long. Eventually, the harsh reality of systemic oppression forces them to confront the broader socio-political structure, challenging the belief that personal effort can overcome deep-rooted societal inequalities.

Following Žižek's analysis, we might argue that working-class children (and even middle-class individuals) are not inherently limited in their understanding of the capitalist system. Rather, it is fantasy that shapes their engagement with the system, providing enjoyment and pleasure in their experiences. While they are aware that the existing system is flawed, it is fantasy that enables them to engage with it. This fantasy does not mask their awareness of the system's shortcomings; instead, it constructs desires that make their participation in the system pleasurable. In this sense, the issue is not their ability to comprehend the capitalist system, but the desires that society instills in them. They know the system is problematic, yet fantasy makes it enjoyable and tolerable.

Fantasy plays a crucial role here: it does not restrict what people know but rather influences what they desire. The capitalist system allows them to see its workings openly, including its flaws, yet they are encouraged to participate within it. The act of resisting, then, does not signal an effort to break free from the system but rather occurs within the parameters set by fantasy. Resistance, in this context, is not an act of dangerous rebellion but an action carried out within the limits of the fantasy that capitalism has constructed for them. Thus, capitalist schooling does not obscure ideology through a false consciousness, as traditional Marxist theory might suggest. Instead, it invites critique and dissent, allowing people to openly voice their complaints. This paradoxically makes capitalism even more powerful, as it markets products—such as ready-made courses, online programs, skill-building workshops, and alternative schools—that encourage individuals to invest in self-improvement. These products sell the idea that by enhancing one's skills, individuals can fully realize their potential as self-entrepreneurs, thus reinforcing capitalist ideology while making the system seem more accessible and rewarding.

Conclusion

Reconsidering *Learning to Labor* through a post-Marxist lens aims to critically reevaluate and offer alternative understandings of the relationship between schools and capitalism in the 21st century. First, the evolving nature of working culture within the capitalist system has blurred the boundaries between work and life, making it difficult to solely view the reproduction of cultural norms through standardized time. Instead, it becomes essential to examine both official and flexible time to understand how student as subject construct their consciousness around life within the work world. In the second aspect, what they learn and desire to become amidst the divide of increasingly characteristics of new jobs is flexible and immaterial. This marks a departure from an era characterized by a division of labor based on mental and manual work. Third, as capitalism increasingly centers on the production of symbols and meaning in all aspects of life, it leads to new social relationships that reconfigure class positioning. A critical question arises: what symbols are subjects producing and exchanging among themselves? This question helps illuminate how people self-

entrepreneur and position themselves within the capitalist structure. To what extent do schools contribute to this process? Finally, we must consider how fantasies and forms of enjoyment are constructed and mediated within the society. How have students engaged with, contributed to, and been shaped by capitalism? Understanding how subjects participate in and are influenced by these structures offers important insights into the dynamics of power, resistance, and acceptance within the modern capitalist framework.

Official Conference Proceedings

Abstract
Previous studies show that VR immersion effectively enhances students' curriculum integration, content understanding, self-efficacy, learning behaviors, and performance. In this study, the impact of creating a VR course related to historical homes tours through Uptale is expected to enhance students' self-efficacy, learning behaviors, and learning performance. The initial test was conducted by recruiting 22 graduate students. Comparison of 2D video and SVVR to test the effectiveness of the software. This experiment explored the SVVR group's self-efficacy, learning behaviors, and learning performance through the results of the Achievement Test in History, and analyzed the effects of SVVR on the learning of historical through descriptive statistics and t-tests. The statistical results show that although there is no significant difference between the two groups, it can be seen that the value of the SVVR group is still higher than that of the 2D film group. It is expected that SVVR teaching will be extended to senior high schools and used in curriculum teaching, and experiments and interviews will be conducted in the hope that effects such as enhanced learning concentration can be facilitated for use in other subjects or professional training programs.

Keywords: Virtual Reality (VR), Self-Efficacy, Learning Behaviors, Learning Performance

Introduction

Research Motivation and Background

Virtual reality (VR) is increasingly being utilized in the domains of education and learning (Zawacki-Richter & Latchem, 2018). Spherical video-based virtual reality (SVVR) serves as a notable example, as it immerses users in realistic scenarios, thereby offering an engaging experience (Elmezeny et al., 2018; Jong et al., 2018). This technology can be implemented using cost-effective or more accessible VR solutions. The application of SVVR spans a wide range of areas, including science education (Yang et al., 2024), library guide (Lin et al., 2019), English language acquisition (Huang et al., 2023), engineering education (Lingli, 2023), teacher training (Pitura et al., 2024), and nursing education training, among others (Chang et al., 2022). Research suggests that SVVR promotes a learning style that enhances student interest, motivation, and academic performance (Geng et al., 2018). Additionally, it has the potential to complement traditional pedagogical approaches, introduce novel concepts, and deepen students' comprehension of content while simultaneously increasing their motivation to learn (Huang, et al., 2020; Lin et al., 2019). However, practical opportunities for students to engage in field trips are often constrained by factors such as time, distance, cost, safety, and the complexities of real-world environments (Geng et al., 2021; Çaliskan, 2011), which may adversely affect their learning interests and opportunities for experiential practice. Furthermore, there is a paucity of research focusing on tours of historical homes within the context of social studies. Consequently, we propose a further investigation to explore the integration of SVVR into senior secondary history education, specifically examining its effects on students' self-efficacy, learning behaviors, and academic performance.

Research Purposes

The main purpose of this study is to allow users to experience a learning experience that is different from traditional learning during the game, and to experience historical situations without being limited by time and space, thereby enhancing students' interest in learning. This study aims to enhance students' interest in learning. Since most senior high school history lessons are typically delivered in a conventional textbook format, students often struggle to develop a profound understanding of the temporal and spatial contexts of historical periods. The purpose of this study is to explore the impact of SVVR learning on students' self-efficacy, learning behavior and academic performance. By enhancing students' sense of self-efficacy, we hope that they will be more confident in handling learning challenges, thereby cultivating positive learning behaviors. In addition, we expect that immersive learning will promote a deeper understanding of history and culture while enhancing interactive learning experiences, resulting in improved academic performance. Researchers believe that this teaching method can present the best interactive and immersive learning, make students better understand history and culture, and provide them with a more interesting and effective learning experience.

Research Questions:

1. What is the effect of self-efficacy on students using SVVR versus 2D Video learning?
2. What is the effect of learning behaviors on students using SVVR versus 2D Video learning?
3. What is the effect of learning performance on students using SVVR 2D Video learning?

Literature Review

Virtual Reality (VR)

Virtual reality (VR) is a new media technology that brings a sense of real presence through computer simulation of a 3D virtual world. It is regarded as an innovative teaching method in learning (Gadelha, 2018). With its 360-degree panoramic immersion, VR allows users to feel as though they are in a genuine environment (Elmezeny et al., 2018; Jong et al., 2018). Chen (2016) pointed out that through appropriate learning design, VR can help students develop more complex and higher-level thinking skills, while improving students' learning motivation, problem-solving ability, opinion expression skills, and strengthening critical thinking Sexual thinking and self-efficacy (Meyer et al., 2019).

The Influence Between Self-Efficacy and Learning Behaviors of SVVR

With the rapid development of technology, VR has been widely used in online courses. This study chose to use spherical video-based virtual reality (SVVR) in course learning. SVVR is VR that uses 360-degree panoramic photos or videos. SVVR has been used in teaching a variety of subjects and has been proven to be effective in influencing students' learning behavior. Research indicates that this kind of course can stimulate students' interest in learning, improve students' learning motivation and learning performance (Geng et al., 2018), and improve academic performance. Research has proven that compared with the learning satisfaction of students who use traditional teaching and students who use SVVR to learn, students who use SVVR to learn achieve better learning satisfaction.

The Impact Between Learning Behaviors and Learning Performance of SVVR

SVVR provides multi-sensory stimulation and allows learners to experience a high degree of interactivity (Chang et al., 2019). Its convenience, interactivity, and contextualized experiences hold great potential for the educational field (Ye et al., 2019). Traditional classroom instruction often struggles to effectively capture learners' attention, which frequently leads to deficiencies in problem-solving and critical thinking skills (Durham, 2015). SVVR can arouse students' interest and motivation to learn through the interaction in the scene. Gilliam et al (2017) pointed out that learning in an authentic learning environment is of certain importance and helps improve students' academic performance in the subject. Chang et al. (2017) introduced SVVR teaching into the natural science geology course in primary schools and used a two-tier testing strategy to improve students' learning performance. Research results show that this teaching method not only improves students' learning performance and motivation but also enables them to learn how to solve problems more proactively.

Self-Efficacy

Self-efficacy refers to an individual's subjective beliefs and feelings regarding their ability to organize and achieve specific competencies (Bandura, 1997). In this study, self-efficacy is operationally defined by the scores of participants on the General Self-Efficacy Scale (GSES), developed by Zhang and Schwarzer (1995). The GSES consists of 10 questions designed to measure an individual's confidence in facing setbacks and solving problems. A higher score on the scale indicates greater self-efficacy, while a lower score reflects diminished self-efficacy.

Post-experiential Immersion Experience Scale

In the study of Jennett et al. (2008), they explored the personal emotional aspect and observed the changes of users during the immersion process through three different experimental situations and proposed the "Immersion Experience Scale after Experience Activities" to make the immersion experience visible. Quantitative testing, this scale contains six aspects and is divided into: 1. Attention: refers to the degree to which the subject is devoted to the interactive navigation system; 2. Temporal dissociation: refers to the subject's degree of concentration Ignore the surrounding things or forget about the passage of time, and only focus on the interactive navigation system; 3. Transportation: refers to the degree to which the subject feels after experiencing the interactive navigation system; 4. Challenge): refers to the subject's level of challenge to the interactive navigation system; 5. Emotional involvement: refers to the degree to which the subject invests his/her emotions in the interactive navigation system; 6. Enjoyment (enjoyment): refers to the subject's level of challenge Experience the level of enjoyment that comes with an interactive tour system.

Methodology

Research Structure

This study employs a quasi-experimental design utilizing the Uptale system to examine the effects of integrating Spherical Video-based Virtual Reality (SVVR) into history instruction for senior secondary school students. The experimental group will engage with SVVR for their learning, while the control group will receive traditional teaching methods. The study's content will feature a guided tour of a historical home relevant to high school curriculum. By interacting with the system in a virtual reality environment, students can develop a deeper understanding of historical figures and their contexts. An overview of the entire study is presented in Figure 1 below.

While the course design of this study was intended for senior secondary school students, postgraduate students were selected as the subjects for this experiment. The goal was to help the courseware designers understand the optimization needs of the SVVR courseware design, allowing them to better grasp the key considerations and precautions necessary for the design of such courseware when it is implemented in other training programs in the future.

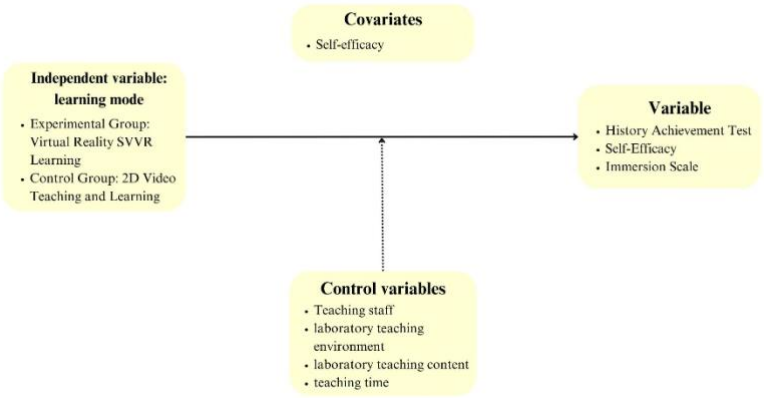

Figure 1: Research in Disguise

System Architecture and Process

This research uses the Uptale system as a development tool. Learners conduct guided tours of historical residences through the SVVR game. They enter the game screen at the beginning, learn historical knowledge through interactive objects (such as videos, slides, voice recognition, tests, etc.) and complete stars (task rewards). collect. Teachers can use the system to check whether students' learning effectiveness and learning behaviors have improved, so as to adjust the teaching material design. Teachers can use the system to evaluate students' learning effectiveness and monitor improvements in their learning behaviors, allowing them to adjust the design of teaching materials accordingly. As shown in Figure 2 below.

Figure 3 below is the research flow chart of this experiment. The entire experiment was conducted according to the following flow.

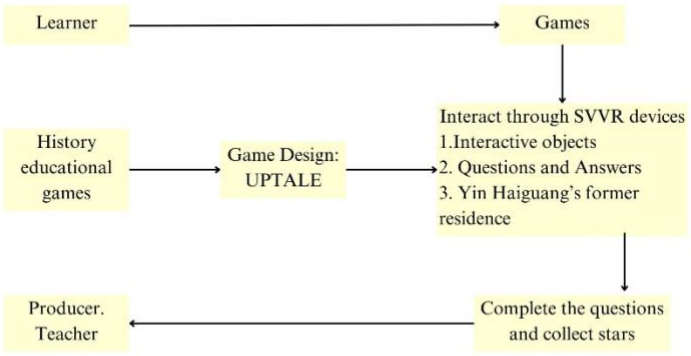

Figure 2: Teaching Material Design Structure

Experimental Flow Chart

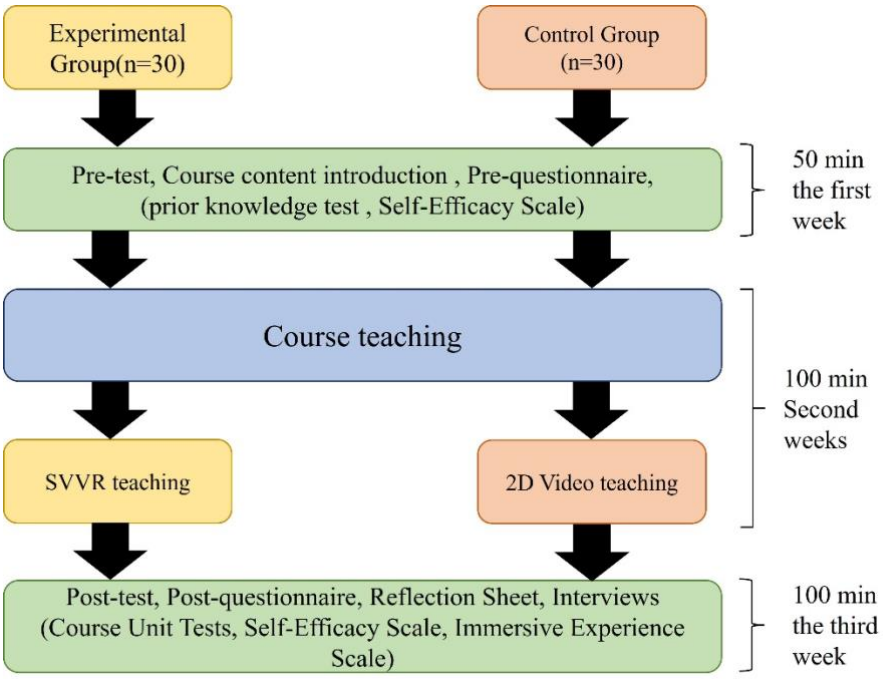

Figure 3: Experimental Flow Chart

Research Object

A total of 22 graduate students from a national university of science and technology in Taiwan participated in a three-week experiment. The subjects did not require prior knowledge and were divided into an experimental group and a control group. The experimental group utilized SVVR for learning, while the control group received instruction through 2D video teaching.

Experimental Design

The following six pictures are the game screens of the SVVR teaching materials, namely Figure 4, Figure 5, Figure 6, Figure 7, Figure 8 and Figure 9. Figure 4 is the first scene when learners enter the screen. Learners can get a preliminary understanding of Yin, Hai Guang's introduction in this scene. Figure 5 further presents Yin, Hai Guang's relevant information through pictures and text, and there are similar introductions in subsequent scenes.

Figure 6 is in Scene 3, which shows important scenes leading to various parts of the former residence, and includes photos and newspaper introductions related to Yin, Hai Guang. The video in Figure 9, also located in this scene, mainly introduces Yin, Hai Guang's life story and the reasons why he lives here.

Figure 7 is a question-and-answer area set up during the learning process, giving users the opportunity to learn more about Yin, Hai Guang's deeds. When the questions are answered correctly, the user can collect the stars needed to complete the level. Figure 8 introduces Yin, Hai Guang's political philosophy through voice. After the introduction, you can give a voice answer. Those who answer correctly can unlock the opportunity to go to other scenes.

Research Results

Independent Two-Sample t-Test

This study adopted a quasi-experimental design. Two sets of independent sample t-tests were used for quantitative analysis in order to explain the differences in learners' prior knowledge and experience during the self-efficacy pre-test. This method can effectively ensure that researchers can exactly value the differences between the experimental group and the control group when conducting post-test analysis results.

Differences in Self-Efficacy Between Learning Styles

An independent samples t-test was conducted using the learning method as the independent variable and self-efficacy as the dependent variable. The results are presented in Table 1. The t-test analysis of the average self-efficacy pretest scores for different learning methods revealed that t(20)=0.97, p=.17 (p>.05). This indicates no significant difference in self-efficacy between the SVVR group (M=3.12, SD=0.37) and the 2D Video group (M=2.91, SD=0.62). Therefore, the pretest results show that the self-efficacy of participants learning history courses through SVVR and 2D Video is not significantly different.

Table 1: The t-Test Analysis of Pre-test Averages for Self-Efficacy Across Different Learning Methods

	n	*M*	*SD*	*t*
SVVR	11	3.12	0.37	0.97
2D Video	11	2.91	0.62	

*p< .05; **p<.01

Independent samples t-test analyses were conducted with learning methods as the independent variable and self-efficacy as the dependent variable. The results of the study are presented in Table 2. The t-test analysis of the mean self-efficacy post-test scores for the different learning styles yielded t(20)=1.76, p=.07, which is greater than .05. This indicates that the self-efficacy scores for the SVVR group (M=3.38, SD=0.34) and the 2D Video group (M=2.95, SD=0.75) were not significantly different. Post-test analyses revealed no significant difference in self-efficacy between the SVVR and 2D Video groups as two distinct learning methods for the history course.

Likewise, statistical analysis of the posttest produced non-significant results, identical to those of the pretest. It is assumed that the lack of significant differences in the posttest can also be attributed to the small sample size and issues related to the scale design. Therefore,

the results regarding research question 1 indicate that the differences in self-efficacy between different learning methods are not significant.

Table 2: The t-Test Analysis of Post-test Averages for Self-Efficacy Across Different Learning Methods

	n	*M*	*SD*	*t*
SVVR	11	3.38	0.34	1.76
2D Video	11	2.95	0.75	

*p< .05; **p<.01

Differences in Learning Behaviors Across Learning Styles

Using learning method as the independent variable and learning behavior as the dependent variable, an independent sample t-test analysis was conducted. The research results are shown in Table 3. The t-test analysis of the average learning behaviors of different learning methods shows that t(20)=0, p=.14>.05, and it can be found that SVVR (M=3.39, SD=0.56) and 2D Video (M=3.39, SD=0.90) The two groups were not significant in the learning behavior section. According to the post-test analysis results, it was found that there was no significant difference in the learning behavior of the subjects regarding the two different learning methods of SVVR and 2D Video used in history courses.

The insignificant results from the above analysis may stem from the limitations of the equipment used in designing the SVVR teaching materials, which hindered the full presentation of details. As a result, students may not have had the opportunity to thoroughly understand the introduction of certain monuments and artifacts, thereby diminishing their sense of immersion. Additionally, the timely provision of guidance is crucial in the effective implementation of SVVR teaching materials. Due to the experimenter's inexperience in administering the guidance portion of the experiment, some students were uncertain about the content of the teaching materials, leading to incomplete levels of understanding.

Table 3: The t-Test Analysis of Average Learning Behaviors Across Different Learning Methods

	n	*M*	*SD*	*t*
SVVR	11	3.39	0.56	0.00
2D Video	11	3.39	0.90	

*p< .05; **p<.01

Differences in Learning Performance Between Learning Styles

Independent samples t-test analyses were conducted using learning methods as independent variables and learning performance as dependent variables. The results of the study are presented in Table 4. The t-test analysis of the mean learning styles across the different groups indicated that $t(20)=0.89$, $p=.87$, which is greater than .05. This finding suggests that there was no significant difference in the learning styles between the SVVR (M=71.82, SD=11.46) and 2D Video (M=67.27, SD=12.52) groups. Furthermore, the post-test analyses revealed no significant difference in the performance of participants using the two different learning methods, SVVR and 2D Video, in the history course.

Kolarik et al. (2024) utilized immersive virtual reality (IVR) in logistics process training and compared its effectiveness to a traditional paper-based test. The findings indicated that there

was no significant difference in the learning test results between the two groups involved in the experiment. Consequently, this statistic suggests that different learning methods do not necessarily impact students' test scores in the subject.

In the future, the design of teaching materials should focus on the connection between the topic and the curriculum. This approach will more effectively demonstrate whether the SVVR teaching materials are appropriate for this type of curriculum.

Table 4: The t-Test Analysis of Average Learning Performance Across Different Learning Methods

	n	*M*	*SD*	*t*
SVVR	11	71.82	11.46	0.89
2D Video	11	67.27	12.52	

*p< .05; **p<.01

Discussion and Conclusion

Discussion

In the first question, we compared the effects of self-efficacy between students who learned through SVVR and those who engaged in conventional learning. The lack of a significant difference may be attributed to the small number of participants and the inadequacy of the scale questions, which were not sufficiently tailored to the content of the subjects taught. Additionally, the number of response options in the scale design may significantly influence the results of subsequent statistical analyses. Utilizing a 4-point scale for the self-efficacy measure may yield insignificant results due to either the limited number of participants or the reduced choices available to respondents when completing the scale. Similarly, the post-test of self-efficacy produced non-significant results, mirroring those of the pre-test in the statistical analyses. It is presumed that the lack of significant difference in the post-test is also a consequence of the small sample size and issues related to the scale design.

As mentioned in Question 2, the lack of a significant effect on learning behaviors between the two groups of students utilizing different learning methods may be attributed to some participants in the SVVR group experiencing moderate dizziness during the experiment. Consequently, the experiment was conducted using a website operation method instead. These factors may have contributed to the absence of a significant difference in the learning behaviors of the two groups.

Previous studies have indicated that motion sickness is linked to individual visual-vestibular perception and conflicts in visual cognition, which can result in symptoms of motion sickness (Drummond, 2005; Golding, 2006).

In the research question three, which compares the impact of learning performance between two groups of students using different learning methods and those employing traditional learning, the results of the historical test indicated that there was no significant difference in the learning outcomes between the two groups. This lack of difference may be attributed to the design of the SVVR teaching materials, which did not align well with the test questions. Additionally, the students exhibited a low level of engagement with the film materials, leading to increased cognitive load and negatively impacting their learning performance.

Conclusion

Although there was no significant difference between the two groups in terms of self-efficacy pre-test and post-test, the mean values indicated that the self-efficacy of the SVVR group was higher than that of the 2D Video group. This suggests that the SVVR group experienced greater self-efficacy with this type of teaching method. When designing the SVVR teaching materials, it was necessary to adjust the number of scenes. During the experiment, participants became disoriented due to the excessive number of scenes and experienced moderate dizziness, which adversely affected their learning behaviors. In the future, by refining the teaching materials and utilizing improved devices, the incidence of dizziness can be minimized. Additionally, due to the small sample size and the discrepancies between the questions of the performance test questions and the teaching materials, the performance component of the performance test was not significant. Therefore, adjustments must be made to prevent similar issues in future when conducting the follow-up studies.

Acknowledgements

I would like to thank the graduate students who participated in the experiments, the professors and seniors who helped me with my questions, and the lab that provided me with the Uptale software and allowed me to create teaching materials. As a first-time postgraduate student, this seminar provided me with a valuable experience in learning how to conduct research and where to make improvements.

Appendices

Appendix A: Post-test-Learning Performance (History Achievement Test)

The post-test consists of 10 multiple-choice questions (40%), 10 multiple-response questions (40%) and 5 essay questions (20%) for 100 points. Compiled by two teachers with 10 years of experience in teaching history.

1. Which philosopher primarily influenced Yin, Hai-Guang's liberal ideas?			
A. John Locke	B. Immanuel Kant	C. Plato	D. Aristotle
2. Yin, Hai-Guang's ideas are associated with which of the following movements?			
A. The Civil Rights Movement	B. The May Fourth Movement	C. The Xinhai Revolution	D. The Taiping Rebellion
3. In Yin, Hai-Guang's liberalism, what is the primary responsibility of intellectuals?			
A. To change social systems	B. To promote technological progress	C. To support government policies	D. To be the eyes of the time
4. What is Yin, Hai-Guang's core definition of freedom?			
A. Unlimited autonomy	B. Collective will	C. Protection of rights	D. Obedience to law
5. According to Yin, Hai-Guang, what is the foundation of democracy?			
A. Economic development	B. Universal education	C. Citizens' awareness of freedom	D. Military strength
6. What is Yin, Hai-Guang's view of democracy?			
A. Democracy is a compromise	B. Democracy is merely a tool	C. Democracy is a political ideal	D. Democracy is useless
7. Yin, Hai-Guang's liberalism primarily influenced which area in later generations?			
A. Political system reform	B. Transformation of educational philosophy	C. Intellectual enlightenment	D. Economic structural adjustments
8. What does Yin, Hai-Guang consider the main role of science to be?			
A. Solving all problems	B. Establishing social order	C. Supporting political authority	D. Providing correct methods of thought
9. How does Yin, Hai-Guang believe freedom should be critiqued?			
A. Through outright denial	B. Through rational discussion	C. By prioritizing practice	D. By integrating tradition
10. How does Yin, Hai-Guang interpret the "May Fourth" movement?			
A. A political movement	B. A literary revolution	C. A social reform movement	D. An intellectual enlightenment movement
11. What is Yin, Hai-Guang's view on tradition and modernity?			
A. Tradition should be fully preserved	B. Modernization should replace all traditions	C. Tradition should integrate with modernity	D. Tradition is a symbol of backwardness
12. In Yin, Hai-Guang's perspective, freedom is inseparable from which concept?			

A. Equality	B. Independence	C. Democracy	D. Authority
13. How does Yin, Hai-Guang suggest intellectuals should engage with society?			
A. Maintain neutrality	B. Stand on the side of truth	C. Follow the masses	D. Support the status quo
14. What is the philosophical foundation of Yin, Hai-Guang's liberalism?			
A. Rationalism	B. Empiricism	C. Skepticism	D. Metaphysics
15. In Yin, Hai-Guang's reflections on civil society, what does he emphasize most?			
A. Religious freedom	B. Social justice	C. Rule of law	D. Individual responsibiliy
16. In the practice of liberalism, which field is Yin, Hai-Guang most concerned with?			
A. Political reform	B. Economic freedom	C. Individual liberty	D. Cultural heritage
17. Why does Yin, Hai-Guang advocate liberalism?			
A. To oppose authoritarian	B. To preserve traditional culture	C. To support religious beliefs	D. Toemphasize national self-determination
18. What characterizes Yin, Hai Guang's academic style?			
A. Moderate and conservative	B. Radical and critical	C. Rational and rigorous	D. Emotional and romantic
19. What is Yin, Hai Guang's greatest contribution to modern society?			
A. Promoting science and technology	B. Establishing a philosophical system	C. Advocating intellectual freedom	D. Creating literary works
20. What is the relationship between liberalism and democracy in Yin Haiguang's advocacy?			
A. Freedom and democracy are unrelated	B. Freedom and democracy are opposed	C. Freedom must conform to democracy	D. Freedom is the foundation of democracy

Appendix B
Questionnaire

- Adoption of Schwarzer, R. (1993). Using a 4-point scale.
- General Self-Efficacy Scale (GSES)
- 10 questions
- Cronbach's αlpha reliability coefficient with values between .82 and .93

General Self-Efficacy Scale

General Self-Efficacy Scale (GSES), the term Self-efficacy was coined by Bandura, and many scholars have developed a variety of self-efficacy scales based on different domains. The GSES was developed by Schwarzer and Jerusalem (1993), with an initial version of 20 questions, which was later revised to 10 in 1997. The GSES has been translated into 25 languages in several countries and has been widely used.

Self-Efficacy Scale Questions

The Self-Efficacy Scale is a 4-point scale with feeling, thinking, and acting as the indicators. The criteria are "1" for completely incorrect; "2" for somewhat correct; "3" for mostly correct; and "4" for completely correct.

1. I can always manage to solve difficult problems if I try hard enough.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
2. If someone opposes me, I can find the means and ways to get what I want.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
3. It is easy for me to stick to my aims and accomplish my goals.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
4. I am confident that I could deal efficiently with unexpected events.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
5. Thanks to my resourcefulness, I know how to handle unforeseen situations.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
6. I can solve most problems if I invest the necessary effort.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
7. I can remain calm when facing difficulties because I can rely on my coping abilities.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
8. When I am confronted with a problem, I can usually find several solutions.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
9. If I am in trouble, I can usually think of a solution.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.
10. I can usually handle whatever comes my way.			
1) Not at all true.	2) Hardly true.	3) Moderately true.	4) Exactly true.

Appendix C

Posttest-Immersion Experience Scale (Learning Behaviors)

- Refer to Jennett et al. (2008) "Immersion Experience Scale after Experiential Activities".
- Likert 5-point scale
- 12 questions
- Cronbach's αlpha reliability coefficient, with values ranging from 0.877 to 0.921.

Immersion Experience Scale after Experiential Activity

Jennett et al. (2008) explored the impact of personal emotion in their research and observed changes in users' immersion through three different experimental situations. They proposed the "Immersion Experience Scale after Experience Activities" to quantify and measure immersion experience. The scale covers six aspects: 1. Attention: refers to the degree to which the subject is absorbed in using the interactive navigation system; 2. Temporal dissociation: refers to the subject's ignorance of the surrounding environment or The passage of time and the degree of complete concentration on the interactive tour system; 3. Transportation: refers to the intensity of the subject's inner feelings after experiencing the

interactive tour system; 4. Challenge: refers to the subject's face The degree of challenge experienced by the interactive tour system; 5. Emotional involvement: refers to the degree to which the subject invests his or her emotions in the interactive tour system; 6. Enjoyment: refers to the subject's experience in the interaction The degree of pleasure experienced during the navigation system.

Likert 5-point Scale

Likert scales (named after their creator, American sociologist Rensis Likert) are very widely used because they are one of the most reliable ways to measure opinions, perceptions, and behaviors. Likert scale questions are widely used in many types of surveys because they provide quantifiable response options, making the data collected easier to analyze. It also provides multiple options covering a whole range of topics, allowing respondents to choose answers that are more closely related to their own feelings.

Historical Textbook Immersion Experience Scale

Attention

In the course materials, do you feel focused on the activity you are doing? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree
Does the content in the textbook hold your attention? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

Temporal Dissociation

Do you feel the passage of time as you engage with the history textbook? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree
Do the experiences in the textbook make you forget about time in real life? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

Transportation

Do you feel drawn into the plot of your history textbook? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree
Do the scenes and stories in the textbook make you feel like you are there? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

Challenge

Did the tasks or challenges in the textbook excite and engage you? (1-5 points)				
1. Strongly	2. Disagree	3. Neither	4. Agree	5. Strongly

Disagree		Agree nor Disagree		Agree
Do you feel challenged by the level of difficulty in the history textbook? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

Emotional Involvement

Did you have a strong emotional experience with your history textbook? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree
Do the characters and situations in the textbook resonate with your emotions? (1-5 marks)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

Enjoyment

Overall, were you satisfied with your experience participating in this history textbook? (on a scale of 1-5)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree
Did the fun in the textbook meet your expectations? (1-5 points)				
1. Strongly Disagree	2. Disagree	3. Neither Agree nor Disagree	4. Agree	5. Strongly Agree

The Results of the Development of a Science Instructional Kit to Improve Teachers' Students' Memory and Understanding in Biology Courses

Phatcharida Inthama, Srinakharinwirot University, Thailand

The Asian Conference on Education 2024
Official Conference Proceedings

Abstract
The objective of this research was to create a scientific learning kit that concentrates on improving the retention and comprehension of biological concepts, with a particular emphasis on the structure and function of cells, for students in the field of science education. Nineteen scientific education students from the Faculty of Education participated in the study, which utilized a one-group pre-test post-test design. The research instruments consisted of student satisfaction questionnaires, achievement assessments, and the scientific learning kit. The scientific learning bundle resulted in a statistically significant improvement in the academic performance of students. The pre-test score (26.74 points) was substantially lower than the average post-test score (43.89 points). The students expressed a high level of satisfaction with the learning kit, with an average satisfaction rating of 4 to 5, which indicates their adoption and approval of the developed package. The scientific learning program significantly enhanced learning achievement, particularly for students with lower pre-test scores, as evidenced by the average normalized gain of 0.73. Consequently, the scientific learning bundle that was developed effectively facilitated the comprehension and retention of biological concepts, as well as the development of students' analytical thinking abilities and the capacity to apply their knowledge. In order to evaluate learning outcomes in broader contexts, future research should consider expanding the sample size and adapting the learning package to more complex biology topics.

Keywords: Scientific Learning Kit, Memory Retention, Understanding, Biology, Learning Achievement

Introduction

Higher education, particularly in the field of science, presents significant challenges due to its complex content and the need for deep understanding. Science teachers' students must acquire both theoretical knowledge and practical skills to prepare themselves for their future roles as educators. Science education emphasizes not only memorization but also fostering understanding that can be applied in real-world contexts. This is especially crucial in biology courses, which cover intricate topics such as cell structure, biological systems, and various processes within living organisms. These are essential areas of knowledge for science teachers' students to master in order to effectively transfer knowledge to younger generations.

The National Education Act B.E. 2542 (1999) emphasizes learner-centered education, recognizing individual differences and the belief that everyone can learn. Teachers play a vital role in enhancing learners' potential through learner-centered approaches (Ministry of Education, 2008). This principle encourages the development of flexible learning materials tailored to the needs of students. In biology courses, using diverse learning materials such as diagrams, models, and animations to illustrate cell structures and processes helps science teachers' students gain deeper understanding and apply their knowledge in real-life situations.

Learning through observation and hands-on practice enables students to better retain and comprehend content. For example, using microscopes to observe cell structures provides learners with a clear visual understanding that connects theory to practice (Institute for the Promotion of Teaching Science and Technology, 2003). Combining theoretical and practical teaching methods is thus an effective approach to fostering in-depth knowledge among science teachers' students, which is critical for enhancing the quality of future teaching.

This integration of media and hands-on activities aligns with research findings that visual aids and colors impact memory and understanding. Warm colors, such as red and yellow, stimulate the brain and increase alertness, which enhances content retention and deeper understanding (Wolters et al., 2005). Therefore, developing learning materials that incorporate visual aids, and hands-on activities can significantly improve learning outcomes.

Science learning kits that are specifically designed not only enhance science teachers' students' understanding of biological content but also help them develop teaching skills applicable to their future classrooms. Creating diverse and innovative teaching materials enables them to design engaging and effective lessons. This is particularly important in today's rapidly evolving knowledge-based society.

This research is significant in developing science learning kits that enhance memory retention and understanding in biology courses for science teachers' students. These kits aim to prepare them to become high-quality educators capable of effectively passing on knowledge to future generations.

Methodology
