Abstract

The teaching of quantitative research design in the social sciences is crucial, but learners' learning motivation are limited and there is a lack of more case studies and timely diagnostic guidance. Utilizing case scenarios and giving scaffolding guidance helps to address these limitations. In this study, we designed an educational game that combines case studies and progressive guidance on the Generative AI (GAI) scaffolding. This study develops an innovative scaffolding guidance module for GAI scripts. When a player asks a question, the player will not be told the answer directly. Instead, it gradually guides the player to find the research design problem and think in the direction of appropriate analytical methods. Learners play the role of an anxious graduate student facing a research bottleneck. For a limited time, he can have a discussion with the scaffolding guide to the NPC played by GAI. A total of 18 people participated in the empirical evaluation of this study. The study found that learners had high flow, low anxiety, found the game fun during the game, and had a desire to play again. (All scores are significantly higher than 3, i.e., the median of the scale.) Learners felt that this game enhanced research design thinking more than the conventional curriculum. 72% of the participants felt that the game helped in understanding the concepts of the research design. 78% of the participants felt that the NPC characters would give guiding hints to help learners find the information they need to solve problems online.

Introduction

The teaching of quantitative research design and statistical learning in the social sciences is critical to the development of researchers. In terms of quantitative research design, students and academics often find the units of quantitative research methodology not only challenging but also anxiety-provoking. In a study by Navodya and colleagues (2022), difficulties in writing research papers and deficient statistical knowledge were shown to be the two main reasons for learners' poor performance. In the study of statistics, there is now a greater demand for statistics teaching and expertise in higher education than ever before, but there is a general lack of motivation among students to learn and a feeling that they do not have the necessary skills (Bromage et al., 2021). In addition, there are other limitations, such as limited teaching time, lack of more case studies and timely diagnostic guidance. Many studies have indicated that the use of game-based learning is an effective teaching strategy (Chien et al., 2024). Generative AI is characterized by Large Language Models (LLMs), which are progressive and adaptive to generate interactive conversations. This advantage is combined in the teaching strategy of contextualized games, and then with the use of case scenarios of story scripts, not only can the Generative AI as a scaffolding for immediate feedback, but also guide learners to discover the problem and search for knowledge, resulting in a flow status, which is expected to improve the learning motivation and learning effectiveness.

However, if learners are passive and get their answers directly from the scaffolding, students will not have the opportunity to think cognitively at a high level and select appropriate analytical methods. According to Limbach and Waugh (2010), active learning, appropriate questioning techniques, and structured feedback enable students to higher level thinking and enjoy it. Chien and colleagues (2024) suggest that Generative AI can provide more realistic scaffolding feedback and guidance if it is used as an NPC (Non-Player Character) in role-playing educational games with contextualization. In this study, we design a Generative AI educational game that combines contextual cases with feedback scaffolding. When players ask questions in the game, the Generative AI will not directly tell the players the answers, but rather progressively guide the players to find the questions in the research design and think in the direction of appropriate analytical methods.

Methods

A total of 18 participants were involved in the initial empirical evaluation of this study. The participants were master's degree students from different universities in Taiwan, and they were all over 22 years old. As shown in Figure 1, learners play the role of an anxious graduate student facing a research bottleneck. For a limited time, he can discuss a flawed research design with the scaffolding guide to the NPC played by GAI, then propose a modified research proposal on Google Forms and pass the professor's assessment. As shown in Figure 2, the NPC will not give the player the answer directly, but is only responsible for the role of guidance, the player needs to go to the Internet to check, find the correct information and then confirm with the NPC, the player will get more feedback and confirm the thinking. In this game, players must also utilize their communication, data search and problem solving skills to learn statistical knowledge related to quantitative research design until the end of the game.

NTUSTMEG GPT game

學姊救我，我要畢業！ - NTUSTMEG EDUCATIONAL GAME with GAI-based GPT-NPC

你，張偉強，綽號阿強，就讀碩士班二年級，今天非常苦惱，因為你繳交一研究設計構想給教授，但教授跟你說：“回去自己先想想看，你的研究設計有幾個很不恰當之處，想一聰明天再找我討論~”，明天就要再重新繳交報告給老師了，但你並沒有想到底哪裡出問題，時間緊迫，這可能會影響到你的畢業日程！你要趕快LINE你的學姊求救。你已經先寄給學姐這個研究構想讓她幫你想想了~

學姊陳若婷，是一個26歲的博士班一年級研究生。她對於統計相關知識較熟，所以你必须邊跟學姊討論一下(用右側的對話視窗)，問問她的想法，絕對比盲目上網找資料來得更有方向！她可能可以給你建議。注意！學姊為你好，將不會直接告訴你答案，因為這樣你就不会去思考，而只是負責引導你，所以你還是要到網路上去查證，若您有正確的資訊，所以你還是要到網路上去查證，但若您有正確的資訊跟她確認，她會樂於給你更多意見確認你的想法囉。當你都弄懂了之後就可以去找教授BOSS做終極討論！沒有把握之前，建議你不要直接認為就可以找教授了，可能要充足充分的準備！有時候學姊更能幫您診斷細節與盲點~

趕快在底下問博士班學姐問問她意見、討論問題，並上網找資料佐證

你可以在這裡跟學姊討論你的研究，比起盲目地找資料更有方向

我：學姐好~請問這個研究設計哪裡有問題？

學姊：阿強，從你的研究設計來看，well，有幾個地方可能需要重新思考一下。妳的實驗組和控制組活動進行時間不同，可能會影響結果的比較囉！還有，使用獨立樣本t檢定或許也會有些問題，這個我建議妳再仔細考慮看看。

我：時間是不是要調成一致比較好呢？

學姊：well，阿強，我覺得這個問題的確有點棘手，時間確實可能是一個影響因素。你怎麼看兩組活動時間不一致這部分？或許可以再想想其他可能的問題哦。

學姊：活動方式好像有差異？

我：對耶，那怎麼辦？

學姊：well，阿強，我覺得可能是研究設計的一些基本部分需要再檢視一下。或許是你採用的統計方法不是最恰當的。我記得自己以前

Results and Discussion

Participants in this study completed post-test questionnaires after the completion of the game, including questionnaires on flow status (Table 1), activity anxiety, game acceptance, usefulness and ease of use, and elements of the game (Table 2), and qualitative analyses, and descriptive statistical analyses were conducted using a single-sample t-test. Table 1 shows the descriptive statistical analysis of the learners' flow status after completing the task. The overall flow ($M=4.07$, $SD=0.65$) is significantly higher than the median of the scale (i.e., 3). Flow antecedents ($M=4.05$, $SD=0.75$), flow experience ($M=4.08$, $SD=0.73$), and other flow average dimensions are all high at a median of the scale (i.e., 3). Most of the sub-dimensions had mean scores higher than 4. In the sub-dimension of flow status, learners scored higher on the items of control ($M=4.36$), playability ($M=4.31$) and autotelic experience ($M=4.31$). This indicates that the contextualized design of the GAI educational game enables the learner to have a high sense of self-control and sufficient playability, in addition to which the player is able to participate in the activity from the heart and will feel that the activity itself is sufficiently satisfying to constitute a reward, and will be immersed in the game in order to actively participate in the game tasks and complete the goals.

Table 1: The Mean and Standard Deviation of Learners' Flow

(n=18)	<i>M</i>	<i>SD</i>	<i>Z</i>	Sig.
Overall Flow	4.07	0.65	3.57***	0.000
Flow antecedents	4.05	0.74	3.42***	0.000
Challenge-skill balance	3.61	1.12	2.09*	0.037
Goals of an activity	4.19	0.89	3.40***	0.000
Unambiguous Feedback	3.78	1.07	2.58*	0.010
Control	4.36	0.87	3.51***	0.000
Playability	4.31	0.82	3.47***	0.000
Flow experience	4.08	0.73	3.51***	0.000
Concentration	4.15	1.11	3.00**	0.003
Time distortion	4.14	0.94	3.28**	0.001
Autotelic experience	4.31	0.62	3.64***	0.000
Loss of self-consciousness	3.44	1.25	1.46	0.145

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Table 2 shows the descriptive statistical analysis of learners' game anxiety, game acceptance and game elements. Overall anxiety ($M=2.29$, $SD=0.91$) was lower than the median of the scale (i.e., 3) and reached significance. Moderately low anxiety is an important indicator of sustained flow during gaming activities. In addition, overall game acceptance ($M=4.20$, $SD=0.50$), game usefulness ($M=4.21$, $SD=0.61$), game ease of use ($M=4.19$, $SD=0.70$), and game elements ($M=4.16$, $SD=0.85$) were also significantly above the median (i.e., 3) of the scale.

Table 2: The Mean and Standard Deviation of Learners' Game Anxiety, Game Acceptance, and Game Elements

(n=18)	<i>M</i>	<i>SD</i>	<i>Z</i>	Sig.
Game Anxiety	2.29	0.91	-2.63**	0.009
Game Acceptance	4.20	0.50	3.73***	0.000
Game Usefulness	4.21	0.61	3.60***	0.000
Game Ease of Use	4.19	0.70	3.59***	0.000
Game elements	4.16	0.85	3.40***	0.000

Conclusion and Limitations

“Senior Sister Help Me” is an educational learning game developed by this study that lets the player take on the role of an anxious graduate student through the use of GAI progressively real-time feedback and case scenario simulation, with an emphasis on training in research methodology and statistical analysis. It also allows learners to use their communication, information-seeking and problem-solving skills to complete tasks and develop higher-level cognitive thinking skills. The study found that learners had high flow, low anxiety, found the game fun during the game, and had a desire to play again. (All scores are significantly higher than 3, i.e., the median of the scale.) Learners felt that this game enhanced research design thinking more than the conventional curriculum. 72% of the participants felt that the game helped in understanding the concepts of the research design. 78% of the participants felt that the NPC characters would give guiding hints to help learners find the information they need to solve problems online. Future research could increase the sample size and include a control group to compare and analyze the progressively scaffolding-oriented NPC conversational feedback mechanism with the contextualized game using the GAI mechanism, and to explore more deeply the differences in learning effectiveness and higher-level cognitive thinking skills between the research methods and statistical analyses.
